BACKGROUND

- **Introduction**
- **Methods of analysis**
 - Study Sites
 - Downhole tools
 - Data Acquisition
 - Image Processing and spatial analysis
- **Results and Discussion**
 - Distributions of pore area, perimeter, and shape index
 - Influence of scale of observation
 - 2D porosity analyses
- **Summary and Conclusions**

OVERVIEW

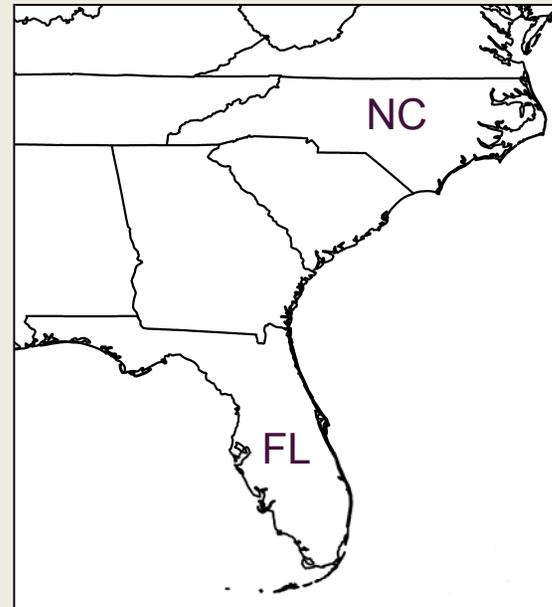

THESIS TITLE

- **Quantitative Comparison of 2D Porosity and Pore Geometry**
- **Between the Upper Castle Hayne, Aquifer, North Carolina, and the Biscayne Aquifer, Florida**
- **Using Image and Geospatial Analysis**

INTRODUCTION

- **Castle Hayne aquifer;**
 - Eastern, NC
- **Biscayne aquifer;**
 - Southeastern, FL
- **Complex internal structure**
- **Development of dissolution features**
- **Significantly influences the hydraulic properties**

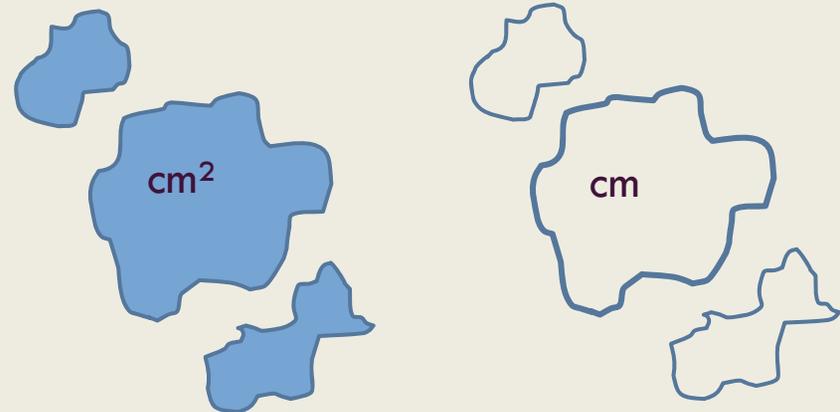

INTRODUCTION CONT.

- Evaluating and comparing these aquifer systems using the often more difficult to obtain data

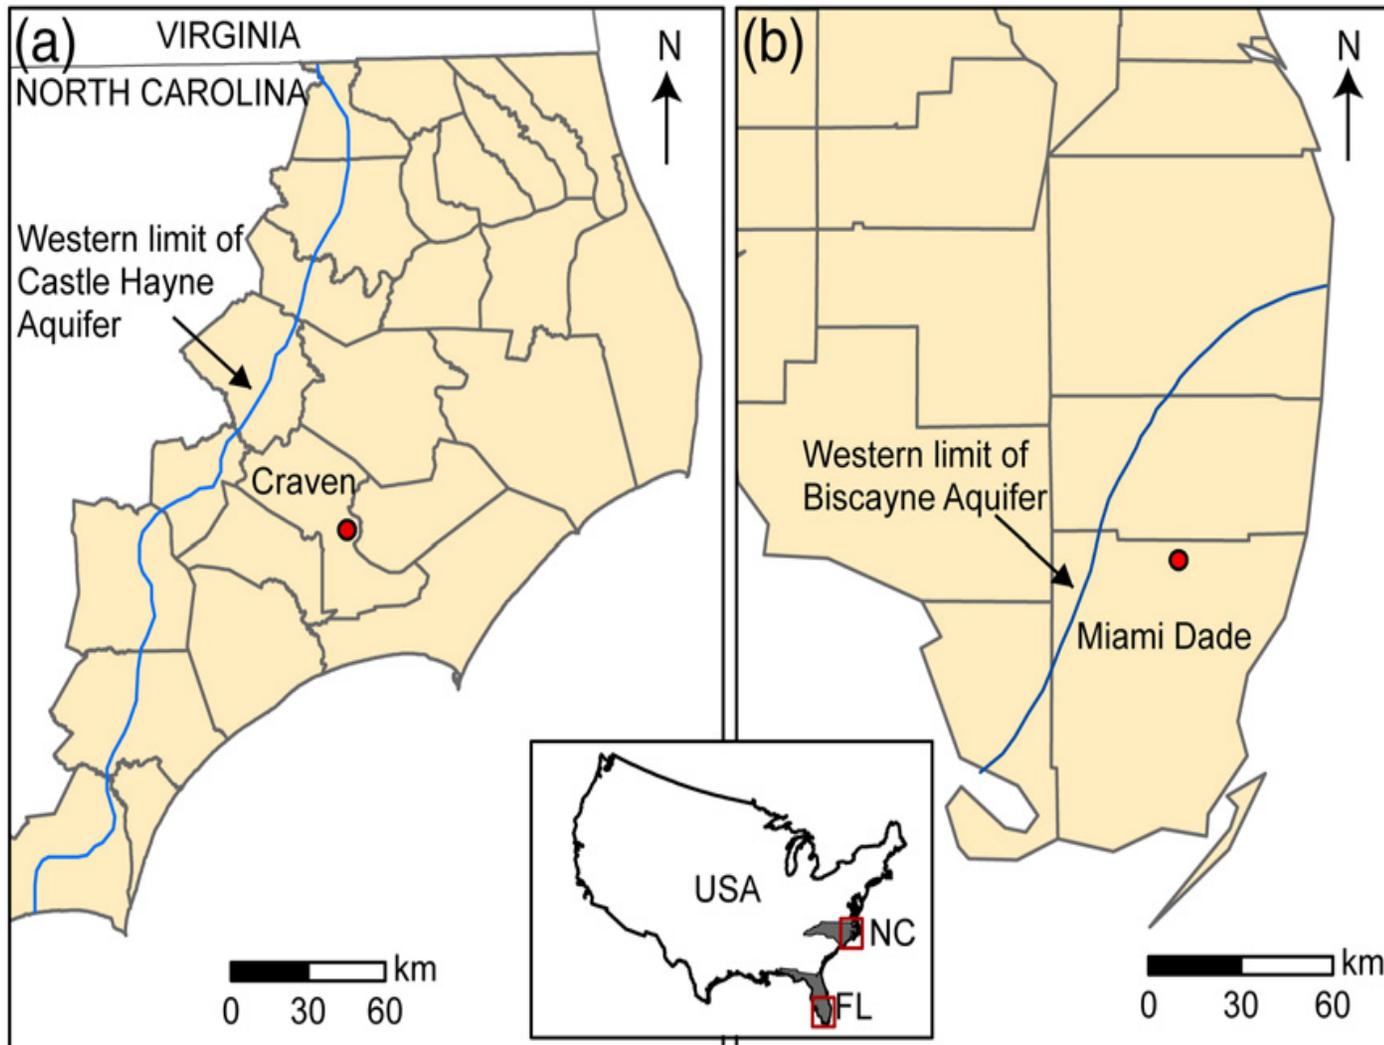

- **Pore Attributes:**

- Pore area
- Pore perimeter
- Pore complexity
- Spatial distribution of porosity

- Critical in advancing the quantitative understanding of these highly productive systems

