

3_12 GR AND SBG GRAPHICS SEARCH RANGE

Question:

My templates are locating the guardrail graphics off the side street from the mainline over 120' away. What can I do if I just wanted to limit the search range of the graphics to what is within my active corridor?

Answer:

The new shoulder section template has parametric constraints that can be used to control and limit the search range of guardrail and SBG graphics. The default search range for guardrail graphics (SR_GR) is 25' from the outside EOP. The default search range for SBG graphics (SR_SBG) is 20' from the outside EOT. Both values can be changed to meet your specific project needs.
