

**NORTH CAROLINA
DEPARTMENT OF TRANSPORTATION
RALEIGH**

**STANDARD SPECIFICATIONS
FOR
ROADS AND STRUCTURES**

JANUARY 2018

FOREWORD

This publication has been prepared to provide a compilation of standard requirements used by the North Carolina Department of Transportation for construction contracts.

When this publication, entitled *Standard Specifications for Roads and Structures*, dated January 2018, is incorporated by reference into the Department's construction bid proposals or contracts; it is made a part of that document and shall be known as the *Standard Specifications*. The requirements stated herein may be revised or amended from time to time by Supplemental Specifications, by Standard Special Provisions which are unique to a select group of projects or by Project Special Provisions which are unique to the specific bid proposal or contract.

Working titles have a masculine gender, such as workman, workmen and foreman. Pronouns such as he, his, and him are used in the *Standard Specifications* for the sake of brevity and are intended to refer to persons of either sex or corporate entities.

Reference by title and date will be made to the governing provisions on plans and contract documents.

GENERAL INFORMATION

For general questions about this publication, please contact the Contract Standards and Development Unit at specs@ncdot.gov or (919) 707-6900.

ORDERING INFORMATION

Copies of the *Standard Specifications* and the *Roadway Standard Drawings* may be purchased through the Contract Standards and Development Unit:

North Carolina Department of Transportation
Contract Standards and Development Unit – Manual Distribution
1591 Mail Service Center
Raleigh, NC 27699-1591
Telephone: (919) 707-6944
Website: <http://www.ncdot.gov/>

The order form is available at <http://www.ncdot.gov/business/order/puborder.html>.

Electronic copies of the *Standard Specifications* and the *Roadway Standard Drawings* are available for download on the Contract Standards and Development Unit's website at <https://connect.ncdot.gov/resources/Specifications/Pages/default.aspx>.

TABLE OF CONTENTS

Foreword.....	ii
Table of Contents.....	iii

DIVISION 1 – GENERAL REQUIREMENTS

101	Definitions of Terms	1-1
102	Bidding Requirements and Conditions.....	1-9
103	Award and Execution of Contract	1-21
104	Scope of Work.....	1-30
105	Control of Work	1-44
106	Control of Material	1-52
107	Legal Relations and Responsibility to Public.....	1-57
108	Prosecution and Progress.....	1-68
109	Measurement and Payment	1-79
150	Maintenance of Traffic	1-89

DIVISION 2 – EARTHWORK

200	Clearing and Grubbing	2-1
205	Sealing Abandoned Wells	2-4
210	Demolition of Buildings and Appurtenances	2-5
215	Removal of Existing Buildings	2-6
220	Blasting	2-8
225	Roadway Excavation.....	2-12
226	Comprehensive Grading.....	2-17
230	Borrow Excavation.....	2-18
235	Embankments.....	2-23
240	Ditch Excavation	2-26
250	Removal of Existing Pavement	2-27
260	Proof Rolling	2-29
265	Select Granular Material	2-30
270	Geotextile for Soil Stabilization	2-31
275	Rock Plating	2-32

DIVISION 3 – PIPE CULVERTS

300	Pipe Installation.....	3-1
305	Drainage Pipe.....	3-5
310	Pipe Culverts	3-6
330	Welded Steel Pipe	3-7
340	Pipe Removal	3-8
350	Pipe Clean Out	3-10

DIVISION 4 – MAJOR STRUCTURES

400	Temporary Structures	4-1
402	Removal of Existing Structures.....	4-2
410	Foundation Excavation.....	4-3
411	Drilled Piers	4-8
412	Unclassified Structure Excavation	4-20
414	Box Culvert Excavation	4-21
416	Channel Excavation.....	4-23
420	Concrete Structures	4-24
422	Bridge Approach Slabs.....	4-46

425	Fabricating and Placing Reinforcement.....	4-47
430	Erecting Prestressed Concrete Members	4-50
440	Steel Structures.....	4-52
442	Painting Steel Structures.....	4-58
450	Piles	4-65
452	Sheet Pile Retaining Walls	4-73
453	CIP Gravity Retaining Walls.....	4-74
454	Segmental Gravity Retaining Walls	4-76
455	Precast Gravity Retaining Walls.....	4-79
458	Waterproofing and Dampproofing	4-82
460	Concrete and Metal Rails	4-84
462	Slope Protection	4-87

DIVISION 5 – SUBGRADE, BASES AND SHOULDERS

500	Fine Grading Subgrade, Shoulders and Ditches	5-1
501	Lime-Treated Soil.....	5-3
505	Aggregate Subgrade	5-8
510	Aggregate Stabilization	5-9
520	Aggregate Base Course	5-10
535	Conditioning Existing Base.....	5-13
540	Cement-Treated Base Course	5-14
542	Soil-Cement Base	5-19
543	Asphalt Curing Seal.....	5-23
545	Incidental Stone Base	5-25
560	Shoulder Construction.....	5-26

DIVISION 6 – ASPHALT PAVEMENTS

600	Prime Coat.....	6-1
605	Asphalt Tack Coat	6-2
607	Milling Asphalt Pavement.....	6-4
609	Quality Management System for Asphalt Pavements	6-7
610	Asphalt Concrete Plant Mix Pavements	6-15
620	Asphalt Binder for Plant Mix	6-32
650	Open-Graded Asphalt Friction Course	6-34
652	Permeable Asphalt Drainage Course, Types P-78M and P-57	6-38
654	Asphalt Plant Mix, Pavement Repair.....	6-40
657	Sealing Existing Pavement Cracks and Joints	6-41
660	Asphalt Surface Treatment	6-42
661	Ultra-Thin Bonded Wearing Course.....	6-48
665	Milled Rumble Strips on Asphalt Concrete Shoulders	6-53

DIVISION 7 – CONCRETE PAVEMENTS AND SHOULDERS

700	General Requirements for Portland Cement Concrete Pavement.....	7-1
710	Concrete Pavement	7-11
720	Concrete Shoulders.....	7-19
723	Concrete Repair	7-21
724	Nonwoven Geotextile Interlayer	7-25
725	Field Laboratory for Portland Cement Concrete Pavement.....	7-27
730	Milled Rumble Strips on Concrete Shoulders	7-28

DIVISION 8 – INCIDENTALS

800	Mobilization	8-1
801	Construction Stakes, Lines and Grades	8-2
802	Disposal of Waste and Debris	8-7
806	Right-of-Way and Control-of-Access Markers	8-10
808	Obliteration of Existing Road.....	8-11
815	Subsurface Drainage	8-11
816	Shoulder Drains.....	8-13
818	Blotting Sand.....	8-15
820	Funnels and Funnel Drains.....	8-16
825	Incidental Concrete Construction	8-17
828	Temporary Steel Cover for Masonry Drainage Structures	8-20
830	Brick Masonry Construction	8-20
832	Reinforced Brick Masonry Construction.....	8-21
834	Block Masonry Construction.....	8-22
836	Sluice Gate	8-23
838	Endwalls.....	8-23
840	Minor Drainage Structures	8-25
846	Concrete Curb, Curb and Gutter, Concrete Gutter, Shoulder Berm Gutter, Concrete Expressway Gutter and Concrete Valley Gutter	8-28
848	Concrete Sidewalks, Driveways and Curb Ramps	8-30
850	Concrete Paved Ditch.....	8-32
852	Traffic Islands and Medians	8-33
854	Concrete Barrier	8-34
857	Precast Reinforced Concrete Barrier - Single Faced	8-36
858	Adjustment of Catch Basins, Manholes, Drop Inlets, Meter Boxes and Valve Boxes	8-37
859	Converting Existing Catch Basins, Drop Inlets and Junction Boxes.....	8-38
862	Guardrail	8-40
863	Remove Existing Guardrail and Guiderail	8-43
864	Remove and Reset Existing Guardrail and Guiderail	8-44
865	Cable Guiderail	8-44
866	Fence	8-46
867	Fence Reset	8-49
869	Relapping Guardrail	8-50
873	Preformed Scour Hole with Level Spreader Apron.....	8-50
876	Rip Rap.....	8-51

DIVISION 9 – SIGNING

900	General Requirements for Signing	9-1
901	Sign Fabrication	9-2
902	Foundations for Ground Mounted Signs	9-10
903	Ground Mounted Sign Supports.....	9-11
904	Sign Erection	9-14
906	Overhead Sign Supports.....	9-17
907	Disposal and Stockpiling of Signing Components	9-22

DIVISION 10 – MATERIALS

1000	Portland Cement Concrete Production and Delivery.....	10-1
1002	Shotcrete Production and Delivery.....	10-19
1003	Grout Production and Delivery	10-21
1005	General Requirements for Aggregate	10-24
1006	Aggregate Quality Control / Quality Assurance.....	10-28
1008	Aggregate for Stabilization	10-28

1010	Aggregate for Non-Asphalt Type Bases.....	10-28
1012	Aggregate for Asphalt Pavements and Surface Treatments	10-29
1014	Aggregate for Portland Cement Concrete.....	10-37
1016	Select Materials	10-40
1018	Borrow Material	10-41
1019	Shoulder and Slope Material	10-43
1020	Asphalt Materials and Additives	10-43
1024	Materials for Portland Cement Concrete	10-49
1026	Curing Agents for Concrete.....	10-53
1028	Joint Materials	10-53
1032	Culvert Pipe.....	10-55
1034	Sanitary Sewer Pipe and Fittings.....	10-61
1036	Water Pipe and Fittings	10-62
1040	Masonry.....	10-64
1042	Rip Rap Materials.....	10-65
1043	Aggregate from Crushed Concrete	10-66
1044	Subsurface Drainage Materials.....	10-67
1046	Guardrail Materials.....	10-67
1050	Fence Materials	10-70
1052	Salt and Lime Stabilizers.....	10-75
1054	Drains	10-76
1056	Geosynthetics	10-77
1060	Landscape Development Materials.....	10-80
1070	Reinforcing Steel.....	10-85
1072	Structural Steel	10-90
1074	Miscellaneous Metals and Hardware.....	10-117
1076	Galvanizing	10-120
1077	Precast Concrete Units	10-121
1078	Prestressed Concrete Members.....	10-129
1079	Bearings and Bearing Materials	10-153
1080	Paint and Paint Materials.....	10-155
1081	Epoxy and Adhesives	10-163
1082	Structural Timber and Lumber	10-172
1084	Piles	10-175
1086	Pavement Markers.....	10-176
1087	Pavement Markings	10-180
1088	Delineators.....	10-185
1089	Traffic Control.....	10-189
1090	Portable Concrete Barrier	10-200
1091	Electrical Materials.....	10-201
1092	Signing Materials	10-205
1094	Ground Mounted Signs.....	10-208
1096	Overhead Sign Structures	10-209
1098	Signals and Intelligent Transportation System Materials	10-210

DIVISION 11 – WORK ZONE TRAFFIC CONTROL

1101	Work Zone Traffic Control General Requirements	11-1
1105	Temporary Traffic Control Devices	11-4
1110	Work Zone Signs.....	11-5
1115	Flashing Arrow Boards.....	11-7
1120	Portable Changeable Message Signs	11-8
1130	Drums	11-9
1135	Cones	11-10
1145	Barricades.....	11-11
1150	Flaggers	11-11

1160	Temporary Crash Cushions	11-12
1165	Truck Mounted Attenuators	11-13
1170	Positive Protection.....	11-14
1180	Skinny Drums.....	11-18
1190	Law Enforcement	11-19

DIVISION 12 – PAVEMENT MARKINGS, MARKERS AND DELINEATION

1205	Pavement Marking General Requirements	12-1
1250	Pavement Markers General Requirements	12-13
1251	Raised Pavement Markers	12-15
1253	Snowplowable Pavement Markers	12-16
1264	Object Markers.....	12-17
1266	Tubular Markers (Fixed)	12-18
1267	Flexible Delineators	12-19

DIVISION 14 – LIGHTING

1400	Roadway Lighting	14-1
1401	High Mount Standard	14-9
1404	Light Standards	14-13
1407	Electric Service Pole and Lateral	14-15
1408	Light Control Equipment.....	14-16
1409	Electrical Duct.....	14-18
1410	Feeder Circuits	14-19
1411	Electrical Junction Boxes	14-21
1412	Underpass Lighting	14-22
1413	Portable Construction Lighting	14-23

DIVISION 15 – UTILITY CONSTRUCTION

1500	General Utility Requirements.....	15-1
1505	Excavation, Trenching, Pipe Laying and Backfilling for Utilities	15-3
1510	Water Lines	15-5
1515	Utility Controls.....	15-7
1520	Sanitary Sewer.....	15-10
1525	Utility Manholes.....	15-14
1530	Abandon or Remove Utilities	15-16
1540	Encasement	15-17
1550	Trenchless Installation of Utilities.....	15-19

DIVISION 16 – EROSION CONTROL AND ROADSIDE DEVELOPMENT

1605	Temporary Silt Fence	16-1
1606	Special Sediment Control Fence	16-2
1607	Gravel Construction Entrance	16-3
1610	Stone for Erosion Control.....	16-3
1615	Temporary Mulching.....	16-4
1620	Temporary Seeding	16-5
1622	Temporary Slope Drains	16-7
1630	Construction and Maintenance of Silt Detention Devices	16-8
1631	Rolled Erosion Control Products.....	16-9
1632	Rock Inlet Sediment Trap.....	16-10
1633	Temporary Rock Silt Checks	16-11
1634	Temporary Rock Sediment Dams	16-12
1635	Rock Pipe Inlet Sediment Trap	16-13
1636	Temporary Stream Crossing.....	16-14

1637	Riser Basin	16-15
1638	Stilling Basin	16-16
1639	Special Stilling Basin	16-17
1640	Coir Fiber Baffle	16-19
1650	Wooded Area Cleanup	16-20
1651	Selective Vegetation Removal.....	16-21
1660	Seeding and Mulching.....	16-22
1661	Repair Seeding	16-26
1662	Supplemental Seeding	16-28
1664	Sodding.....	16-28
1665	Fertilizer Topdressing.....	16-31
1667	Specialized Hand Mowing	16-32
1670	Planting.....	16-32

DIVISION 17 – SIGNALS AND INTELLIGENT TRANSPORTATION SYSTEMS

1700	General Requirements	17-1
1705	Signal Heads.....	17-5
1706	Backplates	17-8
1710	Messenger Cable	17-9
1715	Underground Cable Installation.....	17-10
1716	Junction Boxes	17-16
1720	Wood Poles.....	17-17
1721	Guy Assemblies.....	17-18
1722	Riser Assemblies	17-19
1725	Inductive Detection Loops	17-21
1726	Lead-In Cable	17-22
1730	Fiber-Optic Cable	17-23
1731	Fiber-Optic Splice Centers	17-25
1732	Fiber-Optic Transceivers	17-28
1733	Delineator Markers	17-28
1734	Remove Existing Communications Cable	17-29
1735	Cable Transfers.....	17-30
1736	Spread Spectrum Radio	17-30
1743	Pedestals	17-33
1745	Signs Installed for Signals	17-35
1746	Relocate Existing Sign	17-36
1747	LED Blankout Sign	17-36
1750	Signal Cabinet Foundations.....	17-37
1751	Controllers with Cabinets	17-38
1752	Modify Cabinet Foundations	17-39
1753	Cabinet Base Adapter/Extender.....	17-41
1755	Beacon Controller Assemblies	17-41
1757	Removal of Existing Traffic Signals	17-42
Index	Index-1

DIVISION 1 GENERAL REQUIREMENTS

SECTION 101 DEFINITIONS OF TERMS

101-1 GENERAL

Whenever the terms defined in this section are used in the contract, in any of the contract documents, or in the plans, the intended meaning of such terms shall be as defined in this section.

101-2 ABBREVIATIONS

8	AASHTO _____	American Association of State Highway and Transportation Officials
9	ABC _____	Aggregate Base Course
10	ACI _____	American Concrete Institute
11	AFAD _____	Automated Flagger Assistance Device
12	AISC _____	American Institute of Steel Construction
13	ANSI _____	American National Standards Institute, Inc.
14	APL _____	Approved Products List
15	ASC _____	Approved Supplier Certification
16	ASB _____	Aggregate Shoulder Borrow

**TABLE 101-1
MEASUREMENT SYMBOLS**

Symbol	Unit Name	Symbol	Unit Name
"	Inch, Inches	lb	Pound, Pounds
%	Percent	lbf	Pound(s) Force
±	Plus or Minus	nm	Nanometer(s)
°	Degree, Degrees	mcd/lux/m ²	Millicandellas per Lux per Square Meter
>	Greater Than	mg-cm	Milligram-Centimeter
≥	Greater Than or Equal to	mm	Millimeter, Millimeters
<	Less Than	mph	Mile(s) per Hour
≤	Less Than or Equal to	oz	Ounce, Ounces
μ	Micro	pcf	Pounds per Cubic Foot
A, amp	Ampere, Amperes	ppm	Parts per Million
cf	Cubic Foot, Cubic Feet	psf	Pounds per Square Foot
cu.in.	Cubic Inch, Cubic Inches	psi	Pounds per Square Inch
cy	Cubic Yard, Cubic Yards	qt	Quart, Quarts
dB	Decibel, Decibels	rpm	Rotations per Minute
F	Fahrenheit	sec	Second, Seconds
ft	Foot, Feet	sf	Square Foot, Square Feet
ft-lb	Foot-Pounds	SFS	Saybolt Furol Seconds
gal	Gallon, Gallons	sq.in.	Square Inch, Square Inches
gpm	Gallon(s) per Minute	sy	Square Yard, Square Yards
G _{mm} @N _{ini}	Maximum Specific Gravity at Initial Number of Gyration	tsf	Tons per Square Foot
hr	Hour, Hours	V, VAC	Voltage, Voltage of Alternating Current
Hz	Hertz	vpm	Vibrations per Minute
J	Joule, Joules	W	Watt, Watts
kbps	Kilobit per Second	Yd	Yard, Yards
ksi	Kips per Square Inch		

1 101-3 DEFINITIONS

- 2 **ACT OF GOD:** Events in nature so extraordinary that the history of climate variations and
3 other conditions in the particular locality affords no reasonable warning of them.
- 4 **ADDITIONAL WORK:** Additional work is that which results from a change or alteration to
5 the contract and for which there are existing contract unit prices.
- 6 **ADVERTISEMENT:** The public advertisement inviting bids for the construction of specific
7 projects.
- 8 **AMOUNT BID:** The amount bid for a particular item of work in a proposal.
- 9 **ARTICLE:** A primary numbered subdivision of a section of the *Standard Specifications*.
- 10 **AWARD:** The decision of the Department of Transportation to accept the bid of the lowest
11 responsible responsive bidder for work that is subject to the furnishing of payment and
12 performance bonds and such other conditions as may be otherwise provided by law, the
13 proposal and these specifications.
- 14 **BASE COURSE:** That portion of the pavement structure of planned thickness placed
15 immediately below the pavement or surface course.
- 16 **BID (OR PROPOSAL):** *Paper Bid:* The offer of a bidder on the proposal furnished by the
17 Department to perform the work and to furnish the labor and materials at the prices quoted.

Section 101

- 1 *Electronic Bid*: The electronic offer of a bidder via Bid Express® to the Department to
2 perform the work and to furnish the labor and materials at the prices quoted.
- 3 **BID BOND OR BID DEPOSIT**: The security furnished by the bidder with his bid as
4 guaranty that he will furnish the required bonds and execute such documents as may be
5 required if his bid is accepted.
- 6 **BIDDER**: An individual, partnership, firm, corporation, LLC or joint venture formally
7 submitting a bid for the work contemplated.
- 8 **BOARD OR BOARD OF TRANSPORTATION**: The Board created by the provisions of
9 NCGS § 143B-350 for formulating policies for the Department of Transportation and
10 awarding all transportation construction contracts.
- 11 **BRIDGE**: A structure including supports, erected over a depression or an obstruction such as
12 water, highway or railway, and having a track or passage way for carrying traffic or other
13 moving loads and having a length measured along the center of the roadway of more than
14 20 ft between undercopings of end supports, spring lines of arches or between extreme ends
15 of openings for multiple reinforced concrete box structures.
- 16 **BRIDGE LENGTH**: The length of a bridge structure is the overall length measured along
17 the line of survey stationing back to back of backwalls of abutments, if present, otherwise end
18 to end of the bridge floor.
- 19 **BRIDGE WIDTH**: The clear width measured at right angles to the longitudinal centerline of
20 the bridge between the bottom of curbs, guard timbers or face of parapets, or in the case of
21 multiple heights of curbs, between the bottoms of the lower risers.
- 22 **CALENDAR DAY**: A day shown on the calendar beginning and ending at midnight.
- 23 **CHIEF ENGINEER**: The Chief Engineer, Division of Highways, North Carolina
24 Department of Transportation acting directly or through his duly authorized representatives.
- 25 **COMPLETION DATE**: That date established as set forth in the contract or as revised by
26 authorized extensions, by which it is required that the work set forth in the contract be
27 satisfactorily completed. When observation periods are required by the Specifications, they
28 are not a part of the work to be completed by the completion date or intermediate contract
29 times stated in the contract unless otherwise noted.
- 30 **CONSTRUCTION EASEMENT**: A right owned by the Department of Transportation in
31 a parcel of land owned by a third party outside the highway right of way for containing
32 construction that exceeds the right of way.
- 33 **CONTRACT**: The executed agreement between the Department and the successful bidder,
34 covering the performance of and compensation for the work.
- 35 The term contract is all inclusive with reference to all written and electronic agreements
36 affecting a contractual relationship and all documents referred to therein. The contract shall
37 include, but not be limited to, the proposal, the printed contract form and attachments,
38 contract bonds, plans, standard specifications and supplemental specifications, standard
39 special provisions and project special provisions contained in the proposal and all executed
40 supplemental agreements. All references to contracts shall include electronic agreements and
41 printed paper agreements. These may include, but not be limited to, the electronic bid bond,
42 Non-Collusion Certification, Debarment Certification, Gift Ban Certification and award
43 limits.
- 44 The contract shall constitute one instrument.
- 45 **CONTRACT ITEM**: A specifically described unit of work for which a unit or lump sum
46 price is provided in the contract. Synonymous with Pay Item.

- 1 **CONTRACT LUMP SUM PRICE:** The amount bid for a lump sum item that has been
2 submitted by the Contractor in his proposal.
- 3 **CONTRACT PAYMENT BOND:** A bond furnished by the Contractor and his corporate
4 surety securing the payment of those furnishing labor, materials and supplies for the
5 construction of the project.
- 6 **CONTRACT PERFORMANCE BOND:** A bond furnished by the Contractor and his
7 corporate surety guaranteeing the performance of the contract.
- 8 **CONTRACT TIME:** The number of calendar days inclusive between the date of availability
9 and the completion date, said dates being established as set forth in the special provisions,
10 including authorized extensions to the completion date.
- 11 **CONTRACT UNIT PRICE:** The unit bid price for a unit item that has been submitted by
12 the Contractor in his proposal.
- 13 **CONTRACTOR:** The successful bidder to whom the contract has been awarded, and who
14 has executed the contract and furnished acceptable contract bonds.
- 15 **CULVERT:** Any structure not classified as a bridge that provides an opening under the
16 roadway.
- 17 **CURRENT CONTROLLING OPERATION OR OPERATIONS:** Any operation or
18 operations, as determined by the Engineer, that if delayed would delay the completion of the
19 project.
- 20 **DATE OF AVAILABILITY:** That date, established as set forth in the special provisions, by
21 which it is anticipated that sufficient work sites within the project limits will be available for
22 the Contractor to begin his controlling operations that are not otherwise limited by
23 moratoriums, listed third party conflicts, or by weather conditions.
- 24 **DEPARTMENT or DEPARTMENT OF TRANSPORTATION:** A principal department
25 of the Executive Branch that performs the functions of planning, design, construction and
26 maintenance of an integrated statewide transportation system.
- 27 **DIVISION OF HIGHWAYS:** The division of the Department of Transportation that, under
28 the direction of the Secretary of Transportation, carries out state highway planning, design,
29 construction and maintenance functions assigned to the Department of Transportation.
- 30 **DRAINAGE EASEMENT:** A right, owned by the Department of Transportation, in a parcel
31 of land owned by a third party outside the highway right of way, to construct and maintain
32 ditches, channels, or structures for directing the course and flow of water outside the highway
33 right of way.
- 34 **EASEMENT:** A property right to use or control real property of another.
- 35 **ENGINEER:** The Chief Engineer of the North Carolina Department of Transportation,
36 acting directly or through a duly authorized representative, such representative acting within
37 the scope of particular assigned duties or authority.
- 38 **EQUIPMENT:** All machinery and equipment, together with the necessary supplies, tools
39 and apparatus for upkeep and maintenance, all of which are necessary for the proper
40 construction and acceptable completion of the work.
- 41 **EXTRA WORK:** Work found necessary or desirable to fully complete the work as
42 contemplated in the contract for which payment is not provided for by the contract unit or
43 lump sum prices in the original contract. Extra work shall not be work that in the terms of the
44 contract is incidental to work for which there is a contract price or work that payment is
45 included in some other contract unit or lump sum price.

Section 101

- 1 **FINAL ACCEPTANCE DATE:** That date on which all work set forth in the contract and
2 work modified by the Engineer is satisfactorily completed excluding any observation periods
3 not specifically made a part of the work by the specifications or special provisions.
- 4 **FINAL ESTIMATE:** The document that contains a final statement of all quantities and total
5 dollar amount for each item of work performed during the life of the contract including any
6 adjustments to those amounts made under the terms of the contract. The final statement will
7 be titled The Final Estimate and will be the document used to document final payment to the
8 Contractor. Receipt of this document by the Contractor will begin the time frame for filing of
9 a verified claim with the Department as provided for in NCGS § 136-29.
- 10 **FINAL ESTIMATE ASSEMBLY:** As constructed plans and other project records that
11 establish the final statement of quantities to be paid and document work performed on the
12 project.
- 13 **FORCE ACCOUNT NOTICE:** A written notice to the Contractor that extra work ordered
14 by the Engineer will be paid as force account work.
- 15 **FORCE ACCOUNT WORK:** Work that is paid in accordance with Article 109-3 or on the
16 basis of the force account formula provided in the contract.
- 17 **HIGHWAY:** A general term denoting a public way for purposes of vehicular travel,
18 including the entire area within the right of way. Synonymous with Road and Street.
- 19 **HOUR:** One of the 24 equal parts of a day.
- 20 **INSPECTOR:** The authorized representative of the Engineer assigned to make a detailed
21 inspection of any or all portions of the work and materials.
- 22 **INTERMEDIATE COMPLETION DATE:** That date established as set forth in the special
23 provisions or as revised by authorized extensions, by which date it is required that the portion
24 of work set forth in the contract be satisfactorily completed.
- 25 **INTERMEDIATE COMPLETION TIME:** The time established as set forth in the special
26 provisions or as revised by authorized extensions, by which it is required that the portion of
27 work set forth in the contract be satisfactorily completed.
- 28 **INTERMEDIATE CONTRACT TIME (DAYS):** The number of calendar days inclusive
29 between the date of availability and the intermediate completion date, said days being
30 established as set forth in the special provisions, or as revised by authorized extensions, by
31 which it is required that a portion of that work set forth in the contract be satisfactorily
32 completed.
- 33 **INTERMEDIATE CONTRACT TIME (HOURS):** The number of hours inclusive
34 between the time of availability and the intermediate completion time, said times being
35 established as set forth in the special provisions, including authorized extensions to the
36 intermediate completion time.
- 37 **INVERT:** The lowest point in the internal cross section of a pipe or other culvert.
- 38 **INVITATION TO BID:** The notification that bids will be received for the construction of
39 specific projects.
- 40 **LABORATORY:** The testing laboratory of the Department of Transportation or any other
41 testing laboratory that may be designated or approved by the Engineer.
- 42 **LOCAL TRAFFIC:** Traffic that must use the facility under construction to reach its
43 destination.
- 44 **MAJOR AND MINOR CONTRACT ITEMS:** Major contract items are listed as such in
45 the project special provisions. All other original contract items and extra work shall be
46 considered as minor items.