- **Spring Garden Member of the Castle Hayne Limestone formation**
- **Lower part of the Miami Limestone and the upper part of the Fort Thompson Formations**

STUDY SITES

Castle Hayne

Biscayne

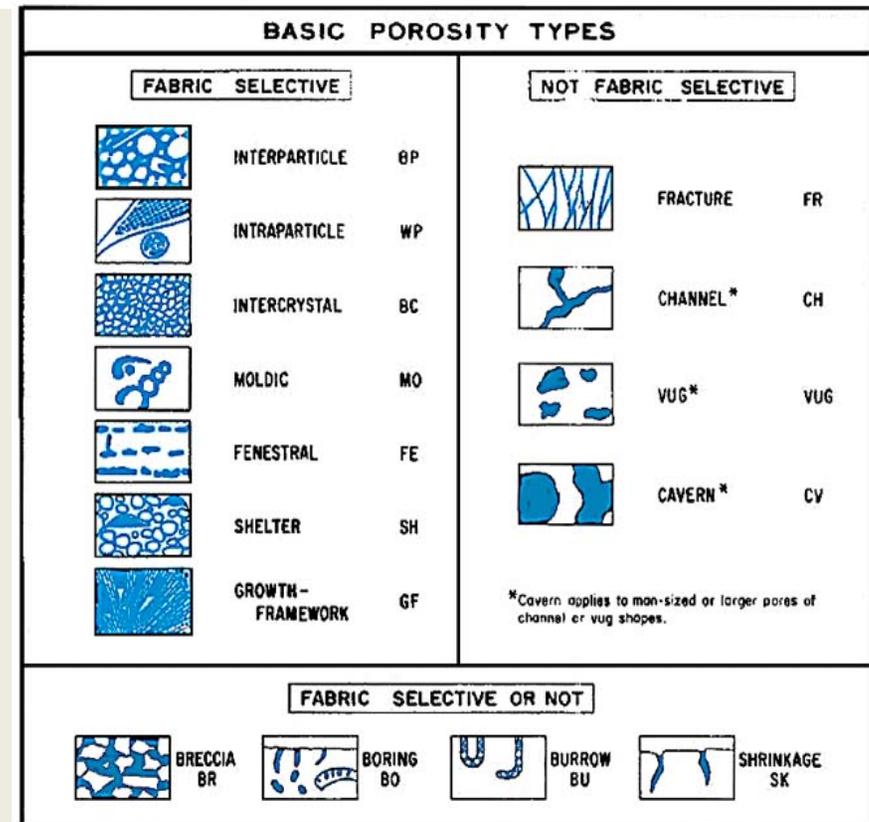

STUDY SITES PORE TYPES

Castle Hayne

- Primarily controlled by selective leaching of aragonite shells

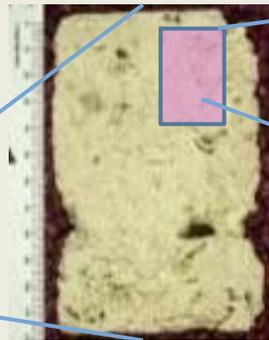

Biscayne

- Highly permeable rock mass is riddled with secondary solution cavities

SCALE OF OBSERVATION

Optical televiewer

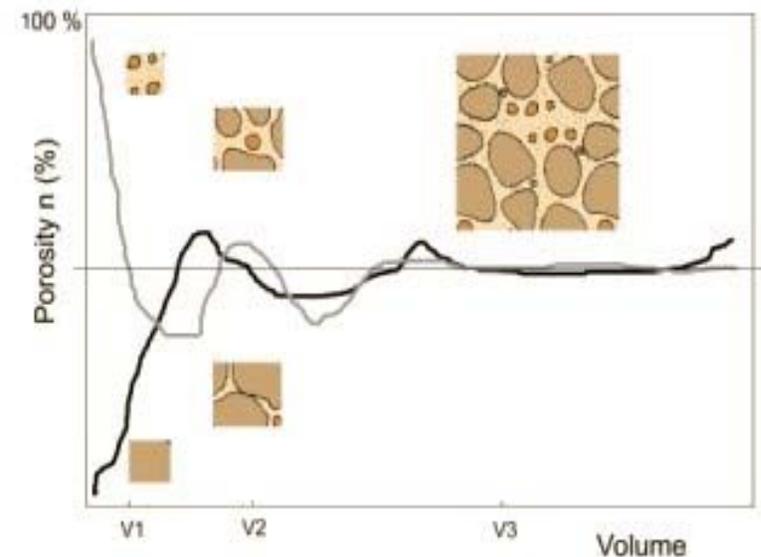

Core

Thin-Section

Scale of observation is critical in the study of karst formations

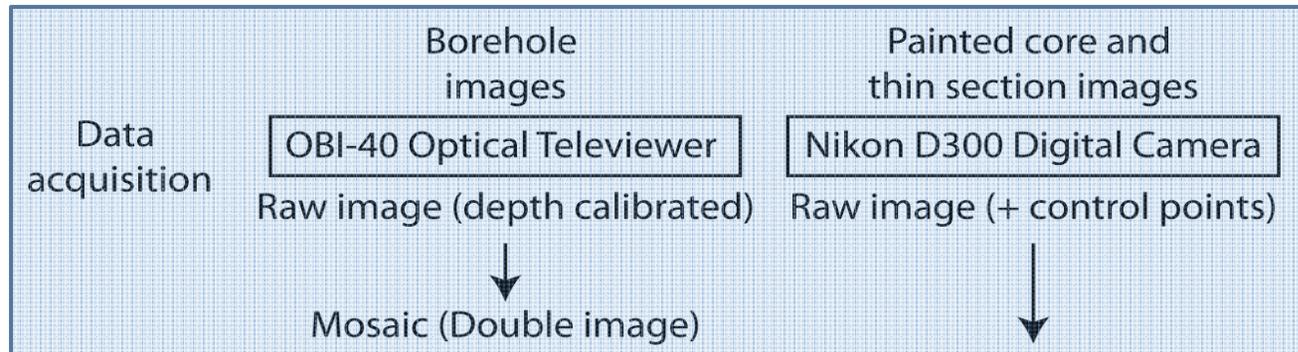

