

About Via.

Via was established in 2012 with a simple, ambitious mission: to build software that powers the world's most convenient and efficient public mobility solutions. Inspired by the potential of shared rides to alleviate congestion and reduce single-occupancy vehicle use, our founders applied their knowledge of complex data networks and machine learning to build a digital platform that could optimize the assignment and aggregation of ride requests across a fleet of vehicles.

Over the past 11 years, we have not only made this platform into the world's most advanced on demand transit system, but built additional capabilities to manage every aspect of public mobility, including paratransit, senior transportation, integrated trip planning and payments systems, electric vehicle (EV) charge management, autonomous vehicle (AV) fleet management, school bus routing, and dynamic road-usage charging (RUC). To date, we have powered 100 million rides around the world.

Via's portfolio also includes Remix, the world's leading transportation planning software. Via and Remix provide an unmatched suite of tools and services to design, plan, optimize and analyze multimodal transportation systems. Together, we have deployed transit solutions in partnership with over 700 cities and transit agencies in 40 countries around the world, powering more than 130 million rides. Below is a map of many of our projects across the globe:
