In October of 2005, the Transportation Planning Branch of the North Carolina Department of Transportation and Robeson County initiated a study to cooperatively develop the Robeson County Comprehensive Transportation Plan (CTP), which includes the towns of Lumber Bridge, Marietta, McDonald, Orrum, Parkton, Proctor-ville, Raynham, Rennert, Rowland, and St. Pauls. This is a long range multi-modal transportation plan that covers transportation needs through 2035. Modes of transportation evaluated as part of this plan include: highway, public transportation and rail, and bicycle. The pedestrian mode was not evaluated in this plan. This plan does not cover standard bridge replacements, routine maintenance, or minor operations issues. Refer to Appendix A for contact information on these types of issues.

Findings of this CTP study were based on an analysis of the transportation system, environmental screening, and public input. Refer to Figure 1 for the CTP maps, which were mutually endorsed/adopted in 2010 and 2011. Implementation of the plan is the responsibility of Robeson County, the towns, and NCDOT. Refer to Chapter 1 for information on the implementation process.

This report documents the recommendations for improvements that are included in the Robeson County CTP. The major recommendations for improvements are listed below. More detailed information about these and other recommendations can be found in Chapter 1.

- I-95: Widen to a six-lane divided freeway from Cumberland County to South Carolina.
- **US 74:** Upgrade to a 4-lane divided freeway from the Lumberton County Planning Area Boundary (PAB) to the Columbus County line.
- **NC 211:** Widen to a 4-lane divided facility from the Red Springs Planning Area Boundary to the Lumberton Planning Area Boundary.
- **NC 20:** Widen to a 4-lane divided boulevard from the Bladen County line to Shaw Rd. (SR 1729).
- **NC 71 Lumber Bridge Bypass:** Construct on new location a 2-lane major thoroughfare bypass of Lumber Bridge.
- **NC 71 Parkton Bypass:** Construct on new location a 2-lane major thoroughfare bypass of Parkton.

I. Analysis of the Existing and Future Transportation System

A Comprehensive Transportation Plan (CTP) is developed to ensure that the progressively developed transportation system will meet the needs of the region for the planning period. The CTP serves as an official guide to providing a well-coordinated, efficient, and economical transportation system for the future of the region. This document should be utilized by the local officials to ensure that planned transportation facilities reflect the needs of the public, while minimizing the disruption to local residents, businesses and environmental resources.

In order to develop a Comprehensive Transportation Plan (CTP), the following are considered:

- Analysis of the transportation system, including any local and statewide initiatives;
- Impacts to the natural and human environment, including natural resources, historic resources, homes, and businesses;
- Public input including community vision, goals, and objectives.

Analysis Methodology and Data Requirements

Reliable forecasts of future travel patterns must be estimated in order to analyze the ability of the transportation system to meet future travel demand. These forecasts depend on careful analysis of the character and intensity of existing and future land use and travel patterns.

An analysis of the transportation system looks at both current and future travel patterns and identifies existing and anticipated deficiencies. This is usually accomplished through a capacity deficiency analysis, a traffic crash analysis, and a system deficiency analysis. This information, along with population growth, economic development potential, and land use trends, is used to determine the potential impacts on the future transportation system.

Roadway System Analysis

An important stage in the development of a CTP is the analysis of the existing transportation system and its ability to serve the area's travel desires. Emphasis is placed not only on detecting the existing deficiencies, but also on understanding the causes of these deficiencies. Roadway deficiencies may result from inadequacies such as pavement widths, intersection geometry, and intersection controls; or system problems, such as the need to construct missing travel links, bypass routes, loop facilities, additional radial routes or infrastructure improvements to meet statewide initiatives.

One of those statewide initiatives is the Strategic Highway Corridor (SHC) Vision Plan adopted by the Board of Transportation on September 2, 2004 and last revised on July 10, 2008. The SHC vision plan represents a timely initiative to protect and maximize the mobility and connectivity on a core set of highway corridors throughout North Carolina, while promoting environmental stewardship through maximizing the use of existing facilities to the extent possible, and fostering economic prosperity through the quick and efficient movement of people and goods.

The primary purpose of the SHC vision is to provide a network of high-speed, safe, reliable highways throughout North Carolina. The primary goal to support this purpose is to create a greater consensus towards the development of a genuine vision for each Corridor – specifically towards the identification of a desired facility type (Freeway, Expressway, Boulevard, or Thoroughfare) for each Corridor. Individual Comprehensive Transportation Plans shall incorporate the long-term vision of each Corridor.

In the development of the Robeson County CTP, travel demand was projected from 2004 to 2035 using a trend line analysis based on Annual Average Daily Traffic (AADT) from 1983 to 2003. In addition, local land use plans and growth expectations were used to further refine future growth rates and patterns. The established future growth rates were endorsed by the Robeson County Planning Board on January 27, 2007.

Existing and future travel demand is compared to existing roadway capacities. Capacity deficiencies occur when the traffic volume of a roadway exceeds the roadway's capacity. Roadways are considered near capacity when the traffic volume is at least eighty percent of the capacity. Refer to Figures 2 and 3 for existing and future capacity deficiencies.

Capacity is the maximum number of vehicles which have a "reasonable expectation" of passing over a given section of roadway, during a given time period under prevailing roadway and traffic conditions. Many factors contribute to the capacity of a roadway including the following:

- Geometry of the road (including number of lanes), horizontal and vertical alignment, and proximity of perceived obstructions to safe travel along the road;
- Typical users of the road, such as commuters, recreational travelers, and truck traffic;
- Access control, including streets and driveways, or lack thereof, along the roadway;
- Development along the road, including residential, commercial, agricultural, and industrial developments;
- Number of traffic signals along the route;
- Peaking characteristics of the traffic on the road;
- Characteristics of side-roads feeding into the road; and

Insert Current Roadway Deficiency Map – Figure 2

• Directional split of traffic or the percentages of vehicles traveling in each direction along a road at any given time.

The relationship of travel demand compared to the roadway capacity determines the level of service (LOS) of a roadway. Six levels of service identify the range of possible conditions. Designations range from LOS A, which represents the best operating conditions, to LOS F, which represents the worst operating conditions.

LOS D indicates "practical capacity" of a roadway, or the capacity at which the public begins to express dissatisfaction. The practical capacity for each roadway was developed based on the 2000 Highway Capacity Manual using the NC Level of Service (NCLOS) software. Recommended improvements and overall design of the transportation plan were based upon achieving a minimum LOS D on existing facilities and a LOS C for new facilities. Refer to Appendix E for detailed information on LOS.

Traffic Crash Analysis

Traffic crashes are often used as an indicator for locating congestion and roadway problems. Crash patterns obtained from an analysis of crash data can lead to the identification of improvements that could improve safety. However, a crash analysis was not performed during the development of this plan. For informational purposes, a crash analysis was performed for the Robeson County CTP, post recommendation development, in the planning area between January 1, 2008 and December 31, 2010. During this period, a total of 12 intersections were identified as high crash locations as illustrated in Figure 4. Refer to Appendix F for a detailed crash analysis.

Bridge Deficiency Assessment

Bridges are a vital and unique element of a highway system. First, they represent the highest unit investment of all elements of the system. Second, any inadequacy or deficiency in a bridge reduces the value of the total investment. Third, a bridge presents the greatest opportunity of all potential highway failures for disruption of community welfare. Finally, and most importantly, a bridge represents the greatest opportunity of all highway failures for loss of life. For these reasons, it is imperative that bridges be constructed to the same design standards as the system of which they are a part.

The NCDOT Bridge Maintenance Unit inspects all bridges in North Carolina at least once every two years. Bridges having the highest priority are replaced as Federal and State funds become available. Fifty-one deficient bridges were identified within the planning area and are illustrated in Figure 5. Refer to Appendix G for more detailed information.

Public Transportation and Rail

Public transportation and rail are vital modes of transportation that give alternative options for transporting people and goods from one place to another.

Public Transportation

North Carolina's public transportation systems serve more than 50 million passengers each year. Five categories define North Carolina's public transportation system: community, regional community, urban, regional urban and intercity.

- Community Transportation Local transportation efforts formerly centered on assisting clients of human service agencies. Today, the vast majority of rural systems serve the general public as well as those clients.
- Regional Community Transportation Regional community transportation systems are composed of two or more contiguous counties providing coordinated and consolidated service. Although such systems are not new, the NCDOT Board of Transportation is encouraging single-county systems to consider mergers to form more regional systems.
- Urban Transportation There are currently nineteen urban transit systems operating in North Carolina, from locations such as Asheville and Hendersonville in the west to Jacksonville and Wilmington in the east. In addition, small urban systems are at work in three areas of the state. Consolidated urban-community transportation exists in five areas of the state. In those systems, one transportation system provides both urban and rural transportation within the county.
- Regional Urban Transportation Regional urban transit systems currently operate in three areas of the state. These systems connect multiple municipalities and counties.

Intercity Transportation - Intercity bus service is one of a few remaining examples
of privately owned and operated public transportation in North Carolina. Intercity
buses serve many cities and towns throughout the state and provide connections
to locations in neighboring states and throughout the United States and Canada.
Greyhound/Carolina Trailways operates in North Carolina. However, community,
urban and regional transportation systems are providing increasing intercity
service in North Carolina.

Robeson County does have an existing transit system called the South East Area Transit System (SEATS). However, no transit recommendations were made in the Robeson County CTP. For more information regarding SEATS visit www.co.robeson.nc.us/seat.htm. Refer to the Public Transportation Division of NCDOT for more information and Appendix A for contact information.