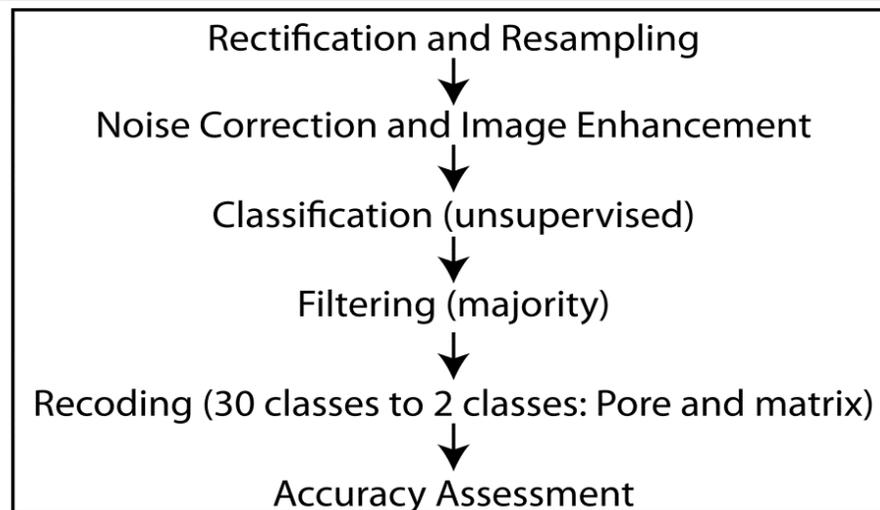

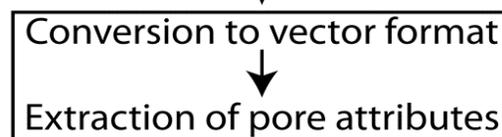

Image Processing

Raster binary image

Spatial Analysis

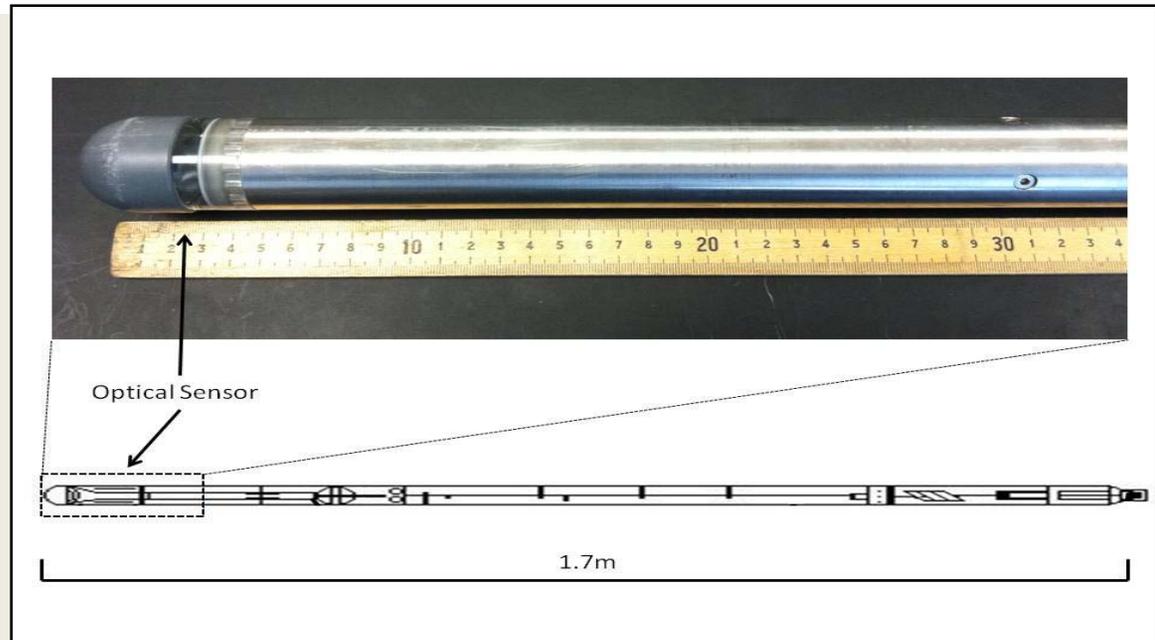

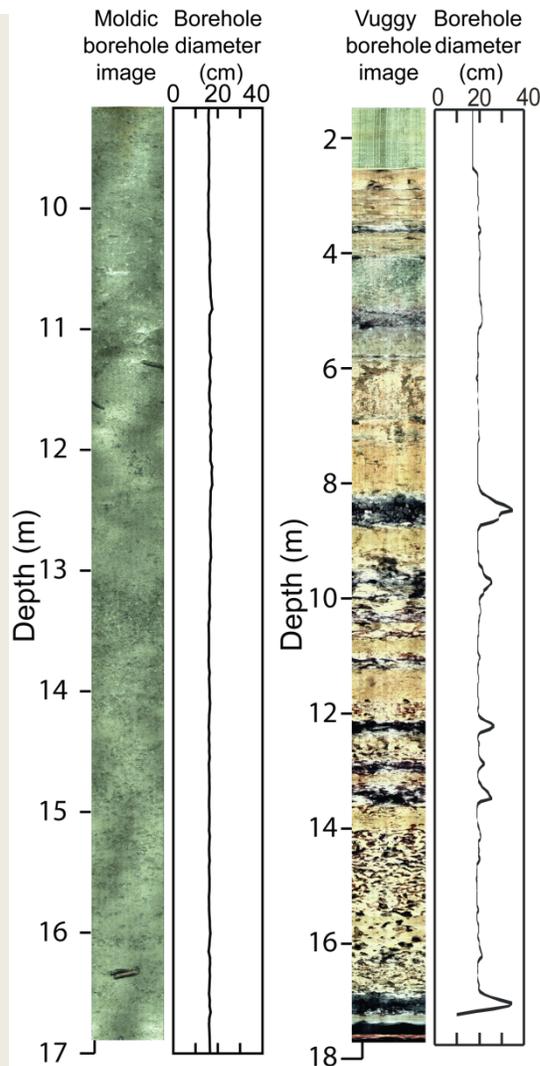

Pore area Pore perimeter Porosity

OVERVIEW OF PROCEDURES

DOWNHOLE TOOLS

- **OBI-40 slimhole optical televiewer manufactured by Advanced Logic Technology (ALT)**
- **Continuous and orientated 360° images**

DATA ACQUISITION

ECU Logging Trailer

Portable PC
-MS Log windows
interface program

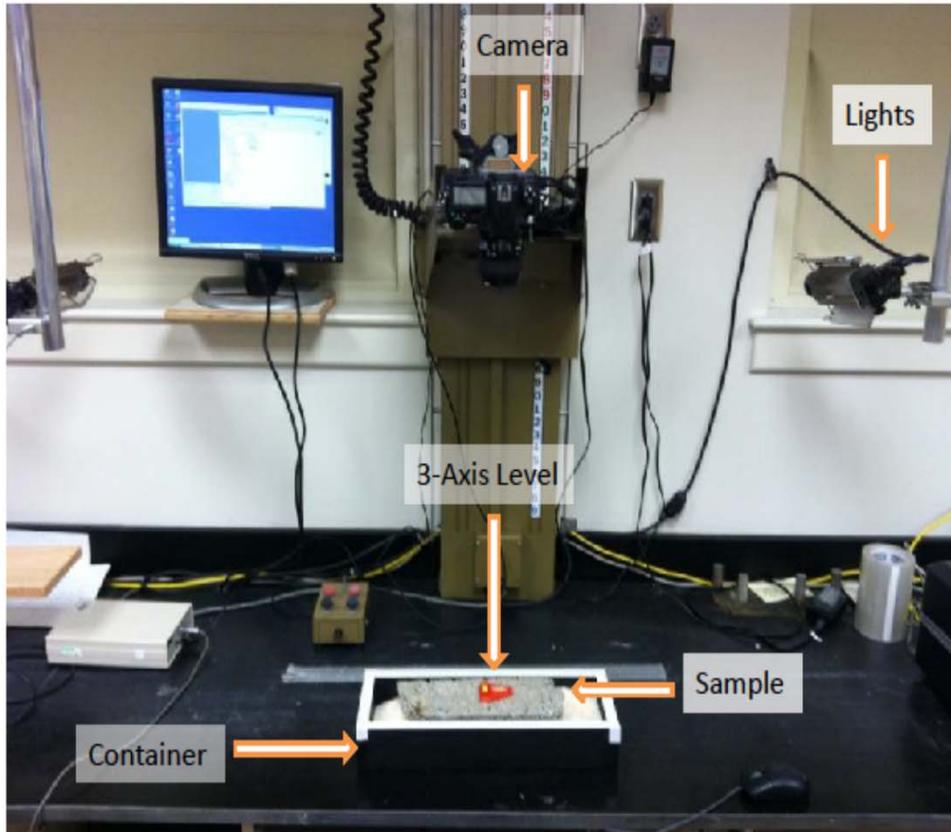

Mount Sopris Instruments

MSI/ ALT MATRIX
Acquisition Console

4MX A-100 Winch
500m single-conductor
Wireline (0.125')

DATA
ACQUISITION
CONT.

