Supplementary Notes:			
16. Abstract  This technical assistance project was conducted to develop a construction cost estimate update method which can be used by the NCDOT STIP Unit, the Highway Divisions, and other DOT Units to better estimate construction costs for roadway and bridge projects. Data obtained from NHCCI, NCDOT CPLs, and NCDOT Bid Tabs were cleaned, grouped by funding programs, and analyzed. Findings and conclusions of analyses as well as recommendations for future studies are provided.

# CHAPTER 1 INTRODUCTION AND OBJECTIVES

## 1.1 Background, Research Needs and Significance

The North Carolina Department of Transportation (NCDOT) has traditionally employed a contingency factor approach for estimating the construction costs of its projects. Although the department mandates that these estimates be updated every two years to ensure successful project execution, recent unpredictable fluctuations in unit prices have challenged the effectiveness of this method. Notably, from 2020 Q4 to 2022 Q4, the USDOT/FHWA indicated that components such as asphalt, grading/excavation, and bridges were the main factors behind the percentage change in the National Highway Construction Cost Index (NHCCI). These fluctuations can render construction estimates significantly inaccurate within the two-year window. Such inaccuracies directly impact the balance of the Statewide Transportation Improvement Program (STIP). Consequently, pre-established project schedules of impacted projects often need re-adjustment to accommodate funding constraints. Given the volatile economic landscape and the pressing need for precise budgeting, there's a compelling need to explore a new variable rate that can be applied to NCDOT construction cost estimates to account for unit price escalation. Considering indicators such as consumer price indices, federal rates, or other local economic indices as predictors for construction cost becomes necessary. Implementing this new variable rate can enhance the adaptability and resilience of NCDOT's cost estimates amidst shifting financial conditions.

## 1.2 Research Objectives

To achieve the aim of this study, the following objectives are proposed:

- To Identify the optimal source for cost trend data and collect the essential data.
- To develop a method to integrate trend data into construction estimates.

## 1.3 Report Organization

An introduction to the research project, research needs and objectives are presented in Chapter 1. A comprehensive literature review is provided in Chapter 2. Chapter 4 summarizes the sources of research data. The research methodology is described in Chapter 4. Chapter 5 focuses on findings and conclusions. Chapter 6 provides recommendations for future research.

## CHAPTER 2 LITERATURE REVIEW

29  
30

### 2.1 Cost Overrun Factors

32 Escalations in contracts increase the risk of cost overrun and may lead to other problems such as  
33 conflicts and delays. Therefore, researchers and industry professionals worldwide have been trying  
34 to identify factors affecting cost overrun and explore approaches to providing accurate  
35 construction project cost estimates. In a recent study, Waugaman (2021) focused on emergency  
36 streambank protection projects of the U.S. Army Corps of Engineers Civil Works projects.  
37 Emergency streambank protection is used to protect public facilities (e.g., bridges and highways).  
38 The author concluded that Riprap placement, material and filter fabric were the major predictors  
39 of cost overrun of the analyzed projects. Welde and Dahl (2021) found that change orders made to  
40 the scope of work, contract size, duration, and urban location increased the risk and size of cost  
41 overrun. Akinradewo et al. (2021) attempted to correlate location, road project size (i.e., road  
42 length and width), median strip, pavement type, scope (i.e., new, renovation, upgrade, and  
43 replacement), and road classification (i.e., trunk, feeder, and urban) with cost overrun, and found  
44 road project scope and road classification significantly affected cost overrun.

### 2.2 Cost Estimation Approaches

46 There are two primary approaches for construction cost estimating: qualitative and quantitative  
47 (Tayefeh Hashemi et al., 2020).

48

49 The qualitative approach involves expert judgment and heuristic rules. Expert judgment relies on  
50 advice from experienced experts and peers to check the validity of the estimating results, which is  
51 intuition-based and mainly relies on unspoken yet not well documented extrapolation techniques.  
52 The heuristic rules, on the other hand, stem from intuitive judgments and relatively similar projects,  
53 oftentimes serve as “rule of thumb” to simplify the estimating process. For instance, Love et al.  
54 (2023) recommended the use of the heuristics approach (e.g., fast-and-frugal trees) to identifying  
55 cues that indicate cost uncertainty.

56

57 As the dominant approach, which has been used by 97% of the studies summarized by Tayefeh  
58 Hashemi et al. (2020), the quantitative approach includes parametric (e.g., regression based and

59 time-series prediction) and non-parametric methods (e.g., machine learning based). For parametric  
60 approach, Swei et al. (2017) presented a new approach to better estimating expected initial costs  
61 and associated variation for probabilistic-based life-cycle cost analysis of roadway pavement  
62 projects. Their approach combined a maximum likelihood estimator for data transformations (i.e.,  
63 Box-Cox transformations) with least angle regression for dimensionality reduction in estimating  
64 the bid unit-price. In addition, their equations presented the relationships between bid quantity,  
65 location, number of bidders, and bid unit-price. Wong and Swei (2021) used time-series methods  
66 and developed four disaggregated cost indices for asphalt concrete (AC) highway construction,  
67 Portland cement concrete (PCC) highway construction, AC highway maintenance and  
68 rehabilitation (M&R), and PCC highway M&R respectively, based on the chained Fisher price  
69 index. Fisher index has been widely recommended by the International Labor Office (ILO), the  
70 World Bank, the US Bureau of Labor Statistics (BLS), and other organizations as the preferred  
71 technique to compute a price index. For non-parametric methods, one example is Tijanić et al.  
72 (2020) discovered that General Regression Neural Network can estimate the cost of roadway  
73 projects with higher accuracy, even when datasets are incomplete.

74  
75 Each of the abovementioned methods has its own advantages and disadvantages. For example, a  
76 regression-based prediction approach is easy to use and transparent, and it allows engineers,  
77 estimators, and other decision makers to track factors leading to cost overrun. However, this  
78 method only works when all the risk factors are known, and most of the time, it requires that  
79 datasets should be complete. In addition, its ability to handle non-linear relationships is not  
80 satisfactory. By contrast, non-parametric approach such as neural networks have several  
81 advantages, such as their ability to detect intricate nonlinear relationships among variables and  
82 ability to discover all possible interrelations between variables. However, like any other subject,  
83 there remains some disadvantages, including the “black box” mechanism leading to  
84 discouragement in finding the origin of the results, their difficult applicability to some problems,  
85 and their need for high computational resources.