Rail

Today North Carolina has 3,684 miles of railroad tracks throughout the state. There are two types of trains that operate in the state, passenger trains and freight trains.

The North Carolina Department of Transportation sponsors two passenger trains, the Carolinian and Piedmont. The Carolinian runs between Charlotte and New York City, while the Piedmont train carries passengers from Raleigh to Charlotte and back everyday. Combined, the Carolinian and Piedmont carry more than 200,000 passengers each year.

There are two major freight railroad companies that operate in North Carolina, CSX Transportation and Norfolk Southern Corporation. Also, there are more than 20 smaller freight railroads, known as shortlines.

An inventory of existing rail facilities for the planning area is presented on Sheet 3 of Figure 1. Currently there are 4 major rail lines operating in Robeson County. No recommendations were made for rail for the Robeson County CTP. Refer to Appendix A for contact information for the Rail Division of NCDOT.

Bicycles & Pedestrians

Bicyclists and pedestrians are a growing part of the transportation equation in North Carolina. Many communities are working to improve mobility for both cyclists and pedestrians.

NCDOT's Bicycle Policy, updated in 1991, clarifies responsibilities regarding the provision of bicycle facilities upon and along the 77,000-mile state-maintained highway system. The policy details guidelines for planning, design, construction, maintenance, and operations pertaining to bicycle facilities and accommodations. All bicycle improvements undertaken by the NCDOT are based upon this policy.

The 2000 NCDOT Pedestrian Policy Guidelines specifies that NCDOT will partner with localities in the construction of sidewalks as incidental features of highway improvement projects. At the request of a municipality, state funds for a sidewalk are made available if matched, using a sliding scale based on population.

NCDOT's administrative guidelines, adopted in 1994, ensure that greenways and greenway crossings are considered during the highway planning process. This policy was incorporated so that critical corridors which have been adopted by localities for future greenways will not be severed by highway construction.

During the development of this plan, the pedestrian mode was not studied by the NCDOT Transportation Planning Branch. Therefore no pedestrian recommendations were made. Bicylcle recommendations were however included in this plan. Inventories of existing and planned bicycle facilities for the planning area are presented on Sheets 4 of Figure 1. The Sandhills Sector NC Bike Route runs through the northern portion of Robeson County. All recommendations for bicycle facilities were coordinated with the local governments and the NCDOT Division of Bicycle and Pedestrian Transportation. Refer to Appendix A for contact information.

Land Use

G.S. §136-66.2 requires that local areas have a current (less than five years old) land development plan prior to adoption of the CTP. For this CTP, the 2010 Robeson County Working Lands Protection Plan was used to meet this requirement.¹

Land use refers to the physical patterns of activities and functions within an area. Traffic demand in a given area is, in part, attributed to adjacent land use. For example, a large shopping center typically generates higher traffic volumes than a residential area. The spatial distribution of different types of land uses is a predominant determinant of when, where, and to what extent traffic congestion occurs. The travel demand between different land uses and the resulting impact on traffic conditions varies depending on the size, type, intensity, and spatial separation of day and the day of the week. For transportation planning purposes, land use is divided into the following categories:

- <u>Residential</u>: Land devoted to the housing of people, with the exception of hotels and motels which are considered commercial.
- <u>Commercial</u>: Land devoted to retail trade including consumer and business services and their offices; this may be further stratified into retail and special retail classifications. Special retail would include high-traffic establishments, such as fast food restaurants and service stations; all other commercial establishments would be considered retail.

¹ See the 2010 Robeson County Working Lands Protection Plan for mapping and detail.

- <u>Industrial</u>: Land devoted to the manufacturing, storage, warehousing, and transportation of products.
- <u>Public</u>: Land devoted to social, religious, educational, cultural, and political activities; this would include the office and service employment establishments.
- <u>Agricultural</u>: Land devoted to the use of buildings or structures for the raising of non-domestic animals and/or growing of plants for food and other production.
- <u>Mixed Use:</u> Land devoted to a combination of any of the categories above.

Anticipated future land development is, in general, a logical extension of the present spatial land use distribution. Locations and types of expected growth within the planning area help to determine the location and type of proposed transportation improvements.

Robeson County anticipates growth in northern portions of the County as a result of the Ft. Bragg Base Realignment and Closure (BRAC). The 2010 Robeson County Working Lands Protection Plan provides detailed information related to existing land use, farm land suitability, population density characteristics, and other information. Information gathered prior to the completion of this land use plan from local planning staff, the Robeson County Planning Board, local municipalities, and others were used to aid in determination of future growth. This information can be seen in Figure 6.

Consideration of Natural and Human Environment

In recent years, the environmental considerations have come to the forefront of the transportation planning process. Section 102 of the National Environmental Policy Act (NEPA) requires consideration of impacts on wetlands, wildlife, water quality, historic properties, and public lands. While a full NEPA evaluation was not conducted as part of the CTP, potential impacts to these resources were identified as a part of the project recommendations in Chapter 2 of this report. Prior to implementing transportation recommendations of the CTP, a more detailed environmental study would need to be completed in cooperation with the appropriate environmental resource agencies.

A full listing of environmental features that were examined as a part of this study is shown in the following tables utilizing the best available data. Environmental features occurring within Robeson County are shown in Figures 7, 8, and 9.

Table 1 – Environmental Features

Public Involvement

Public involvement is a key element in the transportation planning process. Adequate documentation of this process is essential for a seamless transfer of information from systems planning to project planning and design.

Robeson County requested the CTP study on January 26th, 2005. Throughout the course of the study, the Transportation Planning Branch cooperatively worked with the Robeson County Planning Board and the Lumber River RPO to provide information on current local plans, to develop transportation vision and goals, to discuss population and employment projections, and to develop proposed CTP recommendations. Refer to Appendix H for detailed information on the vision statement, the goals and objectives survey and a listing of committee members.

The public involvement process included holding two public drop-in sessions in Robeson County to present the proposed Comprehensive Transportation Plan to the public and solicit comments. The first meeting was held on June 10th, 2009 at the Robeson County Commissioners chambers; the second meeting was held on November 16th, 2009 at the Robeson County Commissioners Chambers. Each session was publicized in the local newspaper and with the first meeting occurring from 3:00 to 6:00 PM and the second occurring from 4:00 to 6:00 PM. For more information regarding these public drop-in sessions see Appendix H.

A public hearing was held on September 7th, 2010 during a Robeson County Commissioners meeting. The purpose of this meeting was to discuss the plan recommendations and to solicit further input from the public. The CTP was adopted during this meeting. The other participating towns held public hearings and adopted the CTP on the dates listed below:

-	Parkton:	October 5, 2010	-	Proctorville:	November 1 st , 2011
-	Lumber Bridge:	January 3 rd , 2011	-	Raynham :	November 9 th , 2011
-	Marietta:	October 19 th , 2010	-	Rennert:	January 17 th , 2011
-	McDonald:	February 3 rd , 2011	-	Rowland:	September 22, 2010
-	Parkton:	October 5 th , 2011	-	St. Pauls:	September 9 th , 2010

The Lumber River RPO endorsed the CTP on March 28th, 2011. The North Carolina Board of Transportation voted to mutually adopt the Robeson County CTP on April 7th, 2011.

This report documents the development of the Robeson County CTP as shown in Figure 1. This chapter presents recommendations for each mode of transportation in Robeson County and the following participating towns: Lumber Bridge, Marietta, McDonald, Parkton, Proctorville, Raynham, Rennert, Rowland, and St. Pauls.

Implementation

The CTP is based on the projected growth for the planning area. It is possible that actual growth patterns will differ from those logically anticipated. As a result, it may be necessary to accelerate or delay the implementation of some recommendations found within this plan. Some portions of the plan may require revisions in order to accommodate unexpected changes in development. Therefore, any changes made to one element of the Comprehensive Transportation Plan should be consistent with the other elements.

Initiative for implementing the CTP rests predominately with the policy boards and citizens of the County and its municipalities. As transportation needs throughout the State exceed available funding, it is imperative that the local planning area aggressively pursue funding for priority projects. Projects should be prioritized locally and submitted to the Lumber River RPO for regional prioritization and submittal to NCDOT. Refer to Appendix A for contact information on funding. Local governments may use the CTP to guide development and protect corridors for the recommended projects. It is critical that NCDOT and local government coordinate on relevant land development reviews and all transportation projects to ensure proper implementation of the CTP. Local governments and the North Carolina Department of Transportation share the responsibility for access management and the planning, design and construction of the recommended projects.

Prior to implementing projects from the CTP, additional analysis will be necessary to meet the National Environmental Policy Act (NEPA) or the North Carolina (or State) Environmental Policy Act (SEPA). This CTP may be used to provide information in the NEPA/SEPA process.

The following pages contain problem statements for each recommendation, organized by CTP modal element.

Problem Statements

<u>HIGHWAY</u>

I-95, Local ID: ROB0001-H

I-95 in Robeson County is anticipated to be over capacity (LOS C) by the year 2035. I-95 is a major north-south route through Robeson County, North Carolina, and the eastern United States. I-95 has a current capacity (LOS C) of 40,500 vehicles per day (vpd). Traffic volumes in the year 2004 range from 29,000 to 38,000 vpd and are expected to increase to 62,000 to 82,000 vpd by the year 2035. Robeson County's vision for this corridor identified in the 2010 Robeson County Working Lands Protection Plan is to accommodate anticipated traffic growth and roadway improvements along I-95 while maintaining planned land patterns and agriculture vitality. The 2010 Lands Protection Plan identifies that I-95 is vital to the counties economy by allowing industry, offices, agriculture, and other jobs and services to reach their respective markets.