- 1 **MATERIALS:** Any substances that may be incorporated into the construction of the project.
- 2 **MEDIAN:** The center section of a divided highway that separates the traffic lanes in one
3 direction from the traffic lanes in the opposite direction.
- 4 **MOBILIZATION:** The work described in Article 800-1.
- 5 **PAVEMENT STRUCTURE:** The combination of base and surface courses placed on
6 a subgrade to support the traffic load and distribute it to the roadbed.
- 7 **PAY ITEM:** Synonymous with Contract Item.
- 8 **PLANS:** The approved plans, profiles, typical roadway sections, appropriate standard
9 drawings, supplemental plans and working drawings, or exact reproductions thereof, that
10 show the location, dimensions and details of the work to be done and that are a part of the
11 contract.
- 12 **PREBID CONFERENCE:** A conference held before bids are accepted on a project at which
13 representatives of the Department will provide information and accept and answer questions
14 from interested parties.
- 15 **PROJECT:** The work specified under the contract.
- 16 **PROJECT SPECIAL PROVISIONS:** Special provisions peculiar to the project and not
17 otherwise thoroughly or appropriately set forth in the standard specifications or plans.
- 18 **PROPOSAL:** The electronic or paper document provided by the Department that the bidder
19 uses to develop his electronic or paper offer to perform the work at designated bid prices.
- 20 **PURCHASE ORDER BIDDER:** A Bidder that can bid on any Department Purchase Order
21 Contract or Division Let Contract.
- 22 **RIGHT OF WAY:** The land area shown in the plans as right of way to be furnished by the
23 Department of Transportation within which the project is to be constructed.
- 24 **ROAD:** Synonymous with Highway and Street.
- 25 **ROADBED:** The graded portion of a highway usually considered as the area between the
26 intersections of top and side slopes, upon which the base course, surface course, shoulders and
27 medians are constructed.
- 28 **ROADSIDE:** A general term denoting the area within the limits of the right of way adjoining
29 the outer edge of the roadway. Extensive areas between the roadways of a divided highway
30 may be considered roadside.
- 31 **ROADWAY:** The portion of a highway within limits of construction.
- 32 **SECTION:** A numbered chapter of the standard specifications.
- 33 **SHOULDER:** The portion of the roadway adjacent to the traveled way for accommodation
34 of stopped vehicles, for emergency use and for lateral support of base and surface courses.
- 35 **SIDEWALK:** That portion of the roadway primarily constructed for pedestrian traffic.
- 36 **SKEW ANGLE:** The angle between the centerline of the project and the centerline of a pipe,
37 culvert, bridge pier, bent, abutment, or other drainage feature, measured to the right of the
38 project centerline facing in the direction of progressing stations.
- 39 **SPECIAL PROVISIONS:** Project special provisions and standard special provisions taken
40 together as one body of special provisions.
- 41 **SPECIFICATIONS:** The general term comprising all the directions, provisions and
42 requirements contained or referred to in the *Standard Specifications*, including the
43 Supplemental Specifications, together with such additional directions, provisions and
44 requirements that may be added or adopted as special provisions.

Section 101

- 1 **STANDARD DRAWINGS:** The general term comprising all the directions, provisions and
2 requirements contained or referred to in the book entitled *Roadway Standard Drawings* and in
3 any subsequent revisions or additions to such book that are issued as Detail Drawings.
- 4 **STANDARD SPECIAL PROVISIONS:** Special directions or requirements not otherwise
5 thoroughly or appropriately set forth in the standard specifications and that are peculiar to
6 a selected group of projects.
- 7 **STANDARD SPECIFICATIONS:** The general term comprising all the directions,
8 provisions and requirements contained or referred to in this book entitled *Standard*
9 *Specifications for Roads and Structures* and in any subsequent revisions or additions to such
10 book that are issued as Supplemental Specifications.
- 11 **STATE:** The State of North Carolina.
- 12 **STATION:** A station, when used as a term of measurement, will be 100 linear feet measured
13 horizontally. When used as a location, it will be a designated point on the project.
- 14 **STREET:** Synonymous with Highway and Road.
- 15 **SUBCONTRACTOR:** An individual, partnership, firm, joint venture, LLC or corporation to
16 whom the Contractor, with the written consent of the Engineer, sublets any part of the
17 contract.
- 18 **SUBGRADE:** That portion of the roadbed prepared as a foundation for the pavement
19 structure including curb and gutter. On portions of projects that do not include the
20 construction of a base course or pavement, the presence of the subgrade will not be
21 recognized during the life of such contract.
- 22 **SUBSTRUCTURE:** All of that part of the structure below the bearings of simple and
23 continuous spans, spans, skew back of arches and tops of footings of rigid frames, together
24 with the backwalls and wingwalls.
- 25 **SUCCESSFUL BIDDER:** The bidder awarded a contract.
- 26 **SUPERINTENDENT:** The representative of the Contractor authorized to supervise and
27 direct the construction for the Contractor and to receive and fulfill directions from the
28 Engineer.
- 29 **SUPERSTRUCTURE:** All of the part of the structure exclusive of the substructure.
- 30 **SUPPLEMENTAL AGREEMENT:** A written agreement between the Contractor and the
31 Department of Transportation covering amendments to the contract.
- 32 **SUPPLEMENTAL SPECIFICATIONS:** Specifications, regulations, standards, manuals or
33 codes referenced in the contract or general revisions or additions to this book of standard
34 specifications that are issued under the title of Supplemental Specifications. Supplemental
35 Specifications shall be considered part of the *Standard Specifications*.
- 36 **SURETY:** A corporate bonding company furnishing the bid bond or furnishing the contract
37 payment and performance bonds.
- 38 **TEMPORARY CONSTRUCTION EASEMENT:** A temporary right, owned by the
39 Department of Transportation, in a parcel of land owned by a third party outside the highway
40 right of way, for the use of the Department of Transportation during the construction and that
41 reverts to the third party on completion of construction.
- 42 **THROUGH TRAFFIC:** Traffic that can reach its destination by a route or routes other than
43 the facility under construction.
- 44 **TIME OF AVAILABILITY:** That time established as set forth in the special provisions, by
45 which it is anticipated that sufficient work sites within the project limits will be available for
46 the Contractor to begin his controlling operations.

1 **TOTAL AMOUNT BID:** Same as total price bid. The total amount bid will be considered
2 to be the correct sum total obtained by adding together the amounts bid for every item in the
3 proposal other than items that are authorized alternates to those items for which an amount bid
4 has been established.

5 **UNBALANCED BID:** A bid that includes any unbalanced bid price.

6 **UNBALANCED BID PRICE:** A unit or lump sum bid price that does not reflect reasonable
7 actual costs that the bidder anticipates for the performance of the item in question along with
8 a reasonable proportionate share of the bidder's anticipated profit, overhead costs and other
9 indirect costs.

10 **WORK:** Work shall mean the furnishing of all labor, materials, equipment and incidentals
11 necessary or convenient to the successful completion of the project, or any part, portion or
12 phase thereof, and the carrying out of all duties and obligations imposed by the contract.

13 **WORKING DRAWINGS:** Stress sheets, shop drawings, erection drawings, falsework
14 drawings, cofferdam drawings, catalog cuts, or any other supplementary drawings or similar
15 data that the Contractor is required to submit to the Engineer for review or approval.

16 **SECTION 102**
17 **BIDDING REQUIREMENTS AND CONDITIONS**

18 **102-1 INVITATION TO BID**

19 After the advertisement has been made, an Invitation to Bid will be made available on the
20 Department's website to interested parties, informing them that bids will be received for the
21 construction of specific projects. Such invitations will indicate the contract identification
22 number, length, locations and descriptions; a general summary of the items and approximate
23 quantities of work to be performed; and the time and place for the public opening and reading
24 of the bids received. Information concerning the cost and availability of plans and proposals
25 will be indicated in the Invitation to Bid.

26 All projects will be advertised in daily newspapers throughout the state before the bid
27 opening.

28 **102-2 CONTRACTOR PREQUALIFICATION**

29 Contractors desiring to perform work on Department projects shall prequalify with the
30 Department. Upon prequalification, contractors will be placed on the Department's
31 Prequalified Contractors' List on the Directory of Transportation Firms. The requirements for
32 prequalification are as follows:

33 **(A) Bidder Prequalification**

- 34 (1) Applicant shall submit a completed Bidder Experience Questionnaire, along with any
35 additional supporting information requested by the Department, as noted in the
36 experience questionnaire package. Additional requirements for prequalification may
37 be set forth in the bid proposal.
- 38 (2) Applicant shall demonstrate that he has sufficient ability and experience in related
39 transportation construction projects to perform the work specified in the
40 Department's contracts, including the type and dollar value of previous contracts.
- 41 (3) Applicant shall demonstrate a history of successful performance and completion of
42 projects in a timely manner, subject to contract time adjustments.
- 43 (4) Applicant shall demonstrate the financial ability to furnish bonds as specified in
44 NCGS § 44A-26 and any other relevant statutes.
- 45 (5) Applicant shall demonstrate sufficient and readily available equipment to perform
46 transportation construction contracts in a timely manner.

Section 102

- 1 (6) Applicant shall demonstrate sufficient available experienced personnel to perform
2 transportation construction contracts. The identities and qualifications of both
3 management and labor work force shall be provided.
- 4 (7) Applicant shall provide names and addresses of persons for whom the firm has
5 performed related work. Responses from the references shall be on Department
6 forms and shall be received by the Department before evaluating the request for
7 prequalification.
- 8 (8) Applicant shall provide any information requested concerning the corporate and
9 operational management structure of the company, the identity of persons or entities
10 owning stock or other equity interest in the company, and the relationship between
11 the applicant and any other company prequalified or applying for prequalification
12 with the Department.
- 13 (9) Applicant shall demonstrate, at the time of application for prequalification, the
14 financial capacity to successfully complete projects containing the work types they
15 so designate.
- 16 (10) Applicant shall provide further information as may be required to determine that the
17 firm is a responsible bidder.
- 18 (11) Applicant shall submit a completed Pre-Bid Non-Collusion Certification, Debarment
19 Certification and Gift Ban Certification in accordance with Article 102-9. These
20 forms can be found on the Department's website.
- 21 (12) Applicant shall submit a completed Safety Index Rating Form with the Questionnaire
22 and annually thereafter in accordance with Subarticle 102-2(D).

23 Bidders shall renew annually and shall requalify every 3 years in accordance with
24 Subarticle 102-2(E).

25 The Bidder Experience Questionnaire shall be completed in its entirety and signed by
26 an officer of the firm. The officer's signature shall be notarized. In addition to
27 submitting the Bidder Experience Questionnaire, the prospective bidder shall submit
28 supporting information in a format of his choosing to address the requirements listed
29 above.

30 It is recommended that the prospective bidder file all required statements and documents
31 with the State Contractual Services Engineer no less than 4 weeks before a given letting.
32 A bid shall not be opened unless all prequalification requirements have been met by the
33 bidder and have been found acceptable by the Engineer.

34 **(B) Purchase Order Bidder Prequalification**

35 Contractors who have been approved to be placed on the Prequalified Bidders' List as
36 noted above may perform work for the Department as a Purchase Order Bidder and need
37 not apply further. However, Purchase Order Bidders will not be placed on the
38 Prequalified Bidders' List unless they submit through the prequalification process
39 described above.

- 40 (1) Applicant shall submit a completed Department Purchase Order Bidder Application
41 along with any additional supporting information requested by the Department, as
42 noted in the application. Additional requirements for prequalification may be in the
43 bid proposal.
- 44 (2) Applicant shall demonstrate that it has sufficient ability and experience in related
45 transportation construction projects to perform the work specified in Department
46 contracts, including the type and dollar value of previous contracts.
- 47 (3) Applicant shall demonstrate a history of successful performance and completion of
48 projects in a timely manner, subject to contract time adjustments.

1 (4) Applicant shall demonstrate sufficient and readily available equipment to perform
2 transportation construction contracts in a timely manner.

3 (5) Applicant shall provide further information as may be required to determine that the
4 firm is a responsible contractor.

5 (6) Applicant shall submit a completed Pre-Bid Non-Collusion Certification, Debarment
6 Certification and Gift Ban Certification. These forms can be found on the
7 Department's website.

8 (7) Applicant shall submit a completed Safety Index Rating Form with the application
9 and annually thereafter in accordance with Subarticle 102-2(D).

10 Purchase Order Bidders shall renew annually and requalify every 3 years in accordance
11 with Subarticle 102-2(E).

12 The application shall be completed in its entirety and signed by an officer of the firm.
13 The officer's signature shall be notarized. In addition to submitting the application, the
14 firm shall submit supporting information in a format of his choosing to address the
15 requirements listed above.

16 It is recommended that the applicant file all required statements and documents with the
17 State Contractual Services Engineer no less than 4 weeks before a given bid opening for
18 their bid to be considered. A bid shall not be opened unless all prequalification
19 requirements have been met by the applicant and have been found acceptable by the
20 Engineer.

21 **(C) Subcontractor Prequalification**

22 Contractors who have been approved to be placed on the Prequalified Bidders' List or the
23 Purchase Order Bidder's List as noted above may perform work for the Department as
24 a subcontractor and need not apply further. However, subcontractors will not be placed
25 on the Prequalified Bidders' List or the Purchase Order Bidder's List unless they submit
26 through the prequalification process described above.

27 (1) Applicant shall submit a completed Subcontractor Application along with any
28 additional supporting information requested by the Department. Additional
29 requirements for prequalification may be in the bid proposal.

30 (2) Applicant shall demonstrate sufficient ability and experience in related transportation
31 construction projects to perform the work specified in Department contracts,
32 including the type of previous contracts.

33 (3) Applicant shall demonstrate sufficient and readily available equipment to perform
34 transportation construction contracts in a timely manner.

35 (4) Applicant shall submit a completed Safety Index Rating Form with the Subcontractor
36 Application and annually thereafter in accordance with Subarticle 102-2(D).

37 (5) Applicant shall provide further information as may be required.

38 Subcontractors shall renew annually and shall requalify every 3 years in accordance with
39 Subarticle 102-2(E).

40 The Subcontractor Application shall be completed in its entirety. In addition to
41 submitting the Subcontractor Application, the prospective subcontractor shall submit
42 supporting information in a format of their choosing to address the requirements listed
43 above.

44 The subcontractor shall file all required statements and documents with the State
45 Contractual Services Engineer no less than 4 weeks before beginning work.
46 A subcontractor will not be allowed to begin work until all prequalification requirements
47 have been met by the subcontractor and have been found acceptable by the Engineer.

Section 102

1 (D) Safety Index

2 The Department will conduct a review of each firm's safety index. To be prequalified,
3 each firm shall maintain a satisfactory safety index. An overall safety index of at least 60
4 is considered satisfactory. An index between 60 and 69 may be considered marginal
5 results in an in-depth safety audit of a firm's safety practices and may result in one or
6 more of the sanctions listed below as a result of a failing Safety Index. An overall safety
7 index equal to or less than 59 is considered unsatisfactory and will prohibit
8 prequalification of new firms.

9 A score of 59 or less for renewing or requalifying firms will result in disciplinary action
10 pursuant to Subarticles 102-2(D)(1) through 102-2(D)(4). The Engineer may require the
11 Contractor to state in writing the reason for the unsatisfactory rating and produce such
12 supporting data as may be necessary to evaluate the circumstances surrounding the rating.
13 When the Contractor cannot provide justification to raise the unsatisfactory safety index,
14 the Engineer may invoke one or more of the following sanctions:

- 15 (1) Removal of the firm from the Prequalified Contractors' List,
- 16 (2) Placement of the firm on probation for up to 2 years,
- 17 (3) Auditing of the firm's safety practices and
- 18 (4) Giving a written warning to correct any safety deficiencies.

19 Firms not approved or disqualified to bid or perform subcontract work due to
20 an unsatisfactory safety index will not be approved or reinstated to bid or perform
21 subcontract work until they can provide adequate evidence that all safety deficiencies
22 have been corrected to the satisfaction of the Engineer.

23 (E) Renewal and Requalification

24 Renewal of firms shall occur annually on or before the firm's anniversary date. Renewal
25 shall consist of submitting an updated application. Bids of firms who fail to submit these
26 documents by their anniversary date will be deemed non-responsive and not considered
27 for award. The Engineer may review performance related issues when considering firms
28 for renewal. Subcontractors who fail to submit these documents by their anniversary date
29 will not be allowed to begin work on any new contracts until these documents are
30 received and approved by the Engineer.

31 Requalifying of firms shall occur every 3 years. Requalifying shall consist of submitting
32 an updated application. Bids of firms who fail to submit these documents by their
33 anniversary date will be deemed non-responsive and not considered for award. The
34 Engineer may review performance related issues when considering firms for
35 requalification. Subcontractors who fail to submit these documents by their anniversary
36 date will not be allowed to begin work on any new contracts until these documents are
37 received and approved by the Engineer.

38 It is recommended that the renewing or requalifying firm file all required statements and
39 documents with the State Contractual Services Engineer no less than 4 weeks before a
40 given letting for their bid to be considered. Following the anniversary date, a bid will not
41 be opened unless all renewal or requalification requirements have been met by the bidder
42 and have been found acceptable by the Engineer. Following the anniversary date, a
43 subcontractor may not begin any new work unless all renewal or requalification
44 requirements have been met by the firm and have been found acceptable by the Engineer.

45 102-3 PROPOSALS AND PLAN HOLDER LISTS

46 On Department projects advertised through the Raleigh Central Office, the bidder shall
47 purchase a proposal for each project for which he intends to submit a bid. The prospective
48 bidder shall pay the Department the sum stated in the Invitation to Bid for each copy of the
49 proposal and set of plans purchased.

1 This proposal will state the location of the contemplated construction and show a schedule of
2 contract items with the approximate quantity of each of these items for which bid prices are
3 invited. It will set forth the date and time for the opening of bids. The proposal will include
4 any special provisions or requirements that vary from, or are not contained in, the plans or
5 *Standard Specifications*.

6 The plans, *Standard Specifications* and other documents designated in the proposal shall be
7 considered a part of the proposal whether or not attached.

8 The names and identity of corporations, firms, partnerships, individuals, LLCs or joint
9 ventures who have requested plans or proposals for the purposes of bidding shall be made
10 public.

11 **(A) Paper Bids**

12 The proposal will include the printed contract forms and signature sheets for execution by
13 both parties to the contract. In the event the bidder is awarded the contract, execution of
14 the bid by the bidder is considered the same as execution of the contract.

15 All papers bound with the proposal are necessary parts thereof and shall not be detached,
16 taken apart or altered.

17 **(B) Electronic Bids**

18 The bidder shall bid in accordance with Subarticle 102-8(B).

19 **102-4 COMBINATION BIDS**

20 If the Department so elects, proposals may be issued for projects in combination or separately,
21 so that bids may be submitted either on the combination or on separate units of the
22 combination. The right is reserved to make awards on combination bids or separate bids to
23 the best advantage of the Department. No combination bids, other than those specified by the
24 Department in the proposal will be considered.

25 **102-5 INTERPRETATION OF QUANTITIES IN PROPOSAL**

26 The quantities appearing in the proposal are approximations only and are to be used solely for
27 the comparison of bids. Payment to the Contractor will be made in accordance with the
28 contract.

29 When revisions in the plans are made by the Engineer that affect the quantities shown for
30 lump sum items, adjustment in compensation may be made under the provisions of
31 Articles 104-3 or 104-7.

32 **102-6 EXAMINATION OF PLANS, SPECIFICATIONS, CONTRACT AND SITE
33 OF WORK**

34 The bidder shall carefully examine the site of the work contemplated, the plans and
35 specifications, and the proposals and contracts therefor. The submission of a bid shall be
36 conclusive evidence that the bidder has investigated and is satisfied as to the conditions to be
37 encountered; the character, quality and scope of work to be performed; the quantities of
38 materials to be furnished; and the conditions and requirements of the proposal, plans and
39 contract under which his bid is offered.

40 A bidder or contractor shall prior to bidding, make such independent investigation and
41 examination as to conditions to be encountered in the performance of the work and with
42 respect to possible local material sources, the quality and quantity of material available from
43 such property, and the type and extent of processing that may be required to produce material
44 conforming to the contract.

Section 102

1 **102-7 SUBSURFACE INVESTIGATION REPORT**

2 If a subsurface investigation report is available on a project, an electronic copy is available
3 on-line with the project letting files.

4 The subsurface report and the subsurface investigation on which it is based were made for
5 study, planning and design and not for construction or pay purposes. The various field boring
6 logs, rock cores and soil test data available may be reviewed or inspected. Contact the
7 Geotechnical Engineering Unit to set up an appointment in the appropriate Regional office.
8 The subsurface investigation report, the field boring logs, rock cores, and soil test data are not
9 part of the contract documents.

10 General soil and rock strata descriptions and indicated boundaries are based on a geotechnical
11 interpretation of available subsurface data and do not necessarily reflect the actual subsurface
12 conditions between borings or between sampled strata within the borehole. The laboratory
13 sample data and the in-place test data can be relied on only to the degree of reliability inherent
14 in the standard test method. The observed water levels or soil moisture conditions indicated
15 in the subsurface investigations are as recorded at the time of the investigation. These water
16 levels or soil moisture conditions may vary considerably with time according to climatic
17 conditions including temperature, precipitation and wind, as well as other nonclimatic factors.

18 Details shown in the subsurface investigation report are preliminary only and the final design
19 details may be different. For bidding and construction purposes, refer to the contract for final
20 design information on this project. The Department does not warrant or guarantee the
21 sufficiency or accuracy of the investigation made, nor the interpretations made or opinions of
22 the Department as to the type of materials and conditions that may be encountered. The
23 bidder or contractor shall make independent subsurface investigations, as to conditions to be
24 encountered on this project. The Contractor assumes all risks for any discrepancies between
25 the subsurface information and the actual conditions encountered and expressly agrees that
26 NCDOT is not liable for any such variances and shall have no claim for additional
27 compensation or for an extension of time for any reason resulting from the actual conditions
28 encountered at the site differing from those indicated in the subsurface investigation.

29 **102-8 PREPARATION AND SUBMISSION OF BIDS**

30 The bidder shall submit a unit or lump sum price for every item in the proposal other than
31 items that are authorized alternates to those items for which a bid price has been submitted.

32 An amount bid shall be entered in the proposal for every item on which a unit price has been
33 submitted. In the case of lump sum items, the price shall be written in figures in the Amount
34 Bid column in the proposal.

35 The bid shall not contain any unauthorized additions, deletions or conditional bids.

36 The bidder shall not add any provision reserving the right to accept or reject an award or to
37 enter into a contract pursuant to an award.

38 The bid shall not be an unbalanced bid.

39 **(A) Paper Bids**

40 (1) The proposal provided by the Department shall be used and shall not be taken apart
41 or altered. The bid shall be submitted on the same proposal that has been furnished
42 to the bidder by the Department.

43 The bid shall be accompanied by a bid bond on the form furnished by the
44 Department or by a bid deposit. The bid bond shall be completely and properly
45 executed in accordance with Article 102-10. The bid deposit shall be a certified
46 check or cashier's check in accordance with Article 102-10.

47 (2) All entries including signatures shall be written in ink.

- 1 (3) The unit prices shall be rounded off by the bidder to contain no more than 4 decimal
2 places.
- 3 (4) An amount bid shall be entered in the proposal for every item on which a unit price
4 has been submitted. The amount bid for each item other than lump sum items shall
5 be determined by multiplying each unit bid price by the quantity for that item and
6 shall be written in figures in the Amount Bid column in the proposal.
- 7 (5) In the case of lump sum items, the price shall be written in figures in the Amount Bid
8 column in the proposal.
- 9 (6) The total amount bid shall be written in figures in the proper place in the proposal.
10 The total amount bid shall be determined by adding the amounts bid for each item.
- 11 (7) Changes in any entry shall be made by marking through the entry in ink and making
12 the correct entry adjacent thereto in ink. A representative of the bidder shall initial
13 the change in ink.
- 14 (8) The bid shall be properly executed. To constitute proper execution, the bid shall be
15 executed in strict compliance with the following:
- 16 (a) If a bid is by an individual, it shall show the name of the individual and shall be
17 signed by the individual with the word *Individually* appearing under the
18 signature. If the individual operates under a firm name, the bid shall be signed
19 in the name of the individual doing business under the firm name.
- 20 (b) If the bid is by a corporation, the President, Vice President, or Assistant Vice
21 President shall execute it in the name of the corporation. The Secretary or
22 Assistant Secretary shall attest it. The seal of the corporation shall be affixed. If
23 the bid is executed on behalf of a corporation in any other manner than as above,
24 a certified copy of the minutes of the Board of Directors of said corporation
25 authorizing the manner and style of execution and the authority of the person
26 executing shall be attached to the bid or shall be on file with the Department.
- 27 (c) If the bid is made by a partnership, it shall be executed in the name of the
28 partnership by one of the general partners.
- 29 (d) If the bid is made by a limited liability company, it shall be signed by the
30 manager, member or authorized agent and notarized.
- 31 (e) If the bid is a joint venture, it shall be executed by each member of the joint
32 venturers in the appropriate manner set out above. In addition, the execution by
33 the joint venturers shall appear below their names.
- 34 (f) The bid execution shall be notarized by a notary public whose commission is in
35 effect on the date of execution. Such notarization shall be applicable to the bid.
- 36 (9) The bid shall be placed in a sealed envelope and shall have been delivered to and
37 received by the Department before the time specified in the Invitation to Bid.

38 **(B) Electronic Bids**

39 The Department will not be responsible if a bidder cannot submit his bid to Bid
40 Express®. Claims will not be accepted for such failure.

- 41 (1) Obtain an account and valid Digital Signature from Bid Express® to bid
42 electronically.
- 43 (2) Subarticle 103-2(B) will apply to Electronic Bidding.
- 44 (3) The bid shall be accompanied by an electronic bid bond or by a bid deposit. The bid
45 bond shall be completely and properly executed in accordance with Article 102-10.

Section 102

1 The bid deposit shall be a certified check or cashier check in accordance with
2 Article 102-10.

3 (4) The bidder shall provide a Non-Collusion Certification, Debarment Certification and
4 Gift Ban Certification in accordance with Articles 102-2 and 102-9.