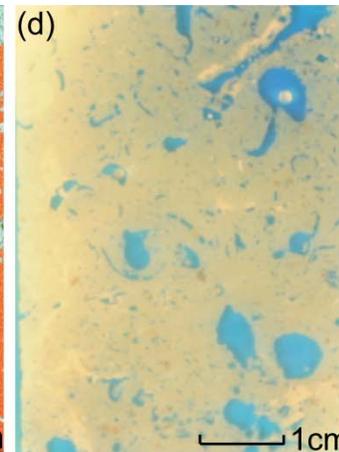

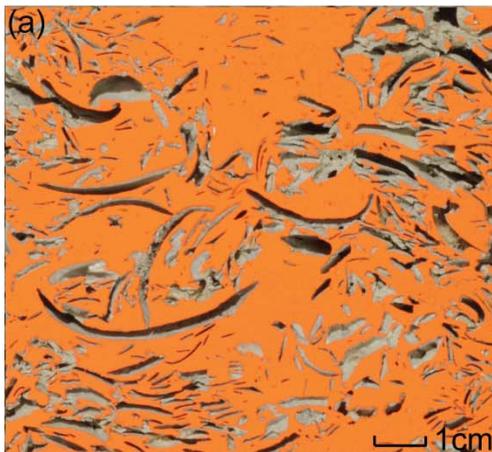

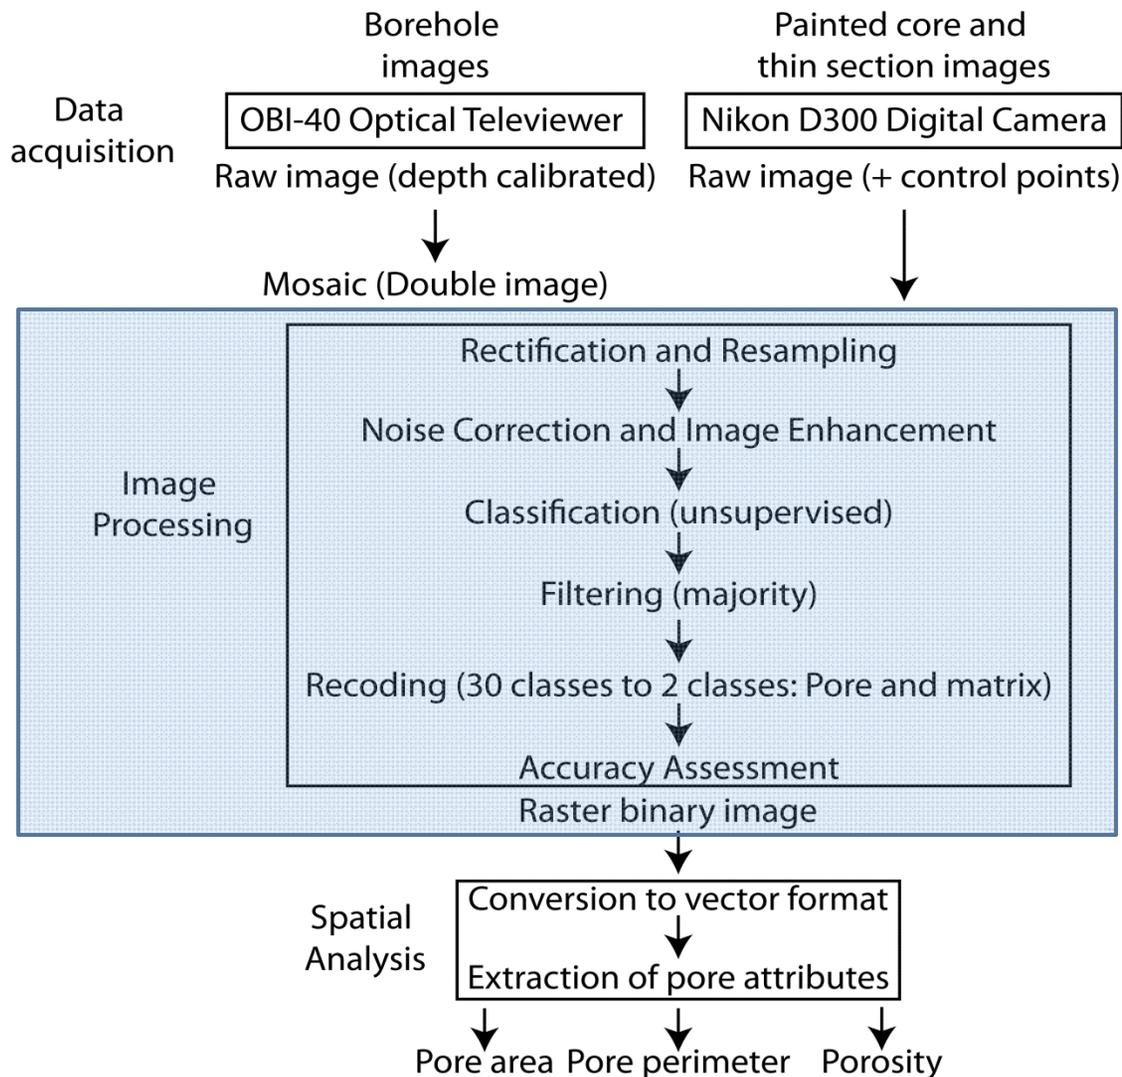

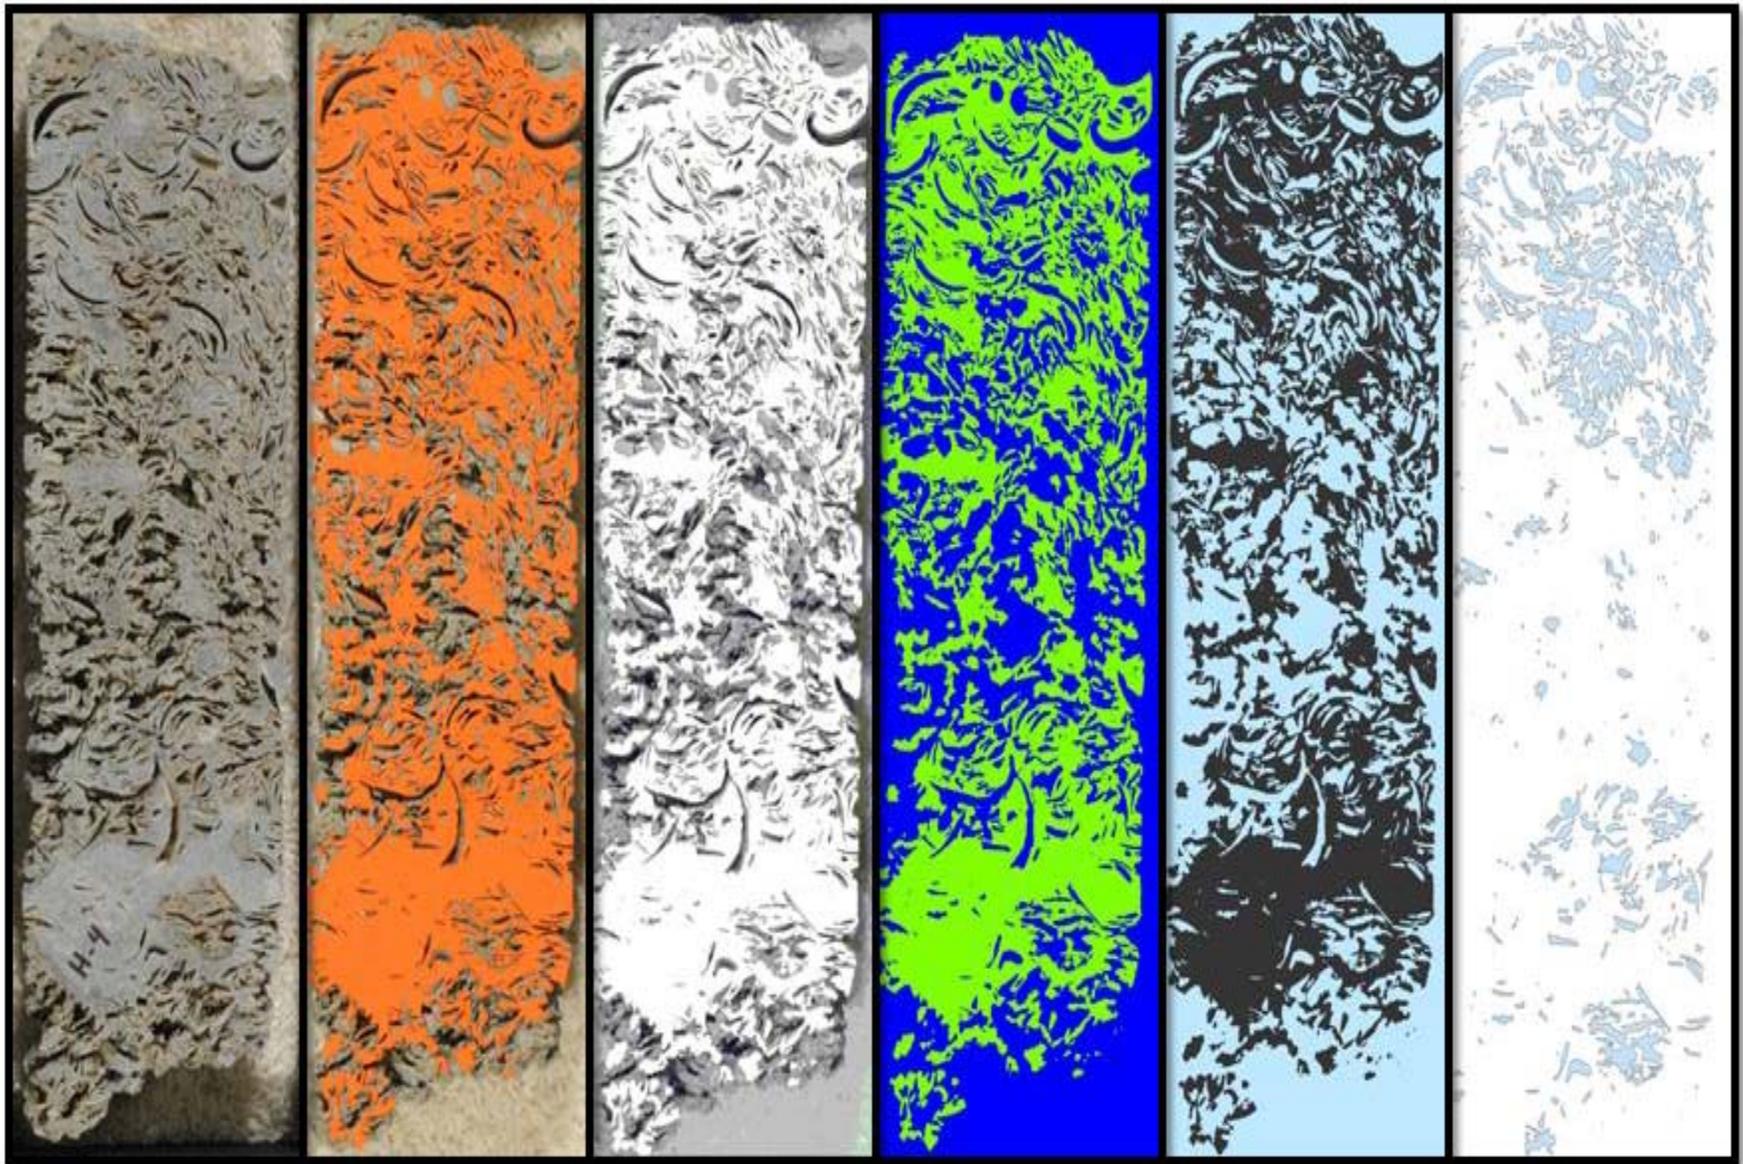

IMAGE PROCESSING AND SPATIAL ANALYSIS

- **Converting images to a GIS ready format**

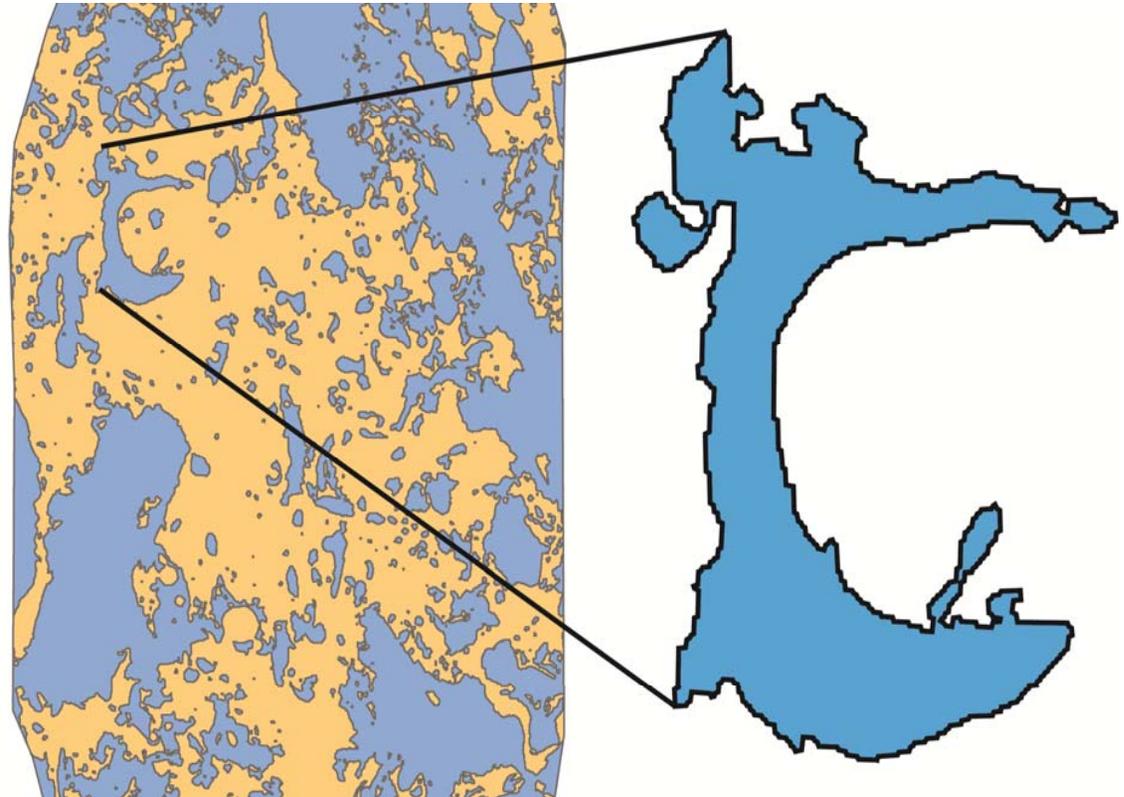

