

## 1\_1 PURPOSE OF “DTM FILES PATH” AT CORRIDOR MODELING PREFS TAB?

### Question:

What is the purpose of the “DTM Files Path” under the Corridor Modeling Preferences tab?

### Answer:

The purpose of the “DTM Files Path” is to define the desired location to place the converted existing TIN to an existing inRoads DTM. This is NOT the location of the existing TIN. It is recommended to be set to the “\CorridorModeling\” folder.

Earlier versions of Corridor Modeling by default would place the converted existing inRoads DTM in the same location as the existing TIN. Of course the existing TIN may exist in the DTM, Photogrammetry, and/or LocationSurveys folder, which Roadway Users do not have permission to write to.

Note, the place to select the location of and import the existing TIN is found under the DTM tab.