5 (5) All addenda and attachments will be considered part of the bid.

6 (6) All bids shall be submitted with an electronically affixed digital signature. Affixing
7 a digital ID to the bid shall be the equivalent of signing before a notary public.

8 (7) By submitting an electronic bid, the bidder certifies that he has read, understands,
9 accepts, acknowledges and agrees to comply with all statements, conditions and
10 specifications in the electronic bid submittal.

11 (8) Bids will be decrypted, opened, printed to paper and read publicly in accordance
12 with Article 102-13.

13 (9) The Contractor shall submit a fully executed Execution of Contract, signature sheet
14 and payment and performance bonds within 14 calendar days of receipt of award
15 letter in accordance with Article 102-10.

16 **102-9 NON-COLLUSION CERTIFICATION, DEBARMENT CERTIFICATION** 17 **AND GIFT BAN CERTIFICATION**

18 **(A) General**

19 Prime Contractors and lower tier participants in each transaction involving public funds
20 shall execute a Non-Collusion Certification, Debarment Certification and Gift Ban
21 Certification. Transactions that require certifications from lower tier participants are:

22 (1) Transactions between a Prime Contractor and a person, other than for a procurement
23 contract, for goods or services, regardless of type.

24 (2) Procurement contracts for goods and services, between a prime contractor and
25 a person, regardless of type, expected to equal or exceed the Federal small purchase
26 threshold fixed at 10 U.S.C. 2304(g) under a prime contract.

27 (3) Procurement contracts for goods or services between a prime contractor and
28 a person, regardless of the amount, under which that person will have a critical
29 influence on or substantive control over the transaction. Such persons include, but
30 are not limited to, bid estimators and contract managers.

31 The certifications for both the Prime Contractor and the lower tier participants shall be on
32 a form furnished by the Department to comply with Federal Highway Administration
33 requirements, as published in 49 CFR Part 29. The Prime Contractor is responsible for
34 obtaining the certifications from the lower tier participants and is responsible for keeping
35 them as part of the contract records.

36 **(B) Non-Collusion Certification**

37 In compliance with applicable Federal and State laws and regulations, each and every
38 bidder shall furnish the Department with a form certifying that the bidder has not entered
39 into any agreement, participated in any collusion, or otherwise taken any action in
40 restraint of free competitive bidding in connection with his bid on the project. The
41 certification shall conclusively indicate that the bidder intends to do the work with its
42 own bona fide employees or subcontractors and is not bidding for the benefit of another
43 contractor.

44 **(C) Debarment Certification**

45 In compliance with applicable Federal and State laws and regulations, each and every
46 bidder shall furnish the Department with a debarment certification, stating that he is not

1 debarred, or if he is debarred, an explanation shall be included. The explanation will not
2 necessarily result in denial of participation in a contract. Failure to furnish a certification
3 or an explanation will be grounds for rejection of a bid. If the prequalified bidder's status
4 changes, he shall immediately submit a new fully executed debarment certification with
5 an explanation of the change.

6 Failure to have a fully executed Non-Collusion Certification, Debarment Certification
7 and Gift Ban Certification on file in the Contractual Services Office before submitting
8 bids will cause those bids to be non-responsive.

9 (1) Paper Bid

10 Execution of Bid, Non-Collusion Certification, Debarment Certification and Gift
11 Ban Certification forms will be included in the proposal as part of the signature
12 sheets. Execution of the signature sheets will constitute Execution of the Bid,
13 Non-Collusion Certification, Debarment Certification and Gift Ban Certification.

14 (2) Electronic Bids

15 The prequalified bidder shall have a fully executed Non-Collusion Certification,
16 Debarment Certification and Gift Ban Certification on file in the Contractual
17 Services Office before submitting his bid. Forms may be downloaded from the
18 Department's website.

19 The bidder shall provide a Debarment Certification in the electronic bid submittal. If
20 a bidder cannot provide the Debarment Certification required, he shall provide
21 an explanation in the Bid Express® miscellaneous folder within the .ebs file.

22 Within 14 calendar days after notice of award is received by him, the successful
23 bidder shall submit a fully executed Execution of Contract, Non-Collusion
24 Certification, Debarment Certification and Gift Ban Certification signature sheet.

25 **102-10 BID BOND OR BID DEPOSIT**

26 Each bid shall be accompanied by a corporate bid bond or a bid deposit of a certified or
27 cashier's check in the amount of at least 5% of the total amount bid for the contract. When
28 a bid is secured by a bid deposit, the execution of a bid bond will not be required.

29 If the bidder has failed to meet all conditions of the bid bond and the Department has not
30 received the amount due under the bid bond, the bidder may be disqualified from further
31 bidding as provided in Article 102-15.

32 No bid will be considered or accepted unless accompanied by one of the foregoing securities.
33 The bid bond shall be executed by a corporate surety licensed to do business in
34 North Carolina. The certified check or cashier's check shall be drawn on a bank or trust
35 company insured by the Federal Deposit Insurance Corporation. Both shall be made payable
36 to the Department of Transportation in an amount of at least 5% of the total amount bid for
37 the contract. The condition of the bid bond or bid deposit is: the Principal shall not withdraw
38 its bid within 60 days after the opening of same and, if the Department shall award a contract
39 to the Principal, the Principal shall, within 14 calendar days after the notice of award is
40 received by him, give payment and performance bonds with good and sufficient surety as
41 required for the faithful performance of the contract and for the protection of all persons
42 supplying labor and materials in the prosecution of the work. In the event of the failure of the
43 Principal to give such payment and performance bonds as required, then the amount of the bid
44 bond shall be immediately paid to the Department as liquidated damages, or, in the case of a
45 bid deposit, the deposit shall be forfeited to the Department.

46 Withdrawal of a bid due to a mistake made in the preparation of the bid, where permitted by
47 Article 103-3, shall not constitute withdrawal of a bid as cause for payment of the bid bond or
48 forfeiture of the bid deposit.

Section 102

1 When a bid is secured by a bid bond, the bid bond shall be on the form furnished by the
2 Department. The bid bond shall be executed by both the bidder and a corporate surety
3 licensed under the laws of North Carolina to write such bonds. The execution by the bidder
4 shall be in the same manner as required by Article 102-8 for the proper execution of the bid.
5 The execution by the corporate surety shall be the same as is provided for by
6 Subarticle 102-8(A)(8)(b), for the execution of the bid by a corporation. The seal of the
7 corporate surety shall be affixed to the bid bond. The bid bond form furnished is for
8 execution of the corporate surety by a General Agent or Attorney in Fact. A certified copy of
9 the Power of Attorney shall be attached if the bid bond is executed by a General Agent or
10 Attorney in Fact. The Power of Attorney shall contain a certification that the Power of
11 Attorney is still in full force and effect as of the date of the execution of the bid bond by the
12 General Agent or Attorney in Fact. If the bid bond is executed by the corporate surety, the
13 President, Vice President or Assistant Vice President, and attested to by the Secretary or
14 Assistant Secretary, then the bid bond form furnished shall be modified for such execution,
15 instead of execution by the Attorney in Fact or the General Agent.

16 An electronic corporate surety bid bond for at least 5% of the total amount bid shall
17 accompany each electronic bid, or the Contractor may submit a certified check or cashier's
18 check instead of an electronic bid bond. The certified check or cashier's check shall be for at
19 least 5% of the total amount bid, shall be received by 5:00 p.m. the last business day before
20 the bid letting and shall be delivered to the Contract Officer at the address shown in the
21 Invitation to Bid.

22 Contact either or both of the following bond management companies to acquire the necessary
23 service to submit an electronic bid bond:

24 (A) Surety 2000

25 100 Terminal Dr., Plainview, NY 11803, 1-800-660-3263

26 (B) Surepath (InSure Vision Technologies, LLC)

27 5170 Sepulveda Blvd., Ste. 200, Sherman Oaks, CA 91403, 1-818-783-3460

28 102-11 DELIVERY OF BIDS

29 Paper Bids shall be delivered before the time and place specified in the contract. Bids
30 received after such time will not be accepted and will be returned to the bidder unopened.

31 Electronic Bids shall be submitted via approved Department electronic bidding software in
32 accordance with Article 102-8.

33 102-12 WITHDRAWAL OR REVISION OF BIDS

34 (A) Paper Bid

35 A bidder may, without prejudice to himself, withdraw a paper bid after it has been
36 delivered to the Department, provided the request for such withdrawal is made, in
37 writing, to the Contract Officer before the date and time set for the opening of bids. The
38 bidder may then submit a revised bid provided it is received before the time set for
39 opening of bids.

40 Only those persons authorized to sign bids under the provisions of Subarticle 102-8(A)(8)
41 shall be recognized as being qualified to withdraw a bid.

42 (B) Electronic Bid

43 An electronic bid may be changed and resubmitted as many times as desired before the
44 advertised bid opening time specified in the Invitation to Bid. The latest time stamped
45 electronically submitted bid before the advertised bid opening time will constitute the
46 bid.

1 Withdrawal of a bid after the date and time set for the opening of bids will be permitted
2 only in accordance with Article 103-3.

3 **102-13 RECEIPT AND OPENING OF BIDS**

4 A bid will be received and opened from any bidder who:

5 (A) Is prequalified in accordance with the provisions of Article 102-2 and

6 (B) Has delivered the bid to the place indicated in the contract before the time indicated in the
7 Invitation to Bid.

8 (1) Paper Bids will be opened and read publicly at the time and place indicated in the
9 Invitation to Bid.

10 (2) Electronic Bids will be decrypted, opened, printed to paper and read publicly at the
11 time and place specified in the Invitation to Bid.

12 Bidders, their authorized agents and other interested parties are invited to be present.

13 A bid received from a bidder who has not complied with the above requirements will under
14 no circumstances be considered for award.

15 In the event of technical difficulties or adverse weather conditions, the Department reserves
16 the right to postpone the reading of bids past the advertised bid opening time and date.

17 **102-14 REJECTION OF BIDS**

18 Any bid submitted that fails to comply with any of the requirements of Articles 102-8, 102-9
19 and 102-10 shall be considered irregular and may be rejected.

20 Irregularities due to apparent clerical errors and omissions may be waived in accordance with
21 Article 103-2.

22 Any bid including any unit or lump sum bid price that is unbalanced to the potential detriment
23 of the Department will be considered irregular and may be rejected. In the event the Board
24 determines it is in the best public interest to accept such irregular bid, it may award the
25 contract based on such bid subject to Subarticle 109-4(C).

26 All bidders shall comply with all applicable laws regulating the practice of general contracting
27 as contained in Chapter 87 of the General Statutes of North Carolina, except where waived by
28 the Department by project special provision for certain specialty work. Bidders shall comply
29 with all other applicable laws regulating the practices of electrical, plumbing, heating and air
30 conditioning and refrigeration contracting as contained in Chapter 87 of the General Statutes
31 of North Carolina.

32 **(A) State Funded Projects**

33 The bidder shall be licensed by the North Carolina Licensing Board for General
34 Contractors where the bid is \$30,000 or more. Bids received from bidders not meeting
35 this requirement will be considered non-responsive and will not be considered for award.

36 **(B) Federal Aid Projects**

37 The bidder is not required to be licensed by the North Carolina Licensing Board for
38 General Contractors to place a bid of \$30,000 or more. However, a project may not be
39 awarded until the bidder provides evidence that the appropriate General Contractor
40 license has been obtained. The license shall be obtained within 60 days of bid opening or
41 the project may be awarded to another bidder or all bids rejected. No contract time
42 extension will be considered for delays associated with obtaining a license.

43 The right to reject any and all bids shall be reserved to the Department.

Section 102

1 **102-15 DISQUALIFICATION OF CONTRACTORS OR SUBCONTRACTORS**

2 Any one of the following causes may be justification for disqualifying a Contractor from
3 further bidding, or a Subcontractor from performing work, until he has applied for and has
4 been requalified in accordance with Article 102-2 as applicable:

5 **(A)** Unsatisfactory progress in accordance with Article 108-8.

6 **(B)** Being declared in default in accordance with Article 108-9.

7 **(C)** Uncompleted contracts which, in the judgment of the Engineer, might hinder or prevent
8 the timely completion of additional work if awarded.

9 **(D)** Failure to comply with prequalification requirements.

10 **(E)** The submission of more than one bid for the same contract by individuals, partnerships,
11 joint ventures, LLCs or corporations whom the Department determines are under
12 sufficient common ownership and management control to warrant the firms be
13 considered a single entity.

14 **(F)** Evidence of collusion among bidders. Each participant in such collusion will be
15 disqualified.

16 **(G)** Failure to furnish a Non-Collusion Certification, Debarment Certification or Gift Ban
17 Certification upon request.

18 **(H)** Failure to comply with Article 108-6.

19 **(I)** Failure to comply with a written order of the Engineer as provided in Article 105-1, if in
20 the judgment of the Engineer, such failure is of sufficient magnitude to warrant
21 disqualification.

22 **(J)** Failure to satisfy the Minority, Women or Disadvantaged Business Enterprise
23 requirements of the project special provisions.

24 **(K)** The Department has not received the amount due under a forfeited bid bond or under the
25 terms of a performance bond.

26 **(L)** Failure to submit the documents required by Article 109-10 within 60 days after request
27 by the Engineer.

28 **(M)** Failure to return overpayments as directed by the Engineer.

29 **(N)** Failure to maintain a satisfactory safety index as required by Article 102-2.

30 **(O)** Failure to restrict a former Department employee as prohibited by Article 108-5.

31 **(P)** False information submitted on any application, statement, certification, reports, records
32 or reproduction.

33 **(Q)** Conviction of any employee of the company, of any applicable state or federal law, may
34 be fully imputed to the business firm with which he is or was associated or by whom he
35 was employed or with the knowledge or approval of the business firm or there after
36 ratified by it.

37 **(R)** Being debarred from performing work with other Federal, State and city agencies.

38 **(S)** Failure to perform guaranty work within the terms of the contract.

39 **(T)** Failure to make prompt payment in accordance with Article 109-4.

40 Upon a determination that a contractor or subcontractor should be disqualified for one or
41 more of the reasons listed above, the Department may, at its discretion, remove all entities
42 which are considered as a single entity as described in Subarticle 102-15(E).

SECTION 103
AWARD AND EXECUTION OF CONTRACT

103-1 CONSIDERATION OF BIDS

After the bids are opened and read, they will be compared on the basis of the summation of the products of the quantities shown in the bid schedule by the unit bid prices. The results of such comparisons will be immediately available to the public. In the event of errors, omissions, or discrepancies in the bid prices, corrections to the bid prices will be made in accordance with Article 103-2. Such corrected bid prices will be used for the comparison and consideration of bids.

The right is reserved to reject any or all bids, to waive technicalities, to request the low bidder to submit an up-to-date financial and operating statement, to advertise for new bids or to proceed to do the work otherwise, if in the judgment of the Department, the best interests of the State will be promoted thereby.

103-2 CORRECTION OF BID ERRORS

The provisions of this article shall apply in waiving irregularities and correcting apparent clerical errors and omissions in the unit bid price and the amount bid for bid items.

(A) Paper Bid

(1) Omitted Unit Bid Price--Amount Bid Completed--Quantity Bid on is One Unit

In the case of a bid item for which the amount bid is completed, but the unit bid price is omitted and the quantity shown in the proposal for the bid item is only one unit, the unit bid price shall be deemed to be the same as the amount bid for that bid item and shall constitute the contract unit price for that bid item.

(2) Omitted Unit Bid Price--Amount Bid Completed--Quantity Bid on is More Than One Unit

In the case of a bid item for which the amount bid is completed (extension of the unit bid price by the quantity) but the unit bid price is omitted and the quantity shown in the proposal for the bid item is more than one unit, the unit bid price shall be deemed to be the amount derived by dividing the amount bid for that item by the quantity shown in the proposal for that bid item and shall constitute the contract unit price for that bid item.

(3) Discrepancy in the Unit Bid Price and the Amount Bid

In the case of a bid item in which there is a discrepancy between the unit bid price and the extension for the bid item (amount bid), the unit bid price shall govern.

As an exception to the above, on bids for contracts not funded with any federal funds, the extension for the bid item (amount bid) shall govern when the discrepancy consists of an obvious clerical mistake in the unit bid price consisting of the misplacement of a decimal point. The correction to the unit bid price will be made only when the following two conditions are met:

(a) The corrected unit bid price multiplied by the quantity equals the amount bid for the bid item.

(b) The corrected unit bid price is closer to the average of the engineer's estimate and the individual bids for the contract item than the uncorrected unit bid price.

(4) Omitted Unit Bid Price and Omitted Amount Bid--Deemed Zero Bid

(a) State Funded Projects

In the case of omission of the unit bid price and the omission of the amount bid for any one item except Mobilization and, in the case of the omission of the

Section 103

1 amount bid where a lump sum price is called for, the amount bid and the unit bid
2 price shall be deemed to be zero where the value of the omitted amount bid is
3 1% or less of the total amount bid for the entire project (excluding the omitted
4 item). The value of the omitted amount bid will be derived by determining the
5 average of the engineer's estimate and the individual bids for that contract item.

6 Where the unit bid price is deemed to be zero as provided in this subarticle, such
7 zero unit bid price shall constitute the contract unit price for the affected bid
8 item.

9 Where the amount bid for a lump sum bid item is deemed to be zero except
10 Mobilization, as provided in this subarticle, such zero amount bid shall
11 constitute the contract lump sum price for that bid item.

12 In the case of omission of the amount bid for Mobilization, the bid shall be
13 deemed irregular and may be rejected.

14 (b) Federally Funded Projects

15 In the case of omission of the unit bid price and the omission of the amount bid
16 for any one item and, in the case of the omission of the amount bid where
17 a lump sum price is called for, the bid will be considered nonresponsive and will
18 not be considered for award.

19 (5) Unit Bid Prices Containing More Than Four Decimal Places

20 In the case of a Bid Item for which the amount bid contains more than 4 decimal
21 places for the Unit Bid Price, only the whole number and the first 4 decimal places
22 shall constitute the Contract Unit Price for that Bid Item.

23 (B) Electronic Bids

24 (1) Enter a unit price in schedule of items. Totals will be generated automatically.

25 (2) Data incorrectly entered may not be recognized, and the bid item may remain blank
26 until entered correctly.

27 (3) Enter no more than 4 decimal places for unit price.

28 (4) Do not enter zero (0) in any unit price field unless zero is the intended bid for that
29 item. Zero will be considered a valid bid. However, where zeros are entered for
30 items that are authorized alternates to those items for which a non-zero bid price has
31 been submitted, zeros will be deemed invalid.

32 (5) When the proposal allows alternate bids, the bidder shall submit a unit or lump sum
33 price for every item in the proposal other than items that are authorized alternates to
34 those items for which a bid price has been submitted. Where the bidder submits
35 a unit price other than zero for all items of an authorized alternate, the Department
36 will determine the lowest total price based on the alternate bid.

37 103-3 WITHDRAWAL OF BIDS—MISTAKE

38 (A) Criteria for Withdrawal of Bid

39 The Department of Transportation may allow a bidder submitting a bid pursuant to
40 NCGS § 136-28.1 for construction or repair work to withdraw his bid after the scheduled
41 time of bid opening upon a determination that:

42 (1) A mistake was in fact made in the preparation of the bid.

43 (2) The mistake in the bid is of a clerical or mathematical nature and not one of bad
44 judgment, carelessness in inspecting the work site or in reading the contract.

- 1 (3) The mistake is found to be made in good faith and was not deliberate or by reason of
2 gross negligence.
- 3 (4) The amount of the error or mistake is equal to or greater than 3% of the total amount
4 bid.
- 5 (5) The notice of mistake and request for withdrawal of the bid by reason of the mistake
6 is communicated to the Engineer within 48 hours after the scheduled time of bid
7 opening. Upon proper notification of a mistake and request for withdrawal of bid,
8 the bidder shall submit within 48 hours written notice of mistake accompanied by
9 copies of bid preparation information to the Engineer. The notification of a mistake,
10 request for withdrawal of bid and copies of bid preparation information shall be
11 submitted to the State Contract Officer or Engineer.
- 12 (6) The Department will not be prejudiced or damaged except for the loss of the bid.

13 **(B) Hearing by the Engineer**

14 If a bidder files a notice of mistake along with a request to withdraw his bid, the Engineer
15 will promptly hold a hearing thereon. The Engineer will give to the requesting bidder
16 reasonable notice of the time and place of any such hearing. The bidder may appear at
17 the hearing and present the original working papers, documents or materials used in the
18 preparation of the bid sought to be withdrawn, together with other facts and arguments in
19 support of his request to withdraw his bid. The bidder shall be required to present
20 a written affidavit that the documents presented are the original, unaltered documents
21 used in the preparation of the bid.

22 **(C) Action by Chief Engineer**

23 A determination may be made by the Chief Engineer that the bidder meets the criteria for
24 withdrawal of the bid as set forth in Subarticle 103-3(A) upon presentation of clear and
25 convincing evidence by the bidder. The Engineer will present his findings to the Chief
26 Engineer for action on the bidder's request. The Engineer will advise the bidder of the
27 Chief Engineer's decision before the Department's consideration of award.

28 **(D) Bid Bond**

29 If a bid mistake is made and a request to withdraw the bid is made, the bid bond shall
30 continue in full force and effect until there is a determination by the Chief Engineer that
31 the conditions in Subarticle 103-3(A) have been met. The effect of the refusal of the
32 Contractor to give payment and performance bonds within 14 calendar days after the
33 notice of award is received by him, if award has been made by the Department after
34 consideration and denial of the Contractor's request to withdraw his bid, shall be
35 governed by the terms and conditions of the bid bond.

36 **103-4 AWARD OF CONTRACT**

37 **(A) General**

38 The lowest responsible bidder will be notified by letter that his bid has been accepted and
39 that he has been awarded the contract. This letter shall constitute the notice of award.
40 Where award is to be made, the notice of award will be issued within 60 days after the
41 opening of bids; except with the consent of the lowest responsible bidder, the decision to
42 award the contract to such bidder may be delayed for as long a time as may be agreed
43 upon by the Department and such bidder. In the absence of such agreement, the lowest
44 responsible bidder may withdraw his bid at the expiration of the 60 days without penalty
45 if no notice of award has been issued.

46 Award of a contract involving any unbalanced bid price may be made in accordance with
47 Article 102-14.

Section 103

1 (B) Title VI and Nondiscrimination

2 The North Carolina Department of Transportation, in accordance with the provisions of
3 Title VI of the Civil Rights Act of 1964 (78 Stat. 252) and the Regulations of the
4 Department of Transportation (49 CFR, Part 21), issued pursuant to such act, hereby
5 notifies all bidders that it will affirmatively insure that contracts entered in pursuant to
6 advertisements, if awarded, will be made by the Department to the lowest responsible
7 bidder without discrimination on the grounds of race, color or national origin.

8 (1) Title VI Assurance

9 During the performance of this contract, the contractor, for itself, its assignees and
10 successors in interest (hereinafter referred to as the "contractor") agrees as follows:

11 (a) Compliance with Regulations

12 The contractor shall comply with the Regulation relative to nondiscrimination in
13 Federally-assisted programs of the Department of Transportation (hereinafter,
14 "DOT") Title 49, Code of Federal Regulations, Part 21, as they may be amended
15 from time to time, (hereinafter referred to as the Regulations), which are herein
16 incorporated by reference and made a part of this contract.

17 (b) Nondiscrimination

18 The Contractor, with regard to the work performed by it during the contract,
19 shall not discriminate on the grounds of race, color, or national origin in the
20 selection and retention of subcontractors, including procurements of materials
21 and leases of equipment. The contractor shall not participate either directly or
22 indirectly in the discrimination prohibited by section 21.5 of the Regulations,
23 including employment practices when the contract covers a program set forth in
24 Appendix B of the Regulations.

25 (c) Solicitations for Subcontractors, Including Procurements of Materials and 26 Equipment

27 In all solicitations either by competitive bidding or negotiation made by the
28 contractor for work to be performed under a subcontract, including
29 procurements of materials or leases of equipment, each potential subcontractor
30 or supplier shall be notified by the contractor of the contractor's obligations
31 under this contract and the Regulations relative to nondiscrimination on the
32 grounds of race, color, or national origin.

33 (d) Information and Reports

34 The contractor shall provide all information and reports required by the
35 Regulations or directives issued pursuant thereto, and shall permit access to its
36 books, records, accounts, other sources of information, and its facilities as may
37 be determined by the North Carolina Department of Transportation (NCDOT) or
38 the Federal Highway Administration (FHWA) to be pertinent to ascertain
39 compliance with such Regulations, orders and instructions. Where any
40 information required of a contractor is in the exclusive possession of another
41 who fails or refuses to furnish this information the contractor shall so certify to
42 the NCDOT, or the FHWA as appropriate, and shall set forth what efforts it has
43 made to obtain the information.

44 (e) Sanctions for Noncompliance:

45 In the event of the contractor's noncompliance with the nondiscrimination
46 provisions of this contract, the NCDOT shall impose such contract sanctions as
47 it or the FHWA may determine to be appropriate, including, but not limited to:

1 (i) Withholding of payments to the contractor under the contract until the
2 contractor complies, and/or

3 (ii) Cancellation, termination or suspension of the contract, in whole or in part.

4 (f) Incorporation of Provisions

5 The contractor shall include the provisions of paragraphs (1) through (6) in
6 every subcontract, including procurements of materials and leases of equipment,
7 unless exempt by the Regulations, or directives issued pursuant thereto.

8 The contractor shall take such action with respect to any subcontractor
9 procurement as the NCDOT or the FHWA may direct as a means of enforcing
10 such provisions including sanctions for noncompliance: provided, however, that,
11 in the event a contractor becomes involved in, or is threatened with, litigation
12 with a subcontractor or supplier as a result of such direction, the contractor may
13 request the NCDOT to enter into such litigation to protect the interests of the
14 NCDOT, and, in addition, the contractor may request the United States to enter
15 into such litigation to protect the interests of the United States.

16 (2) Title VI Nondiscrimination Program

17 Title VI of the 1964 Civil Rights Act, 42 U.S.C. 2000d, provides that: “No person in
18 the United States shall, on the grounds of race, color, or national origin, be excluded
19 from participation in, be denied the benefits of, or be subjected to discrimination
20 under any program or activity receiving Federal financial assistance.” The broader
21 application of nondiscrimination law is found in other statutes, executive orders, and
22 regulations (see Section III, Pertinent Nondiscrimination Authorities), which provide
23 additional protections based on age, sex, disability and religion. In addition, the 1987
24 Civil Rights Restoration Act extends nondiscrimination coverage to all programs and
25 activities of federal-aid recipients and contractors, including those that are not
26 federally-funded.

27 The North Carolina Department of Transportation (NCDOT) hereby gives assurance
28 that no person shall on the ground of race, color, national origin, sex, age, and
29 disability, be excluded from participation in, be denied the benefits of, or be
30 otherwise subjected to discrimination under any program or activity conducted by
31 the recipient, as provided by Title VI of the Civil Rights Act of 1964, the Civil
32 Rights Restoration Act of 1987, and any other related Civil Rights authorities,
33 whether those programs and activities are federally funded or not.