### 86 **2.3 A Hybrid Approach**

87 Considering the characteristics of qualitative and quantitative approaches reviewed above, a hybrid  
88 approach that integrates both qualitative and quantitative methods often yields superior results.

89 The reason is that experienced experts can help ensure the validity of the estimates obtained via  
90 quantitative approaches.

91

92 One representative research study incorporating both qualitative and quantitative approaches (Kim,  
93 2013) was conducted to develop an excel-based hybrid estimating tool using case-based reasoning  
94 (CBR) and hybrid analytic hierarchy process (AHP) to improve the accuracy of highway project  
95 estimates in South Korea. CBR captures past experiences and matches the important features of  
96 new problem to those of the old cases that have been successfully solved. Its strength is its ability  
97 to reuse the case even if it only partially matches the current problem.

98

99 On the other hand, AHP is a Multiple-Criteria Decision-Making (MCMD) method that was  
100 originally developed by Thomas Saaty (1980). It has proven to be an effective decision-making  
101 tool for fields such as government, business, and industry. Kim (2013) used AHP method and  
102 interviewed/surveyed 18 industry professionals on cost factors of highway projects, where 24 cost  
103 factors (e.g., completed year, actual duration, type of site, length and width of highway, materials  
104 used, etc.) were identified and ranked based on the relative importance of each factor.

105

106

107

108

### CHAPTER 3 RESEARCH DATA

109 This chapter describes the sources of data that have been collected and analyzed to develop the  
110 proposed prototype of the estimate update tool, including quarterly NHCCI components’ percent  
111 changes, NCDOT Bid Tabs, and NCDOT Comprehensive Project Lists (CPLs).

#### 112 3.1 Quarterly NHCCI Reports

113 The U.S. Department of Transportation and the Federal Highway Administration publish National  
114 Highway Construction Cost Index (NHCCI) on a quarterly basis ([NHCCI Analysis and Narrative  
115 - Policy | Federal Highway Administration \(dot.gov\)](#)). In 2023, two quarterly reports were  
116 published on September 12, 2023 (2023 Q1) and November 13, 2023 (2023 Q2). Both reports  
117 noted the unusual average quarterly growth of 5.2 percent in 2021 and 2022, and that these elevated  
118 changes may have been caused by “supply chain disruptions and fluctuating oil prices.” To avoid  
119 potential impacts from these unforeseen factors to this research project, it was decided to focus on  
120 construction cost escalations that occurred in 2023 and use the present changes published in  
121 NHCCI 2023 Q2 to capture cost estimate changes in the same year.

122

123 The NHCCI includes 9 components which can be divided into 2 categories: (1) for Bridge projects  
124 and (2) for Roadway projects (Table 1). These 2 types of projects are required by NCDOT to be  
125 the target project types in this research project.

126

127

*Table 1. NHCCI Component Contributions to Changes from Previous Quarter (2023 Q2)*

NHCCI Component	Percent Change since 2023 Q1	Category
Asphalt	1.27%	Roadway
Base Stone	0.17%	Roadway
Concrete	0.07%	Roadway
Drainage	0.07%	Roadway
Electrical	0.38%	Roadway
Grading/Excavation	0.45%	Roadway
Traffic Control	0.74%	Roadway
Utilities, erosion control, clearing, painting, and equipment	0.36%	Roadway
Bridge	0.31%	Bridge

128 Percent changes in column 2 of Table 1 were used to calculate a construction cost estimate  
129 adjustment factor, and categories in column 3 were used to further divide the projects into  
130 subcategories to better delineate cost groups, as described in Chapter 4.

### 131 **3.2 NCDOT Bid Tabs**

132 NCDOT publishes bid tabs through Connect NCDOT ([Bid Tab Sheets \(ncdot.gov\)](https://www.ncdot.gov/Bid-Tab-Sheets)) in two formats:  
133 Excel and PDF. The Excel files are password protected, therefore, PDF files were downloaded and  
134 converted into the Excel format for further analysis. The following bid tabs for 2023 projects were  
135 downloaded from the abovementioned website and then further analyzed:

- 136 • Bid Tabs 2302 Post.pdf
- 137 • Bid Tabs 2303 Post.pdf
- 138 • Bid Tabs 2304 Post.pdf
- 139 • Bid Tabs 2305 Post.pdf
- 140 • Bid Tabs 2306 Post.pdf
- 141 • Bid Tabs 2307 Post.pdf
- 142 • Bid Tabs 2308 Post.pdf
- 143 • Bid Tabs 2309 Post.pdf
- 144 • Bid Tabs 2310 Post.pdf
- 145 • Bid Tabs 2311 Post.pdf
- 146 • Bid Tabs 2312 Post.pdf

147 Data mining was conducted on item descriptions and their prices in each bid tab, and then placed  
148 them under corresponding NHCCI components. This process was time consuming due to the  
149 format inconsistency issues caused by the PDF-to-Excel conversion process. For bridge projects,  
150 one NHCCI component, Bridge, was studied. For roadway projects, the following 8 NHCCI  
151 components were studied:

- 152 1. Asphalt
- 153 2. Base Stone
- 154 3. Concrete
- 155 4. Drainage
- 156 5. Electrical

- 157 6. Grading/Excavation
- 158 7. Traffic Control
- 159 8. Utilities, Erosion Control, Clearing, Painting, and Equipment

160 A total of 322 bids submitted in 2023 to NCDOT were studied, and Figure 1 shows the box plots  
 161 of the 8-roadway related NHCCI components in terms of their percentages of the total bid prices.  
 162 Summary statistics are included in Table 2.

