 DATE: April 25, 2000
 SUBJECT: Intermediate Guiderail Anchors

This is to address plan incongruity with Intermediate Guiderail Anchors. These anchors have sometimes but not always been shown on our plans. Intermediate Guiderail Anchors are used at 2000 feet maximum intervals in continuous guiderail. The anchors overlap and there is no actual break in the guiderail. A sketch is attached.

It is not necessary nor desired to show these anchors since the provisions dictate their placement. We need only calculate them similar to fence post calculation and show in the guardrail summary. In the interest of plan uniformity, do not show these Intermediate Anchors in the plan view of your cable guiderail.

Thank you for you help in this matter.