34 During the performance of this contract, the Contractor and its subcontractors are
35 responsible for complying with NCDOT’s Title VI Program. The Contractor must
36 ensure that NCDOT’s Notice of Nondiscrimination is posted in conspicuous
37 locations accessible to all employees and subcontractors on the jobsite, along with
38 the Contractor’s own Equal Employment Opportunity (EEO) Policy Statement. The
39 Contractor shall physically incorporate this “Title VI and Nondiscrimination”
40 language, in its entirety, into all its subcontracts on federally-assisted and state-
41 funded NCDOT-owned projects, and ensure its inclusion by subcontractors into all
42 subsequent lower tier subcontracts. The Contractor and its subcontractors shall also
43 physically incorporate the FHWA-1273, in its entirety, into all subcontracts and
44 subsequent lower tier subcontracts on Federal-aid highway construction contracts
45 only. The Contractor is also responsible for making its subcontractors aware of
46 NCDOT’s Discrimination Complaints Process, as follows:

47 (a) Applicability

48 These complaint procedures apply to the beneficiaries of the NCDOT’s
49 programs, activities, and services, including, but not limited to, members of the

Section 103

1 public, contractors, subcontractors, consultants, and other sub-recipients of
2 federal and state funds.

3 (b) Eligibility

4 Any person or class of persons who believes he/she has been subjected to
5 discrimination or retaliation prohibited by any of the Civil Rights authorities,
6 based upon race, color, sex, age, national origin, or disability, may file a written
7 complaint with NCDOT's Civil Rights office. The law prohibits intimidation or
8 retaliation of any sort. The complaint may be filed by the affected individual or
9 a representative, and must be in writing.

10 (c) Time Limits and Filing Options

11 A complaint must be filed no later than 180 calendar days after the following:

12 (i) The date of the alleged act of discrimination; or

13 (ii) The date when the person(s) became aware of the alleged discrimination; or

14 (iii) Where there has been a continuing course of conduct, the date on which that
15 conduct was discontinued or the latest instance of the conduct.

16 Title VI and other discrimination complaints by be submitted to the following
17 entities:

18 (d) Format for Complaints

19 Complaints must be in writing and signed by the complainant(s) or a
20 representative and include the complainant's name, address, and telephone
21 number. Complaints received by fax or e-mail will be acknowledged and
22 processed. Allegations received by telephone will be reduced to writing and
23 provided to the complainant for confirmation or revision before processing.
24 Complaints will be accepted in other languages including Braille.

25 (e) Discrimination Complaint Form

26 Contact NCDOT Civil Rights to receive a full copy of the Discrimination
27 Complaint Form and procedures.

28 (g) Complaint Basis

29 Allegations must be based on issues involving race, color, national origin, sex,
30 age, or disability as shown in Table 103-1. The term "basis" refers to the
31 complainant's membership in a protected group category. Contact the NCDOT
32 Civil Rights to receive a Discrimination Complaint Form.

TABLE 103-1 COMPLAINT BASIS				
Protected Categories	Definition	Examples	Applicable Statutes and Regulations	
			FHWA	FTA
Race	An individual belonging to one of the accepted racial groups; or the perception, based usually on physical characteristics that a person is a member of a racial group	Black/African American, Hispanic/Latino, Asian, American Indian/Alaska Native, Native Hawaiian/Pacific Islander, White	Title VI of the Civil Rights Act of 1964; 49 CFR Part 21; 23 CFR 200	Title VI of the Civil Rights Act of 1964; 49 CFR Part 21; Circular 4702.1B
Color	Color of skin, including shade of skin within a racial group	Black, White, brown, yellow, etc.		
National Origin	Place of birth. Citizenship is not a factor. Discrimination based on language or a person's accent is also covered.	Mexican, Cuban, Japanese, Vietnamese, Chinese		
Sex	Gender	Women and Men	1973 Federal-Aid Highway Act	Title IX of the Education Amendments of 1972
Age	Persons of any age	21 year old person	Age Discrimination Act of 1975	
Disability	Physical or mental impairment, permanent or temporary, or perceived.	Blind, alcoholic, para-amputee, epileptic, diabetic, arthritic	Section 504 of the Rehabilitation Act of 1973; Americans with Disabilities Act of 1990	

1 (3) Pertinent Nondiscrimination Authorities

2 During the performance of this contract, the contractor, for itself, its assignees, and
3 successors in interest agrees to comply with the following non-discrimination
4 statutes and authorities, including, but not limited to:

5 (a) Title VI of the Civil Rights Act of 1964 (42 U.S.C. § 2000d *et seq.*, 78 stat.
6 252), (prohibits discrimination on the basis of race, color, national origin); and
7 49 CFR Part 21.

8 (b) The Uniform Relocation Assistance and Real Property Acquisition Policies Act
9 of 1970, (42 U.S.C. § 4601), (prohibits unfair treatment of persons displaced or
10 whose property has been acquired because of Federal or Federal-aid programs
11 and projects);

Section 103

- 1 (c) Federal-Aid Highway Act of 1973, (23 U.S.C. § 324 *et seq.*), (prohibits
2 discrimination on the basis of sex);
- 3 (d) Section 504 of the Rehabilitation Act of 1973, (29 U.S.C. § 794 *et seq.*), as
4 amended, (prohibits discrimination on the basis of disability); and 49 CFR Part
5 27;
- 6 (e) The Age Discrimination Act of 1975, as amended, (42 U.S.C. § 6101 *et seq.*),
7 (prohibits discrimination on the basis of age);
- 8 (f) Airport and Airway Improvement Act of 1982, (49 USC § 471, Section 47123),
9 as amended, (prohibits discrimination based on race, creed, color, national
10 origin, or sex);
- 11 (g) The Civil Rights Restoration Act of 1987, (PL 100-209), (Broadened the scope,
12 coverage and applicability of Title VI of the Civil Rights Act of 1964, The Age
13 Discrimination Act of 1975 and Section 504 of the Rehabilitation Act of 1973,
14 by expanding the definition of the terms “programs or activities” to include all
15 of the programs or activities of the Federal-aid recipients, sub-recipients and
16 contractors, whether such programs or activities are Federally funded or not);
- 17 (h) Titles II and III of the Americans with Disabilities Act, which prohibit
18 discrimination on the basis of disability in the operation of public entities, public
19 and private transportation systems, places of public accommodation, and certain
20 testing entities (42 U.S.C. §§ 12131 – 12189) as implemented by Department of
21 Transportation regulations at 49 C.F.R. parts 37 and 38;
- 22 (i) The Federal Aviation Administration’s Non-discrimination statute (49 U.S.C. §
23 47123) (prohibits discrimination on the basis of race, color, national origin, and
24 sex);
- 25 (j) Executive Order 12898, Federal Actions to Address Environmental Justice in
26 Minority Populations and Low-Income Populations, which ensures
27 discrimination against minority populations by discouraging programs, policies,
28 and activities with disproportionately high and adverse human health or
29 environmental effects on minority and low-income populations;
- 30 (k) Executive Order 13166, Improving Access to Services for Persons with Limited
31 English Proficiency, and resulting agency guidance, national origin
32 discrimination includes discrimination because of limited English proficiency
33 (LEP). To ensure compliance with Title VI, you must take reasonable steps to
34 ensure that LEP persons have meaningful access to your programs (70 Fed. Reg.
35 at 74087 to 74100);
- 36 (l) Title IX of the Education Amendments of 1972, as amended, which prohibits
37 you from discriminating because of sex in education programs or activities (20
38 U.S.C. 1681 *et seq.*).
- 39 (m) Title VII of the Civil Rights Act of 1964 (42 U.S.C. § 2000e *et seq.*, Pub. L. 88-
40 352), (prohibits employment discrimination on the basis of race, color, religion,
41 sex, or national origin);
- 42 (n) 49 CFR Part 26, regulation to ensure nondiscrimination in the award and
43 administration of DOT-assisted contracts in the Department’s highway, transit,
44 and airport financial assistance programs, as regards the use of Disadvantaged
45 Business Enterprises (DBEs);
- 46 (o) Form FHWA-1273, “Required Contract Provisions,” a collection of contract
47 provisions and proposal notices that are generally applicable to all Federal-aid
48 construction projects and must be made a part of, and physically incorporated
49 into, all federally-assisted contracts, as well as appropriate subcontracts and

1 purchase orders, particularly Sections II (Nondiscrimination) and III
2 (Nonsegregated Facilities).

3 **(C) Award Limits**

4 A bidder who desires to bid on more than one project on which bids are to be opened on
5 the same date and who desires to avoid receiving an award of more projects than he is
6 equipped to handle, may bid on any number of projects but may limit the total amount of
7 work awarded to him on selected projects by completing the form Award Limits on
8 Multiple Projects for each project subject to the award limit. In the event that a bidder is
9 the lowest responsible bidder on projects subject to the award limit and the value of such
10 projects is more than the award limit established by such bidder, the Department will not
11 award such bidder projects from among those subject to the award limit which have
12 a total value exceeding the award limit. The projects to be awarded to the bidder will be
13 those projects on which award will result in the lowest total cost to the Department.

14 In determining the lowest total cost to the Department, the options of rejecting a bid or
15 readvertising for new bids may be considered.

16 All bids submitted without the properly executed form Award Limits on Multiple
17 Projects will not be subject to the award limit. In the event that there is a discrepancy
18 between the completed award limit forms submitted by the same bidder for the different
19 projects in a letting, the Department reserves the right to declare all such award limit
20 forms invalid or to make such interpretation of the discrepancy as may be in the best
21 interests of the Department. However, the presence of such discrepancy shall not be
22 reason for declaring any bid irregular nor shall it invalidate the conditions of his bid bond
23 or bid deposit.

24 Where a prequalified Contractor bids individually (as opposed to a Joint Venture) on one
25 or more projects and bids on one of more projects as part of a Joint Venture, such
26 individual bidder and such Joint Venture will be considered separate bidders in applying
27 the provisions of this article.

28 (1) Paper Bids

29 This form will be bound within each proposal. This form will not be effective unless
30 the amount is filled in and the form is properly signed.

31 (2) Electronic Bids

32 This form is located in the .ebs miscellaneous data file of Expedite. The bidder shall
33 click on yes or no to indicate whether or not the bidder desires to limit the award.

34 **103-5 CANCELLATION OF AWARD**

35 The Department reserves the right to rescind the award of a contract for any reason at any
36 time before the receipt of the properly executed contract bonds from the successful bidder.

37 **103-6 RETURN OF BID BOND OR BID DEPOSIT**

38 Checks that have been furnished as a bid deposit by all bidders, other than the 3 lowest
39 responsible bidders, will be retained not more than 10 calendar days after the date of opening
40 of bids. After the expiration of such period, the checks that were furnished as a bid deposit
41 will be returned to all bidders other than the 3 lowest responsible bidders.

42 Checks that have been furnished as a bid deposit by the 3 lowest responsible bidders will be
43 retained until after the contract bonds have been furnished by the successful bidder at which
44 time the checks that were furnished as a bid deposit will be returned to the 3 lowest
45 responsible bidders.

Section 104

1 Paper bid bonds will be retained by the Department until the contract bonds are furnished by
2 the successful bidder after which all such bid bonds will be destroyed unless the individual
3 bid bond form contains a note requesting that it be returned to the bidder or the Surety.

4 103-7 CONTRACT BONDS

5 The successful bidder, within 14 calendar days after the notice of award is received by him,
6 shall provide the Department with a contract payment bond and a contract performance bond
7 each in an amount equal to 100% of the amount of the contract. All bonds shall be in
8 conformance with NCGS § 44A-33. The corporate surety furnishing the bonds shall be
9 authorized to do business in the State.

10 103-8 EXECUTION OF CONTRACT

11 As soon as possible following receipt of the properly executed contract bonds, the Department
12 will complete the execution of the contract, retain the original contract and return one copy of
13 the contract to the Contractor.

14 103-9 FAILURE TO FURNISH CONTRACT BONDS

15 The successful bidder's failure to file acceptable bonds within 14 calendar days after the
16 notice of award is received by him shall be just cause for the forfeiture of the bid bond or bid
17 deposit and rescinding the award of the contract. Award may then be made to the next lowest
18 responsible bidder or the work may be readvertised and constructed under contract or
19 otherwise, as the Department may decide.

20 SECTION 104 **21 SCOPE OF WORK**

22 104-1 INTENT OF CONTRACT

23 The intent of the contract is to prescribe the work or improvements that the Contractor
24 undertakes to perform, in full compliance with the contract documents. In case the method of
25 construction or character of any part of the work is not covered by the plans, these
26 specifications shall apply. The Contractor shall perform all work in accordance with the lines,
27 grades, typical sections, dimensions and other data shown in the plans, or that may be
28 modified by written orders and shall do such additional, extra and incidental work as may be
29 considered necessary to complete the work to the full intent of the plans and specifications.
30 Unless otherwise provided in the contract, the Contractor shall furnish all implements,
31 machinery, equipment, tools, materials, supplies, transportation and labor necessary for the
32 prosecution and completion of the work.

33 104-2 SUPPLEMENTAL AGREEMENTS

34 Whenever it is necessary to make amendments to the contract to satisfactorily complete the
35 proposed construction or to provide authorized time extensions, the Engineer shall have the
36 authority to enter into a supplemental agreement covering such amendments.

37 Supplemental agreements shall become a part of the contract when executed by the Engineer
38 and an authorized representative of the Contractor. The Contractor shall file with the
39 Engineer a copy of the name or names of his representatives who are authorized to sign
40 supplemental agreements.

41 104-3 ALTERATIONS OF PLANS OR DETAILS OF CONSTRUCTION

42 The Engineer reserves the right to make, at any time during the progress of the work, such
43 alterations in the plans or in the details of construction as may be found necessary or
44 desirable. Under no circumstances will an alteration involve work beyond the termini of the
45 proposed construction except as may be necessary to satisfactorily complete the project. Such
46 alterations shall not invalidate the contract nor release the Surety, and the Contractor agrees to
47 perform the work as altered at his contract unit or lump sum prices the same as if it had been
48 a part of the original contract except as otherwise herein provided.

1 An adjustment in the affected contract unit or lump sum prices due to alterations in the plans
2 or details of construction that impacts the controlling operation and materially changes the
3 character of the work and the cost of performing the work will be made by the Engineer only
4 as provided in this article.

5 If the Engineer makes an alteration in the plans or details of construction, which he
6 determines will materially change the character of the work and the cost of performing the
7 work, an adjustment will be made and the contract modified in writing accordingly. The
8 Contractor will be paid for performing the affected work in accordance with
9 Subarticle 104-8(A).

10 When the Contractor is required to perform work that is, in his opinion, an alteration in the
11 plans or details of construction that materially changes the character of the work and the cost
12 of performing the work, he shall notify the Engineer in writing before performing such work.
13 The Engineer will investigate and, based upon his determination, one of the following will
14 occur:

15 (A) If the Engineer determines that the affected work is an alteration of the plans or details of
16 construction that materially changes the character of the work and the cost of performing
17 the work, the Contractor will be notified in writing by the Engineer and compensation
18 will be made in accordance with Subarticle 104-8(A).

19 (B) If the Engineer determines that the work is not such an alteration in the plans or details of
20 construction that materially changes the character of the work and the cost of performing
21 the work, he will notify the Contractor in writing of his determination. If the Contractor,
22 upon receipt of the Engineer's written determination, still intends to file a claim for
23 additional compensation by reason of such alteration, he shall notify the Engineer in
24 writing of such intent before beginning any of the alleged altered work, and the
25 provisions of Subarticle 104-8(B) shall be strictly adhered to.

26 No contract adjustment will be allowed under this article for any effects caused on
27 unaltered work.

28 If the Contractor elects to file a written claim or requests an extension of contract time, it shall
29 be submitted on the Contractor Claim Submittal Form available through the Construction
30 Unit.

31 **104-4 SUSPENSIONS OF WORK ORDERED BY THE ENGINEER**

32 **(A) Suspensions of the Work Ordered by the Engineer**

33 When the Engineer suspends in writing the performance of all or any portion of the work
34 for a period of time not originally anticipated, customary or inherent to the construction
35 industry and the Contractor believes that additional compensation for idle equipment or
36 labor is justifiably due as a result of such suspension, the Contractor shall notify the
37 Engineer in writing of his intent to file a claim for additional compensation within
38 7 calendar days after the Engineer suspends the performance of the work and the
39 provisions of Subarticle 104-8(C) shall be strictly adhered to.

40 Within 14 calendar days of receipt by the Contractor of the notice to resume work, the
41 Contractor shall submit his claim to the Engineer in writing on the Contractor Claim
42 Submittal Form available through the Construction Unit. Such claim shall set forth the
43 reasons and support for such adjustment in compensation including cost records and any
44 other supporting justification in accordance with Subarticle 104-8(C).

45 **(B) Alleged Suspension**

46 If the Contractor contends he has been prevented from performing all or any portion of
47 the work for a period of time not originally anticipated, customary or inherent to the
48 construction industry because of conditions beyond the control of and not the fault of the
49 Contractor, its suppliers or subcontractors at any tier and not caused by weather, but the

Section 104

1 Engineer has not suspended the work in writing, the Contractor shall submit to the
2 Engineer a written notice of intent to file a claim for additional compensation by reason
3 of such alleged suspension. No adjustment in compensation will be allowed for idle
4 equipment or labor before the time of the submission of the written notice of intent to file
5 a claim for additional compensation by reason of such alleged suspension. Upon receipt,
6 the Engineer will evaluate the Contractor's notice of intent to file a claim for additional
7 compensation. If the Engineer agrees with the Contractor's contention, the Engineer will
8 suspend in writing the performance of all or any portion of the work, and
9 Subarticle 104-8(C) shall be strictly adhered to.

10 If the Engineer does not agree with the Contractor's contention as described above and
11 determines that no portion of the work should be suspended, he will notify the Contractor
12 in writing of his determination. If the Contractor does not agree with the Engineer's
13 determination, Subarticle 104-8(C) shall be strictly adhered to. Within 14 calendar days
14 after the last day of the alleged suspension, the Contractor shall submit his claim to the
15 Engineer in writing on the Contractor Claim Submittal Form available through the
16 Construction Unit. Such claim shall set forth the reasons and support for such adjustment
17 in compensation, including cost records and any other supporting justification in
18 accordance with Subarticle 104-8(C).

19 (C) Conditions

20 No adjustment in compensation will be allowed under Subarticles 104-4(A) and 104-4(B)
21 for any reason whatsoever for each occurrence of idle equipment or idle labor that has
22 a duration of 24 hours or less.

23 No adjustment in compensation will be allowed under Subarticles 104-4(A) and 104-4(B)
24 to the extent that performance would have been suspended by any other cause or for
25 which an adjustment is provided for or excluded under any other term or condition of the
26 contract.

27 No adjustment in compensation will be allowed under Subarticles 104-4(A) and 104-4(B)
28 for any effects caused on unchanged work. No adjustment in compensation will be
29 allowed under Subarticles 104-4(A) and 104-4(B) except for idle equipment or idle labor
30 resulting solely from the suspension of work in writing by the Engineer.

31 No adjustment in compensation will be allowed under Subarticles 104-4(A) and 104-4(B)
32 where temporary suspensions of the work have been ordered by the Engineer in
33 accordance with Article 108-7 and the temporary suspensions are a result of the fault or
34 negligence of the Contractor.

35 **104-5 OVERRUNS AND UNDERRUNS OF CONTRACT QUANTITIES**

36 (A) General

37 The Engineer reserves the right to make at any time during the work such changes in
38 quantities as are necessary to satisfactorily complete the project. Such changes in
39 quantities shall not invalidate the contract, nor release the Surety, and the Contractor
40 agrees to perform the work as changed. The Engineer will notify the Contractor in
41 writing of the significant changes in the quantities.

42 The Contractor will be entitled to an adjustment in contract unit prices for increased costs
43 incurred over the original bid prices in performing contract items that overrun or
44 underrun the estimated contract quantities only as provided for in this article.

45 (B) Overruns - Increase in Unit Price

46 If the actual quantity of any major contract item overruns the original bid quantity by
47 more than 15% of such original bid quantity, or the actual quantity of any minor contract
48 item overruns the original bid quantity by more than 100% of such original bid quantity,
49 an increase to the contract unit price, excluding loss of anticipated profits, may be

1 authorized by the Engineer. Revised contract unit prices pertaining to overruns will be
 2 applicable only to that portion of the overrun that is in excess of the percentages stated
 3 above.

4 (1) Whenever it is anticipated that an overrun in a major or minor contract item in excess
 5 of that described above will occur, the Contractor may make written request for
 6 a revision to contract unit prices. It shall be incumbent upon the Contractor to justify
 7 the request for a revision to contract unit prices. After reviewing the Contractor's
 8 request, the Engineer will notify the Contractor of his determination as follows:

9 (a) If the Engineer determines a revision to the contract unit price is justified and
 10 the Engineer and the Contractor are in agreement as to the revision to be made
 11 to the contract unit price, a supplemental agreement covering the revised
 12 contract unit price will be consummated before performing work on that
 13 quantity in excess of the percentage set forth above.

14 If the Engineer determines a revision to the contract unit price is justified and
 15 the Engineer and the Contractor are not in agreement as to the revision to be
 16 made to the contract unit price, the Engineer will issue a force account notice
 17 before performing work on that quantity in excess of the percentage set forth
 18 above.

19 (b) If the Engineer determines a revision to the contract unit price is not justified he
 20 will notify the Contractor of his determination in writing and payments will be
 21 made for the work at the contract unit price. Upon completion of the work, the
 22 Contractor may request an adjustment to the contract unit price as provided
 23 below.

24 (2) Whenever an overrun in a contract item in excess of the percentages previously set
 25 forth has occurred and a supplemental agreement establishing an increase to the
 26 contract unit price has not been executed or the Engineer has not issued a force
 27 account notice, the Contractor may make written request for a revision in the original
 28 contract unit price. Any adjustment to the contract unit prices due to overruns will
 29 be made by the Engineer based upon his evaluation and comparison of the
 30 Contractor's documented cost records of the contract unit prices for those contract
 31 items. The Contractor's documented cost records for the work performed on those
 32 quantities beyond the percentages stated above shall be kept in accordance with
 33 Article 109-3. The Contractor's cost records and supporting data shall be complete
 34 in every respect and in such form that they can be checked. It shall be incumbent
 35 upon the Contractor to satisfy the Engineer of the validity of any request presented
 36 by the Contractor for an adjustment to the contract unit price. After reviewing the
 37 Contractor's request, the Engineer can make such adjustment as he deems warranted
 38 based upon his engineering judgment and the payment to the Contractor will be
 39 made accordingly.

40 (C) Underruns - Increase in Unit Price

41 If the actual quantity of any major contract item underruns the original bid quantity by
 42 more than 15% of such original bid quantity, an increase to the contract unit price,
 43 excluding loss of anticipated profit, may be authorized by the Engineer. Revised contract
 44 unit prices pertaining to underruns of major contract items will be applicable to the entire
 45 quantity of the contract item that underruns. No revision will be made to the contract unit
 46 price for any minor contract item that underruns the original bid quantities.

47 (1) Whenever it is anticipated that an underrun in a major contract item in excess of that
 48 described above will occur, the Contractor may make written request for a revision
 49 to the contract unit price. If the Engineer and the Contractor are in agreement as to
 50 the revision to be made to the contract unit price, then a supplemental agreement
 51 covering the revised unit price will be entered into. If the Engineer and the

Section 104

1 Contractor are not in agreement, then after performance of the work, a revised unit
2 price may be determined as described below.

3 (2) Whenever an underrun in a major contract item in excess of the percentage
4 previously set forth has occurred and a supplemental agreement establishing
5 an increase to the contract unit price has not been executed, the Contractor may make
6 written request for a revision to the original contract unit price. The Contractor shall
7 submit sufficient documentation and analysis of his costs to satisfy the Engineer of
8 any non-recovered costs included in the item that underran. Any adjustment to the
9 contract unit prices due to underruns will be made by the Engineer based upon his
10 evaluation of the Contractor's documentation and an analysis showing how changes
11 in contract item cost are attributable to the underrun. An analysis of costs shall be
12 supplemented with the Contractor's documented cost records for work performed on
13 the total quantity of the affected item where the Contractor's request for
14 compensation includes compensation for costs other than recovered fixed costs.
15 The Contractor's cost records shall be complete in every respect and in such form
16 that the Engineer can check them. It shall be incumbent upon the Contractor to
17 satisfy the Engineer of the validity of any request presented by the Contractor for
18 adjustment to the contract unit price. After reviewing the Contractor's request, the
19 Engineer may make such adjustment as he deems warranted, based upon his
20 engineering judgment. Payment will be made on the final estimate. The total
21 payment, including any additional compensation granted by the Engineer due to an
22 underrun in a major contract item, shall not exceed the payment that would have
23 been made for the performance of 100% of the original contract quantity at the
24 original contract unit price.

25 Where non-stock fabricated materials are involved in minor items that underrun or in
26 major items that underrun by less than 15%, and where fabrication of such material
27 has begun or been completed before the Contractor is advised of the reduction in the
28 quantity of the pay item, the Department will reimburse the Contractor for the
29 verified fabrication cost, including the cost of material less salvage value, or it may
30 instruct the Contractor to have the fabricated material delivered to a site designated
31 by the Engineer and make payment for such material in accordance with
32 Article 109-6.

33 (D) Overruns and Underruns - Reduction In Unit Price

34 Whenever it is anticipated that an overrun or underrun in a major contract item in excess
35 of 15% or an overrun in a minor contract item in excess of 100% will occur, the Engineer
36 may make written request for a reduction to the contract unit price. If the Engineer and
37 the Contractor are in agreement as to the decrease to be made to the contract unit price,
38 a supplemental agreement covering the revised unit price will be consummated before
39 beginning work on that quantity in excess of the allowable percentages. If the Engineer
40 and the Contractor are not in agreement as to the decrease to be made, the Contractor will
41 be directed to perform the affected work on a force account basis. Payment for the
42 affected work will be made based upon force account records kept in accordance with
43 Article 109-3 but shall not exceed that payment that would have been made at the
44 original contract unit price.

45 104-6 ELIMINATED CONTRACT ITEMS

46 The Engineer may eliminate any item from the contract, and such action will in no way
47 invalidate the contract. In the event the item of work involves pre-fabricated materials that
48 are not considered to be stock items and fabrication of such material is begun or completed
49 before the Contractor is advised of the elimination of the contract item, the Department may
50 reimburse the Contractor for the verified fabrication cost including the cost of materials less
51 salvage value or may instruct the Contractor to have the fabricated material delivered to a site

1 designated by the Engineer and make payment for such material in accordance with
2 Article 109-6.

3 If the Contractor has partially completed a contract item before notification of the elimination
4 of such item, the Department will reimburse the Contractor for the verified actual cost of the
5 partially completed work not to exceed the payment that would have been made at the
6 contract unit or lump sum price for the completed work.

7 No payment will be made for loss of anticipated profits, and no other allowance will be made
8 for eliminated items except as listed above.