163

164 Figure 1. Box Plots of the 8 Roadway Related NHCCI Components (percent of the total bid price)

166  
 167

Table 2. Summary Statistics of the 8 Roadway Related NHCCI Components (percent of the total bid price)

	First quartile (Q1 or 25th percentile)	Mean	Median (Q2 or 50th percentile)	Third quartile (Q3 or 75th percentile)	Maximum (Q4 or 100th percentile)
Asphalt	9.7%	29.0%	18.2%	54.8%	80.9%
BaseStone	0.0%	0.9%	0.4%	0.8%	9.5%
Concrete	1.5%	12.0%	7.5%	18.3%	56.5%
Drainage	0.6%	7.3%	2.9%	12.1%	60.2%
Electrical	0.0%	0.7%	0.0%	0.5%	37.6%
Grading Excavation	10.0%	20.6%	19.5%	28.3%	86.8%
TrafficControl	2.8%	5.1%	4.4%	6.3%	38.0%
Utilities_ErosionControl_Clearing_Painting_Equi	4.5%	8.2%	6.6%	9.8%	44.9%

168

169 Box plots in Figure 1 allow NCDOT engineers to have an overall understanding of the construction  
170 cost structure of all 322 bids submitted to NCDOT in 2023. These bids were further divided into  
171 7 subcategories based on each project’s Funding Program, and corresponding box plots and  
172 summary statistics were provided for NCDOT engineers to review the cost structure at subcategory  
173 levels (as described in Chapter 4).

174

175 In Chapter 4, medians, as included in Table 2, were calculated for each subcategory, and then used  
176 to calculate a construction cost estimate adjustment factor. The averages, Mean values as included  
177 in Table 2, were not used because of the large number of outliers observed in Figure 1.

178

179 Another important piece of information that was obtained from NCDOT Bid Tabs is the project’s  
180 final bid price, which is typically the lowest bid price among several bids. When the engineer’s  
181 estimate is multiplied by the construction cost estimate adjustment factor, it is expected that the  
182 product would be as close as possible to a project’s final bid price.

### 183 **3.3 NCDOT Comprehensive Project Lists (CPLs)**

184 NCDOT publishes CPLs on a weekly basis and these CPLs were available to researchers upon  
185 request. The following CPLs were provided by the NCDOT engineer:

- 186 1. Comprehensive Project List2023-01-03.xlsx
- 187 2. Comprehensive Project List2023-02-07.xlsx
- 188 3. Comprehensive Project List2023-03-07.xlsx
- 189 4. Comprehensive Project List2023-04-04.xlsx
- 190 5. Comprehensive Project List2023-05-09.xlsx
- 191 6. Comprehensive Project List2023-06-06.xlsx
- 192 7. Comprehensive Project List2023-07-04.xlsx
- 193 8. Comprehensive Project List2023-08-01.xlsx
- 194 9. Comprehensive Project List2023-09-05.xlsx
- 195 10. Comprehensive Project List2023-10-03.xlsx
- 196 11. Comprehensive Project List2023-11-07.xlsx
- 197 12. Comprehensive Project List2023-12-05.xlsx

198 As instructed by the NCDOT engineer, projects are no longer included in a CPL once they have  
199 let to construction. Therefore, to obtain a complete list of projects, it was necessary to combine  
200 these 12 CPLs and then use the most recent “Let Date” to remove duplicates.

201  
202 It should be noted that all these projects were subcategorized using their “Funding Program”, and  
203 the first 2 CPLs on the abovementioned list do not have the “Funding Program Description”  
204 column. Consequently, the remaining 10 CPLs were combined and a total of 26,261 projects were  
205 obtained. After duplicates were removed, a total of 3,137 projects remained. The CPL data  
206 merging and duplicate removing process are shown in Figure 2 below.