I-95 is recommended to be widened from a 4-lane divided facility to a 6-lane divided facility. This widening is expected to occur within the existing right-of-way (ROW) of 300 feet. This project should coincide with other I-95 Transportation Improvement Program (TIP) widening projects in NC such as I-4745. No multi-modal considerations were recognized in the development of this recommendation. In a public workshop held on June 10th, 2009, favorable comments were received from workshop attendees regarding improvements to I-95. For further information regarding public involvement for this plan, refer to Appendix H.

US 74, Local ID: ROB0002-H

US 74 is identified as a Strategic Highway Corridor (SHC) throughout Robeson County. This corridor is not anticipated to have capacity deficiencies by the year 2035 but is identified by the SHC vision for improvement to improve mobility and safety. US 74 is recommended to be improved to a 4-lane divided freeway from the Lumberton Planning Area Boundary (PAB) to the Columbus County line. At public workshops for the CTP, comments were received from attendees regarding improvements to US 74 which focused on proposed interchange locations at N. Broadridge Rd. (SR 2220) and N. Creek Rd. (SR 2225). For detailed information regarding public involvement for this project refer to Appendix H.

NC 211, Local ID: ROB0003-H

NC 211 is anticipated to be operating over-capacity by the year 2035 from the Lumberton PAB to the Red Springs PAB. Current capacity along NC 211 is 9,500 vpd while future travel demand is expected to range from 10,000 to 11,500 vpd. This section of NC 211 has been recommended to be improved to a 4-lane divided expressway in order to improve mobility and safety between Red Springs and

Lumberton. For information regarding public involvement for this plan, refer to Appendix H.

NC 20 Boulevard, Local ID: ROB0004-H

NC 20 is anticipated to be operating over-capacity by the year 2035 from the Bladen County line to Shaw Rd. (SR 1729). Existing capacities along this facility range from 9,500 to 42,400 vpd. These capacities range widely due to this section of NC 20 varying from a 2-lane rural highway to a downtown 4-lane cross section with parking. Future travel demand is expected to range from 9,900 to 26,000 vpd. NC 20 is recommended to be upgraded to a 4-lane divided boulevard along this section. A small portion through downtown St. Pauls is not recommended to be upgraded to a boulevard. At public workshops for the CTP, favorable comments were received from workshop attendees for the majority of the recommendations with some concern for boulevard recommendation through downtown St. Pauls. In addressing concerns from citizens, the boulevard recommendation through downtown St. Pauls was removed as this sections capacity should meet future travel demand. For further information regarding public involvement for this plan, refer to Appendix H.

NC 20 Major Thoroughfare, Local ID: ROB0005-H

NC 20 is anticipated to be operating near and over-capacity by the year 2035 from the Hoke County line to Shaw Rd. (SR 1729). Existing capacity along this facility is 9,500 vpd. Future travel demand is anticipated to range from 7,600 to 14,000 vpd. NC 20 is recommended to be improved to a 3-lane major thoroughfare along this section. For information regarding public involvement for this plan, refer to Appendix H.

US 301, Local ID: ROB0006-H

US 301 is anticipated to be operating over-capacity by the year 2035 from I-95 to NC 20 in St. Pauls. Capacities along existing US 301 range from 9,400 to 9,500 vpd. Future travel demand is anticipated to range from 9,500 to 12,000 vpd. For information regarding public involvement for this plan, refer to Appendix H.

NC 71 Lumber Bridge Bypass, Local ID: ROB0007-H

NC 71 is expected to be over capacity through Lumber Bridge by the year 2035. Existing capacity on this facility is 9,500 vpd. Future travel demand is expected to range from 9,700 to 15,000 vpd. A 2-lane major thoroughfare bypass of Lumber Bridge is recommended to provide better mobility and relieve anticipated deficiencies along existing NC 71. For information regarding public involvement for this plan, refer to Appendix H.

NC 71 Parkton Bypass, Local ID: ROB0008-H

NC 71 is expected to be over-capacity through Parkton by the year 2035. Existing capacity on this facility is 9,500 vpd. Future travel demand is expected to be 17,000 vpd. A 2-laned major thoroughfare bypass of Parkton is recommended to provide better mobility and relieve anticipated deficiencies along existing NC 71. For information regarding public involvement for this plan, refer to Appendix H.

NC 41, Local ID: ROB0009-H

NC 41 is expected to be operating over-capacity by the year 2035 from the Fairmont PAB to the Lumberton PAB. Existing capacity along NC 41 is 9,500 vpd and future travel demand is expected to range from 10,000 to 12,000 vpd. NC 41 is recommended to be widened to a 4-lane major thoroughfare along this section. For information regarding public involvement for this plan, refer to Appendix H.

NC 71, Local ID: ROB0010-H

NC 71 is expected to be over capacity by the year 2035. Current capacities along this corridor are 9,500 vpd. Future travel demand is expected to range from 9,700 vpd to 22,000 vpd. It is recommended that NC 71 be widened to 3 lanes from the Maxton Planning Area Boundary (PAB) to the Red Springs PAB and from the Red Springs PAB to Leeper Rd. (SR 1716) (ROB0010-H). Bypasses of Lumber Bridge and Parkton are recommended in conjunction with this recommendation (Refer to ROB0007-H and ROB0008-H). For information regarding public involvement for this plan, refer to Appendix H. See CTP Mapping (Figure 1) and Appendix C for more information.

<u>Leeper Rd. (SR 1716), ROB0011-H</u>

Improvements to Leeper Rd. (SR 1716) are needed in order to improve mobility and safety. Currently there are no identified capacity deficiencies on this road, however this project is recommended to be widen to 4 lanes from future I-295 to NC 71 as Leeper Rd. (SR 1716) will be affected by I-295 (TIP# U-2519). For information regarding public involvement for this plan, refer to Appendix H. See CTP Mapping (Figure 1) and Appendix C for more information.

<u>Glenn Rd. (SR 1710), ROB0012-H</u>

Improvements to Old Stage Rd. (SR 1741) are needed in order to improve mobility and safety. It is anticipated that this road widening will included as part of I-295 (TIP# U-2519). Currently there are no identified capacity deficiencies on this road. Widening to 3 lanes from Lumber Bridge to the Cumberland County line will coincide with improved access to a proposed interchange on I-295 (TIP # U-2519). For information regarding public involvement for this plan, refer to Appendix H. See CTP Mapping (Figure 1) and Appendix C for more information.

<u>NC 72, ROB0013-H</u>

NC 72 is expected to be near and over capacity by the year 2035. Current capacity along NC 72 is 9,500 vpd. Future travel demand along this corridor is anticipated to range from 7,800 to 11,800 vpd. It is recommended that NC 72 be widened to two 12-ft lanes from the Lumberton PAB to US 74. For information regarding public involvement for this plan, refer to Appendix H. See CTP Mapping (Figure 1) and Appendix C for more information.

Old Lowry Rd. (SR 1505), ROB0014-H

Improvements to Old Lowry Rd. (SR 1505) are needed in order to improve mobility and safety. Currently there are no identified capacity deficiencies on this road, however two intersections were identified near the corridor as high crash locations (refer to Appendix F for and Figure 4 for further information). It is recommended that Old Lowry Rd. (SR 1505) be widened to two 12-ft lanes with paved shoulders from NC 211 to NC 71 to help address safety. For information regarding public involvement for this plan, refer to Appendix H. See CTP Mapping (Figure 1) and Appendix C for more information.

<u>NC 41, ROB0015-H</u>

NC 41 is expected to be over capacity by the year 2035. Current capacity along this corridor is 9,500 vpd while future travel demand ranges from 10,000 to 14,800 vpd. It is recommended that NC 41 be widened to two 12-ft lanes with paved shoulders (with turn lanes at major intersections) from the Lumberton PAB to Bladen County. For information regarding public involvement for this plan, refer to Appendix H. See CTP Mapping (Figure 1) and Appendix C for more information.

Rennert Rd. (SR 1752), ROB0016-H

Rennert Rd. (SR 1752) is expected to be over capacity by the year 2035. Current capacities along the corridor range from 9,300 to 9,500 vpd while future travel demand is anticipate to range from 14,000 to 16,000 vpd. It is recommended that Rennert Rd. (SR 1752) be widened to two 12-ft lanes with paved shoulders (with turn lanes at major intersections) from the Lumberton PAB to NC 71. For information regarding public involvement for this plan, refer to Appendix H. See CTP Mapping (Figure 1) and Appendix C for more information.

Old Stage Rd. (SR 1734), ROB0017-H

Improvements to Old Stage Rd. (SR 1734) are needed in order to improve mobility and safety. Currently there are no identified capacity deficiencies on this road. Three intersections were identified near the corridor in St. Pauls as high crash locations (refer to Appendix F for and Figure 4 for further information). It is recommended that Old Stage Rd. (SR 1741) be widened to a 4 lane divided facility from NC 20 to Great Marsh Church Rd. (SR 1006) to improve safety and mobility. For information regarding public

involvement for this plan, refer to Appendix H. See CTP Mapping (Figure 1) and Appendix C for more information.