9 **104-7 EXTRA WORK**

10 The Contractor shall perform extra work whenever it is deemed necessary or desirable to
11 complete fully the work as contemplated. Extra work, as defined in Section 101, shall be
12 performed in accordance with the contract and as directed. No extra work shall be
13 commenced before specific authorization for the performance of such extra work being given
14 by the Engineer.

15 Extra work that is specifically authorized by the Engineer will be paid in accordance with
16 Subarticle 104-8(A).

17 When the Contractor is required to perform work that is, in his opinion, extra work, he shall
18 notify the Engineer in writing before performing such work. The Engineer will investigate
19 and, based upon his determination, one of the following will occur.

20 (A) If the Engineer determines that the affected work is extra work, the Contractor will be
21 notified in writing by the Engineer and compensation will be made in accordance with
22 Subarticle 104-8(A).

23 (B) If the Engineer determines that the work is not extra work, he will notify the Contractor
24 in writing of his determination. If the Contractor upon receipt of the Engineer's written
25 determination intends to file a claim for additional compensation by reason of such work,
26 he shall notify the Engineer in writing of such intent before beginning any of the alleged
27 extra work and in conformance with Subarticle 104-8(B).

28 Work performed without prior written consent of the Engineer will be considered incidental to
29 the work of the contract.

30 If the Contractor elects to file a written claim or requests an extension of contract time, it shall
31 be submitted on the Contractor Claim Submittal Form available through the Construction
32 Unit.

33 **104-8 COMPENSATION AND RECORD KEEPING**

34 **(A) Compensation for Articles 104-3 or 104-7**

35 When the Engineer and Contractor agree that compensation is due under
36 Articles 104-3 or 104-7, payment will be made in accordance with one of the following:

37 (1) When the Engineer and the Contractor agree to the prices to be paid, the agreement
38 will be set forth in a supplemental agreement. If the estimated total cost of the
39 affected work is equal to or less than \$25,000 and the prices for performing the work
40 have been mutually agreed to, the Contractor may begin work before executing the
41 supplemental agreement. If the estimated total cost of the affected work is more than
42 \$25,000, the Contractor shall not begin the affected work until the supplemental
43 agreement is executed.

44 (2) When the Engineer and the Contractor cannot agree to the prices to be paid for the
45 affected work, the Engineer will issue a force account notice before the Contractor
46 begins work. In this instance the affected work shall be performed as directed by the
47 Engineer and paid in accordance with Article 109-3.

Section 104

1 (B) Claim for Additional Compensation

2 The Contractor's notice of intent to file a claim for additional compensation under
3 Articles 104-3 and 104-7 shall be given to the Engineer in writing. The Contractor shall
4 keep accurate and detailed cost records in accordance with Article 109-3. The
5 Contractor's cost records and supporting data shall be complete in every respect and in
6 such form that they may be checked by the Engineer. The Contractor's cost records and
7 supporting data shall clearly indicate the cost of performing the work in dispute and shall
8 separate the cost of any work for which payment has been made. The Contractor's cost
9 records shall be kept up to date and the Engineer shall be given the opportunity to review
10 the methods by which the records are being maintained. The cost records shall be
11 prepared weekly for each occurrence for which notice of intent to file a claim has been
12 given and submitted to the Engineer within 7 calendar days after the end of a given
13 weekly period.

14 If the Contractor chooses to pursue the claim after the disputed work is complete, he shall
15 submit a written claim to the Engineer for an adjustment in compensation based upon his
16 cost records within 120 calendar days after completion of the disputed work. This claim
17 shall summarize previously submitted cost records and clearly describe the Contractor's
18 justification for an adjustment in compensation under the terms of the contract. The
19 claim shall be accompanied by a certification from an officer of the company or person
20 authorized to execute supplemental agreements, stating that the claim is truthful and
21 accurate.

22 Upon receipt, the Engineer will review the Contractor's request and supporting
23 documentation and notify the Contractor if the request is complete with all necessary
24 supporting documentation and cost records.

25 If the Engineer determines that the work covered by the claim is in fact compensable
26 under the terms of the contract, an adjustment in compensation will be made based upon
27 the documentation presented and his engineering judgment. The adjustment will be made
28 on the next partial pay estimate and reflected on the final estimate. The compensation
29 allowed shall be limited to the amount that would be paid if the work was performed in
30 accordance with Article 109-3.

31 If the Engineer determines that the work covered by the claim is not compensable under
32 the terms of the contract, the claim will be denied. The Engineer will notify the
33 Contractor of his determination whether or not an adjustment of the contract is warranted
34 within 120 calendar days after receipt of the complete request, all necessary supporting
35 justification and cost records.

36 The failure on the part of the Contractor to perform any of the following shall be a bar to
37 recovery under Articles 104-3 or 104-7:

- 38 (1) The failure to notify the Engineer in writing before performing the work in dispute
39 that he intends to file a claim.
- 40 (2) The failure of the Contractor to keep records in accordance with Article 109-3.
- 41 (3) The failure of the Contractor to give the Engineer the opportunity to monitor the
42 methods by which records are being maintained.
- 43 (4) The failure of the Contractor to submit additional documentation requested by the
44 Engineer provided documentation requested is available within the Contractor's
45 records.
- 46 (5) The failure of the Contractor to submit cost records weekly.
- 47 (6) The failure of the Contractor to submit the written request for an adjustment in
48 compensation with cost records and supporting information within 120 calendar days
49 of completion of the affected work.

(C) Compensation for Article 104-4

The Contractor's notice of intent to file a claim for additional compensation under Subarticle 104-4(A) shall be given to the Engineer in writing within 7 calendar days after the Engineer suspends the performance of the work. For an alleged suspension, the Contractor's notice of intent to file a claim for additional compensation under Subarticle 104-4(B) shall be given to the Engineer in writing. The Contractor shall keep accurate and detailed records of the alleged idle equipment and alleged idle labor. The Contractor's cost records, supporting data and supporting information shall be complete in every respect and in such form that they may be checked by the Engineer. The Contractor's cost records, supporting data and supporting information for equipment idled due to the suspension or alleged suspension shall specifically identify each individual piece of equipment, its involvement in the work, its location on the project, the requested rental rate and justification as to why the equipment cannot be absorbed into unaffected work on the project during the period of suspension or alleged suspension. The Contractor's cost records, supporting data and supporting information for idle labor shall include the specific employees, classification, dates and hours idled, hourly rate of pay, their involvement in the project and justification as to why they cannot be absorbed into the unaffected work on the project or other projects during the period of suspension or alleged suspension. The Contractor's cost records, supporting data and supporting information shall be kept up to date and the Engineer shall be given the opportunity to review the methods by which the records, data and information are being maintained. The cost records, supporting data and supporting information shall be prepared weekly for each occurrence for which notice of intent to file a claim has been given and submitted to the Engineer within 7 calendar days after the end of a given weekly period.

If the Contractor chooses to pursue the claim after the suspension or alleged suspension period has ended, he shall submit a written claim to the Engineer for an adjustment in compensation based upon his cost records due to idle equipment and/or idle labor within 14 calendar days of receipt of the notice to resume work or within 14 calendar days of expiration of the alleged suspension period. This request shall summarize previously submitted cost records and clearly describe the Contractor's justification for an adjustment in compensation under the terms of the contract.

Upon receipt, the Engineer will evaluate the Contractor's request. If the Engineer agrees that the cost of the work directly associated with the suspension or alleged suspension has increased as a result of such suspension or alleged suspension and the suspension or alleged suspension was caused by conditions beyond the control of and not the fault of the Contractor, his suppliers or subcontractors at any approved tier and not caused by weather, the Engineer will make an adjustment, excluding profit, and will modify the contract in writing accordingly. The Contractor will be paid the verified actual cost of the idle equipment and idle labor. The compensation allowed shall be limited to the equipment, labor, bond, insurance and tax costs, excluding profits, computed in accordance with Article 109-3.

If the Engineer determines that the suspensions of the work by the Engineer or alleged suspensions do not warrant an adjustment in compensation, he will notify the Contractor in writing of his determination.

The Engineer will notify the Contractor of his determination of whether or not an adjustment in compensation is warranted within 120 calendar days after receipt of the complete request, all necessary supporting justification and cost records.

Section 104

1 The failure on the part of the Contractor to perform any of the following shall be a bar to
2 recovery under Article 104-4:

3 (1) The failure to notify the Engineer in writing within 7 calendar days after the
4 Engineer suspends in writing the performance of all or any portion of the work.

5 (2) The failure to notify the Engineer in writing that he intends to file a claim by reason
6 of alleged suspension.

7 (3) The failure of the Contractor to keep records in accordance with the details of
8 Article 109-3.

9 (4) The failure of the Contractor to give the Engineer the opportunity to monitor the
10 methods by which records are being maintained.

11 (5) The failure of the Contractor to submit additional documentation requested by the
12 Engineer provided the documentation requested is available within the Contractor's
13 records.

14 (6) The failure of the Contractor to submit cost records weekly.

15 (7) The failure of the Contractor to submit the written request for an adjustment in
16 compensation with cost records, supporting data and supporting information within
17 14 calendar days of receipt of the notice to resume work.

18 (8) The failure of the Contractor to submit the written request for an adjustment in
19 compensation with cost records, supporting data and supporting information within
20 14 calendar days after the last day of the period during which the Contractor
21 contends he has been prevented from performing all or any portion of the work for
22 an unreasonable period of time (not originally anticipated, customary, or inherent to
23 the construction industry) because of conditions beyond the control of, and not the
24 fault of, the Contractor, its suppliers or subcontractors at any approved tier and not
25 caused by weather.

26 **(D) Notification of Determination**

27 The failure on the part of the Engineer to notify the Contractor of his determination on
28 the requested adjustment in compensation within 120 calendar days after receipt of the
29 complete request, all supporting justification and cost records will result in payment of
30 interest on any monies determined to be due from the requested adjustment in
31 compensation. Interest, at the average rate earned by the State Treasurer on the
32 investment within the State's Short Term Investment Fund during the month preceding
33 the date interest becomes payable, will be paid to the Contractor on the next partial pay
34 estimate and reflected on the final estimate for the period beginning on the 121st day after
35 receipt of the complete request, all supporting justification and cost records, and
36 extending to the date the Engineer makes his determination on the disputed work.

37 If the Contractor fails to receive such adjustment in compensation for the disputed work
38 as he claims to be entitled to under the terms of the contract, the Contractor may resubmit
39 the written request for an adjustment in compensation to the Engineer as a part of the
40 final claim after the project is complete. The Contractor will only be allowed to submit
41 the request for an adjustment in compensation one time during the construction of the
42 project.

104-9 DISPOSITION OF SURPLUS PROPERTY

All property that is surplus to the needs of the project will remain or become the property of the Contractor, unless otherwise stated in the contract, with the following exceptions:

(A) Materials that are the property of utility companies providing service to buildings that are to be demolished or removed in accordance with Sections 210 and 215,

(B) Materials resulting from the removal of existing pavement in accordance with Section 250 that are to be stockpiled for the use of the Department,

(C) Materials resulting from the removal of existing structures in accordance with Section 402 where the contract indicates that the material will remain the property of the Department,

(D) Aggregate base course where the contract requires that this material become the property of the Department,

(E) Left over materials for which the Department has reimbursed the Contractor as provided in Article 109-6 and

(F) Materials that have been furnished by the Department for use on the project.

Property shall include but not be limited to materials furnished by the Contractor or the Department for either temporary or permanent use on the project, salvaged materials that were part of the existing facility on the date of availability for the project, and all implements, machinery, equipment, tools, supplies, laboratories, field offices and watercraft that are necessary for the satisfactory completion of the project.

All property that is the property of the Contractor shall be removed from the project by the Contractor before final acceptance.

104-10 MAINTENANCE OF THE PROJECT

The Contractor shall maintain the project from the date of availability or the date of beginning work, whichever occurs first, until the project is finally accepted. On resurfacing projects the Contractor shall maintain each part of the project, as defined by map numbers, from the date of beginning work on that part until such part is finally accepted. This maintenance shall be continuous and effective and shall be prosecuted with adequate equipment and forces to the end that all work covered by the contract is kept in satisfactory and acceptable condition at all times.

The Contractor shall maintain all existing drainage facilities, except where the work consists of resurfacing only, such that they are in the same condition upon acceptance of the project as they were when the project was made available to the Contractor.

In the event that the Contractor's work is suspended for any reason, the Contractor shall maintain the work covered by the contract, as provided herein.

When a portion of the project is accepted as provided in Article 105-17, immediately after such acceptance the Contractor will not be required to maintain the accepted portions. Should latent defects be discovered or become evident in an accepted portion of the project, such defective work shall be repaired or replaced at no cost to the Department.

Where an observation period is required that extends beyond the final acceptance date, the Contractor shall perform any work required by the observation period until satisfactory completion of the observation period. The Contractor will not be directly compensated for any maintenance operations necessary, as this work will be incidental to the work covered by the various contract items.

Section 104

1 **104-11 FINAL CLEANING UP**

2 Before acceptance of the project, the highway, borrow sources, waste areas and all ground
3 occupied by the Contractor within the project limits in connection with the work shall be
4 cleaned of all rubbish, excess materials, temporary structures and equipment. All parts of the
5 work shall be left in an acceptable condition.

6 The Contractor will not be directly compensated for the work of final cleaning up, as this
7 work will be considered incidental to the work covered by the various contract items.

8 **104-12 VALUE ENGINEERING PROPOSAL**

9 This value engineering specification is to provide an incentive to the Contractor to initiate,
10 develop and present to the Department for consideration, any cost reduction proposals
11 conceived by him involving changes to the contract. This specification does not apply unless
12 the proposal submitted is specifically identified by the Contractor as being presented for
13 consideration as a Value Engineering Proposal (VEP). Submittals that propose material
14 substitutions of permanent features, such as, but not limited to, changes from rigid to flexible
15 or flexible to rigid pavements, concrete to steel or steel to concrete bridges will not be
16 considered acceptable VEPs. Depending on the complexity of evaluation and
17 implementations, VEPs that provide for a total savings before distribution of less than
18 \$10,000 may not be considered.

19 **(A) Types of Proposals**

20 VEPs contemplated are those that would result in a net savings to the Department by
21 providing a decrease in the total cost of construction or reduce the construction time
22 without increasing the cost to construct the project. The effects the VEP may have on the
23 following items, but not limited to these items, will be considered by the Department
24 when evaluating the VEP:

- 25 (1) Service life,
- 26 (2) Safety,
- 27 (3) Reliability,
- 28 (4) Economy of operation,
- 29 (5) Ease of maintenance,
- 30 (6) Desired aesthetics,
- 31 (7) Design,
- 32 (8) Standardized features, and
- 33 (9) Environmental impact.

34 **(B) Evaluation of Proposals**

35 The Department reserves the right to reject the VEP or deduct from the savings identified
36 in the VEP to compensate for any adverse effects to these items that may result from
37 implementation of the VEP.

38 The Department reserves the right to reject, at its discretion, any VEP submitted that
39 would require additional right of way. Substitution of another design alternate detailed in
40 the contract plans for the one that the Contractor bid will not be allowed. Plan errors that
41 are identified by the Contractor and that result in a cost reduction will not qualify for
42 submittal as a VEP. Pending execution of a formal supplemental agreement
43 implementing an approved VEP and transferal of final plans (hard copy and electronic)
44 sealed by an engineer licensed in the State of North Carolina incorporating an approved
45 VEP to the Resident Engineer and the State Value Management Engineer, the Contractor
46 shall remain obligated to perform in accordance with the terms of the existing contract.
47 No time extension will be granted due to the time required to review a VEP.

1 (C) Subcontractors

2 The Contractor is encouraged to include this specification in contracts with
3 subcontractors. The Contractor shall encourage submissions of VEPs from
4 subcontractors; however, it is not mandatory that the Contractor accept or transmit to the
5 Department, VEPs proposed by his subcontractors. The Contractor may choose any
6 arrangement for the subcontractor value engineering payments, provided that these
7 payments shall not reduce the Department's share of the savings resulting from the VEP.

8 (D) Preliminary Review

9 Should the Contractor desire a preliminary review of a possible VEP, before expending
10 considerable time and expense in full development, a copy of the preliminary VEP shall
11 be submitted to the Resident Engineer and the State Value Management Engineer at
12 ValueManagementUnit@ncdot.gov. The submittal shall state "Preliminary Value
13 Engineering Proposal Review Request" and shall contain sufficient drawings, cost
14 estimates and written information that can be clearly understood and interpreted. Include
15 the identity of any Private Engineering Firms proposed by the Contractor to prepare
16 designs or revisions to designs. The Department will review the preliminary submittal
17 only to the extent necessary to determine if it has possible merit as a VEP. This review
18 does not obligate the Department to approve the final VEP should a preliminary review
19 indicate the VEP has possible merit. The Department is under no obligation to consider
20 any VEP (Preliminary or Final) that is submitted.

21 (E) Final Proposal

22 A copy of the Final VEP shall be submitted by the Contractor to the Resident Engineer
23 and the State Value Management Engineer at ValueManagementUnit@ncdot.gov. The
24 VEP shall contain, at a minimum, the following:

- 25 (1) A statement that the request for the modification is being made as a VEP.
- 26 (2) A description of the difference between the existing contract requirements and the
27 proposed modifications, with the comparative advantages and disadvantages of each.
- 28 (3) If applicable, a complete drawing of the details covering the proposed modifications
29 and supporting design computations shall be included in the final submittal. The
30 preparation of new designs or drawings shall be accomplished and sealed by
31 an engineer licensed in the State of North Carolina. Further, the Department may
32 require a review, and possibly the redesign, be accomplished by the project's original
33 designer, or an approved equal. The Department may contract with private
34 engineering firms, when needed, for reviews requested by the Department. The
35 Contractor shall contract with the original project designer, or an approved equal,
36 when required by the Department, for any design work needed to completely and
37 accurately prepare contract drawings. The Department may waive the requirements
38 to have the preparation of contract drawings accomplished by an engineer licensed in
39 the State of North Carolina or the project's original design based on the extent, detail
40 and complexity of the design needed to implement the proposal.
- 41 (4) An itemized list of the contract requirements that would be modified and
42 a recommendation of how to make each modification.
- 43 (5) A detailed estimate of the cost of performing the work under the proposed
44 modification.
- 45 (6) A statement of the time when approval of the proposal shall be issued by the
46 Department to obtain the total estimate cost reduction during the remainder of the
47 contract, noting any effect on the contract completion or delivery schedule.

Section 104

1 (F) Modifications

2 To facilitate the preparation of revisions to contract drawings, the Contractor may
3 purchase reproducible copies of drawings for his use through the Department's Value
4 Management Unit. The preparation of new design drawings by or for the Contractor
5 shall be coordinated with the appropriate Design Branch through the State Value
6 Management Engineer. The Contractor shall provide, at no charge to the Department,
7 one set of reproducible drawings of the approved design needed to implement the VEP.
8 Drawings (hardcopy and electronic) which are sealed by an engineer licensed in the State
9 of North Carolina shall be submitted to the State Value Management Engineer no later
10 than 10 business days after acceptance of a VEP unless otherwise permitted.

11 The Engineer will be the sole judge of the acceptability of a VEP requested in accordance
12 with these requirements and of the estimated net savings resulting from the approval of
13 all or any part of the VEP. The Contractor has the right to withdraw, in whole or in part,
14 any VEP not accepted by the Department within the period to be specified in the VEP per
15 Subarticle 104-12(E)(6).

16 If a VEP is approved, the necessary changes will be effected by supplemental agreement.
17 Included as a part of the supplemental agreement will be requirements for price
18 adjustment giving the Contractor 50% of the net savings to the project resulting from the
19 modifications. Supplemental agreements executed for design-bid-build contracts shall
20 reflect any realized savings in the corresponding line items. Supplemental agreements
21 executed for design-build contracts shall add one line item deducting the full savings
22 from the total contract price and one line item crediting the Contractor with 50% of the
23 total VEP savings.

24 The Department reserves the right to include in the supplemental agreement any
25 conditions it deems appropriate for consideration, approval and implementation of the
26 VEP. Acceptance of the supplemental agreement by the Contractor shall constitute
27 acceptance of such conditions.

28 The final net savings to be distributed will be the difference in cost between the existing
29 contract cost for the involved unit bid items and actual final cost occurring as a result of
30 the modification. Only those unit bid items directly affected by the supplemental
31 agreement will be considered in making the final determination of net savings. In
32 determining the estimated net savings, the Department reserves the right to disregard the
33 contract prices if, in the judgment of the Department, such prices do not represent a fair
34 measure of the value of the work to be performed or to be deleted. Subsequent change
35 documents affecting the modified unit bid items, but not related to the VEP, will be
36 excluded from such determination. The Department's review and administrative costs for
37 VEPs will be borne by the Department. The Contractor's costs for designs and/or
38 revisions to designs and the preparation of design drawings will be borne by the
39 Contractor. The costs to either party will not be considered in determining the net
40 savings obtained by implementing the VEP. The Contractor's portion of the net savings
41 shall constitute full compensation to him for effecting all changes pursuant to the
42 agreement. The net savings will be prorated, 50% to the Contractor and 50% to the
43 Department, for all accepted VEPs.

44 Upon execution of the supplemental agreement, the Department will thereafter have the
45 right to use, duplicate or disclose, in whole or in part, any data necessary for the use of
46 the modification on other projects without obligation or compensation of any kind to the
47 Contractor. Restrictions or conditions imposed by the Contractor for use of the VEP on
48 other projects shall not be valid.

49 Except as may be otherwise precluded by this specification, the Contractor may submit
50 a previously approved VEP on another project.

1 Unless and until a supplemental agreement is executed and issued by the Department and
2 final plans (hard copy and electronic) sealed by an engineer licensed in the State of North
3 Carolina incorporating an approved VEP have been provided to the Resident Engineer
4 and the State Value Management Engineer, the Contractor shall remain obligated to
5 perform the work in accordance with the terms of the existing contract.

6 Acceptance of the modification and its implementation will not modify the completion
7 date of the contract unless specifically provided for in the supplemental agreement.

8 The Contractor shall not be entitled to additional compensation under Section 104 for
9 alterations in the plans or in the details of construction pursuant to the VEP.

10 The Department will not be liable to the Contractor for failure to accept or act upon any
11 VEP nor for any delays to the work attributable to any such VEP.

12 The Department reserves the right to negotiate desired changes with the Contractor under
13 the requirements of the contract even though the changes are the result of a VEP
14 submitted on another contract. In this instance the savings will be prorated in accordance
15 with the terms of the negotiated agreement.

16 **104-13 RECYCLED PRODUCTS OR SOLID WASTE MATERIALS**

17 It is the policy of the Department to aid in reduction of materials that become a part of our
18 solid waste stream. To that extent the Department encourages contractors to initiate, develop
19 and use products and construction methods that incorporate the use of recycled or solid waste
20 products in the project. Recycled products or waste materials will be those products or
21 materials that would otherwise become solid waste and are collected, separated, or processed
22 and reused or returned to reuse in the form of raw materials or products that are incorporated
23 into a beneficial reuse on the project. Targeted materials include, but are not limited to, the
24 following: plastic, glass, paper, cardboard, shingles, tires, fly ash, bottom ash, sludge and
25 construction and demolition debris.

26 This Specification will not be applicable to reclaimed asphalt materials used in accordance
27 with Section 610 and shall not be applicable to any recycled or solid waste materials that are
28 specified for use by the Department on the project.

29 To use recycled or solid waste materials, the Contractor shall submit to the Department of
30 Transportation a Recycled Products or Solid Waste Materials Proposal for approval. This
31 proposal shall be submitted to the Resident Engineer and the State Value Management
32 Engineer in the Value Management Office. The proposal shall contain, at a minimum,
33 a statement that the request for the modification is being made as a Recycled Products or
34 Solid Waste Materials proposal and the requirements in Subarticles 104-12(E)(2)
35 through 104-12(E)(6).

36 The Contractor shall be responsible for obtaining any and all permits that may be required for
37 the hauling, storing, or handling of the targeted materials.

38 If a Recycled Products or Solid Waste Materials proposal is approved, the necessary changes
39 will be effected by supplemental agreement. Included as a part of the supplemental
40 agreement will be requirements for price adjustment as follows:

41 (A) If the proposal results in a net savings to the Department the savings and distribution of
42 the savings shall be done in accordance with Article 104-12.

43 (B) If the proposal results in a net increase in the project cost but is judged to have
44 a significant effect on the development of long term markets for the targeted materials, or
45 results in significant beneficial usage of project generated debris that would have
46 otherwise been disposed of in accordance with Section 802, the Department will bear the
47 approved increased costs, if any. This includes recycled products that have been
48 approved by the Department but were not originally included in this contract.

Section 105

1 (C) If the proposal is new and innovative, never used in the Department projects before as
2 approved by the Engineer and results in a net savings to the Department, the savings shall
3 be distributed in accordance with Article 104-12. However, when this innovative
4 proposal results in a net increase in project cost, Subarticle 104-13(B)(2) shall apply, and
5 at least \$500, but not more than \$2,500, may be awarded to the Contractor.

6 The Contractor shall provide certification that verifies the source of the material and the
7 percentage of targeted materials to be used.

8 The quantities of reused or recycled materials either incorporated in the project or diverted
9 from landfills and any practice that minimized the environmental impacts on the project shall
10 be reported by July 1 annually by the Contractor on the Project Construction Reuse and
11 Recycling Reporting Form. The Project Construction Reuse and Recycling Reporting Form
12 and a location tool for local recycling facilities are available on the Department's web site.

13 The Contractor shall remain obligated to perform the work in accordance with the terms of the
14 existing contract pending execution of the supplemental agreement that implements
15 an approved Recycled Products or Solid Waste Materials proposal and will not be entitled to
16 any additional compensation or additional contract time if a Recycled Products or Solid Waste
17 Materials proposal is not accepted.

18 The Department reserves the right to reject, at its discretion, any Recycled Products or Solid
19 Waste Materials proposal. The Engineer will be the sole judge of the acceptability, the value,
20 the estimated net savings and any additional compensation to be paid to the Contractor for all
21 or any part of the proposal.

22 Article 104-3 does not apply to a Recycled Products or Solid Waste Materials proposal.

23 Upon execution of the supplemental agreement, the Department will hereafter have the right
24 to use, duplicate or disclose in whole or in part any data necessary for use of the modification
25 on other projects without obligation or compensation of any kind to the Contractor.
26 Restrictions of conditions imposed by the Contractor for use of the proposal by the
27 Department on other projects shall not be valid.

28 The Department will not be liable to the Contractor for failure to accept or act upon any
29 Recycled Products or Waste Materials proposal submitted pursuant to this Specification, nor
30 for any delays to the work attributable to any third party claims, or fines that may be levied as
31 a result of the Contractor's decision to use targeted materials.

SECTION 105 CONTROL OF WORK

105-1 AUTHORITY OF THE ENGINEER

35 The Engineer will decide all questions that may arise as to the quality and acceptability of
36 materials furnished, work performed, rate of progress of the work; interpretation of the
37 contract; and fulfillment of the contract on the part of the Contractor. His decision shall be
38 final, and he shall have executive authority to enforce and make effective such decisions and
39 orders as the Contractor fails to carry out promptly.