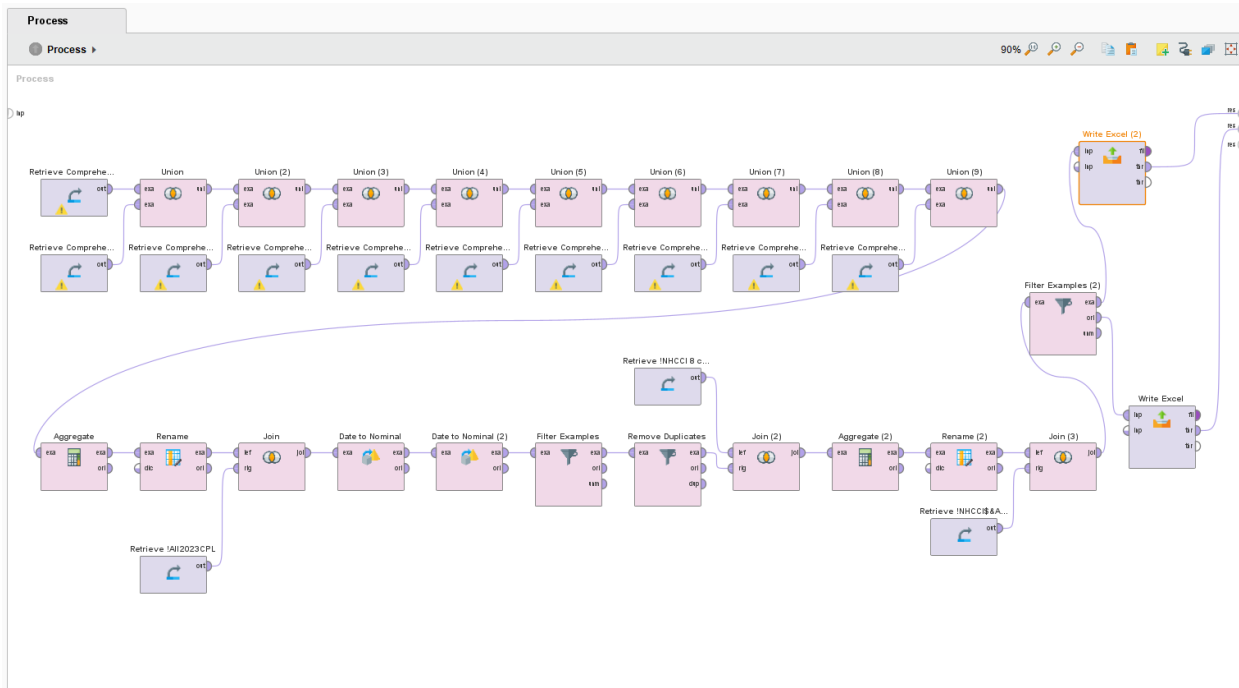

Figure 2. CPL Data Merging and Duplicate Removing Process

207  
208  
209

210

## CHAPTER 4 RESEARCH METHODOLOGY

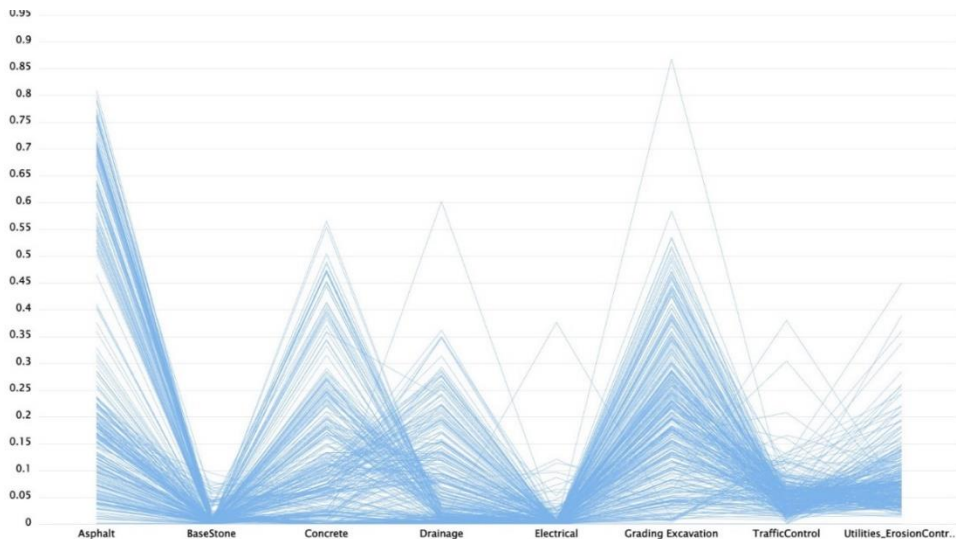

211 This chapter describes the procedures that were performed to develop the proposed prototype of  
212 the estimate update tool, including the regrouping of roadway projects and the development of the  
213 construction cost estimate adjustment factor.

### 214 4.1 Regrouping of Roadway Projects

215 The construction projects considered in this research project were initially divided into two  
216 categories: Bridge and Roadway. A standalone NHCCI component, Bridge, is directly related to  
217 the Bridge project category. This one-to-one relationship simplifies the prototype development  
218 process for the Bridge project category and allows researchers to be more focused on the other  
219 one-to-many relationship, which is the 8 NHCCI components relating to the Roadway project  
220 category.

221

222 A parallel coordinates plot of 322 bids (the NCDOT bid tabs data set as described in Section 3.2)  
223 was developed (Figure 3) to explore the relationships, trends, and variations of these 8 components  
224 altogether. In addition to several outliers, the most significant variations exist for Asphalt,  
225 followed by Grading/Excavation, Concrete, and Drainage. A few clusters are quite obviously  
226 visible in this plot. This indicates that one single category, Roadway, is not sufficient to represent  
227 this large cost group, and a regrouping seems to be necessary.

228

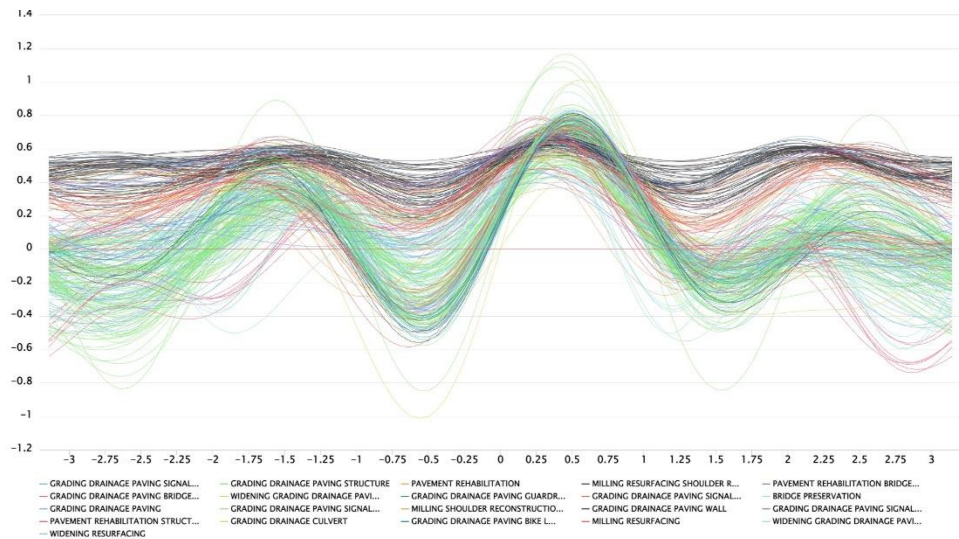

229

Figure 3. Parallel Coordinates Plot of 322 Bids

230 As an attempt to regroup these projects, another parallel coordinates plot of the same 322 bids and  
 231 color-coded by project types (extracted from NCDOT Bid Tabs) is presented in Figure 4. This plot  
 232 includes 322 lines (bids) in 21 different colors (project types). It can be observed that the  
 233 boundaries between color groups are not distinct, which means project types are not a good factor  
 234 that should be used to regroup these projects. The same conclusion can be drawn from an Andrew's  
 235 plot (Figure 5) where color lines are tangled with each other, and a distinct grouping is not observed.

236  
 237 *Figure 4. Parallel Coordinates Plot of 322 Bids (colored by Project Types)*

240  
 241 *Figure 5. Andrew's Plot of 322 Bids (colored by Project Types)*

243 An insight from the NCDOT engineer suggests that “Funding Program” could be used to regroup  
 244 these projects. Another data merging process is needed as information related to the NHCCI  
 245 components and “Funding Program” reside in two different data sets (Tables 3 and 4).