- **Essential to obtain accurate information for image analysis**

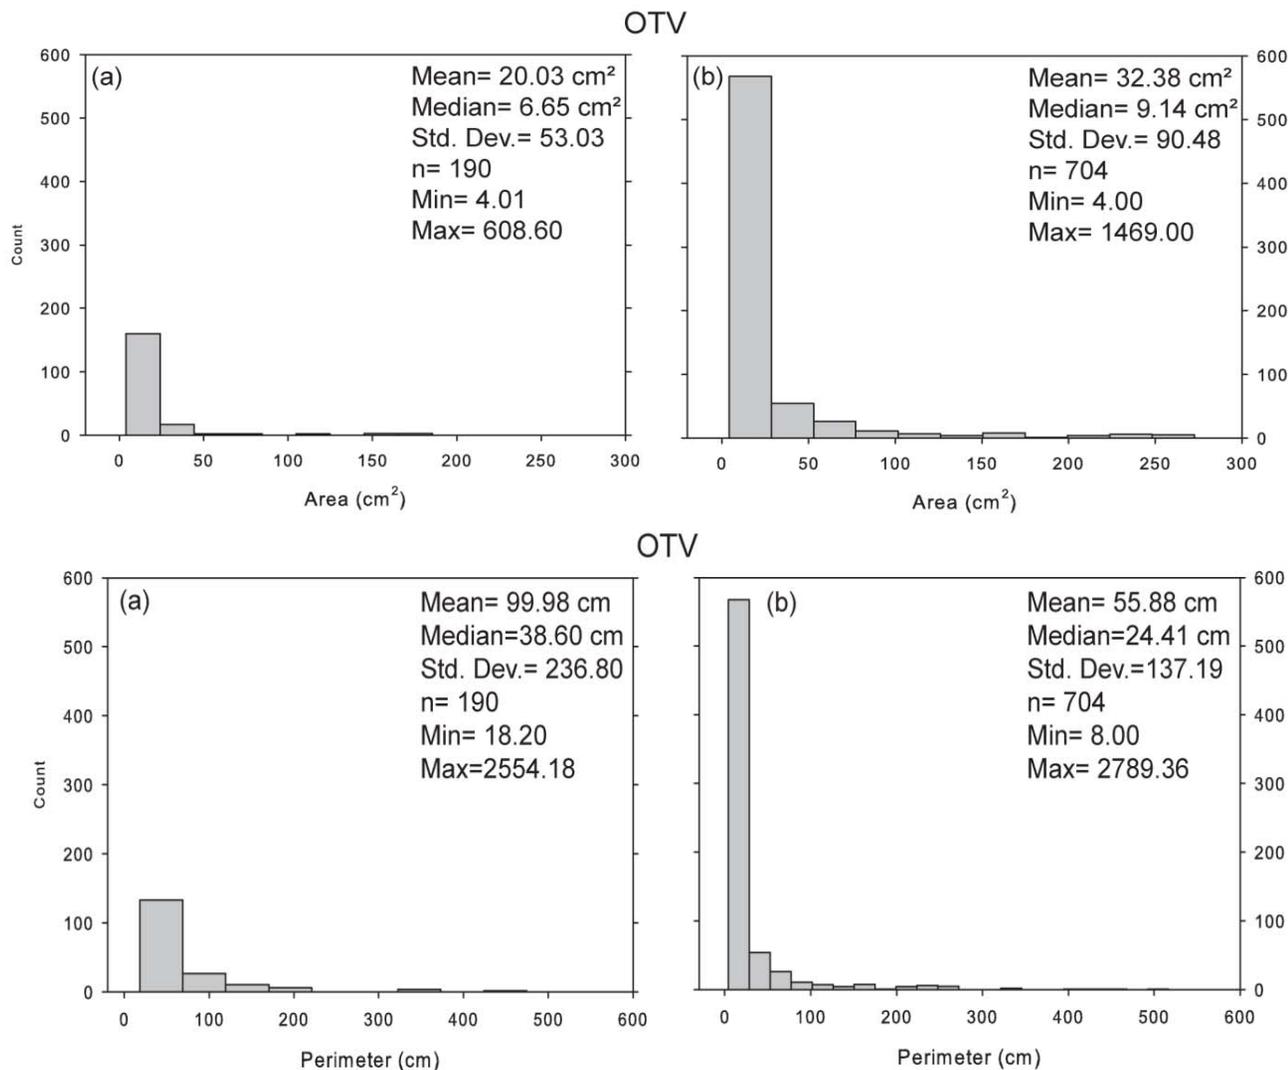

VECTOR ANALYSIS

- In the GIS the binary raster image was converted to vector format.
- Individual features represented as polygons with unique attributes
- The ability to integrate GIS for data extraction

DISTRIBUTIONS OF PORE AREA AND PERIMETER