40 The Engineer shall have the authority to issue any written order to the Contractor which he
41 considers necessary to the prosecution of the work and shall have executive authority to
42 enforce such written orders the Contractor fails to carry out promptly. Failure on the part of
43 the Contractor to comply with any written order issued by the Engineer may be justification
44 for disqualifying the Contractor from further bidding in accordance with Article 102-15.

105-2 PLANS AND WORKING DRAWINGS

46 Plans will show details of all structures, lines, grades, typical cross sections of the roadway,
47 location and design of all structures and a summary of items appearing in the proposal.

1 The plans shall be supplemented by such approved working drawings as are necessary to
2 adequately control the work. Working drawings furnished by the Contractor and approved by
3 the Engineer shall consist of such detailed drawings as may be required to adequately control
4 the work and are not included in the plans furnished by the Department. They may include
5 stress sheets, shop drawings, erection drawings, falsework drawings, cofferdam drawings,
6 bending diagrams for reinforcing steel, catalog cuts, or any other supplementary drawings or
7 similar data required of the Contractor. When working drawings are approved by the
8 Engineer, such approval shall not operate to relieve the Contractor of any of his responsibility
9 under the contract for the successful completion of the work.

10 Unless otherwise specified, the Contractor shall allow 30 calendar days for review and
11 approval, or acceptance, of working drawings from the date they are received until they are
12 returned by the Engineer, unless otherwise stated. If revised drawings are required,
13 appropriate additional time shall be allowed for review and approval, or acceptance, of the
14 revised drawings. The Contractor shall have no claim for extension of completion dates or
15 additional compensation due to this review period.

16 Changes on shop drawings after approval or distribution shall be subject to the approval of the
17 Engineer and he shall be furnished a record of such changes.

18 Payment at the contract prices will be full compensation for all costs of furnishing all working
19 drawings.

20 **105-3 CONFORMITY WITH PLANS AND SPECIFICATIONS**

21 All work performed and all materials furnished shall be in reasonably close conformity as
22 determined by the Engineer with the lines, grades, cross sections, dimensions and material
23 requirements, including tolerances, shown in the contract.

24 In the event the Engineer finds the materials or the finished product in which the materials are
25 used not within reasonably close conformity with the contract but that reasonably acceptable
26 work has been produced, he will then make a determination if the work is to be accepted and
27 remain in place. If the Engineer determines that the work is to be accepted, he will have the
28 authority to make such adjustment in contract price as he deems warranted based upon his
29 engineering judgment and the final estimate will be paid accordingly.

30 In the event the Engineer finds the materials, or the finished product in which the materials
31 are used, or the work performed, are not in reasonably close conformity with the contract and
32 have resulted in an inferior or unsatisfactory product, the work or materials shall be removed
33 and replaced or otherwise corrected by the Contractor at no cost to the Department.

34 **105-4 COORDINATION OF PLANS, SPECIFICATIONS, SUPPLEMENTAL
35 SPECIFICATIONS AND SPECIAL PROVISIONS**

36 The *Standard Specifications*, the Supplemental Specifications, the Plans, the Special
37 Provisions and all supplementary documents are essential parts of the contract, and
38 a requirement occurring in one is as binding as though occurring in all. They are
39 complimentary and provide and describe the complete contract. In case of discrepancy or
40 ambiguity, the following will apply in ascending order:

41 Calculated dimensions shall govern over scaled dimensions;

42 Supplemental Specifications shall govern over *Standard Specifications*;

43 Plans shall govern over Supplemental Specifications and *Standard Specifications*;

44 Standard Special Provisions shall govern over Plans, Supplemental Specifications and
45 *Standard Specifications*; and

46 Project Special Provisions shall govern over Standard Special Provisions, Plans,
47 Supplemental Specifications and *Standard Specifications*.

Section 105

1 The Contractor shall not take advantage of any apparent error or omission in the contract. In
2 the event such errors or omissions are discovered the Engineer will make such corrections and
3 interpretations as may be determined necessary for the fulfillment of the intent of the contract.

4 105-5 COOPERATION BY CONTRACTOR

5 The Contractor shall cooperate with the Engineer, his inspectors and other contractors in
6 every way possible and shall give the work the constant attention necessary to facilitate the
7 progress and satisfactory performance thereof. The Contractor shall notify the Engineer in
8 writing at least 7 calendar days before beginning work on the project. He shall notify the
9 Engineer at least 1 calendar day in advance when work is to be suspended and at least
10 2 calendar days in advance when work is to be resumed.

11 The Contractor shall keep available on the project site a copy of the entire contract at all
12 times.

13 105-6 SUPERVISION BY CONTRACTOR

14 (A) On Site Personnel

15 At all times that work is actually being performed, the Contractor shall have present on
16 the project one competent individual who has been authorized to act in a supervisory
17 capacity over all work on the project including work subcontracted. The individual who
18 has been so authorized shall be experienced in the type of work being performed and is to
19 be fully capable of managing, directing and coordinating the work, of reading and
20 thoroughly understanding the contract and of receiving and carrying out directions from
21 the Engineer or his authorized representatives. He shall be an employee of the Contractor
22 unless otherwise approved by the Engineer.

23 (B) On Call Personnel

24 At all times during the life of the project the Contractor shall provide one permanent
25 employee who shall have the authority and capability for the overall responsibility of the
26 project and who shall be personally available at the site of work within 24 hours' notice.
27 Such employee shall be fully authorized to conduct all business with the subcontractors,
28 to negotiate and execute all supplemental agreements and to execute the orders or
29 directions of the Engineer.

30 (C) Exceptions

31 If the Contractor elects to have the employee described under Subarticle 105-6(B)
32 constantly available in person on the project, then the presence of this employee will be
33 considered as meeting Subarticle 105-6(A). However, whenever such employee is absent
34 from the project then an authorized individual meeting Subarticle 105-6(A) shall be
35 present on the project.

36 105-7 COOPERATION BETWEEN CONTRACTORS

37 The Department reserves the right at any time to contract for and perform other or additional
38 work on or near the work covered by the contract.

39 When separate or additional contracts are let within the limits of any one project, each
40 Contractor shall conduct his work so as not to interfere with or hinder the progress or
41 completion of the work being performed by other contractors. Contractors working within the
42 limits of the same project shall cooperate with each other.

43 Each Contractor shall conduct his operations in such a manner as to avoid damaging any work
44 being performed by others or that has been completed by others.

1 When a project is let under more than one contract and the plans or special provisions include
2 a construction schedule, it shall be the responsibility of the Contractors to complete the
3 various phases of the project in accordance with the time limits specified such that the total
4 contracts will be completed by the completion date. This construction schedule will remain in
5 effect until such time as the Contractors, at their option submit to the Engineer a joint
6 construction schedule meeting the approval of the Engineer. This joint construction schedule
7 shall be signed by authorized representatives of each firm and upon the approval of the
8 Engineer shall be binding on each firm. Subsequent modifications to the joint construction
9 schedule may be made during the course of the work in the same manner.

10 Failure of the Contractor to complete the various phases of work within the time limits set
11 forth in the construction schedule or latest approved joint construction schedule shall be just
12 cause for removing the Contractor from the Department's list of qualified contractors.
13 A Contractor disqualified by reason of this provision will not be reinstated until such time as
14 his progress is in accordance with the latest approved construction schedule or until the
15 project is completed and accepted, whichever occurs first.

16 The Department will under no circumstances be liable for any claim for additional
17 compensation due to acts of one contractor holding up the work of another.

18 The Department will under no circumstances be liable for any damages experienced by one
19 Contractor as a result of the presence and operations of other contractors working within the
20 limits of the same project.

21 **105-8 COOPERATION WITH UTILITY OWNERS**

22 Before the beginning of construction, the Department will notify all utility owners known to
23 have facilities affected by the construction of the project and will make arrangements for the
24 necessary adjustments of all affected public or private utility facilities. The utility
25 adjustments may be made either before or after the beginning of construction of the project.
26 The adjustments will be made by the utility owner or his representative or by the Contractor
27 when such adjustments are part of the work covered by his contract.

28 The Contractor shall use an independent utility locating service to locate utilities. Identify
29 excavation locations by means of pre-marking with white paint, flags, or stakes or provide a
30 specific written description of the location in the locate request. The Contractor shall use
31 special care working in, around and near all existing utilities that are encountered during
32 construction, protecting them where necessary so that they will give uninterrupted service.

33 The Contractor shall cooperate with the utility owner and/or the owner's representative in the
34 adjustment or placement of utility facilities when such adjustment or placement is made
35 necessary by the construction of the project or has been authorized by the Department.

36 In the event that utility services are interrupted by the Contractor, the Contractor shall
37 promptly notify the owners and shall cooperate with the owners and/or the owner's
38 representative in the restoration of service in the shortest time possible.

39 Existing fire hydrants shall be kept accessible to fire departments at all times.

40 Before submitting his bid, the Contractor shall make his own determination as to the nature
41 and extent of the utility facilities, including proposed adjustments, new facilities, or temporary
42 work to be performed by the utility owner or his representative; and as to whether or not any
43 utility work is planned by the owner in conjunction with the project construction. The
44 Contractor shall consider in his bid all of the permanent and temporary utility facilities in their
45 present or relocated positions, whether or not specifically shown in the plans or covered in the
46 project special provisions. It will be the Contractor's responsibility to anticipate any
47 additional costs to him resulting from such utility work and to reflect these costs in his bid for
48 the various items in the contract.

Section 105

1 No additional compensation, except as provided for in Article 104-4, will be allowed for
2 delays, inconvenience or damage sustained by the Contractor due to any interference from
3 said utility facilities or the operation of moving them, and any such delay, inconvenience or
4 damage, except as provided for in Article 104-4, shall not constitute a basis for a claim for
5 additional compensation.

6 Where changes to utility facilities are to be made solely for the convenience of the Contractor,
7 it shall be the Contractor's responsibility to arrange for such changes and the Contractor shall
8 bear all costs of such changes.

9 105-9 CONSTRUCTION STAKES, LINES AND GRADES

10 Unless otherwise required in the contract, the Engineer will set construction stakes
11 establishing lines, slopes and continuous profile-grade in road work, centerline and bench
12 marks for bridge work, culvert work, protective and accessory structures and appurtenances
13 that require the use of an engineer's level and transit, and will furnish the Contractor with all
14 necessary information relating to lines, slopes and grades. These stakes and marks shall
15 constitute the field control by, and in accordance with which, the Contractor shall establish
16 other necessary controls and perform the work.

17 The Contractor shall be held responsible for the preservation of all stakes and marks, and if
18 any of the construction stakes or marks have been destroyed or disturbed by the Contractor,
19 the cost of replacing them will be charged against him and will be deducted from the payment
20 for the work.

21 105-10 AUTHORITY AND DUTIES OF THE INSPECTOR

22 Inspectors employed by the Department are authorized to inspect all work performed and
23 materials furnished. Such inspection may extend to all or any part of the work and to the
24 preparation, fabrication, or manufacture of the materials to be used. The inspector is not
25 authorized to alter or waive the requirements of the contract. The inspector is not authorized
26 to issue instructions contrary to the contract, or to act as foreman for the Contractor; however,
27 he has the authority to reject work or materials until any questions at issue can be referred to
28 and decided by the Engineer. The inspector is not authorized to make any final acceptance of
29 the work.

30 105-11 INSPECTION OF WORK

31 All materials and each part or detail of the work shall be subject to inspection by the
32 Engineer. The Contractor shall allow and provide a reasonable access to all parts of the work
33 to the Engineer or his authorized representative. The Contractor shall furnish such
34 information and assistance as is required to make a complete and detailed inspection. Such
35 access shall meet the approval of the Engineer.

36 The presence of the Engineer or inspector at the work site shall in no way lessen the
37 Contractor's responsibility for conformity with the contract. Should the Engineer or
38 Inspector, at any time before final acceptance, fail to point out or reject materials or work that
39 does not conform to the contract, whether from lack of discovery or for any other reason, it
40 shall in no way prevent later rejection or corrections to the unsatisfactory materials or work
41 when discovered. The Contractor shall have no claim for losses suffered due to any necessary
42 removals or repairs resulting from the unsatisfactory work.

1 If the Engineer requests it, the Contractor, at any time before final acceptance of the work,
2 shall remove or uncover such portions of the finished work as may be directed. After
3 examination, the Contractor shall restore said portions of the work to the standard required by
4 the specifications. The Contractor shall keep cost records of the work performed and if the
5 uncovered work is found to be acceptable by the Engineer, the Department will pay the
6 Contractor on a force account basis in accordance with Article 109-3 for the cost of
7 uncovering, or removing and the replacing of the covering or making good of the parts
8 removed; but should the work so exposed or examined prove unacceptable by the Engineer,
9 the uncovering or removing and the replacing of the covering or making good of the parts
10 removed, shall be at no cost to the Department.

11 When any other unit of government or political subdivision is to pay a portion of the cost of
12 the work covered by the contract, its respective representatives shall have the right to inspect
13 the work. When work is to be performed on the right of way of any railroad corporation or in
14 proximity to other public utilities, the representatives of the railroad corporation and/or the
15 public utilities shall have the right to inspect the work. Such inspection shall in no sense
16 make any unit of government or political subdivision or any railroad corporation or public
17 utility a party to the contract and shall in no way interfere with the rights of either party
18 thereunder.

19 **105-12 UNAUTHORIZED WORK**

20 No work shall be performed without established lines and grades except as otherwise
21 permitted by the Engineer. Work performed contrary to the instructions of the Engineer or
22 contrary to any approvals granted by the Engineer will be considered as unauthorized and
23 may not be paid under the requirements of the contract. Work performed beyond the lines
24 shown in the plans or as given, except as herein specified, or any extra work performed
25 without authority will be considered as unauthorized and may not be paid under the
26 requirements of the contract. Any of the above work so performed may be ordered removed,
27 replaced, or repaired at no cost to the Department.

28 Upon failure on the part of the Contractor to comply on time with any order of the Engineer
29 made under the provisions of this article, the Engineer will have the authority to cause such
30 unauthorized work to be removed or adjusted or both to conform to the contract and to deduct
31 the cost of removal or adjustment, or both, from any monies due or to become due the
32 Contractor.

33 **105-13 LIMITATIONS OF OPERATIONS**

34 At any time when, in the opinion of the Engineer, the Contractor has obstructed, closed, or is
35 conducting operations on a greater portion of the work than is necessary for the prosecution of
36 the work so as to constitute a hazard to the general public or impair the function of the facility
37 being constructed where traffic shall be maintained, the Engineer may require the Contractor
38 to suspend such unnecessary operations or closures and to finish the portions on which work
39 is in progress before starting work on additional portions of the work.

40 **105-14 NIGHT WORK**

41 Whenever the Contractor's operations are being conducted at night, the Contractor shall
42 provide such artificial lighting as may be necessary to provide for safe and proper
43 construction and to provide for adequate inspection of the work as described in Section 1413.
44 The Contractor shall comply with all applicable regulations governing noise abatement.

45 **105-15 RESTRICTION OF LOAD LIMITS**

46 The Contractor shall comply with all legal load restrictions in hauling equipment and
47 materials on roads under the jurisdiction of the Department.

Section 105

1 The Department has the right to place load limit restrictions on the load a Contractor may haul
2 on any road or bridge in the vicinity of his contract. The Contractor, before bidding on
3 a project, will be responsible for making his own investigations to determine the possibility of
4 load limit restrictions being placed on any of the highways he plans to use for hauling
5 purposes. The Contractor shall not be entitled to an extension of time or to compensation for
6 any costs, inconvenience, delay, or any other adversity to the Contractor as the result of any
7 reduction by the Department in load limit, or as the result of a refusal by the Department to
8 raise load limits as hereinafter provided or under any other conditions. Any such reduction in
9 load limit or refusal to raise load limits shall not constitute a basis for a claim for additional
10 compensation.

11 Wherever load limit restrictions below the statutory legal load limit have been posted on any
12 roads and bridges on the project or within the vicinity of the project, the Department may
13 remove the load limit restrictions from such roads and bridges upon written request from the
14 Contractor, and the Contractor thereafter will be allowed to haul up to the statutory legal
15 limits over such roads and bridges, provided the Contractor enters into an agreement with the
16 Department providing for:

17 (A) Maintenance by the Contractor of such roads in a condition satisfactory to the Engineer
18 during the haul period.

19 (B) Repair by the Contractor at his expense, of all damages to such roads after haul is
20 completed to place them in a condition as good as they were before removal of the load
21 limits.

22 (C) Furnishing a bond by the Contractor in an amount determined by the Engineer for the
23 roads. Furnishing a bond for the roads does not entitle the Contractor to exceed the
24 posted load limits of any bridge.

25 (D) Assumption by the Contractor of all costs of strengthening any bridges that may be
26 necessary to safely haul loads up to statutory legal limits. The Department will, upon
27 request by the Contractor, make a determination as to the method and extent of
28 strengthening required for the bridges and will advise the Contractor as to the amount of
29 work to be done or an estimate of the charges for the work if performed by Department
30 forces. When Department forces perform the work, the Contractor shall reimburse the
31 Department in the amount of the actual charges for said work. When Contractor's forces
32 perform the work, it shall be done in accordance with plans approved by the Engineer and
33 under his inspection.

34 (E) Indemnification of the Department against any and all claims from third persons arising
35 out of or resulting from the hauling operation or the maintenance, or lack of maintenance,
36 of haul roads. Haul roads shall be maintained for the Contractor's hauling operations and
37 for the use of the general public.

38 Equipment operated on proposed bridges shall comply with load restrictions in Table 105-1.

TABLE 105-1	
RESTRICTIONS FOR EQUIPMENT ON BRIDGES	
Property	Maximum Load in Pounds
Axle load	36,000
Axle load on tandem axles	30,000
Gross load	90,000

39 The Contractor shall keep the bridge floor clean to reduce impact forces and place approved
40 temporary guides on the bridge floor to position the wheel loads as nearly as possible over the
41 bridge girders. Only one earth-moving vehicle shall be on a bridge at any time. Upon
42 completion of hauling over each bridge, the Contractor shall clean the bridge floor, curbs and
43 rails.

1 Regulations pertaining to size and weight will not apply to equipment used on the project
2 provided the vehicles involved are not operated on pavement, completed base course, or
3 structures.

4 **105-16 FAILURE TO MAINTAIN THE PROJECT OR PERFORM EROSION**
5 **CONTROL WORK**

6 Failure on the part of the Contractor to comply with Article 104-10 or to perform erosion
7 control work as directed will result in the Engineer notifying the Contractor to comply with
8 these Specifications. In the event that the Contractor fails to begin such remedial action or
9 fails to begin erosion control work within 24 hours after receipt of such notice with adequate
10 forces and equipment, the Engineer may proceed to have the work performed with other
11 forces. No payment will be made to the Contractor for work performed by others. Any costs
12 incurred by the Department for work performed by others as provided above in excess of the
13 costs that would have been incurred had the work been performed by the Contractor will be
14 deducted from monies due the Contractor on his contract.

15 **105-17 INSPECTION AND ACCEPTANCE**

16 Upon completion of the entire project as determined by the Engineer, the Engineer will
17 inspect the project for final acceptance. If all construction provided for and contemplated by
18 the contract is found to be satisfactorily completed, the project will be accepted. The
19 acceptance of projects in their entirety will not be altered except as listed below:

20 (A) When any continuous project is equal to or in excess of 5 miles in length, the Department
21 will accept the project in two increments with the first increment equaling at least 50% of
22 the total length of the project.

23 (B) Under resurfacing contracts, the Department will accept the project in parts as defined by
24 map numbers representing at least 25% of the total length of project.

25 (C) When it is considered to be in the best interest of the Department, other increments or
26 parts of projects may be considered for acceptance.

27 (D) When the contract contains an intermediate completion date requiring the completion of
28 a portion of the work in its entirety, such portion of the work may be accepted if
29 requested in writing by the Contractor.

30 (E) Bridge decks and rails that have been constructed or rehabilitated at such time as when
31 they are open to public traffic.

32 (F) Permanent sign panels, including hardware and retroreflective sheeting, that are located
33 where the roadway is open to public traffic and that are required to be installed before the
34 final acceptance of the project.

35 Acceptance of any increment or part of a project shall not operate to waive the assessment of
36 all or any portion of liquidated damages assessable under the terms of the contract.

37 When the inspection discloses any work, in whole or in part, as being unsatisfactory or
38 incomplete, the Engineer will advise the Contractor of such unsatisfactory or incomplete
39 work, and the Contractor shall immediately correct, repair or complete such work. The
40 project will not be accepted and the Contractor shall be responsible for the maintenance of the
41 project and maintenance of traffic until all of the recommendations made at the time of the
42 inspection have been satisfactorily completed.

43 The Engineer will notify the Contractor in writing that the project has been accepted as soon
44 as practicable after the completion of the project. When an observation period is required that
45 extends beyond the final acceptance date, the satisfactory completion of the observation
46 period shall be covered by the contract bonds.

**SECTION 106
CONTROL OF MATERIAL**

106-1 GENERAL REQUIREMENTS

(A) General

The materials used in the work shall meet all requirements of the contract and shall be subject to inspection, test, or rejection by the Engineer at any time. Materials used in the work shall be new, recycled, or recovered as permitted by the contract.

It is the Department's intent to expand the use of recyclable and recovered materials in its construction programs. The Contractor is encouraged to find innovative and alternative ways for beneficial use of recyclable materials that are currently a part of the solid waste stream and that contribute to problems of declining space in landfills.

The Contractor shall make his own determination of the various kinds and quantities of materials that are necessary for the acceptable performance and timely completion of the work. It shall be the Contractor's responsibility to obtain materials that meet the requirements of the contract. The Contractor shall be responsible for the acceptability of all materials used in the work and for the timely delivery of materials to the project so that adequate time will be available for the safe and proper performance of the work.

To facilitate testing by the Department, the Contractor shall furnish a complete statement of the origin of all materials to be used in the construction of the work, together with samples when required. The statement of origin shall be furnished to the Materials and Tests Unit sufficiently in advance of any shipment or fabrication of materials so that arrangements can be made for proper inspection.

The Contractor shall furnish a SDS with all paints and hazardous chemicals proposed for use on the project. The SDS shall be in accordance with the North Carolina Hazard Communication Standard, 13 NCAC 7CF.0101(a)(99).

The Contractor shall provide access, means and assistance in the verification of all testing equipment, scales, measures and other devices operated by him in connection with the testing of the materials.

If the Contractor desires or is required to furnish materials from local deposits, other than those, if any, described in the contract, he shall assume full responsibility for the sampling of the sources and the acceptability of the material in accordance with these specifications. He shall furnish without charge such preliminary samples as may be required; except that, if requested in writing, the Engineer may allow Department forces to take samples as requested by the Contractor. In the latter case, the Contractor shall reimburse the Department for the total expense of the sampling as determined by the Engineer. Tests will be made and reports rendered, but it is understood that such tests shall in no way be construed as a guarantee of acceptance of any material that may be delivered later for incorporation in the work. The Contractor shall assume full responsibility for the production of uniform and satisfactory materials from such local deposits and shall indemnify and save harmless the Department from any and all claims for loss or damages resulting from the opening and operation thereof, or from the failure of the deposit after development to produce materials acceptable to the Engineer, in either quality or quantity.

(B) Domestic Steel

All steel and iron products that are permanently incorporated into this project shall be produced in the United States except minimal amounts of foreign steel and iron products may be used provided the combined material cost of the items involved does not exceed 0.1% of the total amount bid for the entire project or \$2,500, whichever is greater. If invoices showing the cost of the material are not provided, the amount of the bid item involving the foreign material will be used for calculations. This minimal amount of foreign produced steel and iron products permitted for use is not applicable to high strength fasteners. Domestically produced high strength fasteners are required.

All steel and iron products furnished as domestic products shall be melted, cast, formed, shaped, drawn, extruded, forged, fabricated, produced, or otherwise processed and manufactured in the United States. Raw materials including pig iron and processed pelletized and reduced iron ore used in manufacturing domestic steel products may be imported; however, all manufacturing processes to produce the products, including coatings, shall occur in the United States.

Before each steel or iron product is incorporated into any project or included for partial payment on a monthly estimate, the Contractor shall furnish the Engineer a notarized certification certifying that the product conforms to the above. The Engineer will forward a copy of each certification to the Materials and Tests Unit.

Each purchase order issued by the Contractor or a subcontractor for steel and iron products to be permanently incorporated into any project shall contain in bold print a statement advising the supplier that all manufacturing processes to produce the steel or iron shall have occurred in the United States. The Contractor and all affected subcontractors shall maintain a separate file for steel products permanently incorporated into any project so that verification of the Contractor's efforts to purchase domestic steel and iron products can readily be verified by an authorized representative of the Department or the Federal Highway Administration.

106-2 SAMPLES, TESTS AND CITED SPECIFICATIONS

All tests will be made in accordance with the most recent standard or interim methods of the AASHTO in force on the date of advertisement. Should no AASHTO method of test exist for a material, the most recent standard or tentative method of ASTM or other methods adopted by the Department will be used.

All reference made to a specification published by AASHTO, ASTM or any other organization other than the Department, that does not indicate the date of publication, will be understood to mean the specification current on the date of advertisement for the project. When a more current specification is published during the life of the project, and when it is mutually agreed by the Contractor and the Engineer and such agreement is documented by a supplemental agreement, the Department may accept materials meeting the requirements of the latest publication.

106-3 CONTRACTOR FURNISHED CERTIFICATION

The Contractor shall furnish the Department material certifications obtained from the producer, supplier or an approved independent testing laboratory for the following types of materials, unless otherwise directed by the Engineer:

- (A) Materials required to meet criteria documented by tests that are normally performed during the production process;
- (B) Materials that are required to meet specifications other than those published by AASHTO, ASTM or the Department;
- (C) Materials produced at locations that are not within routine travel distance for Department representatives;

Section 106

1 (D) Materials required to meet criteria documented by tests involving special equipment not
2 readily available to Department representatives; and

3 (E) Any other special material when so directed by the Engineer.

4 Material certifications of one of the following types shall be furnished for pre-tested
5 materials. The specific type of material certification for each material shall be in accordance
6 with the schedule maintained by the Materials and Tests Unit. Copies of this schedule may be
7 obtained from the Materials and Tests Unit.

8 **Type 1 - Certified Mill Test Report**

9 A certified mill test report shall be a certified report of tests conducted by the manufacturer on
10 samples taken from the same heat or lot number as the material actually shipped to the
11 project. The report shall identify the heat or lot number.

12 **Type 2 - Typical Certified Mill Test Report**

13 A typical certified mill test report shall be a certified report of tests conducted by the
14 manufacturer on samples taken from a lot that is typical of the material actually shipped to the
15 project, but that may or may not be from the lot shipped.

16 **Type 3 - Manufacturer's Certification**

17 A manufacturer's certification shall be a certified statement that the material actually shipped
18 to the project was manufactured by production processes that are periodically and routinely
19 inspected to assure conformance to specification requirements.