<u>NC 130, ROB0018-H</u>

NC 130 is expected to be near capacity by the year 2035. Current capacities range from 9,500 to 11,100 vpd. Future travel demand is anticipated to range from 8,000 vpd to 8,400 vpd. It is recommended that NC 130 be widened to 3 lanes from NC 710 to I-95 as traffic is expected to approach capacity. Widening is not recommended from US 301 to Hickory St through Rowland based on comments from a local officials at a town board meeting on March 10th, 2009. For information regarding public involvement for this plan, refer to Appendix H. See CTP Mapping (Figure 1) and Appendix C for more information.

PUBLIC TRANSPORTATION & RAIL

No recommendations for Public Transportation and Rail were made in the development of the Robeson County CTP. Existing rail corridors were identified and can be found on Figure 1 – Sheet 2.

BICYCLE

<u>NC 711, ROB0001-B</u>

NC 711 needs to provide increased mobility and safety for bicyclists. As part of the Robeson County CTP steering committee, the Robeson County Planning Board identified NC 711 as a local route for improving accommodations for bicyclists. It is recommended that better signage and pavement markings be added to NC 711 from the Pembroke PAB to the Lumberton PAB. This recommendation aims to provide an adequate cross section for regional bicycle traffic. Positive comments were received at a public workshop for the CTP, in regards to providing enhanced facilities for bicycle traffic between Pembroke and Lumberton. See CTP Mapping (Figure 1) and Appendix C for more information.

Leeper Rd. (SR 1716), ROB0002-B

Leeper Rd. (SR 1716) needs to provide increased mobility and safety for bicyclists. The Robeson County Planning Board identified the Sandhills Sector state bike route (see also ROB0003-B and ROB0004-B) as needing enhanced bicycle accommodations. The Sandhills Sector bike route provides a continuous bicycle route in northern Robeson County. It is recommended that Leeper Rd. (SR 1716) add widened paved shoulders from the Cumberland Co. line to NC 71 (coordinate with ROB0009-H) to provide improved accommodations for bicyclists. For information regarding public involvement for this plan, refer to Appendix H. See CTP Mapping (Figure 1 – Sheet 4) and Appendix C for more information.

<u>NC 71, ROB0003-B</u>

NC 71 needs to provide increased mobility and safety for bicyclists. As a part of the Sandhills Sector bike route, this route was recognized for needing improvement. It is recommended that Leeper Rd. (SR 1716) add widened paved shoulders from Barlow Rd. (SR 1712) to Leeper Rd. (SR 1716) (coordinate with ROB0009-H). For information regarding public involvement for this plan, refer to Appendix H. See CTP Mapping (Figure 1 – Sheet 4) and Appendix C for more information.

Barlow Rd. (SR 1712), ROB0004-B

Barlow Rd. (SR 1712) needs to provide increased mobility and safety for bicyclists. As a part of the Sandhills Sector bike route, this route was recognized for needing improvement. It is recommended that Barlow Rd. (SR 1712) add widened paved shoulders from the Hoke Co. line to NC 71 (coordinate with ROB0009-H). For information regarding public involvement for this plan, refer to Appendix H. See CTP Mapping (Figure 1 – Sheet 4) and Appendix C for more information.

PEDESTRIAN

During the development of the Robeson County CTP, pedestrian recommendations were not considered and development of pedestrian planning analysis was being developed by the NCDOT – Transportation Planning Branch. Future updates to this CTP will include pedestrian study.

Appendix A Resources and Contacts

North Carolina Department of Transportation

Customer Service Office

Contact information for other units within the NCDOT that are not listed in this appendix is available by calling the Customer Service Office or by visiting the NCDOT homepage:

1-877-DOT-4YOU (1-877-368-4968) https://apps.dot.state.nc.us/dot/directory/authenticated/ToC.aspx

<u>Secretary of Transportation</u> Mr. Eugene A. Conti, Jr., Ph.D. 1501 Mail Service Center Raleigh, NC 27699-1501 (919) 733-2520 http://www.ncdot.org/about/leadership/secretary.html

Board of Transportation Member

J. Gary Ciccone PO Box 53668 Fayetteville, NC 28305 (910) 323-3171 http://www.ncdot.gov/about/board/default.html

Highway Division Engineer

Contact the Division Engineer with general questions concerning NCDOT activities within each Division and for information on Small Urban Funds.

Mr. Greg Burns, PE PO Box 1150, 28302 (Mail) 558 Gillespie St., 28301 (Delivery) Fayetteville, NC <u>gburns@ncdot.gov</u> <u>http://www.ncdot.gov/doh/operations/division6/</u>

Division Project Manager

Contact the Division Project Manager with questions concerning transportation projects within each Division.

Mr. Jerry Bradley PO Box 1150, 28302 (Mail) 558 Gillespie St., 28301 (Delivery) Fayetteville, NC (910)-437-2611 jbradley@ncdot.gov

Division Construction Engineer

Contact the Division Construction Engineer for information concerning major roadway improvements under construction.

Mrs. Tracey Conrad Pittman, PE PO Box 1150, 28302 (Mail) 558 Gillespie St., 28301 (Delivery) Fayetteville, NC (910)-486-1493 tpittman@ncdot.gov

Division Traffic Engineer

Contact the Division Traffic Engineer for information concerning traffic signals, highway signs, pavement markings and crash history.

Mr. W. L. "Lee" Jernigan, Jr., PE PO Box 1150, 28302 (Mail) 450 Transportation Drive, 28301 (Delivery) Fayetteville, NC (910)- 437-2599 Ijernigan@ncdot.gov

Division Operations Engineer

Contact the Division Operations Engineer for information concerning facility operations.

Vacant PO Box 1150, 28302 (Mail) 558 Gillespie St., 28301 (Delivery) Fayetteville, NC (910)- 486-1959

Division Maintenance Engineer

Contact the Division Maintenance Engineer for information regarding maintenance of all state roadways, improvement of secondary roads and other small improvement projects. The Division Maintenance Engineer also oversees the District Offices, the Bridge Maintenance Unit and the Equipment Unit.

Mr. Ken Murphy, Jr, PE PO Box 1150, 28302 (Mail) 558 Gillespie St., 28301 (Delivery) Fayetteville, NC (910) 486-1493 <u>rkmurphy@ncdot.gov</u>

District Engineer

Contact the District Engineer for information on outdoor advertising, junkyard control, driveway permits, road additions, subdivision review and approval, Adopt A Highway program, encroachments on highway right of way, issuance of oversize/overwidth permits, paving priorities, secondary road construction program and road maintenance.

Mr. Charles (Chuck) S. Miller, Jr., PE PO Box 2157, 28359 (Mail) 872 NC 711 Highway, 28360 (Delivery) Lumberton, NC (910) 618-5546 csmiller@ncdot.gov

Transportation Planning Branch (TPB)

Contact the Transportation Planning Branch for information on long-range multi-modal planning services.

Appendix B Comprehensive Transportation Plan Definitions

Highway Map

For visual depiction of facility types for the following CTP classification, visit <u>http://www.ncdot.gov/doh/preconstruct/tpb/SHC/facility/</u>.

Facility Type Definitions

- Freeways
- Functional purpose high mobility, high volume, high speed
- Posted speed 55 mph or greater
- Cross section minimum four lanes with continuous median
- Multi-modal elements High Occupancy Vehicles (HOV)/High Occupancy Transit (HOT) lanes, busways, truck lanes, park-and-ride facilities at/near interchanges, adjacent shared use paths (separate from roadway and outside ROW)
- Type of access control full control of access
- Access management interchange spacing (urban one mile; non-urban three miles); at interchanges on the intersecting roadway, full control of access for 1,000ft or for 350ft plus 650ft island or median; use of frontage roads, rear service roads
- Intersecting facilities interchange or grade separation (no signals or at-grade intersections)
- Driveways not allowed

• Expressways

- Functional purpose high mobility, high volume, medium-high speed
- Posted speed 45 to 60 mph
- Cross section minimum four lanes with median
- Multi-modal elements HOV lanes, busways, very wide paved shoulders (rural), shared use paths (separate from roadway but within ROW)
- Type of access control limited or partial control of access;
- Access management minimum interchange/intersection spacing 2,000ft; median breaks only at intersections with minor roadways or to permit U-turns; use of frontage roads, rear service roads; driveways limited in location and number; use of acceleration/deceleration or right turning lanes
- Intersecting facilities interchange; at-grade intersection for minor roadways; right-in/right-out and/or left-over or grade separation (no signalization for through traffic)
- Driveways right-in/right-out only; direct driveway access via service roads or other alternate connections

• Boulevards

- Functional purpose moderate mobility; moderate access, moderate volume, medium speed
- Posted speed 30 to 55 mph
- Cross section two or more lanes with median (median breaks allowed for Uturns per current NCDOT *Driveway Manual*
- Multi-modal elements bus stops, bike lanes (urban) or wide paved shoulders (rural), sidewalks (urban local government option)
- Type of access control limited control of access, partial control of access, or no control of access
- Access management two lane facilities may have medians with crossovers, medians with turning pockets or turning lanes; use of acceleration/deceleration or right turning lanes is optional; for abutting properties, use of shared driveways, internal out parcel access and cross-connectivity between adjacent properties is strongly encouraged
- Intersecting facilities at grade intersections and driveways; interchanges at special locations with high volumes
- Driveways primarily right-in/right-out, some right-in/right-out in combination with median leftovers; major driveways may be full movement when access is not possible using an alternate roadway

