

5_4 CROSS SECTION LABELER – LABELER DIALOG BOX CRASHES

Question:

I am trying to run the Cross Section Labeler in Corridor Modeling and it keeps crashing or sometimes even takes a long period for the dialog box to come open. Do you know what is causing this issue?

Answer:

The problem is that the cross section labeling VBA does not work correctly when it sees GPK names longer than 8 characters. The fix is to rename any gpk to reduce the name to 8 characters or less or keep the same name and change the .gpk extension to a .bak extension.
