

Modeling Guidelines and Procedures for Medium-Sized Urban Areas in North Carolina

North Carolina Model Users Group Meeting
November 12, 2008

Leta Huntsinger | PB | 919-468-2156 | huntsinger@pbworld.com

Dan Thomas | NC DOT | 919-715-5482 | danthomas@ncdot.gov

Background

■ North Carolina Profile

- 17 MPOs, 10 with population < 250,000
- 20 Rural Planning Organizations
- 1959 GS 136-66.2
- 2001 revisions were made to GS 136-66.2

Current Challenges

- Changing workforce
- Changes in scope and responsibility
- Loss of experienced, knowledgeable staff leading to an erosion of modeling skills and loss of institutional knowledge in modeling practice

NCDOT's Efforts

- Broad scale effort to improve travel forecasting tools in NC
- Sponsored research to develop best practice guidelines for planning analysis tools (Tier 1 and 2 communities)
- Contracted with PB to develop standard modeling guidelines and procedures (Tier 3 communities)

Outline

- North Carolina Combined Survey Database
- Model Structure
- Traditional Approach vs. Key Features of New Approach
- Graphical User Interface
- Benefits

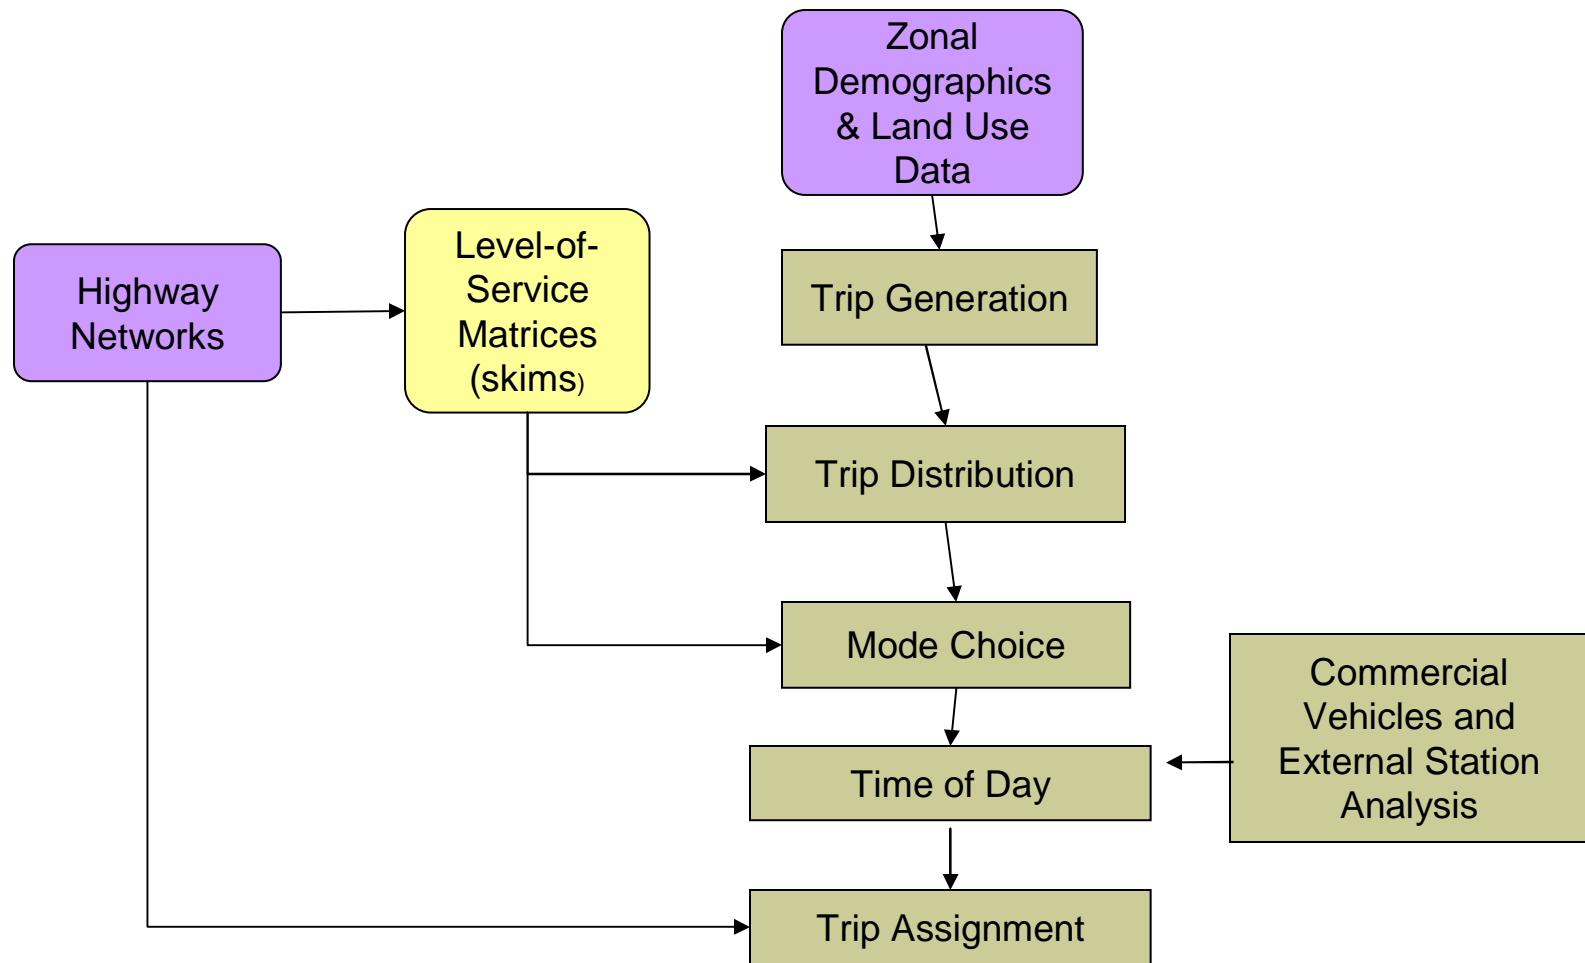

Combined Survey Database

- Household travel survey data from 3 MPOs across North Carolina
- Used to develop default rates and parameters
 - Household disaggregate curves
 - Production and attraction rates
 - Initial gamma coefficients
 - Mode split factors
 - Vehicle occupancy factors
 - Time of day distribution
- Starting point for communities with no observed travel survey data

Model Structure

Traditional Approach vs. New Approach