• Other Major Thoroughfares

- Functional purpose balanced mobility and access, moderate volume, low to medium speed
- Posted speed 25 to 55 mph
- Cross section four or more lanes without median
- Multi-modal elements bus stops, bike lanes/wide outer lane (urban) or wide paved shoulder (rural), sidewalks (urban)
- Type of access control no control of access
- Access management continuous left turn lanes; for abutting properties, use of shared driveways, internal out parcel access and cross-connectivity between adjacent properties is strongly encouraged
- Intersecting facilities intersections and driveways
- Driveways full movement on two lane roadway with center turn lane as permitted by the current NCDOT *Driveway Manual*

• Minor Thoroughfares

- Functional purpose balanced mobility and access, moderate volume, low to medium speed
- Posted speed 25 to 45 mph
- Cross section ultimately three lanes (no more than one lane per direction) or less without median
- Multi-modal elements bus stops, bike lanes/wide outer lane (urban) or wide paved shoulder (rural), sidewalks (urban)
- ROW no control of access

- Access management continuous left turn lanes; for abutting properties, use of shared driveways, internal out parcel access and cross-connectivity between adjacent properties is strongly encouraged
- Intersecting facilities intersections and driveways
- Driveways full movement on two lane with center turn lane as permitted by the current NCDOT *Driveway Manual*

Other Highway Map Definitions

- **Existing** Roadway facilities that are not recommended to be improved.
- Needs Improvement Roadway facilities that need to be improved for capacity, safety, or system continuity. The improvement to the facility may be widening, other operational strategies, increasing the level of access control along the facility, or a combination of improvements and strategies. "Needs improvement" does not refer to the maintenance needs of existing facilities.
- **Recommended** Roadway facilities on new location that are needed in the future.
- **Interchange** Through movement on intersecting roads is separated by a structure. Turning movement area accommodated by on/off ramps and loops.
- **Grade Separation** Through movement on intersecting roads is separated by a structure. There is no direct access between the facilities.
- **Full Control of Access** Connections to a facility provided only via ramps at interchanges. No private driveway connections allowed.
- Limited Control of Access Connections to a facility provided only via ramps at interchanges (major crossings) and at-grade intersections (minor crossings and service roads). No private driveway connections allowed.
- Partial Control of Access Connections to a facility provided via ramps at interchanges, at-grade intersections, and private driveways. Private driveway connections shall be defined as a maximum of one connection per parcel. One connection is defined as one ingress and one egress point. These may be combined to form a two-way driveway (most common) or separated to allow for better traffic flow through the parcel. The use of shared or consolidated connections is highly encouraged.
- **No Control of Access** Connections to a facility provided via ramps at interchanges, at-grade intersections, and private driveways.

Public Transportation and Rail Map

- **Bus Routes** The primary fixed route bus system for the area. Does not include demand response systems.
- **Fixed Guideway** Any transit service that uses exclusive or controlled rights-of-way or rails, entirely or in part. The term includes heavy rail, commuter rail, light rail, monorail, trolleybus, aerial tramway, included plane, cable car, automated guideway transit, and ferryboats.

- **Operational Strategies** Plans geared toward the non-single occupant vehicle. This includes but is not limited to HOV lanes or express bus service.
- **Rail Corridor** Locations of railroad tracks that are either active or inactive tracks. These tracks were used for either freight or passenger service.
 - Active rail service is currently provided in the corridor; may include freight and/or passenger service
 - Inactive right of way exists; however, there is no service currently provided; tracks may or may not exist
 - Recommended It is desirable for future rail to be considered to serve an area.
- **High Speed Rail Corridor** Corridor designated by the U.S. Department of Transportation as a potential high speed rail corridor.
 - Existing Corridor where high speed rail service is provided (there are currently no existing high speed corridor in North Carolina).
 - Recommended Proposed corridor for high speed rail service.
- **Rail Stop** A railroad station or stop along the railroad tracks.
- Intermodal Connector A location where more than one mode of public transportation meet such as where light rail and a bus route come together in one location or a bus station.
- **Park and Ride Lot** A strategically located parking lot that is free of charge to anyone who parks a vehicle and commutes by transit or in a carpool.

Bicycle Map

- **On Road-Existing** Conditions for bicycling on the highway facility are adequate to safely accommodate cyclists.
- On Road-Needs Improvement At the systems level, it is desirable for an existing highway facility to accommodate bicycle transportation; however, highway improvements are necessary to create safe travel conditions for the cyclists.
- **On Road-Recommended** At the systems level, it is desirable for **a recommended** highway facility to accommodate bicycle transportation. The highway should be designed and built to safely accommodate cyclists.
- Off Road-Existing A facility that accommodates bicycle transportation (may also accommodate pedestrians, e.g. greenways) and is physically separated from a highway facility usually on a separate right-of-way.
- Off Road-Needs Improvement A facility that accommodate bicycle transportation (may also accommodate pedestrians, e.g. greenways) and is physically separated from a highway facility usually on a separate right-of-way that will not adequately serve future bicycle needs. Improvements may include but are not limited to, widening, paving (not re-paving), and improved horizontal or vertical alignment.
- Off Road-Recommended A facility needed to accommodate bicycle transportation (may also accommodate pedestrians, e.g. greenways) and is physically separated from a highway facility usually on a separate right-of-way. This

may also include greenway segments that do not necessarily serve a transportation function but intersect recommended facilities on the highway map or public transportation and rail map.

Appendix C CTP Inventory and Recommendations

Assumptions/ Notes:

- ID: If a TIP project number exists it is listed as the ID. Otherwise, the following system is used to create a code for each recommended improvement (this code is the same as the one used as the SPOT prioritization tool ID): the first 4 letters of the county name is combined with a 4 digit unique numerical code followed by '-H' for highway, '-T' for public transportation, '-R' for rail, '-B' for bicycle, or '-P' for pedestrian modes. If a different code is used along a route it indicates separate projects will probably be requested. Also, upper case alphabetic characters (i.e. 'A', 'B', or 'C') are included after the numeric portion of the code if it is anticipated that project segmentation or phasing will be recommended.
- Jurisdiction: Jurisdictions listed are based on municipal limits, county boundaries, and MPO Metropolitan Planning Area Boundaries (MAB), as applicable.
- **Cross-Section:** Listed under '(ft)' is the approximate width of the roadway from edge of pavement to edge of pavement. Listed under 'lanes' is the total number of lanes, with the letter 'D' if the facility is divided.
- **ROW:** The estimated existing right-of-way is based on using the NCDOT Road Conditions layer and from aerial photography. These right-of-way amounts are approximate and may vary.
- Existing Capacity: The estimated capacities are given in vehicles per day (vpd) based on LOS C for existing facilities and LOS C for new facilities. These capacity estimates were developed using the NCLOS program, as documented in Chapter II.
- 2035 AADT (Annual Average Daily Traffic) volumes, given in vehicles per day (vpd), are estimates only based on a systems-level analysis. The '2035 AADT' is an estimate of the volume in 2035 with no additional facilities/ improvements assumed to be in place that were not open to traffic in the base year (2004). For additional information about the assumptions and techniques used to develop the AADT volume estimates, refer to Chapter II.
- Rec. (Recommended) Cross-section: The CTP recommended cross-sections are listed by code; for depiction of the cross-section, refer to Appendix D. An entry of 'ADQ' indicates the existing facility is adequate and there are no improvements recommended as part of the CTP.
- **CTP Classification:** The CTP classification is listed, as shown on the adopted CTP Maps (see Figure 1). Abbreviations are F= freeway, E= expressway, B= boulevard, Maj= other major thoroughfare, Min= minor thoroughfare.
- **Tier:** Tiers are defined as part of the North Carolina Mulitmodal Investment Network (NCMIN). Abbreviations are Sta= statewide tier, Reg= regional tier, Sub= subregional tier.
- Other Modes: If there is an improvement recommended for another mode of transportation that relates to the given recommendation, it is indicated by an alphabetic code (H=highway, T= public transportation, R= rail, B= bicycle, and P= pedestrian).

Appendix D Typical Cross Sections

Cross section requirements for roadways vary according to the capacity and level of service to be provided. Universal standards in the design of roadways are not practical. Each roadway section must be individually analyzed and its cross section determined based on the volume and type of projected traffic, existing capacity, desired level of service, and available right-of-way. These cross sections are typical for facilities on new location and where right-of-way constraints are not critical. For widening projects and urban projects with limited right-of-way, special cross sections should be developed that meet the needs of the project.

On all existing and proposed roadways delineated on the CTP, adequate right-of-way should be protected or acquired for the recommended cross sections. In addition to cross section and right-of-way recommendations for improvements, Appendix C may recommend ultimate needed right-of-way for the following situations:

- roadways which may require widening after the current planning period,
- roadways which are borderline adequate and accelerated traffic growth could render them deficient, and
- roadways where an urban curb and gutter cross section may be locally desirable because of urban development or redevelopment.

Typical Cross Sections

A: Four Lanes Divided with Median - Freeway

Cross section "A" is typical for four-lane divided highways in rural areas that may have only partial or no control of access. The minimum median width for this cross section is 46 feet, but a wider median is desirable.

B: Seven Lanes - Curb & Gutter

Cross section "B" is typically not recommended for new projects. When the conditions warrant six lanes, cross section "D" should be recommended. Cross section "B" should be used only in special situations such as when widening from a five-lane section where right-of-way is limited. Even in these situations, consideration should be given to converting the center turn lane to a median so that cross section "D" is the final cross section.

C: Five Lanes - Curb & Gutter

Typical for major thoroughfares, cross section "C" is desirable where frequent left turns are anticipated as a result of abutting development or frequent street intersections.

