

16_14 Layout X-sect with Offset

Question:

Im trying to layout some metric x-sections with an offset to the page. The x-sections are too long to run on one page and I need to run a left and rightt. I've tried modifying the inputs but it will lay it down the middle and just cut off the left or right side.

Answer:

If you are using one of the existing scales from the .xssl file and you want to lay a left or right offset, then simply define it in the "Sheet Stack Column". Default setting is "0.41" m for 125 scale xpl. For left offset change to "0.2" m. For right offset change it "0.6"m. "0.88"m is the limit of your width of the page. Remember to also change the "Station Label" and "Sheet Label" Alignment offset numbers to match the "sheet stack column" if you choose an offset.
