# Highway Maintenance Improvement Program Needs Assessment Report

Pursuant to N.C.G.S. 136-44.3A.(g) the North Carolina Department of Transportation (NCDOT) submits the following report on the Highway Maintenance Improvement Program (HMIP) Needs Assessment.

## Background and Methodology

The needs-based assessment is a five-year pavement analysis of investment needed to meet the level of service (LOS) targets at the end of the fifth year. The goal of this analysis is to minimize the cost to reach the LOS targets. Five years is used in the analysis to minimize budgetary impacts. The average of the five-year analysis facilitates a consistent paving program and provides a projected budget that will result in reaching target service levels.

2025 pavement conditions for the primary (NC and US routes) and secondary systems are:

| System                     | % Good | % Fair | % Poor |
|----------------------------|--------|--------|--------|
| Primary (NC and US Routes) | 70.50  | 25.32  | 4.18   |
| Secondary                  | 68.49  | 27.92  | 3.59   |

LOS goals by system are:

| System                     | % Good (Minimum) | % Poor (Maximum) |
|----------------------------|------------------|------------------|
| Primary (NC and US Routes) | 80               | 7.5              |
| Secondary                  | 70               | 10               |

For example, if a division has a current primary system score of 60% good and 15% poor. Instead of setting the analysis to meet targets in year one, the targets in the analysis are set as shown below. This gradual increase of LOS minimizes budgetary swings in any given year.

| Year | % Good | % Poor |
|------|--------|--------|
| 1    | 64     | 13     |
| 2    | 68     | 11     |
| 3    | 72     | 9      |
| 4    | 76     | 8      |
| 5    | 80     | 7.5    |

As a second example, if a division is at target or slightly above target with a primary system score of 82% good and 8% poor, the targets in the analysis are set to maintain current LOS as shown below.

| Year | % Good | % Poor |
|------|--------|--------|
| 1    | 82     | 7.5    |
| 2    | 82     | 7.5    |
| 3    | 82     | 7.5    |
| 4    | 82     | 7.5    |
| 5    | 82     | 7.5    |

The analysis consists of an automated and iterative process which applies preservation, resurfacing and rehabilitation treatments to achieve target LOS over the five-year period. Preservation treatments, such as crack sealing and chip seals, are applied to roads in high-fair to good condition in order to extend their service life. Resurfacing treatments include single- and double-layer overlays and mill and fill operations. Rehabilitation is done to correct existing deficiencies and to increase the structural capacity (thickness) of a pavement to meet future traffic needs.

The analysis provides results in the budget categories for preservation, resurfacing, and rehabilitation. This report includes the estimated cost for each budget category for each division. The average cost over the five-year period is calculated for each division and each budget category. The rehabilitation and resurfacing categories are then combined as they are both funded from the contract resurfacing appropriation.

### **Budgeting and Allocations**

The needs assessment, along with the inventory of roads in each division, provides the basis to calculate the allocations for each funding category. A division's needs-based portion of their allocation in a funding category is the ratio of the division's need in that category divided by the statewide total need in that category, unless otherwise stated in legislation. Similarly, a division's inventory-based portion of their allocation in a funding category is the ratio of the division's inventory of roads divided by the statewide total inventory of roads.

These allocations are used as inputs to the budget-based analysis, generating the starting point for the 5-year HMIP plan. The goal of a budget-based analysis is to maximize the benefit to the system when constrained by the budget. The benefit can be expressed in terms of pavement condition over time. By simulating a five-year needs assessment, an agency will deplete less expensive treatment projects and will begin treating roads requiring more extensive work, such as patching or thicker overlays. Over time, more of the system is in good condition, but must have preservation and resurfacing treatments to maintain this condition.

### **Division Needs**

The HMIP needs assessment indicates the following monetary needs per year to meet LOS:

- \$158,361,728 in pavement preservation funding
- \$719,539,900 in contract resurfacing funding

The estimated lanes miles needed to be treated per year are approximately:

- 13,957 in pavement preservation
- 8,024 in contract resurfacing

The planned lane miles in the FY 2027 – FY 2031 HMIP plan per year are approximately:

- 2,761 in preservation
- 5,130 in resurfacing

Per N.C.G.S. 136-44.3A.(c) the current HMIP plan is based on previous FY allocations and will be adjusted according to the Department's needs-based allocation process during the current budget cycle.

| System Needs Analysis |                                |                   |                    |                               |                   |                    |
|-----------------------|--------------------------------|-------------------|--------------------|-------------------------------|-------------------|--------------------|
| Division              | Pavement Preservation Per Year |                   |                    | Contract Resurfacing Per Year |                   |                    |
|                       | Needed Cost                    | Needed Lane Miles | Planned Lane Miles | Needed Cost                   | Needed Lane Miles | Planned Lane Miles |