246 *Table 3. NCDOT Bid Tab Data Structure*

Project ID	Asphalt	BaseStone	Concrete	Drainage	Electrical	Grading Excavation	Traffic Control	Utilities_ErosionControl_Clearing_Painting_Equipment	Bid Price
Project 1									
Project 2									
Project 3									
...									

247  
 248  
 249 *Table 4. NCDOT CPL Data Structure*

Project ID	Let Date	Funding Program Description	CON \$	CON Estimate Date
Project i				
Project i+1				
Project i+2				
...				

250  
 251

252 After merging these two data sets using Project ID as the key attribute, the final data set has 213  
 253 bids which belong to 48 projects (each project can include up to 5 bids). A bar chart (Figure 6) and  
 254 box plots developed using these 213 bids are shown below (Figures 7-14).

255

256 A total of 6 different funding programs are included in the CPL data sets. They are:

- 257 1. Highway – Bridge
- 258 2. Highway - Interstate Maintenance
- 259 3. Highway - Locally Selected
- 260 4. Highway – Safety
- 261 5. Highway - STI (Prioritization)
- 262 6. Rail - STI (Prioritization)

263 Some projects were not assigned a funding program, and their corresponding funding programs  
 264 were categorized as Unknown. As shown in Figure 6, the funding program “Highway – STI  
 265 (Prioritization)” has funded the largest number of projects, which is 19 (87 bids), and the funding  
 266 program “Rail – STI” has funded the least number of projects, which is one (2 bids). Box plots of  
 267 8 NHCCI components (Figures 7-14) display summary statistics, including the min., max., mean,  
 268 median, and other quartiles, that enable the NCDOT engineers to quickly understand the important  
 269 point values across all funding programs. It should be noted that bridge projects funded by the

270 Highway – Bridge funding program have their own NHCCI percent change rate, and their  
 271 appearance in Figures 7-14 is for reference purposes only.

To check the regrouping results using Funding Program as the indicator, a parallel coordinates plot is presented in Figure 15. This plot includes 213 lines (bids) in 7 different colors (Funding Programs). It can be observed that the boundaries between color groups are distinct, which means Funding Programs are a good factor that should be used to regroup these projects. The same conclusion can be drawn from an Andrew’s plot (Figure 16) where clusters of color lines are visibly separate from each other, and a distinct grouping is observed.

300  
301

With this conclusion, the next step would be to calculate a construction cost estimate adjustment factor for each Funding Program. The procedure is described in Section 4.2.

## 308 4.2 Construction Cost Estimate Adjustment Factors

309 Construction cost estimate adjustment factors for 6 funding programs are calculated using  
310 Equation (1):

313 Construction Cost Estimate Adjustment Factor<sub>i</sub>  
 314 = *Weighted Composite Index*<sub>i</sub> × *Scaling Factor*<sub>i</sub>  
 315 =  $\left(1 + \sum_{i=1}^5 \sum_{j=1}^8 (NHCCI_j \times Median_{i,j})\right) \times \left(\frac{1}{\sum_{j=1}^8 Median_j}\right)$  (1)

311 where,  
 312

316  
 317 *i*: Funding Programs. When the Funding Program is Highway – Bridge, the  
 318 Weighted Composite Index is a constant, 1.0031. Other 5 Funding Programs are:  
 319 Highway – Interstate Maintenance, Highway – Locally Selected, Highway – Safety,  
 320 Highway – STI (Prioritization), and Rail – STI (Prioritization).

321  
 322 *j*: NHCCI components. *j* is from 1 to 8, including Asphalt, Base Stone, Concrete,  
 323 Drainage, Electrical, Grading/Excavation, Traffic Control, and Utilities, Erosion  
 324 Control, Clearing, Painting, and Equipment

325  
 326 *Scaling Factor*: An adjustment factor that is used to extrapolate a portion of a bid  
 327 to represent the whole bid. For each bid, the sum of median percentages of 8  
 328 NHCCI components is less than 100%, and the remaining percentage does not  
 329 belong to any one of the 8 components. Thus, the sum of median percentages (the  
 330 portion) should be scaled up to represent the whole bid (the whole entity).

331  
 332 *Median*: Median percentages of 8 NHCCI components.  
 333

334 Estimated construction costs for 6 funding programs are calculated using Equation (2):  
 335

336 Estimated Construction Cost <sub>i</sub> = CON \$<sub>i</sub> × Construction Cost Estimate Adjustment Factor<sub>i</sub>  
 337 (2)

338 where,  
 339

340 *i*: Funding Programs. When the Funding Program is Highway – Bridge, the  
 341 Weighted Composite Index is a constant, 1.0031. Other 5 Funding Programs are:  
 342 Highway – Interstate Maintenance, Highway – Locally Selected, Highway – Safety,  
 343 Highway – STI (Prioritization), and Rail – STI (Prioritization).

344  
 345 CON \$: NCDOT engineers’ construction cost estimates, which is included in  
 346 NCDOT CPLs. CON \$ includes the total construction cost, Contract administration,  
 347 and contingency, and the latter two are estimated to be approximately 15% of the  
 348 total construction cost. Therefore, to make a valid comparison, the bid prices are  
 349 adjusted by multiplying an 115% factor.

350  
 351 Construction cost estimate adjustment factors and estimated construction costs were  
 352 calculated for each funding program, and the results are presented in Tables 5-10 and  
 353 Figures 17-22.

403 **CHAPTER 5 FINDINGS AND CONCLUSIONS**

404 This technical assistance project was conducted to develop a construction cost estimate method  
405 which can be used by the NCDOT engineers to better estimate construction costs for bridge and  
406 roadway projects. Findings and conclusions upon the completion of this project are presented  
407 below.

408 **5.1 Research Data**

409 As described in Chapter 3, NCDOT engineers provided two out of three types of data that were  
410 used to conduct data analyses for this research project. Researchers observed that two data sets  
411 obtained from NCDOT are complete and of high quality. The flowchart below (Figure 24)  
412 illustrates how key information was used in this project.