Component	Traditional Approach	New Approach
Data Collection	<ul style="list-style-type: none"> ▪ 100% field inventory 	<ul style="list-style-type: none"> ▪ Census data ▪ Private vendor data
Highway Network	<ul style="list-style-type: none"> ▪ No standard approach 	<ul style="list-style-type: none"> ▪ Minimum required attributes
Rates and Parameters	<ul style="list-style-type: none"> ▪ Borrowed from other areas 	<ul style="list-style-type: none"> ▪ Default rates derived from combined survey database
Trip generation	<ul style="list-style-type: none"> ▪ 3 trip purposes ▪ Productions by 5 dwelling unit classes ▪ Attractions by 5 employment types ▪ Vehicle trips 	<ul style="list-style-type: none"> ▪ 5 trip purposes ▪ Productions by household size and auto ownership (20 classes) ▪ Attractions by 5 employment types ▪ Person trips

Traditional Approach vs. New Approach

Component	Traditional Approach	New Approach
Trip distribution	<ul style="list-style-type: none">▪ Friction factor table▪ Impedance = initial travel time	<ul style="list-style-type: none">▪ Gamma function▪ Impedance = generalized cost
Mode Split	<ul style="list-style-type: none">▪ No mode split step	<ul style="list-style-type: none">▪ Mode factors applied to person trip tables
Commercial vehicles	<ul style="list-style-type: none">▪ Trip rate applied to total commercial vehicles per zone▪ CV trips combined with NHB trips for distribution	<ul style="list-style-type: none">▪ Separate production and attraction equations for 3 classes of CV▪ 3 classes maintained through time of day