20 **Type 4 - Certified Test Reports**

21 A certified test report shall be a certified report of test conducted by an approved independent
22 testing laboratory on samples taken from the same heat or lot number as the material actually
23 shipped to the project. The report shall identify the heat or lot number.

24 **Type 5 - Typical Certified Test Reports**

25 A certified test report shall be a certified report of tests conducted by an approved
26 independent testing laboratory on samples taken from a lot that is typical of the material
27 actually shipped to the project, but that may or may not be from the lot shipped.

28 **Type 6 - Supplier's Certification**

29 A supplier's certification is a signed statement by the supplier that the material described in
30 the certification is of the specification grade required and that the supplier has on hand Type 1
31 or Type 2 material certifications to cover the material that is included in the Type 6 supplier's
32 certification.

33 **Type 7 - Contractor's Certification**

34 Contractor's certification is a signed statement by a contractor that the used material described
35 in the certification meets the current specifications to the best of the contractor's knowledge
36 and that the contractor had in his possession at the time of purchase a Type 1
37 or Type 2 material certification to cover the material that is included in the
38 Type 7 Contractor's certification.

39 **106-4 DELIVERY AND HANDLING OF MATERIALS**

40 All materials shall be handled carefully and in such manner as to preserve their quality and
41 fitness for the work. Materials damaged during delivery or handling shall not be used without
42 approval of the Engineer.

1 106-5 STORAGE OF MATERIALS

2 Materials shall be stored so as to insure the preservation of their quality and fitness for the
3 work. Stored materials that may have been approved before storage shall be subject to
4 inspection at any time and shall meet the specifications at the time it is put into use. Stored
5 materials shall be located to facilitate their inspection. Subject to the approval of the
6 Engineer, that portion of the right of way not required for public travel may be used for
7 storage purposes and for the Contractor's plant and equipment, but any additional space
8 required therefor shall be provided by the Contractor at no expense to the Department. All
9 storage sites located within the right of way shall be restored to their original condition by the
10 Contractor at no expense to the Department, except where the materials stored are or are to
11 become the property of the Department.

12 106-6 INSPECTION AT SOURCE

13 The Engineer may undertake the inspection of materials at the source of supply. This
14 inspection will be performed by Department personnel or private organizations retained by
15 the Department. Where approved by the Engineer, the results of tests performed by private
16 laboratories, producers, or manufacturer's laboratories may be used in determining
17 compliance of a material or product with the specifications.

18 The Department assumes no obligation to inspect materials at the source of supply. Such
19 inspection will be undertaken only upon condition that:

20 (A) The cooperation and assistance of the Contractor and the producer with whom he has
21 contracted for materials is assured.

22 (B) The representative of the Engineer will have full entry authority at all times to such parts
23 of the plant as may concern the manufacture or production of the materials.

24 (C) Approved laboratory facilities shall be provided when required by the Engineer.

25 Where the Department agrees to inspect or test materials during their production or at the
26 source of supply, the Contractor shall bear the cost of testing performed on materials ordered
27 by him but not incorporated into the project.

28 The Department reserves the right to retest all materials that have been tested and accepted at
29 the source of supply after the same have been delivered and to reject all materials that, when
30 retested, do not meet the specifications.

31 106-7 SCALES AND PUBLIC WEIGHMASTER

32 When material is to be paid on a per ton basis, the Contractor shall furnish platform scales or
33 other weighing devices that have been certified by the N.C. Department of Agriculture. If the
34 platform scales or other weighing devices are located outside of North Carolina, they shall
35 have been certified by the Department of Agriculture within the particular state. The scales
36 may be constructed and operated to provide automatic weighing, recording and printing of
37 tickets for the load being weighed.

38 The Department may deny or withhold any portion of payment for any load of materials
39 weighed if in relation to such load of materials, the Contractor falsifies any weighing
40 certification information or otherwise fails to comply with the requirements contained in this
41 contract.

Section 106

1 All scales shall be operated by a public weighmaster licensed in accordance with
2 NCGS § 81A. A certified weight certificate shall be issued by a North Carolina public
3 weighmaster for each load. The certificate shall be in the form of a ticket furnished by the
4 Contractor and shall contain the following information:

5 (A) Department project contract number

6 (B) Date

7 (C) Time issued, if for bituminous plant mix or Portland cement stabilized base course mixed
8 in a central plant

9 (D) Type of material

10 (E) Gross weight

11 (F) Tare weight

12 (G) Net weight of material

13 (H) Quarry or plant location

14 (I) Department's Job Mix Formula Number, if ticket is for asphalt plant mix

15 (J) Department's Asphalt Plant Certification Number, if ticket is for asphalt plant mix

16 (K) Truck number

17 (L) Contractor's name

18 (M) Public weighmaster's stamp or number

19 (N) Public weighmaster's signature or initials

20 When certified weighing devices other than platform scales are to be used, the gross weight
21 and tare weight will not be required.

22 The Engineer may direct the Contractor to re-weigh the contents of any truck load that is to be
23 delivered to the work on approved platform scales at no cost to the Department.

24 When tractor and trailer units are to be used in hauling material to be weighed, the platform
25 scales shall be of sufficient length so as to accommodate the entire unit or the tractor shall be
26 disconnected and the trailer and its contents weighed as a separate unit.

27 **106-8 DEPARTMENT FURNISHED MATERIAL**

28 The Contractor shall furnish all materials necessary to complete the work, except those
29 materials specified in the contract to be furnished by the Department. Payment at the contract
30 price for the item that includes the use of Department furnished material will be full
31 compensation for all costs of handling and placing such materials after they are delivered or
32 made available to the Contractor.

33 The Contractor shall be held responsible for all material furnished to him, and deductions will
34 be made from any money due him to make good any shortage and deficiencies from any
35 cause whatsoever and for any damage that may occur after Department furnished material has
36 been made available.

37 **106-9 DEFECTIVE MATERIAL**

38 All materials that are not in conformity to the contract shall be defective and such materials,
39 whether in place or not, may be rejected and removed from the site of the work unless
40 otherwise permitted by the Engineer in accordance with Article 105-3. No rejected material,
41 the defects of which may have been substantially corrected, may be used until approval has
42 been given by the Engineer.

43 **106-10 DENSITY DETERMINATION BY NUCLEAR METHODS**

44 The Engineer may, at his option, use nuclear methods as described in
45 Articles 520-9 and 610-10 to determine the density of selected pavement materials. The use
46 of nuclear methods will include the establishment of the required density through the use of
47 control strips constructed from materials actually being used on the project, and the
48 determination of the density being obtained in test sections located throughout the project.

Section 107

1 107-4 PATENTED DEVICES, MATERIALS AND PROCESSES

2 If the Contractor employs any design, device, material, or process covered by letters of patent
3 or copyright, he shall provide for such use by suitable legal agreement with the patentee or
4 owner. The Contractor and his Surety shall indemnify and save harmless the Department
5 from any and all claims for infringement by reason of the use of such patented design, device,
6 material, process, trademark or copyright and shall indemnify and save harmless the
7 Department from any costs, expenses and damages which it may be obligated to pay at any
8 time during the prosecution or after the completion of the work by reason of any alleged
9 infringement.

10 107-5 ENCROACHMENT ON RIGHT OF WAY

11 Any entity wishing to encroach on highway right of way shall secure a written permit from
12 the Department. The Contractor is not authorized to allow any entity to perform any work
13 within the limits of the project unless such work has been authorized in writing by the
14 Engineer.

15 When so directed by the Engineer, the Contractor shall make any repairs necessary due to
16 such encroachments and such work will be paid as extra work.

17 107-6 FEDERAL PARTICIPATION

18 When the United States Government pays all or any portion of the cost of the work, the
19 Federal laws authorizing such participation and the rules and regulations made pursuant to
20 such laws shall be observed by the Contractor. The work will be subject to the inspection of
21 the representative of such Federal agencies as are created for the administration of these laws.
22 The Contractor shall have no right to make the Federal Government a party to any court
23 action solely by reason of its participation in the cost of the work or by reason of its
24 inspection of the work.

25 107-7 SANITARY PROVISIONS

26 The Contractor shall provide and maintain in a neat, sanitary condition such accommodations
27 for the use of employees as may be necessary to comply with the requirements of the State
28 and local Boards of Health, or of other bodies or tribunals having jurisdiction. Control and
29 manage disposal of sanitary waste such that no adverse impacts occur to water quality.

30 107-8 PUBLIC CONVENIENCE AND SAFETY

31 The Contractor shall at all times conduct his work as to insure the least possible obstruction to
32 traffic. The safety and convenience of the general public and the residents along the highway,
33 and the protection of persons and property, shall be provided for by the Contractor as
34 specified in Section 150.

35 107-9 COORDINATION WITH RAILWAY

36 All work to be performed by the Contractor on railway right of way shall be performed in
37 accordance with the contract and in a manner satisfactory to the railway company and shall be
38 performed at such times and in such manner as not to unnecessarily interfere with the
39 movement of traffic upon the track of the railway company. The Contractor shall use all care
40 and precautions to avoid accidents, damage, or unnecessary delays or interference with the
41 railway company's traffic or other property. The Contractor shall carry such railroad
42 protective insurance and public liability and property damage insurance as may be stipulated
43 in the contract. The Department shall not be responsible for any damage or injury to the
44 railway company's traffic or property caused by the Contractor.

1 When the Contractor is required by the contract to transport materials or equipment across the
2 tracks of any railway or to perform work on railway right of way, the Department will obtain
3 any necessary written authority from the railway company for the establishment of a railway
4 crossing or for the performance of work on railway right of way. The Contractor will not be
5 required to bear the cost of any watchman service or flagging protection necessary due to such
6 operations, as the railway company will be reimbursed directly by the Department for the cost
7 of such work.

8 In case the Contractor elects or finds it necessary to transport materials or equipment across
9 the tracks of any railway at any point where a crossing is not required by the contract or at any
10 point other than an existing public crossing, he shall obtain specific written authority from the
11 railway company for the establishment of a private railway crossing and shall bear all costs in
12 connection with such crossing, including installation, drainage, maintenance, any necessary
13 insurance, watchman service, flagging protection and removal of such private railway
14 crossing.

15 107-10 WORK IN, OVER OR ADJACENT TO NAVIGABLE WATERS

16 All work in or over navigable waters shall be in accordance with conditions contained in the
17 permit obtained by the Department from the authority granting the permit. These conditions
18 will be included in the contract. The work shall be performed in such manner so as not to
19 interfere with navigation of the waterways unless approval therefor is obtained from the
20 authority granting the permit. The Department shall not be responsible for any damage or
21 injury to entities upon or adjacent to navigable waters caused by the Contractor.

22 The Contractor shall prepare drawings necessary to obtain any addenda that may be required
23 for his operations that are not included in the Department's permit and shall coordinate the
24 submission with the Engineer.

25 107-11 PROTECTION AND RESTORATION OF PROPERTY

26 The Contractor shall be responsible for the protection from his activities of all public and
27 private property on and adjacent to the work and shall use every reasonable precaution
28 necessary to prevent damage or injury thereto. The Contractor shall use suitable precautions
29 to prevent damage to pipes, conduits and other underground structures and to poles, wires,
30 cables and other overhead structures.

31 The Contractor shall protect carefully from disturbance or damage all land monuments and
32 property markers until the Engineer has witnessed or otherwise referenced their location and
33 shall not remove them until directed.

34 The Contractor shall be responsible for the removal, preservation and resetting of all
35 mailboxes disturbed by the construction operations. The mailboxes and their supports, when
36 reset, shall be left in as good a condition as they were before removal. The Contractor will
37 not be required to furnish new material except as required to repair damage resulting from
38 construction operations.

39 The Contractor shall be held responsible for all damage or injury to property of any character
40 resulting from any act, omission, negligence, or misconduct in the prosecution of the work.
41 When any direct or indirect damage or injury is done to public or private property by or on
42 account of any act, omission, negligence, or misconduct in the execution of the work, he shall
43 either restore at his own expense such property to a condition similar or equal to that existing
44 before such damage or injury was done, or shall make good such damage or injury in
45 a manner acceptable to the owner of the damaged property and to the Department. In case of
46 failure on the part of the Contractor to restore such property or make good such damage or
47 injury, the Department may, at the Contractor's expense, repair, rebuild, or otherwise restore
48 such property in such manner as the Engineer may consider necessary.

Section 107

1 107-12 CONTROL OF EROSION, SILTATION AND POLLUTION

2 (A) General

3 The Contractor shall take whatever measures are necessary to minimize soil erosion and
4 siltation, water pollution and air pollution caused by his operations. The Contractor shall
5 comply with the applicable regulations of all legally constituted authorities relating to
6 pollution prevention and control. The Contractor shall keep himself fully informed of all
7 such regulations that in any way affect the conduct of the work and shall at all times
8 observe and comply with all such regulations. In the event of conflict between such
9 regulations and the specifications, the more restrictive requirements shall apply.

10 The Engineer will limit the area over which clearing and grubbing, excavation, borrow
11 and embankment operations are performed whenever the Contractor's operations do not
12 make effective use of construction practices and temporary measures which will
13 minimize erosion, or whenever construction operations have not been coordinated to
14 effectively minimize erosion, or whenever permanent erosion control features are not
15 being completed as soon as permitted by construction operations.

16 Following completion of any construction phase or operation, on any graded slope or any
17 disturbed area, the Contractor shall provide ground cover sufficient to restrain erosion
18 within 21 calendar days or within a time period specified by the
19 NCG 010000 Construction Permit. The ground cover shall be either temporary or
20 permanent and the type specified in the contract.

21 (B) Erosion and Siltation Control

22 The Contractor shall exercise every reasonable precaution throughout the life of the
23 project to prevent the eroding of soil and the silting of rivers, streams, lakes, reservoirs,
24 other water impoundments, wetlands, ground surfaces or other property.

25 Before suspension of operations on the project or any portion thereof, the Contractor shall
26 take all necessary measures to protect the construction area, including, but not limited to,
27 borrow sources, soil type base course sources and waste areas from erosion during the
28 period of suspension.

29 Unless otherwise approved in writing by the Engineer, construction operations in rivers,
30 streams and water impoundments shall be restricted to those areas where channel changes
31 are shown in the plans and to those areas which must be entered for the construction or
32 removal of temporary or permanent structures.

33 Excavated materials shall not be deposited, nor shall earth dikes or other temporary earth
34 structures be constructed, in rivers, streams, or impoundments. As an exception to the
35 above, confined earth materials will be permitted when approved in writing by the
36 Engineer.

37 Forging of live streams with construction equipment will not be permitted; therefore,
38 temporary bridges or other structures shall be used wherever stream crossings are
39 necessary. Unless otherwise approved in writing by the Engineer, mechanized equipment
40 shall not be operated in live streams except as may be necessary to construct channel
41 changes and to construct or remove temporary or permanent structures.

(C) Coordination of Erosion Control Operations

Temporary and permanent erosion control measures shall be provided as shown in the plans or as directed by the Engineer. All permanent erosion control work shall be incorporated into the project at the earliest practicable time. Temporary erosion control measures shall be coordinated with permanent erosion control measures and all other work on the project to assure economical, effective and continuous erosion control throughout the construction and post construction period and to minimize siltation of rivers, streams, lakes, reservoirs, other water impoundments, wetlands, ground surfaces, or other property.

Temporary erosion control measures shall include, but not be limited to, the use of temporary berms, dikes, dams, drainage ditches, silt basins, silt ditches, slope drains, structures, vegetation, mulches, mats, netting, gravel, or any other methods or devices that are necessary. Temporary erosion control measures may include work outside the right-of-way or construction limits where such work is necessary as a result of construction such as borrow operations, haul roads, plant sites, equipment storage sites and disposal of waste or debris. The Contractor shall be liable for all damages to public or private property caused by silting or slides originating in waste areas furnished by the Contractor.

Materials for temporary erosion control measures shall have been approved by the Engineer before being used or shall be as directed by the Engineer. The Contractor shall acceptably maintain erosion control measures installed.

(D) Water and Air Pollution

Exercise every reasonable precaution throughout the life of the project to prevent pollution of ground waters and surface waters, such as rivers, streams and water impoundments. Do not discharge onto the ground or surface waters any pollutants such as chemicals, raw sewage, fuels, lubricants, coolants, hydraulic fluids, concrete, bitumens and any other petroleum products. Operate and maintain equipment on site in a manner as to prevent the potential or actual pollution of surface or ground waters of the State. Dispose of spent fluids in accordance with applicable Federal and State disposal regulations. Immediately clean up any spilled fluids to the extent practicable and dispose of properly.

Manage, control and dispose of litter on site such that no adverse impacts to water quality occur. Comply with all Federal, State or local air pollution regulations throughout the life of the project.

(E) Dust Control

The Contractor shall control dust throughout the life of the project within the project area and at all other areas affected by the construction of the project, including, but not specifically limited to, unpaved secondary roads, haul roads, access roads, disposal sites, borrow and material sources and production sites. Dust control shall not be considered effective where the amount of dust creates a potential or actual unsafe condition, public nuisance, or condition endangering the value, utility, or appearance of any property.

The Contractor will not be directly compensated for any dust control measures necessary, as this work will be incidental to the work covered by the various contract items.

(F) Application of Specifications

Article 107-12 shall apply to all construction operations. Further references and detailed requirements concerning erosion, siltation and pollution prevention and control are given in other sections of the *Standard Specifications* as supplements to the general requirements of this article.

Section 107

1 (G) Sanctions

2 In the event that temporary erosion and pollution control measures become necessary due
3 to the Contractor's negligence, carelessness, or failure to incorporate permanent erosion
4 control measures into the project at the earliest practicable time, such measures shall be
5 performed by the Contractor as directed by the Engineer at no cost to the Department. If
6 the Contractor fails to perform such measures as directed, the Engineer may have the
7 work performed in accordance with Article 105-16.

8 Failure of the Contractor to fulfill any of the requirements of this article may result in the
9 Engineer ordering the stopping of construction operations in accordance with
10 Article 108-7 until such failure has been corrected. Such suspension of operations will
11 not justify an extension of contract time.

12 Failure on the part of the Contractor to perform the necessary measures to control
13 erosion, siltation and pollution will result in the Engineer notifying the Contractor to take
14 such measures. In the event that the Contractor fails to perform such measures within
15 24 hours after receipt of such notice with adequate forces and equipment, the Engineer
16 may suspend the work as provided above, or may proceed to have such measures
17 performed with other forces and equipment, or both. No payment will be made to the
18 Contractor for the performance of this work and the cost of such work so performed will
19 be deducted from monies due the Contractor on his contract.

20 107-13 PROTECTION OF PUBLIC LANDS

21 In the execution of any work within or adjacent to any National or State forest, park or other
22 public lands, the Contractor shall comply with all regulations of all authorities having
23 jurisdiction over such forest, park or lands, governing the protection of public lands and the
24 carrying out of work within public lands and shall observe all sanitary laws and regulations
25 with respect to the performance of work in public lands. He shall keep the areas in an orderly
26 condition, properly dispose of all refuse and obtain permits for the construction and
27 maintenance of all construction camps, stores, warehouses, residences, latrines, cesspools,
28 septic tanks and other structures in accordance with the regulations of the appropriate
29 authorities.

30 The Contractor shall take all reasonable precaution to prevent and suppress forest fires and
31 shall require his employees and subcontractors, both independently and at the request of forest
32 officials, to do all reasonable within their power to prevent and suppress and to assist in
33 preventing and suppressing forest fires and to make every possible effort to notify a forest
34 official at the earliest possible moment of the location and extent of any fire seen by them.

35 The Contractor shall obtain any construction permits that may be required for his operations,
36 which are not a part of the project, in accordance with the regulations of the appropriate
37 authorities.

38 107-14 RESPONSIBILITY FOR DAMAGE CLAIMS

39 The Contractor shall indemnify and save harmless the Board and its members and the
40 Department, its officers, agents and employees from all suits, actions, or claims of any
41 character brought for any injury or damages received or sustained by any person, persons, or
42 property by reason of any act of the Contractor, subcontractor, its agents or employees, in the
43 performance of the contract. The Contractor's liability to save harmless and indemnify shall
44 include, but not by way of limitation, the following:

45 (A) Damages or claims for the failure of the Contractor to safeguard the work;

46 (B) Damages or claims by reason of the failure of the Contractor to erect adequate barricades
47 and post adequate warnings to the public of such barricades;

48 (C) Any damage or claims caused through the Contractor's use of defective materials or by
49 the performance of defective work;

- 1 **(D)** Any claims by reason of the Contractor's infringement of patent, trademark, or copyright;
- 2 **(E)** Any amounts paid by the Department by reason of the Contractor's failure to comply with
- 3 or for violations of laws, ordinances, orders, or decrees;
- 4 **(F)** Any damages or claims caused by blasting operations of the Contractor with or without
- 5 proof of negligence on the part of the Contractor;
- 6 **(G)** Damages or claims caused by the failure of the Contractor to protect private or public
- 7 property pursuant to Article 107-11, including damages to public and private property
- 8 caused by silting and slides from waste areas furnished by the contractor, without proof
- 9 of negligence; and
- 10 **(H)** Damages caused by the failure of the Contractor to control erosion in accordance with the
- 11 contract.

12 In addition to any remedy authorized by law, the Department shall have a right to retain from
13 monies due the Contractor, as the Department considers necessary until final disposition has
14 been made of the following suits or claims:

- 15 (1) For all claims against the Department involving claims or damages that are the
- 16 Contractor's responsibility under Section 107. The Contractor and the Surety shall
- 17 remain responsible until such suits or claims against the Department have been
- 18 settled and until the Department has been indemnified and saved harmless.
- 19 (2) In case of claims by third parties against the Contractor involving tort liability for
- 20 which the Department might be held liable for as a taking of property, or as a tort
- 21 before the Industrial Commission. However, monies due the Contractor will not be
- 22 retained provided the Contractor produces satisfactory evidence to the Department
- 23 that he is adequately protected from such tort liability by public liability and property
- 24 damage insurance. In all other cases involving claims or suits by third parties against
- 25 the Contractor, amounts due the Contractor will not be withheld provided that the
- 26 consent of the Surety is furnished and the Surety guarantees payment of any amounts
- 27 for which the Contractor may be determined to be legally liable.
- 28 (3) In cases of damage to property of the Department, such amounts necessary to pay for
- 29 such damage.

30 In cases where claims are made or suits filed against the Board or its members and the
31 Department, its officers, agents and employees, the Department may retain from any monies
32 due the Contractor, an amount sufficient to indemnify such member of the Board or officer,
33 agent or employee of the Department for any amounts which they may be held liable for but
34 for which the Contractor is responsible under Section 107. In the event that there is not
35 sufficient monies available from the final estimate, the Department may collect from the
36 Contractor or its Surety amounts sufficient to indemnify such employee, agent or officer of
37 the Department or member of the Board for such damages incurred.

38 **107-15 LIABILITY INSURANCE**

39 The Contractor shall be liable for any losses resulting from a breach of the terms of this
40 contract. The Contractor shall be liable for any losses due to the negligence or willful
41 misconduct of its agents, assigns and employees including any sub-contractors which causes
42 damage to others for which the Department is found liable under the Torts Claims Act, or in
43 the General Courts of Justice, provided the Department provides prompt notice to the
44 Contractor and that the Contractor has an opportunity to defend against such claims. The
45 Contractor shall not be responsible for punitive damages.

Section 107

1 The Contractor shall at its sole cost and expense obtain and furnish to the Department
2 an original standard Association for Cooperative Operations Research and
3 Development (ACORD) form certificate of insurance evidencing commercial general liability
4 with a limit for bodily injury and property damage in the amount of \$5,000,000 per
5 occurrence and general aggregate, covering the Contractor from claims or damages for bodily
6 injury, personal injury, or for property damages that may arise from operating under the
7 contract by the employees and agents of the Contractor. The required limit of insurance may
8 be obtained by a single general liability policy or the combination of a general liability and
9 excess liability or umbrella policy. The State of North Carolina shall be named as an
10 additional insured on this commercial general liability policy. The policy may contain the
11 following language as relates to the State as an additional insured: "This insurance with
12 respect to the additional insured applies only to the extent that the additional insured is held
13 liable for your or your agent's acts or omissions arising out of and in the course of operations
14 performed for the additional insured."

15 The Contractor shall maintain all legally required insurance coverage, including without
16 limitation, worker's compensation and vehicle liability, in the amounts required by law. Prior
17 to beginning services, all contractors shall provide proof of coverage issued by a workers'
18 compensation insurance carrier, or a certificate of compliance issued by the Department of
19 Insurance for self-insured subcontractors, irrespective of whether having regularly in service
20 fewer than three employees. Providing and maintaining adequate insurance coverage is a
21 material obligation of the contractor and is of the essence of this contract. All such insurance
22 shall meet all laws of the State of North Carolina. Such insurance coverage shall be obtained
23 from companies that are authorized to provide such coverage and that are authorized by the
24 Commissioner of Insurance to do business in North Carolina. The Contractor shall at all
25 times comply with the terms of such insurance policies.

26 Upon execution of the contract, provide evidence of the above insurance requirements to the
27 Engineer. When required by the contract, the Contractor shall carry insurance of the kinds
28 and in the amounts specified therein in addition to any other forms of insurance or bonds
29 required under the terms of the contract, or any other insurance carried by the Contractor.

30 **107-16 OPENING SECTIONS OF PROJECT TO TRAFFIC**

31 If it is determined by the Engineer that the Contractor will not complete the work by the
32 completion date, intermediate completion date, or intermediate completion time, the Engineer
33 may notify the Contractor in writing that upon expiration of contract time or intermediate
34 contract time the project, or any portion thereof, will be open to traffic. On such sections that
35 are opened, the Contractor shall conduct the remainder of his operations so as to cause the
36 least obstruction to traffic. The Contractor shall not be relieved of his liability or
37 responsibility, shall not receive any additional compensation due to the added cost of the
38 work, nor shall he receive any extension of the completion date, intermediate completion date,
39 or intermediate completion time, by reason of such openings.

40 **107-17 CONTRACTOR'S RESPONSIBILITY FOR WORK**

41 Until final acceptance of the work by the Engineer, as evidenced in writing, the Contractor
42 shall have the charge and care thereof and shall take every precaution against injury or
43 damage to any part thereof by the action of the elements, or from any other cause, whether
44 arising from the execution or from the nonexecution of the work. The Contractor shall
45 rebuild, repair, restore and make good all injuries or damages to any portion of the work
46 occasioned by any of the above causes before final acceptance and shall bear the expense
47 thereof, except as provided in other sections of the Specifications. The Department will
48 reimburse the Contractor for the repair of the work due to actions of the elements of such
49 exceptional nature as to be contractually classified as Acts of God.

50 In case of suspension of work from any cause whatsoever, the Contractor shall be responsible
51 for all materials and shall properly store them, if necessary, and shall provide suitable

1 drainage of the roadway and erect necessary temporary structures at no cost to the
2 Department.

3 **107-18 FURNISHING RIGHT OF WAY**

4 The Department will be responsible for the securing of all necessary rights of way.

5 **107-19 PERSONAL LIABILITY OF PUBLIC OFFICIALS**

6 The Board and its members and the Department's officers, agents and employees shall not be
7 held personally liable for any damages connected with the work, it being specifically
8 understood in all such matters that they act solely as agents and representatives of the Board
9 or the Department.