413  
414 *Figure 24. Key Information of NCDOT Data Sets*

415 As shown in the final step of this workflow, information of 48 projects was extracted and the  
416 numbers of these projects supported by following funding programs are:

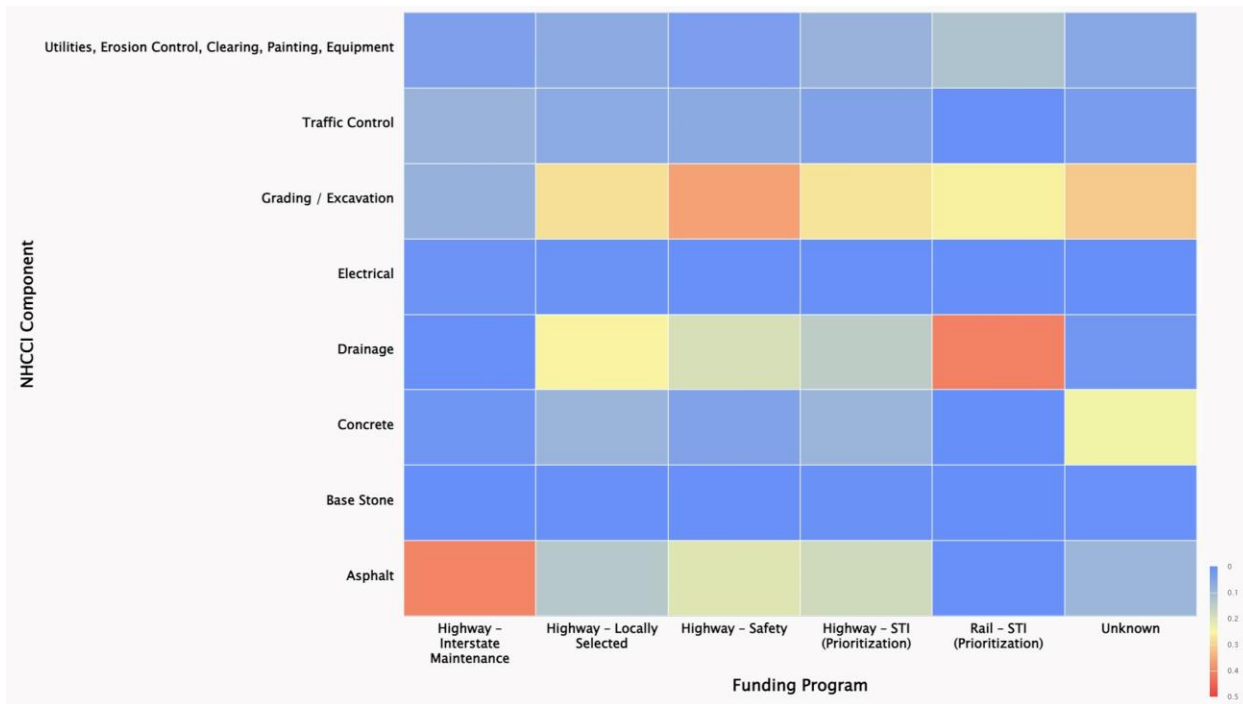

- 417 • Highway – Bridge: 8
- 418 • Highway – Interstate Maintenance: 10
- 419 • Highway – Locally Selected: 1
- 420 • Highway – Safety: 2
- 421 • Highway – STI (Prioritization): 19
- 422 • Rail – STI (Prioritization): 1
- 423 • Unknown: 7

424 **5.2 Summary Statistics of NHCCI Components**

425 Summary statistics of the following information are included in Table 12:

- 426 • A total of 322 bids (as shown in Figure 24)
- 427 • Percentage of the total bid prices of 8 NHCCI components
- 428 • By 7 Funding Programs

429 Figure 25 presents a heatmap generated using the median values of 8 NHCCI components. Since  
 430 the final merged data in this project shows that three funding programs, Highway – Locally  
 431 Selected, Highway – Safety, and Rail – STI (Prioritization), each supported only one or two  
 432 projects in 2023, their representations in Figure 25 are not the focus of this heatmap. For the  
 433 Highway – Interstate Maintenance program, most of the funding went to Asphalt, followed by  
 434 Grading/Excavation and Traffic. For the Highway – STI (Prioritization) program, a large  
 435 percentage of funding went to Grading/Excavation, followed by Asphalt, Drainage, and Concrete.  
 436 For projects supported by the Unknown funding program, a large percentage of funding went to  
 437 Concrete, followed by Grading/Excavation. This funding allocation makes sense since most of the  
 438 projects in this category seem to be bridge projects (Figure 23). Similarly, funding has been  
 439 reasonably allocated for the Interstate Maintenance and STI (Prioritization) program.

440  
441

Figure 25. Heatmap of Summary Statistics

Table 12. The Construction Cost Estimate Adjustment Factor for Funding Program: Unknown

Funding Program	NHCCI Component	First quartile (Q1 or 25th percentile)	Mean	Median (Q2 or 50th percentile)	Third quartile (Q3 or 75th percentile)	Maximum (Q4 or 100th percentile)
Highway – Interstate Maintenance	Asphalt	16.2%	36.9%	40.6%	56.1%	71.3%
	Base Stone	0.0%	0.1%	0.0%	0.2%	0.6%
	Concrete	0.0%	12.7%	1.6%	18.3%	56.5%