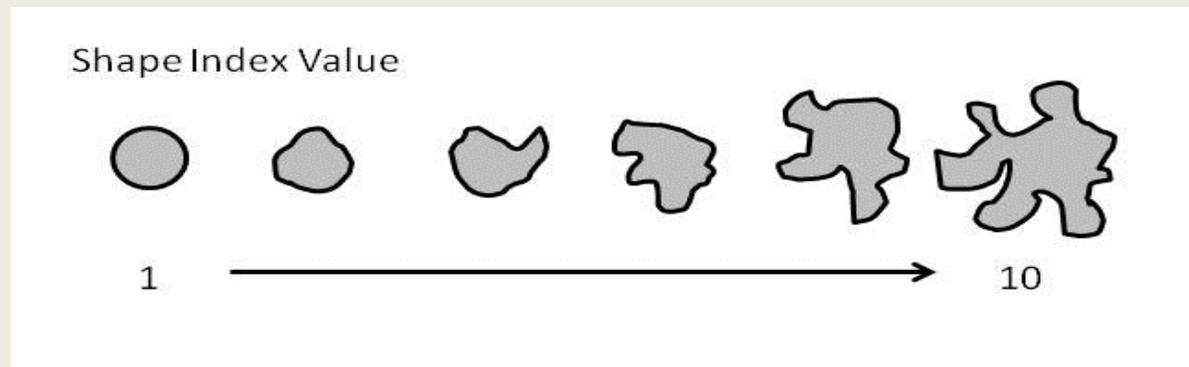

- **All three-scales observed exponential distribution**
- **Areas have fairly similar results**
- **Perimeters are nearly twice as high in the Castle Hayne**

SHAPE INDEX

- Used to compute, a shape measure that describes the complex nature of pore shapes
- Range from one to infinity

