

15_08 Curb Ramps - Quantity Calculations

Q: How do we quantify curb ramps?

A: For each set of truncated domes, there should be an associated quantity of curb ramps. In some island details, there could be 2 or 3 sets of truncated domes. In each case, the quantity of curb ramps should match the number of sets of truncated domes. Exception: For median islands with pedestrian crossings that are less than 6' wide, no truncated domes are required. This type of "curb ramp" should be quantified as 1 curb ramp.