Highway – Locally Selected	Asphalt	13.1%	14.2%	13.8%	15.6%	16.0%
	Base Stone	0.2%	0.2%	0.2%	0.3%	0.3%
	Concrete	6.7%	9.1%	9.0%	11.6%	12.0%
	Drainage	22.0%	26.7%	25.5%	32.7%	34.9%
	Electrical	0.7%	1.8%	0.7%	4.1%	5.2%
	Grading / Excavation	26.0%	29.1%	28.1%	33.1%	34.2%
	Traffic Control	6.2%	7.0%	6.4%	8.5%	9.2%
	Utilities, Erosion Control, Clearing, Painting, Equipment	6.1%	6.8%	6.6%	7.5%	7.8%
Highway – Safety	Asphalt		20.6%	20.6%		21.9%
	Base Stone		0.1%	0.1%		0.2%
	Concrete		4.6%	4.6%		4.7%
	Drainage		19.2%	19.2%		19.5%
	Electrical		0.4%	0.4%		0.4%
	Grading / Excavation		36.8%	36.8%		39.1%
	Traffic Control		6.5%	6.5%		7.3%
	Utilities, Erosion Control, Clearing, Painting, Equipment		3.6%	3.6%		3.7%
Highway – STI (Prioritization)	Asphalt	16.1%	18.1%	18.0%	20.8%	31.8%
	Base Stone	0.3%	1.7%	0.5%	1.9%	9.5%
	Concrete	5.9%	9.2%	8.9%	11.5%	21.0%
	Drainage	9.5%	16.7%	14.9%	22.1%	36.1%
	Electrical	0.2%	0.6%	0.3%	0.4%	9.7%
	Grading / Excavation	21.9%	28.9%	27.7%	36.9%	53.5%
	Traffic Control	3.2%	4.4%	4.6%	5.7%	8.0%
	Utilities, Erosion Control, Clearing, Painting, Equipment	7.2%	10.6%	8.5%	13.5%	28.4%
Rail – STI (Prioritization)	Asphalt		0.2%	0.2%		0.2%
	Base Stone		0.0%	0.0%		0.0%
	Concrete		0.0%	0.0%		0.0%
	Drainage		41.2%	41.2%		60.2%
	Electrical		0.0%	0.0%		0.0%
	Grading / Excavation		25.9%	25.9%		33.9%
	Traffic Control		0.2%	0.2%		0.2%
	Utilities, Erosion Control, Clearing, Painting, Equipment		12.6%	12.6%		17.2%
Unknown	Asphalt	5.1%	13.4%	9.3%	23.5%	31.2%
	Base Stone	0.1%	0.6%	0.4%	0.7%	3.4%
	Concrete	9.1%	22.8%	23.9%	34.0%	47.4%
	Drainage	1.0%	3.7%	1.8%	3.1%	17.0%
	Electrical	0.0%	0.4%	0.0%	0.9%	1.9%
	Grading / Excavation	17.5%	32.1%	31.2%	45.8%	86.8%
	Traffic Control	2.1%	4.1%	3.0%	6.0%	11.3%
	Utilities, Erosion Control, Clearing, Painting, Equipment	4.6%	7.0%	5.7%	9.6%	16.3%

444 This table allows NCDOT engineers to review cost distributions among NHCCI components at  
445 the funding program level. It should be noted that missing values in some cells indicate that the  
446 corresponding statistics cannot be calculated due to data scarcity.

### 447 **5.3 Accuracy of the Construction Cost Estimate Adjustment Factor**

448 As described in Section 4.2, a construction cost estimate adjustment factor was calculated for each  
449 funding program. Then an estimated construction cost was calculated using this factor. Due to the  
450 time constraint, new bid prices in 2024 are not used to validate the accuracy of this factor. Rather,  
451 a comparison between a project's final bid price (the lowest bid price) and its estimated  
452 construction cost was conducted to check the performance of the factor. The equation for the  
453 percentage error is:

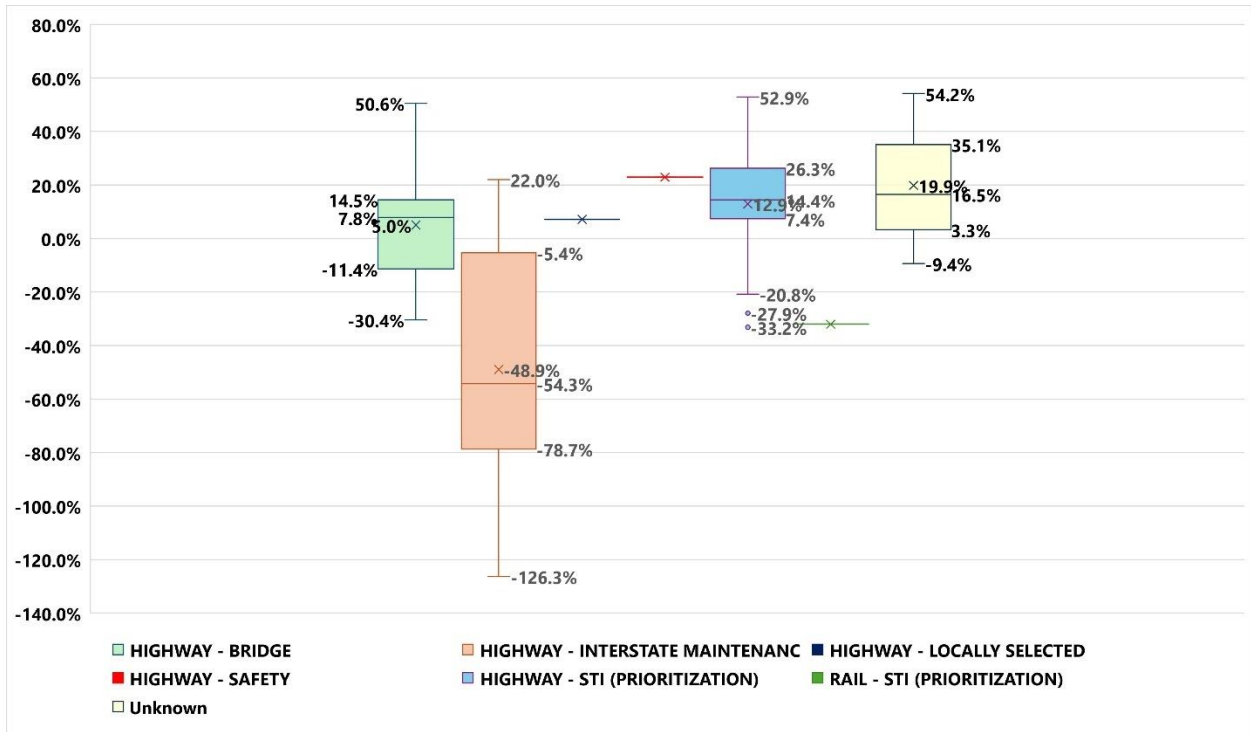

$$454 \text{Percentage Error} = \left( \frac{\text{Adjusted Bid Price} - \text{Estimated CON \$}}{\text{Adjusted Bid Price}} \right) \times 100\% \quad (3)$$