D: Six Lanes Divided with Raised Median - Curb & Gutter

E: Four Lanes Divided with Raised Median - Curb and Gutter

Cross sections "D" and "E" are typically used on major thoroughfares where left turns and intersection streets are not as frequent. Left turns would be restricted to a few selected intersections. The 16-ft median is the minimum recommended for an urban boulevard-type cross section. In most instances, monolithic construction should be utilized due to greater cost effectiveness, ease and speed of placement, and reduced future maintenance requirements. In certain cases, grass or landscaped medians result in greatly increased maintenance costs and an increase danger to maintenance personnel. Non-monolithic medians should only be recommended when the above concerns are addressed.

F: Four Lanes Divided - Boulevard, Grass Median

Cross section "F" is typically recommended for urban boulevards or parkways to enhance the urban environment and to improve the compatibility of major thoroughfares with residential areas. A minimum median width of 24 ft is recommended, with 30 ft being desirable.

G: Four Lanes - Curb and Gutter

Cross section "G" is recommended for major thoroughfares where projected travel indicates a need for four travel lanes but traffic is not excessively high, left turning movements are light, and right-of-way is restricted. An additional left turn lane would likely be required at major intersections. This cross section should be used only if the above criteria are met. If right-of-way is not restricted, future strip development could take place and the inner lanes could become de facto left turn lanes.

H: Three Lanes - Curb and Gutter

In urban environments, thoroughfares that are proposed to function as one-way traffic carriers would typically require cross section "H".

I: Two Lanes – Curb and Gutter, Parking both sides

J: Two Lanes – Curb and Gutter, Parking one side

Cross section "I" and "J" are usually recommended for urban minor thoroughfares since these facilities usually serve both land service and traffic service functions. Crosssection "I" would be used on those minor thoroughfares where parking on both sides is needed as a result of more intense development.

K: Two Lanes - Paved Shoulder

Cross section "K" is used in rural areas or for staged construction of a wider multilane cross section. On some thoroughfares, projected traffic volumes may indicate that two travel lanes will adequately serve travel for a considerable period of time. For areas that are growing and future widening will be necessary, the full right-of-way of 100 ft should be required. In some instances, local ordinances may not allow the full 100-ft. In those cases, 70 ft should be preserved with the understanding that the full 70-ft will be preserved by use of building setbacks and future street line ordinances.

L: Six Lanes Divided with Grass Median - Freeway

Cross section "L" is typical for controlled access freeways. The 46-ft grass median is the minimum desirable width, but variation from this may be permissible depending upon design considerations. Right-of-way requirements are typically 228 ft or greater, depending upon cut and fill requirements.

M: Eight Lanes Divided with Raised Median - Curb and Gutter

Also used for controlled access freeways, cross section "M" may be recommended for freeways going through major urban areas or for routes projected to carry very high volumes of traffic.

N: Five Lanes with Curb & Gutter, Widened Curb Lanes

O: Two Lanes/Shoulder Section

P: Four Lanes Divided with Raised Median – Curb & Gutter, Widened Curb Lanes

If there is sufficient bicycle travel along the thoroughfare to justify a bicycle lane or bikeway, additional right-of-way may be required to contain the bicycle facilities. The North Carolina Bicycle Facilities Planning and Design Guidelines should be consulted for design standards for bicycle facilities. Cross sections "N", "O" and "P" are typically used to accommodate bicycle travel.

General

The urban curb and gutter cross sections all illustrate the sidewalk adjacent to the curb with a buffer or utility strip between the sidewalk and the minimum right-of-way line. This permits adequate setback for utility poles. If it is desired to move the sidewalk farther away from the street to provide additional separation for pedestrians or for aesthetic reasons, additional right-of-way must be provided to insure adequate setback for utility poles.

The right-of-way shown for each typical cross section is the minimum amount required encompassing the street, sidewalks, utilities, and drainage facilities. Cut and fill requirements may require either additional right-of-way or construction easements. Obtaining construction easements is becoming the more common practice for urban roadway construction.

Bicycle Cross Sections

Cross sections B-1, B-2, B-3, B-4, and B-5 are typical bicycle cross sections. Contact the NCDOT Division of Bicycle and Pedestrian Transportation for more information regarding these cross-sections.

B-1: Four Lanes Divided with Wide Outside Lanes

B-2: Five Lanes with Wide Outside Lanes

A widened outside lane is an effective way to accommodate bicyclists riding in the same lane with motor vehicles. With a wide outside lane, motorists do not have to change lanes to pass a bicyclist. The additional width in the outside lane also improves sight distance and provides more room for vehicles to turn onto the roadway. Therefore, on roadways with bicycle traffic, widening the outside lane can improve the capacity of that roadway. Also, by widening the outside lane by a few extra feet both motorists and bicyclists have more space in which to maneuver. This facility type is generally considered for use in urban, suburban, and occasionally rural conditions on roadways where there is a curb and gutter. Wide outside lanes can be applied to several different roadway cross sections.

B-3: Bicycle Lanes on Collector Streets

Bicycle lanes may be considered when it is desirable to delineate road space for preferential use by cyclists. Streets striped with bicycle lanes should be part of a connected bikeway system rather than being an isolated feature. Bicycle lanes function most effectively in mid-block situations by separating bicyclists from overtaking motor vehicles. Integrating bicyclists into complicated intersection traffic patterns can sometimes be problematic. Strip development areas, or roadways with a high number of commercial driveways, tend to be less suitable for bicycle lanes due to frequent and unpredictable motorist turning movements across the path of straight-through cyclists. Striped bike lanes can be effective as a safety treatment, especially for less experienced bicyclists. Two-lane residential/collector streets with lower traffic volume, low-posted speed limit, adequate roadway width for both bike lanes and motor vehicle travel lanes, and an absence of complicated intersections. A median-divided multi-lane roadway with lower traffic volumes and a low volume of right and left turning traffic would be a more appropriate location for bicycle lanes than a high traffic volume undivided multi-lane roadway with a continuous center turn lane. Most bicyclists will choose a route that combines direct access with lower traffic volumes. An origin and destination of less than 4 miles is desirable to generate usage on a facility.

B-4: Wide Paved Shoulders

On urban streets with curb and gutter, wide outside lanes and bicycle lanes are usually the preferred facilities. Shoulders for bicycle use are not typically provided on roadways with curb and gutter. On rural roadways where bicycle travel is common, such as roads in coastal resort areas, wide paved shoulders are highly desirable. On secondary roadways without curb and gutter where there are few commercial driveways and intersections with other roadways, many bicyclists prefer riding on wide, smoothly paved shoulders.

B-5: Multi-use Pathway

When properly located, multi-use pathway can be a safer type of facility for novice and child bicyclists because they do not have to share the path with motor vehicles. The design standards used for this cross section provides adequate width for two-directional use by both cyclists and pedestrians, provisions of good sight distance, avoidance of steep grades and tight curves, and minimal cross-flow by motor vehicles. A multi-use pathway can serve a variety of purposes, including recreation and transportation. This pathway should not be located immediately adjacent to a roadway because of safety considerations at intersections with driveways and roads. Sidewalks should never be used as a multi-use pathway.

Appendix E Level of Service Definitions

The relationship of travel demand compared to the roadway capacity determines the level of service (LOS) of a roadway. Six levels of service identify the range of possible conditions. Designations range from LOS A, which represents the best operating conditions, to LOS F, which represents the worst operating conditions.

Design requirements for roadways vary according to the desired capacity and level of service. LOS D indicates "practical capacity" of a roadway, or the capacity at which the public begins to express dissatisfaction. Recommended improvements and overall design of the transportation plan were based upon achieving a minimum LOS D on existing facilities and a LOS C on new facilities. The six levels of service are described below and illustrated in Figure 12.

- LOS A: Describes primarily free flow conditions. The motorist experiences a high level of physical and psychological comfort. The effects of minor incidents of breakdown are easily absorbed. Even at the maximum density, the average spacing between vehicles is about 528 ft, or 26 car lengths.
- LOS B: Represents reasonably free flow conditions. The ability to maneuver within the traffic stream is only slightly restricted. The lowest average spacing between vehicles is about 330 ft, or 18 car lengths.
- <u>LOS C</u>: Provides for stable operations, but flows approach the range in which small increases will cause substantial deterioration in service. Freedom to maneuver is noticeably restricted. Minor incidents may still be absorbed, but the local decline in service will be great. Queues may be expected to form behind any significant blockage. Minimum average spacing is in the range of 220 ft, or 11 car lengths.
- <u>LOS D</u>: Borders on unstable flow. Density begins to deteriorate somewhat more quickly with increasing flow. Small increases in flow can cause substantial deterioration in service. Freedom to maneuver is severely limited, and the driver experiences drastically reduced comfort levels. Minor incidents can be expected to create substantial queuing. At the limit, vehicles are spaced at about 165 ft, or 9 car lengths.
- LOS E: Describes operation at capacity. Operations at this level are extremely unstable, because there are virtually no usable gaps in the traffic stream. Any disruption to the traffic stream, such as a vehicle entering from a ramp, or changing lanes, requires the following vehicles to give way to admit the vehicle. This can establish a disruption wave that propagates through the upstream traffic flow. At capacity, the traffic stream has no ability to dissipate any disruption. Any incident can be expected to produce a serious breakdown with extensive queuing. Vehicles are spaced at approximately 6 car lengths, leaving little room to maneuver.

• **LOS F**: Describes forced or breakdown flow. Such conditions generally exist within queues forming behind breakdown points.