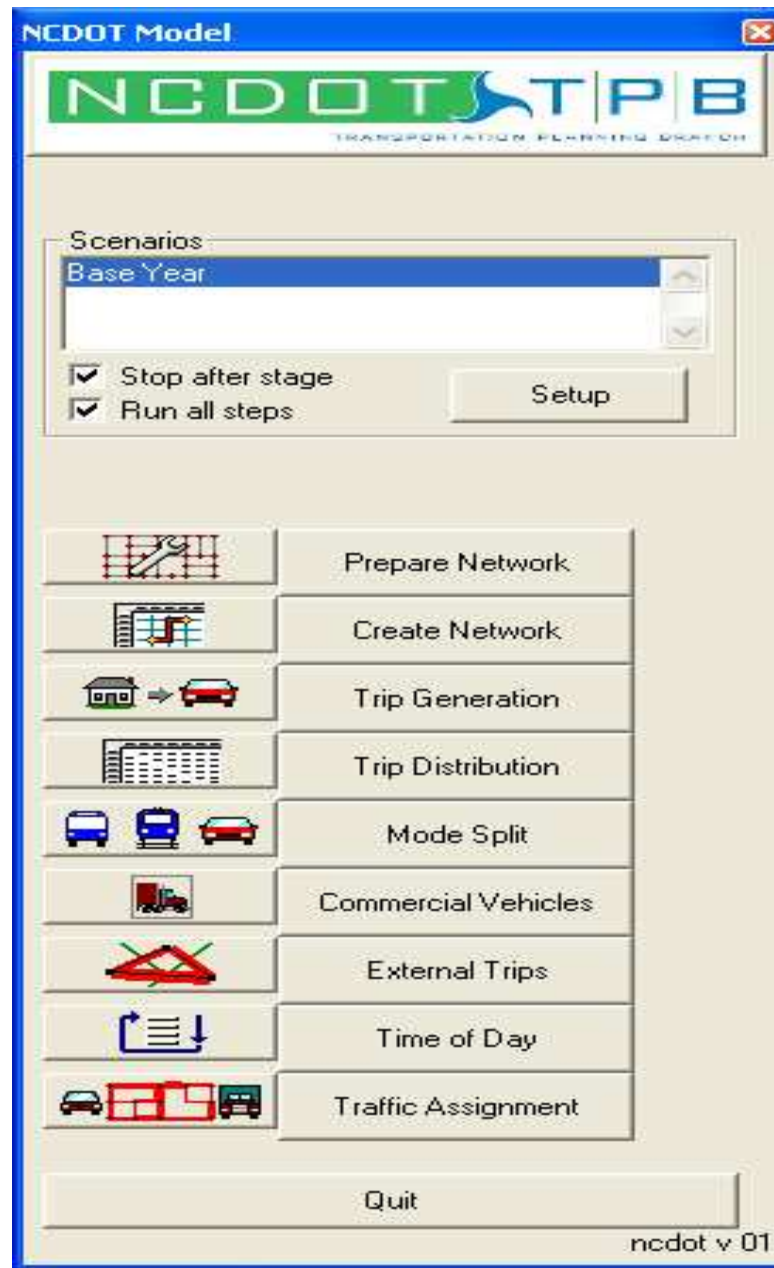

Traditional Approach vs. New Approach

Component	Traditional Approach	New Approach
Time of day	<ul style="list-style-type: none">▪Daily model	<ul style="list-style-type: none">▪AM, Midday, PM, and Off Peak time periods▪Vehicle occupancy factors
Highway assignment	<ul style="list-style-type: none">▪Primarily all-or-nothing	<ul style="list-style-type: none">▪Time period equilibrium assignment using a conical delay function
Validation and Reasonableness Checking	<ul style="list-style-type: none">▪Primarily performed at highway assignment using screenline and coverage counts	<ul style="list-style-type: none">▪Reasonableness checks at each step in the process using secondary sources of data

Graphical User Interface

Overall benefits

- Streamlines and standardizes model development
- Moves NCDOT towards current best practice
- Provides basis for training
- Adaptable to future enhancements
- Rates and parameters based on North Carolina data