456 A box plot of percentage errors shows the following:

- 457 • The Bridge program has the highest accuracy (a median of 7.8%), followed by STI  
458 (Prioritization) (14.4%), Unknown (16.5%), and Interstate Maintenance (-54.3%).  
459 Percentage errors from the other three programs, Locally Selected, Safety, and Rail – STI,  
460 are not representative due to their very small sample sizes.
- 461 • For the Bridge, STI (Prioritization), and Unknown programs, most projects' adjusted bid  
462 prices are higher than the estimated construction costs. This means that the magnitude of  
463 the construction cost estimate adjustment factor developed in this research is small.
  - 464 ○ This research project considered one quarterly percent rate published by NHCCI  
465 and can use two quarterly rates. The reason is that NCDOT is interested in  
466 evaluating construction cost adjustments on projects with estimates 6 months old  
467 or more. The compound effect of two quarterly rates, mostly likely having positive  
468 values, can increase the magnitude of the construction cost estimate adjustment  
469 factor and improve the accuracy.
- 470 • For the Interstate Maintenance program, most projects' adjusted bid prices are lower than  
471 the estimated construction costs. This means that the magnitude of the construction cost  
472 estimate adjustment factor developed in this research is large.

473  
474

- This indicates that there is a need to further look into the bid price data to identify anomalies.

Figure 26. Box Plot of Percentage Error by Funding Programs

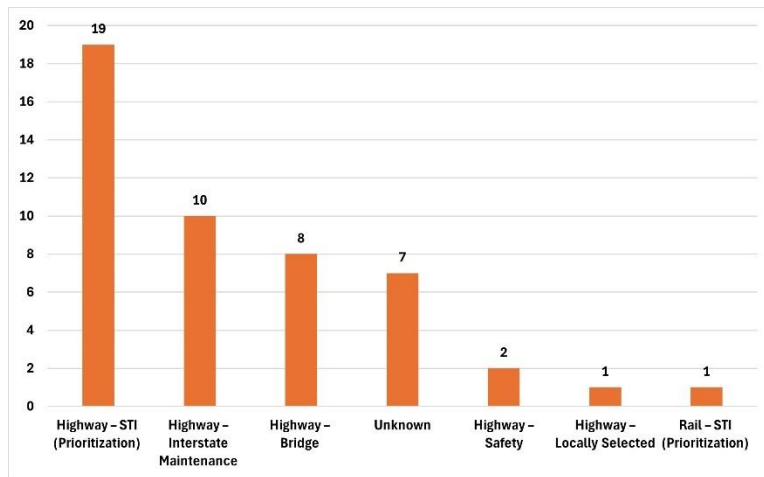

480

## CHAPTER 6 RECOMMENDATIONS

481 Upon the completion of this technical assistance research project, researchers would like to make  
482 the following recommendations for future studies:

483 1. More bridge and roadway project data should be collected for future studies. This study  
484 used the data that was collected in the most recent and available year, 2023, in order to  
485 avoid negative impacts from unforeseen factors such as “supply chain disruptions and  
486 fluctuating oil prices” that occurred in 2021 and 2022. After the data cleansing process was  
487 completed, only 48 projects were left and the distribution of these projects of 7 funding  
488 programs is quite unbalanced (Figure 27). It was challenging to draw meaningful  
489 conclusions from three programs, Safety, Locally Selected, and Rail, due to their very small  
490 sample sizes. The largest sample size is 19, which is not sufficient to be used to make  
491 unbiased conclusions. For future studies, it is recommended that data from at least 30  
492 projects, meaning data from multiple years, in each funding program should be collected.

493

494

495 *Figure 27. Number of Projects Available for Study by Funding Programs*

496

497 2. Multiple NHCCI quarterly rates should be used. NCDOT is interested in evaluating  
498 construction cost adjustments on projects with estimates 6 months old or more. This means  
499 at least two NHCCI quarterly rates can be used for this type of research project. The  
500 compound effect of at least two quarterly rates, mostly likely having positive values, can  
501 increase the magnitude of the construction cost estimate adjustment factor and improve the

502 accuracy. NHCCI published only two NHCCI quarterly rates in 2023. One rate was  
503 published in September 2023, and the other one in November 2023. Any project that has  
504 its CON \$ estimate date before June 2023 and its let date after September 2023 can take  
505 two NHCCI quarterly rates into consideration. Researchers decided not to proceed because  
506 only 12 out of 48 projects meet this requirement. More published NHCCI quarterly rates  
507 along with information collected from more projects in 2024, however, can support this  
508 method.

509 3. The construction cost estimate adjustment factor for the Highway – Interstate Maintenance  
510 funding program should be further studied due to the factor’s poor performance in this  
511 study. One possible reason could be its relatively small sample size of 10. High variations  
512 of its NHCCI components could be another reason. The implementation of  
513 recommendations 1 and 2 can be helpful in finding a solution to improve the accuracy of  
514 the factor.

515 4. Bid tabs in Excel format should be obtained and used for future projects. Bid tabs provide  
516 real-world cost distributions that are used to calculate construction cost estimate adjustment  
517 factors for each funding program. Therefore, being able to extract information easily from  
518 bid tabs is an important condition to develop a cost estimate prototype tool in Excel. Due  
519 to security reasons, bid tabs in Excel format are password protected. Researchers had to  
520 convert PDF files into Excel for information retrieval. This process was time-consuming  
521 and error-prone, mainly because of the inconsistent format of converted Excel files.  
522 Custom-built equations that work in one Excel file would fail to run in the next Excel file.  
523 It is strongly recommended that NCDOT would grant access to bid tabs for future studies.