Figure 11 - Level Of Service Illustrations

Level of Service A

Driver Comfort: High Maximum Density: 12 passenger cars per mile per lane

Level of Service D

Driver Comfort: Poor Maximum Density:

42 passenger cars per mile per lane

Level of Service B

Driver Comfort: High Maximum Density: 20 passenger cars per mile per lane

Level of Service E

Driver Comfort: Extremely Poor Maximum Density:

67 passenger cars per mile per lane

Level of Service C

Driver Comfort: Some Tension Maximum Density: 30 passenger cars per mile per lane

Level of Service F

Driver Comfort:The lowest Maximum Density:

More than 67 passenger cars per mile per lane

Appendix F Traffic Crash Analysis

A crash analysis performed for the Robeson County CTP factored crash frequency, crash type, and crash severity to an average severity rating. Crash frequency is the total number of reported collisions and contributes to the ranking of the most problematic intersections. Crash type provides a general description of the crash and allows the identification of any trends that may be correctable through roadway or intersection improvements. Crash severity is the crash rate based upon injuries and property damage incurred.

The severity of every crash is measured with a series of weighting factors developed by the NCDOT Division of Highways (DOH). These factors define a fatal or incapacitating crash as 47.7 times more severe than one involving only property damage and a crash resulting in minor injury is 11.8 times more severe than one with only property damage. In general, a higher severity index indicates more severe accidents. Listed below are levels of severity for various severity index ranges.

<u>Severity</u>	Severity Index
low	< 6.0
average	6.0 to 7.0
moderate	7.0 to 14.0
high	14.0 to 20.0
very high	> 20.0

Table 4 depicts a summary of the crashes occurring in the planning area between January 1, 2008 and December 31, 2010. The data represents crash locations with 10 or more crashes and/or a severity average greater than that of the state's average crash severity index (4.56). The "Total" column indicates the total number of accidents reported within 150-ft of the intersection during the study period. The severity listed is the average crash severity for that location.

Table 4 - Crash Locations

Map Index	Intersection	Average Severity	Total Collisions

8	SR 1752 and SR 1758	4.08	12

	Table 4 - Crash Location	ns Continued	
9	US 301 and SR 1006	4.08	12
10	SR 1001 and SR 1006	3.69	11
11	I-95 and NC 20	3.18	17
12	US 301 and NC 20	3.02	11

The NCDOT is actively involved with investigating and improving many of these locations. To request a more detailed analysis for any of the locations listed in Table 4, or other intersections of concern, contact the Division Traffic Engineer. Contact information for the Division Traffic Engineer is included in Appendix A.

Appendix G Bridge Deficiency Assessment

The Transportation Improvement Program (TIP) development process for bridge projects involves consideration of several evaluation methods in order to prioritize needed improvements. A sufficiency index is used to determine whether a bridge is sufficient to remain in service, or to what extent it is deficient. The index is a percentage in which 100 percent represents an entirely sufficient bridge and zero represents an entirely insufficient or deficient bridge. Factors evaluated in calculating the index are listed below.

- structural adequacy and safety
- serviceability and functional obsolescence
- essentiality for public use
- type of structure
- traffic safety features

The NCDOT Bridge Maintenance Unit inspects all bridges in North Carolina at least once every two years. A sufficiency rating for each bridge is calculated and establishes the eligibility and priority for replacement. Bridges having the highest priority are replaced as Federal and State funds become available.

A bridge is considered deficient if it is either structurally deficient or functionally obsolete. Structurally deficient means there are elements of the bridge that need to be monitored and/or repaired. The fact that a bridge is "structurally deficient" does not imply that it is likely to collapse or that it is unsafe. It means the bridge must be monitored, inspected and repaired/replaced at an appropriate time to maintain its structural integrity. A functionally obsolete bridge is one that was built to standards that are not used today. These bridges are not automatically rated as structurally deficient, nor are they inherently unsafe. Functionally obsolete bridges are those that do not have adequate lane widths, shoulder widths, or vertical clearances to serve current traffic demand or to meet the current geometric standards, or those that may be occasionally flooded.

A bridge must be classified as deficient in order to quality for Federal replacement funds. Additionally, the sufficiency rating must be less than 50% to qualify for replacement or less than 80% to qualify for rehabilitation under federal funding. Deficient bridges within the planning area are listed in Table 5.

Robeson County Transportation Survey

The Transportation Planning Branch of the North Carolina Department of Transportation, in cooperation with Robeson County, is developing a transportation plan for the county. The transportation plan is a long-range plan that identifies major transportation improvements that will be needed over the next 25 TO 30 YEARS. This survey is a means of identifying transportation issues that are important to the citizens, officials, and businesses of Robeson County.

The municipalities of Lumberton, Maxton, Fairmont, and Red Springs already have existing transportation plans. A separate joint effort is underway to develop of transportation plan for Pembroke. When answering survey questions, please think specifically about the other municipalities and rural county areas.

1. Please rate the importance of each of the following potential transportation goals:

	Important	Important	Important
Increased Public Transportation Options			
Economic Growth			
Community and Rural Culture Preservation			
Environmental Protection			
Faster Travel Times			
Service of Special Needs			
Increased Transportation Choices			

Please rate the importance of the following Strategies for improving a road's efficiency to move traffic:

Building additional travel lanes		
Making improvements to intersections, better traffic signal timing, adding turn lanes, creating roundabouts		
Controlling the frequency and locations of driveways and crossstreets that access the road		

3. Are you concerned with traffic accidents or other safety problems?

□Yes □No

If yes, please list specific locations:

4. Do you use alternate routes to avoid I-95?

□Yes □No

If yes, please list specific routes and locations:

5. When traveling in your area, do you find that you often have to go out of your way to get to your destination because the most direct route is too congested?

□Yes □No

If yes, please list specific locations:

6. Is truck traffic a problem in the area?

□Yes □No

If yes, please list specific locations:

To what areas or roads would you like to see improved access (please check all that apply)?

DNC 904	Raleigh
Wilmington	Charlotte
Fayetteville	Myrtle Beach
□ South Carolina	Other – Please specify:

- 8. If available, would you consider using the following types of facilities instead of your personal automobile (check all that apply)?
 - Sidewalks

 Off -Road trails or Greenways
 On-Road Bicycle routes
 Bus Service around the county
 Park-and-Ride lots

If you answered checked any of the above, please list specific locations and comments

Do you currently use the on-demand transit service run by the Lumber River Council of Governments?

□Yes	□No
------	-----

10. One of the recommended alternatives for a SouthEast Rail Corridor is Wilmington to Raleigh through Pembroke and Fayetteville. Would you consider using this facility?

□Yes □No

11. What are the key transportation issues in your area?

Please return by April 30, 2006 to: NCDOT – Transportation Planning Branch Attn: Sara Sherman 1554 Mail Service Center Raleigh, NC 27699

Robeson Country Transportation Survey Results

1. Please rate the importance of each of the following

potential transportation goals:

Community and Rural Culture Preservation 15 Very Important 19 Importrant

5 Not Important

Environmental Protection 27 Very Important 9 Importrant 4 Not Important

Increased Transportation Options 21 Very Important 15 Importrant 1 Not Important

2. Please rate the importance of the following strategies for improving a road's efficiency to move traffic:

Making Improvements to intersections (better traffic signal timing, adding turn lanes, creating roundabouts)

- 22 Very Important
- 13 Important

Controlling the frequency and locations of driveways and crossstreets that access the road

- 21 Very Important
- 15 Important
- 1 Not Important

3. Are you concerned with traffic accidents or other safety problems?

39 Yes

If Yes, please list specific locations:

I-95 north of weigh station to exit 31 I-95 (3) Bridges over I-95 Fayetteville Rd (old US 301) (2) Rennert Rd and NC 71 intersection Red Hill Rd and NC 71 intersection NC 71 flashing light in Parkton US 74 NC 904 and NC 41 intersection (mentioned multiple times) Mountonaire Farms in Lumber Bridge "Normal St and NC 711 intersection "Normal St and NC 711 intersection "Prospect Rd and Red Banks intersection, people don't stop at stop sign "McDonalds entrance near college

4. Do you use alternate routes to avoid I-95?

"comments received, but not applicable to county planning area

5. When traveling in your area, do you find that you often have to go out of your way to get to your destination because the most direct route is too congested? 9 Yes

If Yes, please list specific locations: traveling from Parkton to Lumberton Fayetteville Rd Hwy 74, 2 lane section NC 41 North Pleasant Meadow Rd Roberts Ave Main Street in Pembroke 3rd Street in Pembroke

6. Is truck traffic a problem in the area?

If Yes, please list specific locations: I-95 (3) NC 71 at Maxton Highway and up through US 301 north (2) NC 71 (2) NC 20 in St Pauls Drivers drive over speed limits "Main Street in Pembroke

7. To what areas or roads would you like to see improved access?

(check all that apply)

Written responses for "other" 401 from Raeford to Lumberton NC 211 NC 72 "My road needs a street sign and a dead end sign" *NC 711 in Lumberton

*comments received, but not applicable to county planning area

8. If available, would you consider using the following types of facilities instead of you

personal automobile (check all that apply)?

