ACTION	YES	NO	N/A	COMMENTS
Locate the basin so that the treated water can get to the outfall easily without creating further erosion.				
Place the basin on solid ground.				
Construct the basin as shown in the plans				
Tie the permeable stone drain in to the dike. Use filter fabric as necessary to keep the water from eroding under or around the stone.				
Install coir fiber baffles.				
Place the outlets of the pump hose as far as possible from the stone drain.				
Clean the basin before it is no longer able to settle solids.				
Check the basin often during the time that the pumps are running.				
Do not pump sediment-laden water directly into a stream.
