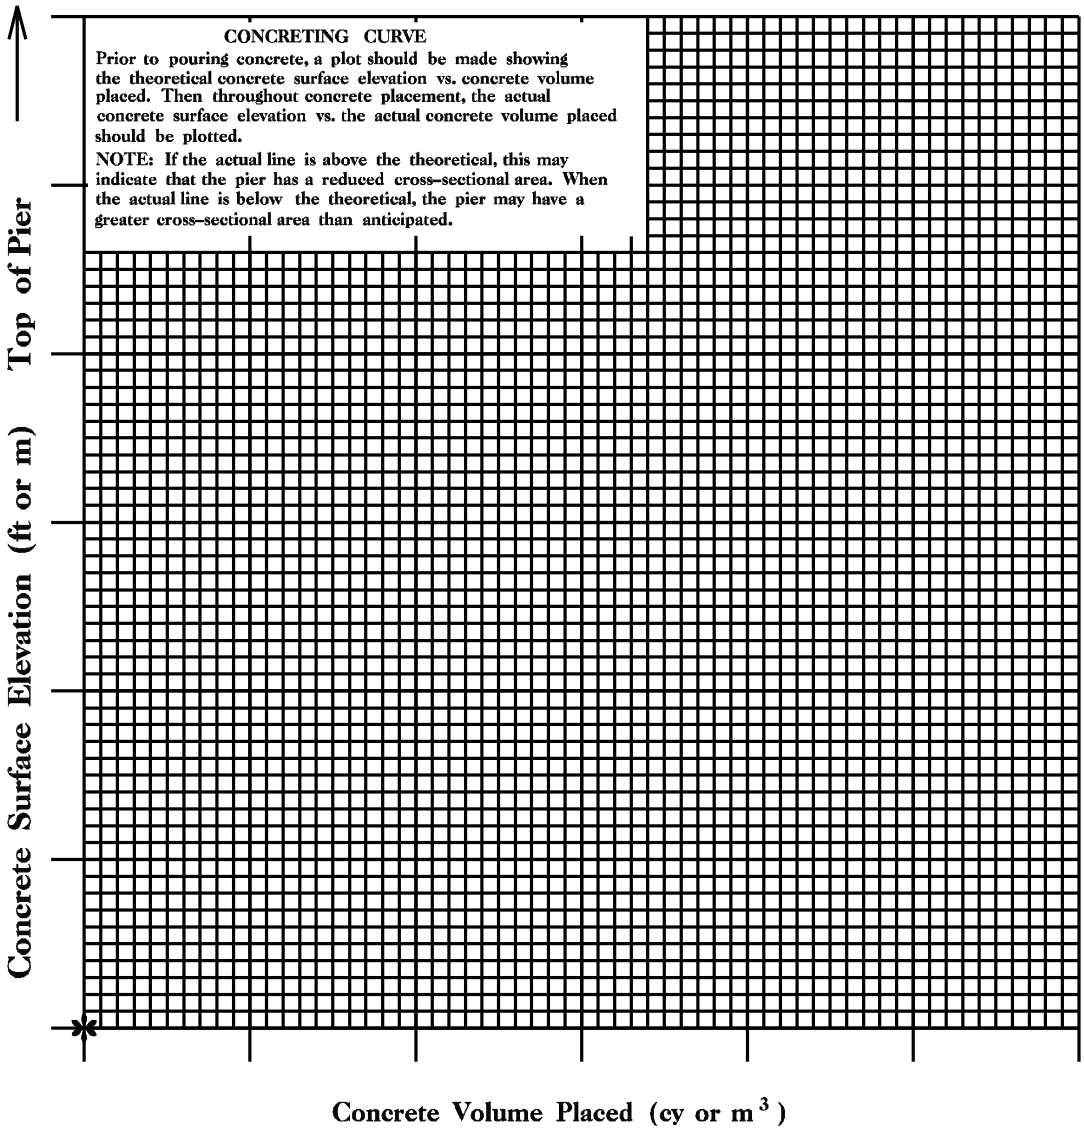
CONCRETE CURVE



CONCRETING CURVE

Prior to pouring concrete, a plot should be made showing the theoretical concrete surface elevation vs. concrete volume placed. Then throughout concrete placement, the actual concrete surface elevation vs. the actual concrete volume placed should be plotted.

NOTE: If the actual line is above the theoretical, this may indicate that the pier has a reduced cross-sectional area. When the actual line is below the theoretical, the pier may have a greater cross-sectional area than anticipated.