If you checked any of the above, please list specific locations and comments:

If crime were reduced, sidewalks would be appropriate

I would use bus service throughout the county

Bus service would be a great tool in conserving fuel. This option would be cost effective with enough participants

St. Pauls Area (checked bus and park-and-rides)

From Lumberton to St. Pauls (checked bus)

Park-and-ride to Fayetteville

Bus Service to Lumberton

*Pembroke rural area (checked onroad bike routes and bus)

*comments received, but not applicable to county planning area

9. Do you currently use the on-demand transit service run by the Lumber River Council of Governments?

10. One of the recommended alternatives for a SouthEast Rail Corridor is Wilmington to Raleigh through Pembroke and Fayetteville. Would you consider using this facility?

11. What are the key transportation issues in your area? 1-95 Accidents on I-95 bring traffic into town US 301 US 301 needs to be 4lanes NC 20 needs to be 4lanes NC 20 Old Stage Rd Heavy Traffic on NC 41 north and heavy traffic at Meadow Rd and Linkhaw Rd intersection congestion Congestion on NC 711 coming ot Pembroke (2) Lack of left turn lanes at busyin intersections (2) Road Quality - Potholes Gas prices too high Traffic Too many Semis on our rural roads and speeding Need more taxi services in the area Congestion, safety, and public transportation Not enough public transportation for senior citizens without cars Personal Auto

- The following pages provide information related to public workshops conducted for the Robeson County CTP. These materials include meeting handouts and letters obtained from locals, local churches, fire departments, and town staff regarding recommendations in the plan.
 - Two public drop-in sessions were held on June 10th, 2009 and November 16th, 2009. At these two drop-in sessions, the Robeson County CTP maps were displayed as well as handouts describing the plans recommendations. TPB and Division 6 staff was present to facilitate the meeting and answer any questions from meeting attendees.

Approximately 8 people attended the June 10th, 2009 meeting. Some of the comments concerned CTP recommendations on NC 20 in downtown St. Pauls and the locations of proposed interchanges along US 74 at Broadridge Rd. (SR 2220) and Creek Rd. (SR 2225).

Approximately 48 people attended the November 16th, 2009 meeting. This meeting consisted mainly of local residents in the vicinity of Orrum and Proctorville. Residents from these areas had concerns over the US 74 proposed interchanges at Broadridge Rd. (SR 2220) and Creek Rd. (SR 2225). TPB staff coordinated with local Division 6 staff, the Robeson County Planning Board, town staff, and locals to reach an agreement for the longer term vision of US 74 in this area. It was decided that the CTP would not address these interchange locations, leaving the decision up to further corridor study.

Robeson County Comprehensive Transportation Plan (CTP) Public Drop-in Session Information Sheet June 16, 2009

Purpose of a Drop-in Session

To provide you the opportunity to understand and comment on transportation planning that's happening in your area.

What is done with your input?

Your input will help us (the NCDOT, the Lumber River Rural Planning Organization, and the CTP steering committee) develop the final CTP.

Once the final CTP is developed it will be presented to your local government(s) for adoption. After the local governments have adopted the CTP, it is then submitted to the Lumber River Rural Planning Organization and the NCDOT Board of Transportation for their endorsements, respectively.

A CTP DOES	A CTP does NOT
Aim to reduce environmental impact	Promise to build roads
Provide a multi-modal transportation	Make final calls on recommended
plan for your area	alignments
Aim to minimize negative economic	
impact	
Coordinates with your local land-use	
plans

TOWN OF ORRUM P. O. Box 9 Orrum, N. C. 28369

January 16, 2009

Chuck Miller, P.E. District Engineer NC Department of Transportation PO Box 2157 Lumberton, NC 28359

Mr. Miller:

Last year the community of Orrum lost a Bridge on highway 130 east of Orrum due to fire. At that time the travel was re-routed to state road 2225. The city council of Orrum realized this could save the state the expense of an interchange on Interstate 74 while giving the traveler a better way to Orrum Middle School, Lumber River State Park, Fair Bluff, and highway 41 south.

It is my understanding that the state is looking at a plan that would put an interchange at state road 2220, an overpass at state road 2225, and an interchange at highway 130 and 72. We would like to propose that the state put an overpass at state road 2220, an interchange at state road 2225, and no interchange at highway 130 and 72. This proposal would save the state the cost of an interchange and the associated cost of maintaining one, while meeting the needs of the people that live in this community as well as those that travel through the area. The proposal would result in less ninety degree turns in the line of traffic.

Thank you for reviewing this proposal,

Vance Banz

Vance Bass, Mayor of Orrum
Broad Rídge Baptíst Church

949 N. Broad ridge Rd. Orrum, NC 28369 910-738-5514

Dear Sirs,

I am writing of my concern about the I-74 intersection with Broad Ridge Rd. I am asking that you continue following the plans that you have previously proposed and adopted with no changes.

I ask this for several reasons.

- The State spent taxpayer dollars to study the busiest intersections on I-74 & determined that Broad Ridge Rd. was the correct location for an intersection.
- 2. If the State decides to move the intersection then the money for this study would have been wasted by moving the intersection to a less traveled intersection.
- The State spent taxpayer dollars to purchase the land surrounding Broad Ridge Rd for the proposed intersection.
- If the State decides to relocate the intersection at Broad Ridge then taxpayers would again have to purchase property, probably at a greater cost & loss of money from the earlier purchase.
- Broad Ridge Rd is a heavily travelled road and intersection by not only commuters but by emergency vehicles.
- If the State decides to relocate an intersection to another area, it would require these emergency vehicles to take longer routes to the scene of the emergencies, which would cost more for the emergency responders, with the potential of additional loss of property and lives.
- Our church which is directly on Broad Ridge Rd has approximately 300 members, many of whom live on the south portion of Broad Ridge Rd. and further,
- If the State relocates the proposed intersection, these members would be placed at a hardship of extended travel for themselves and loss of quick response of emergency services.

Therefore, because of the loss of taxpayers' dollars, going against your own studies and the loss of emergency services, I ask that you leave the proposed intersection on I-74 at Broad Ridge Rd.

Sincerely, Bill Pealer, Pastor ORRUM VOL FIRE DEPT 28375 P O BOX 285 PROCTORVILLE N C NOV 12,2009

MARK EATMAN TRANSPORTATION ENGINEER 1 N C DOT TRANSPORTATION PLANNING

THE ORRUM VOL FIRE DEPT IS FULL SUPPORT OF THE ON_OFF RAMP AT U S 74 AND S R 2220 BROAD RIDGE ROAD. IT IS ALONG DISTANT ON U S 74 FROM N C 41 TO LUMBER RIVER AND FOR THE SAFTY OF THE PUBLIC, IT IS 7.8 MILES FROM S R 41 TO MT ELIM RD. SR 2220 IS A VERY GOOD EASY ACCESS FOR ORRUM VOL FIRE DEPT . THEY ALSO NEED HELP FROM OTHER VOL FIRE DEPTS AT LONG BRANCH AS A BACK_ UP UNIT

THIS ON OFF RAMP IS VERY IMPORTANT TO THE ORRUM VOL FIRE DEPT. AND TO BRITTS VOL FIRE DEPT.

THE SAFTY OF THE COMMUNITY AND THE HIGHWAY 74 THIS IS AN A VERY GOOD LOCATION.

THANKS,

THE ORRUM VOL FIRE DEP PRESIDENT 56 TREASURER BRITT SECRETARY FIRE CHIEF LENWOOD HUN

November 5, 2009

Dear Mark Eatman:

We the members of First Orrum Missionary Baptist Church request that the interchange located at State Road 2220 and interstate 74 (Broad ridge Road) remain as the original specification as originally planned.

Your consideration in this matter will be greatly appreciated.

Clipton W. Spidt. chairmon of Dearon Ministry

Antioch Missionary Baptist Church PO Box 177 Proctorville, NC 28374 (910) 628-9650 Office (910) 733-2703 Cell Dr. Lawrence M. Dowdy, D.Min. Pastor

November 12th, 2009

Mr. Mark Eatman 1554 Mail Service Center Raleigh, North Carolina, 27699-1554

Dear Mr. Eatman,

This comes to express my deep concern about the proposed change of the interstate exchange from the Broadridge Road exit on Interstate 74 to the Creek road exit.

I serve a small membership church of about 150 members. I would estimate that a third to half of my membership use the Broadridge Road to go to and from Lumberton. As a mater of fact, it is my preferred way of entering Lumberton. I certainly believe that any change would be a detriment to the Proctorville community. So many of our neighbors use this route to enter Lumberton. For many, it is the quickest way to the hospital and for their Doctor's appointment. For us, it is so easy to take Broadridge to get on 72, and make our way into town. It would also hurt our access to other services such as fire, emergency, and law enforcement. The long route could make the difference between life and death too many in our community.

Therefore, I want to recommend that the Broadridge Road exchange be left as is. The number of communities and citizens that it services, I believe, warrants that the State Transportation Department maintain its original plan which would best serve the citizens of this section of the 74 corridor.

Thank you so much for your kind consideration and cooperation.

TOWN OF PROCTORVILLE

Main & Carolina Streets Proctorville, N. C. 28375

November 4, 2009

Subject: Robeson County Comprehensive Transportation Plan

Dear Mark Eatman:

This letter is in reference to the Robeson County Comprehensive Transportation Plan US Highway 74 and State Road 2220, Broadridge.

The Town of Proctorville supports the specifications set in the original plans for access to Highway US 74 to remain at the Broadridge intersection. This would give better access to our community as well as the fire department which responds to emergency calls.

Thank you for your consideration of this matter.

Sincerely,

H.B. Johnson

Mayor of Proctorville

Deborah Connor, Alterman Town of Proctorville

Jennifer Connor, Alterman Town of Proctorville

James McKnight, Alterman Town of Proctorville