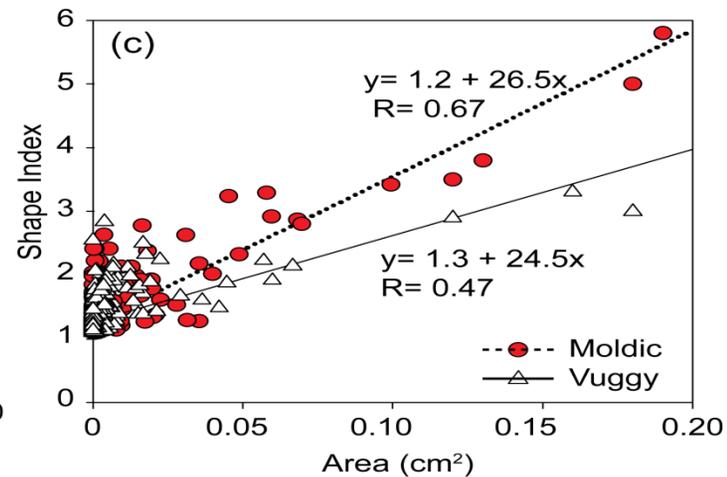

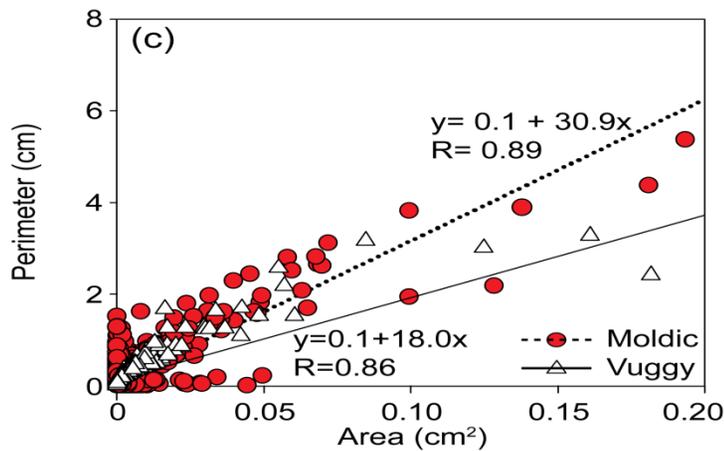

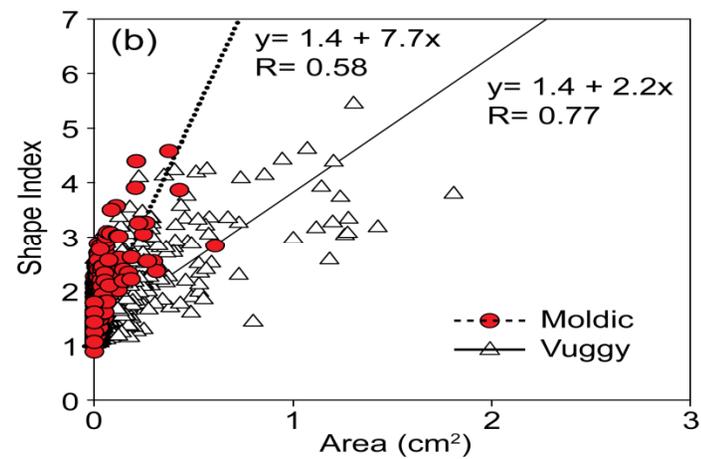

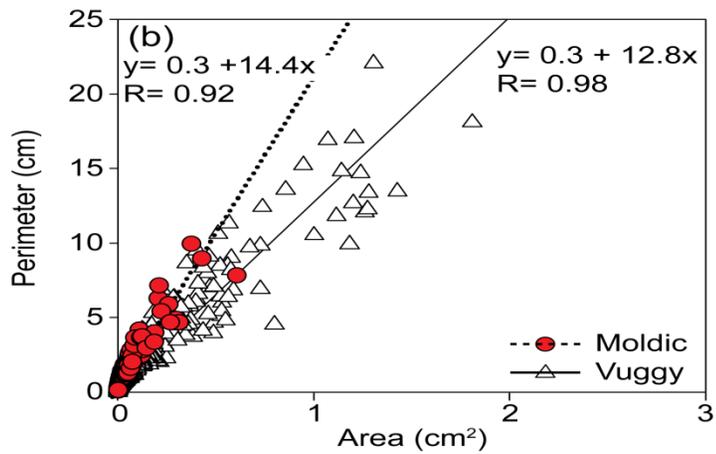

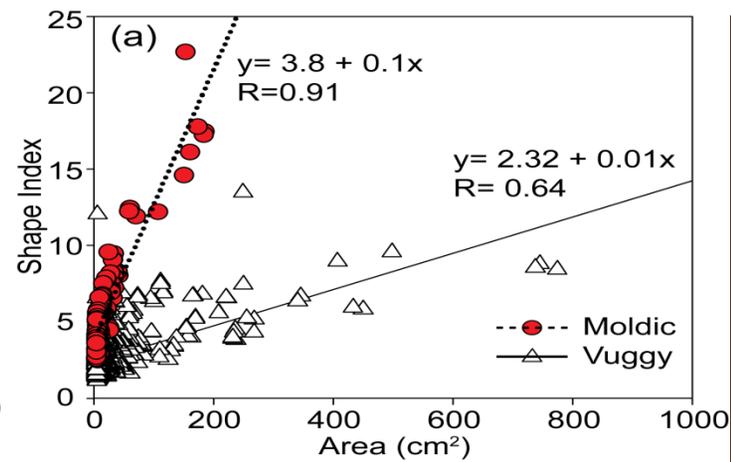

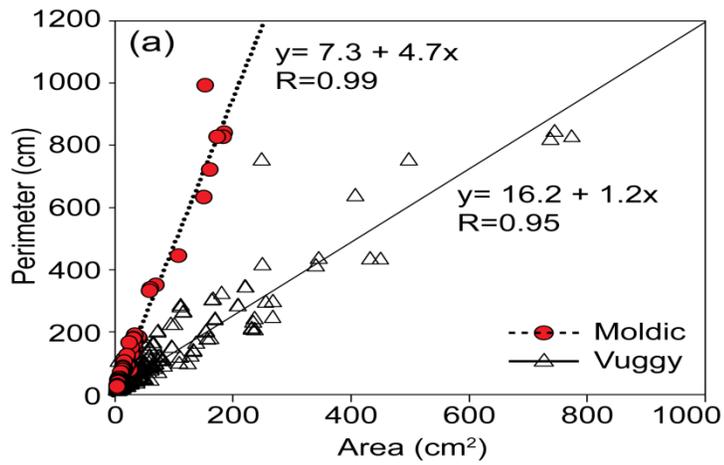

$$\gamma = \frac{P}{2\sqrt{\pi A}}$$

γ = Shape Index
 P = Perimeter
 A = Area

- Shape index is associated with the connectivity of the pores

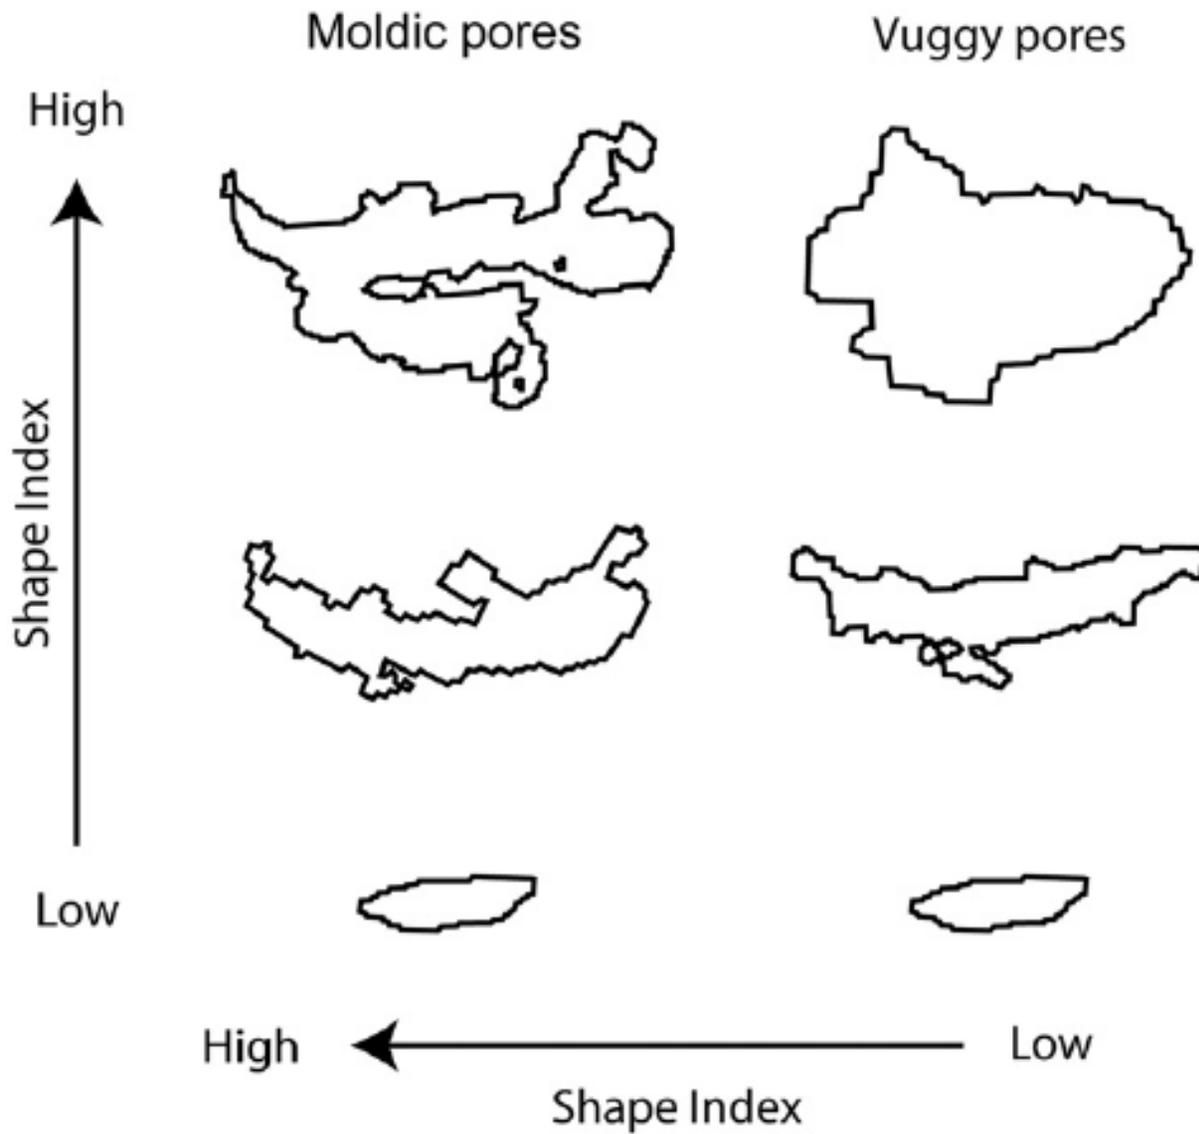

CROSS PLOTS

Area vs. Shape
Index

2D POROSITY ANALYSIS

- The percentage of surface area occupied by macropores within a window
- Determine area of macropores within the polygon
- Dividing by the area of the polygon gave a percent area covered by macropores (i.e. the porosity)

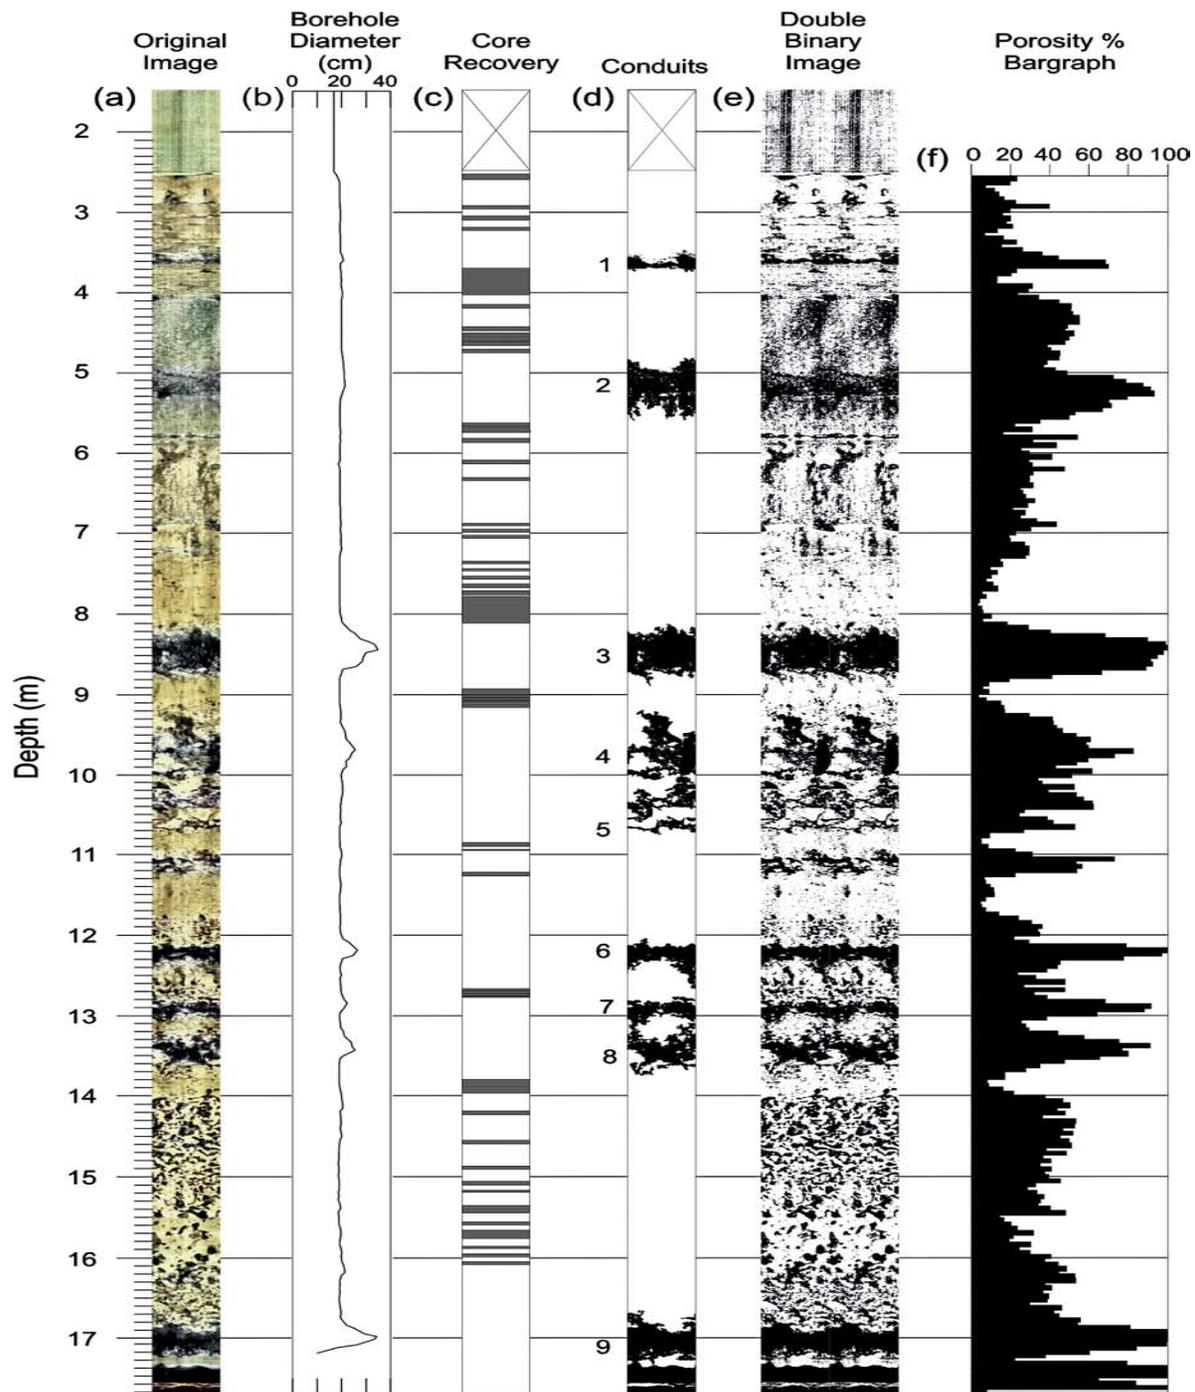

GEOSPATIAL POROSITY ANALYSIS

- Conduits
- Porosity
- OTV Scale
- Heterogeneous

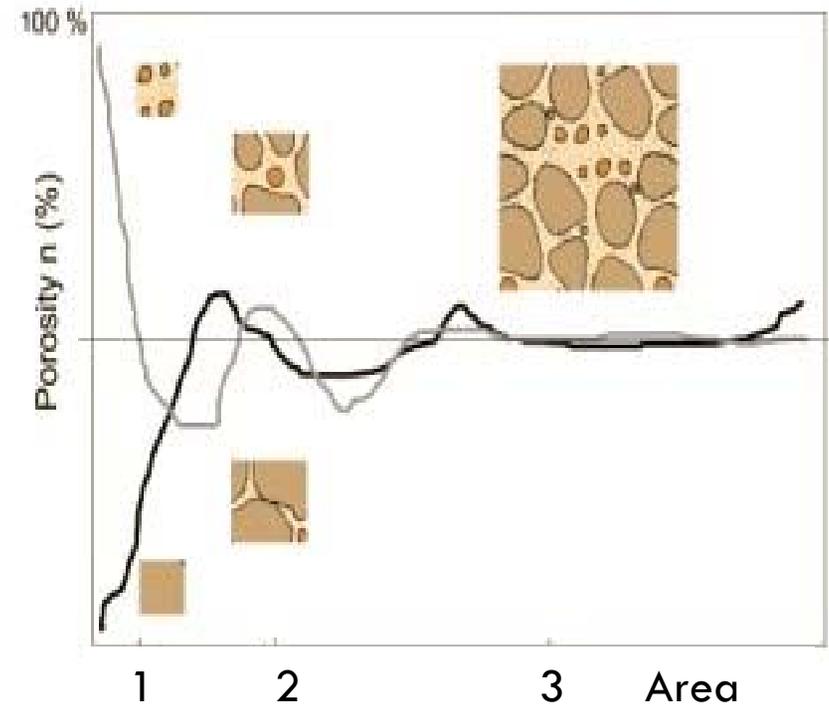

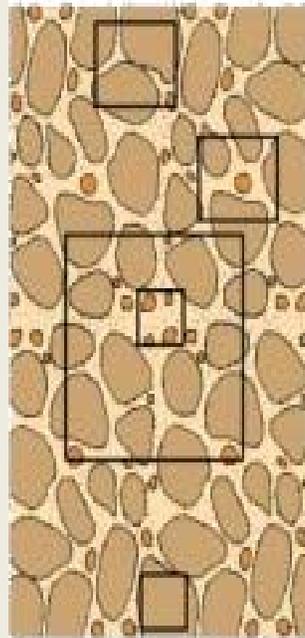

GRAPHIC
DISPLAY

MULTI-SCALE GEOSPATIAL ANALYSIS

- **Heterogeneous character of karst aquifers**

- hydraulic properties, including porosity, vary greatly as a function of scale

- **Implementing a multi-scale, geospatial, analysis provides benefits which compliment other techniques applied to karst formations**

CONCLUSIONS

■ **Qualitative to Quantitative Assessment**

- quantitative measures of pore attributes and structure may be used to compare karst media with different porosity characteristics

■ **New Technology**

- Using digital imaging and GIS spatial-analysis techniques

■ **Better understanding of porosity structure**

■ **Overcome the unique challenges confronting the evaluation of groundwater flow in karst aquifers.**