10 **107-20 WAIVER OF LEGAL RIGHTS BY THE DEPARTMENT**

11 Upon completion of the work, the Department will expeditiously make an inspection and
12 notify the Contractor of acceptance. Such final acceptance and processing of the final
13 estimate, however, shall not preclude or estop the Department from correcting any
14 measurement, estimate, or certificate made before or after completion of the work, nor shall
15 the Department be precluded or estopped from recovering from the Contractor or his Surety,
16 or both, such overpayment as it may sustain, or by failure on the part of the Contractor to
17 fulfill his obligations under the contract. A waiver on the part of the Department of any
18 breach of any part of the contract shall not be held to be a waiver of any other or subsequent
19 breach.

20 The Contractor, without prejudice to the terms of the contract, shall be liable to the
21 Department for latent defects, fraud, or such gross mistakes as may amount to fraud, or as
22 regards the Department's rights under any warranty or guaranty.

23 **107-21 SAFETY AND ACCIDENT PROTECTION**

24 The Contractor shall comply with all applicable Federal, State and local laws, ordinances and
25 regulations governing safety, health and sanitation, and shall provide all safeguards, safety
26 devices and protective equipment, and shall take any other needed actions, on his own
27 responsibility, that are reasonably necessary to protect the life and health of employees on the
28 job and the safety of the public, and to protect property in connection with the performance of
29 the work covered by the contract.

30 All Contractors' personnel, all subcontractors and their personnel, and any material suppliers
31 and their personnel shall wear a reflective vest or outer garment conforming to MUTCD at all
32 times while on the project.

33 **107-22 WAGES AND CONDITIONS OF EMPLOYMENT**

34 The Contractor's attention is directed to the provisions and requirements of any and all public
35 statutes that regulate hours or conditions of employment on public work. Such provisions and
36 requirements that are appropriate, in accordance with the intent of the particular law, act, or
37 statute, will be applicable to all work performed by the Contractor with his own organization
38 and with the assistance of workmen under his immediate superintendence and to all work
39 performed by subcontract. It shall be the responsibility of the Contractor to ascertain the
40 appropriate application of such provisions and requirements to the work.

41 In addition to the general requirements of the various regulations referred to above, certain
42 additional regulations and restrictions may be imposed that are peculiar to the particular work
43 under the contract. In such cases, these regulations and restrictions will be included in the
44 contract for the particular project involved.

Section 107

1 For projects that are financed wholly or in part with Federal funds, the minimum wage rates to
2 be paid to all mechanics and laborers employed on the project will be determined by the
3 U.S. Secretary of Labor. A schedule of such wage rates will be included in the proposal for
4 such projects. The Contractor shall provide at the job site at no cost to the Department
5 a weatherproof bulletin board covered with glass or rigid transparent plastic and shall display
6 thereon at all times the required federal aid posters with regard to employment and wages that
7 will be furnished to him. The bulletin board shall be located in a conspicuous place easily
8 accessible to all employees.

9 In the event that changes should occur in any of the regulations referred to in this article, or in
10 any application thereof to the work under contract, no additional compensation will be
11 allowed the Contractor as a result of such changes.

107-23 LIABILITY TO THIRD PARTIES

13 It is not intended by any of the provisions of any part of these specifications to make the
14 public or any member thereof a third party beneficiary hereunder, or to authorize anyone who
15 is not a party to a contract entered into pursuant to these specifications to maintain a suit for
16 personal injury or property damage otherwise than as authorized and provided by law.

107-24 RIGHT OF THE CONTRACTOR TO FILE VERIFIED CLAIM

18 If the Contractor fails to receive such settlement as he claims to be entitled to under the terms
19 and provisions of the contract, the Contractor may submit a written and verified claim for
20 such amounts he deems himself or his subcontractor entitled to under the terms and provisions
21 of the contract provided he has complied with the applicable provisions of the contract
22 including, but not limited to, giving written notice of intent to file a claim, keeping and
23 submission of cost records and the initial submission of a written claim within the specified
24 time period. The claim shall be submitted to the Chief Engineer within 60 calendar days from
25 the time the Contractor receives the final estimate as defined by Section 101 and shall be
26 submitted in accordance with NCGS § 136-29.

27 Submission of records by the Contractor and physical acceptance by the Department, during
28 the course of the project shall not be construed as an admission of liability by the Department
29 and shall be accepted by the Department for record keeping purposes only and not as
30 an acknowledgement of entitlement by the Contractor.

107-25 HAZARDOUS, CONTAMINATED AND TOXIC MATERIAL

32 When the Contractor's operations encounter or expose any abnormal condition that may
33 indicate the presence of a hazardous, contaminated, or toxic material, such operations shall be
34 discontinued in the vicinity of the abnormal condition and the Engineer shall be notified
35 immediately. Upon notification by the Contractor, the Engineer will investigate the work,
36 consult the GeoEnvironmental Section of the Geotechnical Engineering Unit and, if
37 necessary, suspend the work in accordance with Article 108-7. The presence of storage
38 drums or barrels; old or abandoned underground storage tanks; discolored earth, metal, wood,
39 etc.; visible fumes; abnormal odors; excessively hot earth; smoke; or anything else that
40 appears abnormal may be indicators of hazardous, contaminated or toxic materials and shall
41 be treated with extraordinary caution as they are evidence of abnormal conditions.

42 The Contractor's operations shall not resume until so directed by the Engineer.

43 Disposition of the hazardous, contaminated, or toxic material will be made in accordance with
44 Federal, State and local requirements and regulations. Where the Contractor performs work
45 necessary to dispose of hazardous, contaminated, or toxic material, payment will be made at
46 the unit prices for pay items included in the contract that are applicable to such work. Where
47 the contract does not include such pay items, the Engineer may have the work performed by
48 others or the Contractor may perform the work in accordance with Article 104-7 for extra
49 work and the following paragraphs.

1 The Contractor shall employ a fully experienced and prequalified geoenvironmental firm to
2 oversee and document the disposal of contaminated material removed from within the project
3 limits. The Contractor shall furnish and deliver to the Department a digital report including
4 all documents necessary to meet the laws, rules and regulations of the environmental
5 regulatory agency(ies) having jurisdiction over each respective site from which contaminated
6 materials are removed. Reports documenting the Contractor's work and laboratory analyses
7 of collected samples shall be submitted to the Department within 30 calendar days after
8 completion of the removal of the contaminated materials. If the Contractor removes any
9 underground storage tanks (UST), a UST Closure Report shall be presented to the Department
10 within 25 calendar days after receipt of laboratory data. The Contractor shall not submit any
11 reports directly to the regulatory agencies. The Contractor shall provide to the Department a
12 Certificate of Remediation from the disposing/treating facility within 60 calendar days after
13 removal of the materials from the project site unless alternate arrangements are approved in
14 writing by the Department.

15 Contaminated material removed during construction shall be transported to a waste treatment
16 and disposal facility that is fully approved and permitted by all applicable environmental
17 regulatory agencies to receive, treat and/or dispose of the material. It shall be the Contractor's
18 responsibility to locate such a facility. Departmental approval of the specific facility
19 identified for use by the Contractor shall occur before removal of any materials from the
20 project limits. Contaminated material shall only be removed to the extent necessary to
21 complete a task or as directed by the Engineer. Remaining contamination shall be left in
22 place and documented in reports provided to the Department. The Contractor shall provide
23 the Department with all transportation manifests and certificates of acceptance from the
24 receiving disposal facility weekly. The Department will be the regulatory generator of all
25 waste excavated and removed from within the project limits. The Contractor, with the
26 approval of the Engineer, is authorized to sign all waste transportation and disposal manifests
27 on behalf of the Department.

28 The Contractor shall maintain qualified personnel on-site at all times during removal of
29 materials from within known areas of contamination for field screening and to monitor
30 ambient air quality. The qualified personnel shall be knowledgeable with the use of
31 an Organic Vapor Analyzer, Flame Ionization Detector, Photo Ionization Detector, or other
32 appropriate monitoring equipment. In the event that there is a need to stockpile contaminated
33 material, the Contractor shall stockpile all contaminated soil excavated from a parcel in
34 a location within the property boundaries of the source parcel in accordance with the Standard
35 Stockpile Containment Detail. If the volume of contaminated material exceeds available
36 space on site, the Contractor shall obtain a permit from the NCDEQ UST Section for off-site
37 temporary storage.

38 The Contractor shall be entirely responsible for compliance with all OSHA, EPA, DOT,
39 NCDEQ, and local rules and regulations pertaining to excavation, transportation and
40 treatment/disposal of the contaminated material. Examples of such rules and regulations
41 include, but are not limited to, 29 CFR 1910 General Industry Standards and 1926
42 Construction Standards, and 40 CFR 260 Hazardous Waste Management System, 261
43 General, Identification and Listing of Hazardous Waste, 262 Standards Applicable to
44 Generators of Hazardous Waste, 263 Standards Applicable to Transporters of Hazardous
45 Waste, 264 Standards for Owners and Operators of Hazardous Waste Treatment, Storage, and
46 Disposal Facilities, 265 Interim Status Standards for Owners and Operators of Hazardous
47 Waste Treatment, Storage, and Disposal Facilities, 49 CFR 173 Shippers-General
48 Requirements for Shipments and Packagings, 49 CFR 178 Specifications for Packagings, 15A
49 NCAC 13A North Carolina Hazardous Waste Management Rules, NCGS § 130A-310
50 Inactive Hazardous Sites, the Federal Comprehensive Environmental Response,
51 Compensation and Liability Act (CERCLA) and the Federal Resource Conservation and
52 Recovery Act (RCRA). It must be noted that inclusion of this paragraph is meant to highlight
53 the Contractor's responsibility for regulatory compliance in all phases of work on this project.

Section 108

1 107-26 FINES AND LEVIES AGAINST THE DEPARTMENT

2 In the event there are fines or charges levied against the Department, actions taken by the
3 Department, or remediation required by the Department due to the contractor's negligence,
4 carelessness, or failure, due to violations charged to the Contractor, or due to the Contractor's
5 failure to comply with the contract, monies will be deducted from monies to be paid to the
6 Contractor on this project.

7 SECTION 108 8 PROSECUTION AND PROGRESS

9 108-1 GENERAL

10 It is the intent of these Specifications that the Contractor shall commence work on the date of
11 availability shown in the contract or as soon thereafter as practicable, except that when
12 required by permits included in the proposal, that work in jurisdictional waters and wetlands
13 shall not begin until a meeting is held between the Department, Regulatory Agencies and the
14 Contractor. The Contractor shall not begin work before the date of availability without
15 written approval of the Engineer. If such approval is given, the Department will assume no
16 responsibility for any delays caused before the date of availability by any reason whatsoever,
17 and such delays, if any, will not constitute a valid reason for extending the completion date.

18 The Contractor shall pursue the work diligently with workmen in sufficient numbers, abilities
19 and supervision, and with equipment, materials and methods of construction as may be
20 required to complete the work described in the contract or as may be amended by the
21 completion date.

22 108-2 PROGRESS SCHEDULE

23 The Contractor shall prepare and submit for review and approval a schedule of proposed
24 working progress. This schedule shall be submitted on forms supplied by the Engineer or in
25 a format that is approved by the Engineer. A detailed Critical Path Method (CPM) schedule
26 shall not be submitted to replace the progress schedule details required below.

27 The proposed progress schedule shall be submitted no later than 7 calendar days before the
28 date of the project preconstruction conference and shall be approved before any payments will
29 be processed for the project.

30 When the Engineer has extended the completion date or if the project overrun is anticipated to
31 exceed 5%, the Contractor may submit a revised progress schedule to the Engineer for review
32 and approval. If plan revisions are anticipated to change the sequence of operations in such
33 a manner as will affect the progress but not the completion date, then the Contractor may
34 submit a revised progress schedule for review and approval but the completion date shall
35 remain unchanged.

36 The proposed progress schedule shall contain the following items:

37 (A) A time scale diagram with major work activities and milestone dates clearly labeled.

38 (1) For purposes of composing the progress schedule, major work activities are defined
39 as components comprising more than 5% of the total project cost or occupying more
40 than 10% of total contract time and shall include, if applicable, the following:

- 41 (a) Clearing and grubbing
- 42 (b) Grading
- 43 (c) Drainage
- 44 (d) Soil stabilization
- 45 (e) Aggregate base course
- 46 (f) Pavement
- 47 (g) Culverts
- 48 (h) Bridges (including removal)

- 1 (i) Signals, ITS and lighting
 2 (j) Overhead signs
- 3 (2) For purposes of composing the progress schedule, major milestones are derived from
 4 the project construction phasing and shall include, if applicable, the following:
- 5 (a) Start of construction
 6 (b) Intermediate completion dates or times
 7 (c) Seasonal limitation/observation periods/moratoriums
 8 (d) Traffic shifts
 9 (e) Beginning and end of each traffic control phase or work area
 10 (f) Road openings
 11 (g) Completion date
- 12 (B) A cash curve corresponding to the milestones and work activities established in
 13 Subarticle 108-2(A) above.
- 14 (C) A written narrative that explains the sequence of work, the controlling operations,
 15 intermediate completion dates, milestones, project phasing, anticipated work schedule
 16 and estimated resources. In addition, explain how permit requirements, submittal
 17 tracking and coordination with subcontractors, utility companies and other entities will be
 18 performed.

19 **108-3 PRECONSTRUCTION CONFERENCE**

20 Immediately after receipt of notice of award, the Division Engineer and the Contractor will
 21 establish a mutually agreeable date on which the preconstruction conference will be held. The
 22 Contractor's project superintendent and other individuals representing the Contractor who are
 23 knowledgeable of the Contractor's proposed progress schedule or who will be in charge of
 24 major items of the work shall attend the preconstruction conference.

25 **108-4 CONSTRUCTION CONFERENCES**

26 After work on the project has begun, construction conferences will be held periodically. The
 27 construction conferences are to be scheduled at times that are mutually agreeable to both the
 28 project superintendent and the Resident Engineer. It shall be the superintendent's
 29 responsibility to attend the conferences.

30 **108-5 CHARACTER OF WORKMEN, METHODS AND EQUIPMENT**

31 The Contractor shall at all times employ sufficient labor and equipment for prosecuting the
 32 several classes of work to full completion in the manner and time required by the *Standard*
 33 *Specifications*.

34 Department employees who elect to become employed by a Contractor may not perform any
 35 function on a project with which they have been involved during employment with the
 36 Department without written consent of the State. Any person employed by the Contractor and
 37 assigned to a project who has previously been involved in the project as a Department
 38 employee shall be, at the written direction of the Engineer, removed from the project.
 39 An exception to these terms may be granted when recommended by the Secretary and
 40 approved by the Board.

41 Failure of the Contractor to comply may be justification for disqualifying him from further
 42 bidding in accordance with Article 102-15 and shall be grounds for termination of this
 43 contract.

44 No person shall be employed by the Contractor or by any subcontractor who has been
 45 determined by the Engineer to have engaged in fraudulent activities in connection with any
 46 work for the Department.

Section 108

1 Any person employed by the Contractor or by any subcontractor who, in the opinion of the
2 Engineer, does not perform his work in a proper and skillful manner or is disrespectful,
3 intemperate, or disorderly or who has been determined by the Engineer to have engaged in
4 fraudulent activities in connection with any work for the Department shall, at the written
5 request of the Engineer, be removed forthwith by the Contractor or subcontractor employing
6 such person and shall not be employed again in any portion of the work without the approval
7 of the Engineer.

8 Should the Contractor fail to remove such persons as required above, the Engineer may
9 suspend the work in accordance with Article 108-7.

10 All equipment proposed to be used on the work is to be of sufficient size and in such
11 mechanical condition as to meet the requirements of the work and to produce a satisfactory
12 quality of work. Equipment used on any portion of the project shall be such that no injury to
13 the roadway, adjacent property, or other highways will result from its use. The Engineer may
14 order in writing the removal and replacement of any unsatisfactory equipment.

15 When the methods and equipment to be used by the Contractor in accomplishing the
16 construction are not prescribed in the contract, the Contractor is free to use any methods or
17 equipment that he demonstrates to the satisfaction of the Engineer will accomplish the
18 contract work in conformity with the contract.

19 When the contract specifies that the construction be performed by the use of certain methods
20 and equipment, such methods and equipment shall be used unless others are approved by the
21 Engineer. If the Contractor desires to use a method or type of equipment other than those
22 specified in the contract, he may request approval from the Engineer to do so. The request
23 shall be in writing and shall include a full description of the methods and equipment proposed
24 to be used and an explanation of the reasons for desiring to make the change. If approval is
25 given it will be on the condition that the Contractor will be fully responsible for producing
26 construction work in conformity with contract requirements. If, after trial use of the
27 substituted methods or equipment, the Engineer determines that the work produced does not
28 meet contract requirements, the Contractor shall discontinue the use of the substitute method
29 or equipment and shall complete the remaining construction with the specified methods and
30 equipment. The Contractor shall remove the unsatisfactory work and replace it with work of
31 specified quality, or take such other corrective action as the Engineer may direct. No change
32 will be made in basis of payment for the construction items involved or in the completion date
33 as a result of authorizing a change in methods or equipment under these provisions.

34 **108-6 SUBLETTING OF CONTRACT**

35 The Contractor shall not sublet, sell, transfer, assign, or otherwise dispose of the contract or
36 any portion thereof; or of his right, title, or interest therein; without written consent of the
37 Engineer. All requests to sublet work shall be submitted within 30 calendar days of the date of
38 availability or prior to expiration of 20% of the contract time, whichever date is later, unless
39 otherwise approved by the Engineer. In case such consent is given, the sublet work shall be
40 performed by the subcontractor unless otherwise approved in writing by the Engineer. Failure
41 of the Contractor to comply with the *Standard Specifications* will be just cause for the work to
42 be considered unauthorized in accordance with Article 105-12. A firm that has been
43 disqualified due to its failure to maintain satisfactory progress under Article 108-8 will not be
44 approved as a subcontractor until the firm demonstrates the ability to perform the work in a
45 satisfactory manner. When directed by the Engineer, the Contractor shall submit a certified
46 copy of the actual subcontract agreement executed between the Contractor and subcontractor
47 before written consent being issued by the Engineer. In case such consent is given, the
48 Contractor will be permitted to sublet a portion thereof, but shall perform with his own
49 organization, work amounting to not less than 40% of the total original contract amount,
50 except:

51 (A) Any items designated in the contract as specialty items may be performed by subcontract
52 and the cost of any such special items so performed by subcontract will be deducted from

1 the total amount bid before computing the amount of work required to be performed by
2 the Contractor with his own organization, and

3 **(B)** Any other items sublet to Disadvantaged Business Enterprise (DBE), Minority
4 Business (MB) or Women's Business (WB), up to the value of the contract DBE, MB or
5 WB goal, will be deducted from the total amount bid before computing the amount of
6 work required to be performed by the Contractor with his own organization.

7 In any event, the Contractor shall perform with his own organization work amounting to not
8 less than 35% of the difference between the total amount bid and the value of specialty items
9 that have been sublet. Purchasing materials for subcontractors is not included in the
10 percentage of work required to be performed by the Contractor. If the Contractor sublets
11 items of work but elects to purchase material for the subcontractor, the value of the material
12 purchased will be included in the total dollar amount considered to have been sublet.

13 Extra work performed in accordance with Article 104-7 will not be considered in the
14 computation of work required to be performed by the Contractor.

15 An assignment by operations of law or assignment for the benefit of creditors, or the
16 bankruptcy of the Contractor, shall not vest any right in this contract in the Trustee in
17 bankruptcy, the Contractor's creditors, or the agent of the creditors.

18 A subcontractor shall not sublet, sell, transfer, assign, or otherwise dispose of his contract
19 with a contractor or any portion thereof; or of his right, title, or interest therein; without
20 written consent of the Engineer. When directed by the Engineer, the contractor shall submit
21 a certified copy of the actual subcontract agreement executed between the subcontractor and
22 the second tier subcontractor. In the event of an assignment by operations of law or the
23 bankruptcy of the subcontractor, the contractor shall have the right, power and authority, in its
24 discretion, without violating the contract or releasing the Surety, to terminate the subcontract.
25 An assignment by operations of law or assignment for the benefit of creditors or the
26 bankruptcy of the subcontractor shall not vest any right in this contract in the Trustee in
27 bankruptcy, nor the subcontractor's creditors or agents of the creditors.

28 Neither the Contractor, nor any subcontractor, shall enter into any written or oral equipment
29 lease or rental agreement, materials purchase agreement or labor agreement that circumvents
30 this article.

31 If the Contractor or a subcontractor enters into a lease or rental agreement for equipment
32 based upon payment for a unit of work, such agreement will be considered subletting of the
33 contract unless the lease or rental agreement is with a commercial equipment company,
34 manufacturer or commercial leasing agency and such firm has been approved by the
35 Engineer. An equipment lease or rental agreement that is based upon unit prices per unit of
36 time will not be considered subletting of the contract.

37 The approval of any subcontract will not release the Contractor of his liability under the
38 contract and bonds, nor will the subcontractor or the second tier subcontractor have any claim
39 against the Department by reason of the approval of the subcontract. The Chief Engineer will
40 review and consider subcontractor claims for additional time or compensation provided such
41 claims are submitted by the Contractor in accordance with Article 107-24 and NCGS § 136-
42 29.

43 Failure of the Contractor to comply with any of the requirements of this article may be
44 justification for disqualifying the Contractor from further bidding in accordance with
45 Article 102-15.

46 **108-7 TEMPORARY SUSPENSION OF THE WORK**

47 The Engineer will have the authority to suspend the work wholly or in part by written order
48 for such periods, as he may deem necessary for any of the following reasons:

49 **(A)** Conditions considered unfavorable for the suitable prosecution of the work, or

Section 108

- 1 **(B)** The Contractor's failure to correct conditions unsafe for workmen or the general public,
2 or
3 **(C)** The Contractor has not carried out orders given to him by the Engineer, or
4 **(D)** The Contractor's failure to perform any provisions of the contract.

5 No extension of the completion date will be allowed for the above suspensions except as may
6 be provided for in Article 108-10.

7 **108-8 FAILURE TO MAINTAIN SATISFACTORY PROGRESS**

8 The Engineer will check the Contractor's progress at the time each partial pay estimate is
9 prepared. The Contractor's progress may be considered as unsatisfactory as follows:

10 **(A)** The Contractor's progress is found to be less than that described in either count below:

11 (1) The dollar value of the work completed, excluding material payments allowed by
12 Article 109-5, is less than the dollar value of the work that should have been
13 completed, on the basis of the Contractor's approved progress schedule, by more than
14 15% of the current contract amount.

15 The dollar value of the work completed will be the total estimate to date shown in
16 the latest partial pay estimate, excluding material payments allowed by
17 Article 109-5. The current contract amount will be the total amount bid plus
18 accumulated overruns less accumulated underruns shown in the latest partial pay
19 estimate.

20 (2) The percentage of the work completed is less than the percentage of contract time
21 elapsed on the work by more than 15%. The percentage of work completed will be
22 the dollar value of the work completed as defined above, divided by the current
23 contract amount as defined above.

24 The percentage of contract time elapsed will be the number of calendar days elapsed
25 as shown in the latest partial pay estimate divided by the total contract time in
26 calendar days.

27 **(B)** The Contractor fails to begin and pursue the work in accordance with Article 108-1
28 before the expiration of 5% of the original contract time after the date work was
29 scheduled to begin based upon the approved progress schedule.

30 **(C)** The Engineer anticipates the Contractor will not complete the work described in the
31 contract by the intermediate contract time or the contract completion date.

32 When the Contractor's progress is found to be unsatisfactory as described in
33 Subarticles 108-8(A), 108-8(B) and 108-8(C) above, the Engineer may make written demand
34 of the Contractor to state in writing the reason for the unsatisfactory progress and produce
35 such supporting data as the Engineer may require or the Contractor may desire to submit. The
36 Engineer will consider the justifications submitted by the Contractor and extensions of the
37 completion date have or may be allowed in accordance with Subarticle 108-10(B).

38 When the Contractor cannot satisfactorily justify the unsatisfactory progress, the Engineer
39 may invoke one or more of the following sanctions:

40 (1) Withhold anticipated liquidated damages from amounts currently due or that become
41 due.

42 (2) Remove the Contractor from the Department's Prequalified Bidders List.

43 When any of the above sanctions have been invoked, they shall remain in effect until
44 rescinded by the Engineer.

108-9 DEFAULT OF CONTRACT**(A) Declaration of Default**

The Department shall have the right to declare default of the contract for breach by the Contractor of any material term or condition of the contract as determined by the Department. Material breach by the Contractor shall include, but specifically shall not be limited to failure to begin work under the contract within the time specified; failure to provide workmen, equipment, or materials adequate to perform the work in conformity with the contract by the completion date; unsatisfactory performance of the work; refusal or failure to replace defective work; failure to maintain satisfactory work progress; failure to comply with equal employment opportunity contract requirements; insolvency or bankruptcy, or any act of insolvency or bankruptcy; and making an assignment for benefit of creditors.

(B) Corrective Actions upon Default

In the event of a breach of the contract by the Contractor, the Department shall have the right, power and authority, in its sole discretion, without violating the contract or releasing the Surety: to assume full control of the prosecution of the contract in the place and stead of the Contractor in directing Contractor's agents, employees and subcontractors in the performance of the work and in utilizing all materials, tools, machinery, equipment and structures located on the project; to perform the work or any part thereof with Department personnel and equipment or to use any or all materials and equipment located on the project that are suitable and acceptable; to relet the work upon such terms and conditions as the Department shall deem appropriate; to employ any other methods that it may determine are required for completion of the contract in an acceptable manner; and to withhold any sums due the Contractor under the contract without penalty or interest until the work is completed and accepted by the Department.

(C) Notice

Before invoking any of the corrective actions provided for herein, the Department will give the Contractor at least 7 calendar days written notice with a copy to the Surety, that will set forth the breach of contract involved and the corrective actions to be imposed. The Department, in its discretion, may grant the Contractor time in excess of 7 calendar days within which to comply with the contract and the time allowed will be set forth in writing. If the Department determines during such period that the Contractor is not proceeding satisfactorily to compliance, it may impose the corrective actions after 24 hours' notice to the Contractor. If the Department determines that the Contractor is not in compliance at the end of the time allowed, it may immediately impose any of the corrective actions set forth herein and will advise the Contractor, in writing, with a copy to the Surety of the corrective actions imposed.

(D) Payment

After declaration of default has been made final, the Contractor will be entitled to receive payment for work satisfactorily completed or portions of work satisfactorily completed, less any sums that may be due the Department from the Contractor but in no event shall payment exceed the contract unit or lump sum price for such work. The Department, at its election, may retain the sum due the Contractor, or any portion thereof, without interest or penalty, until the contract work is completed; or it may make payment to the Contractor upon declaration of default for work satisfactorily completed to the date that notice of default is received by the Contractor. The Contractor may be required by the Engineer to carry to a stage of completion satisfactory to the Engineer any work in progress, the value of which, otherwise, would be lost by immediate cessation of work. Payment for such work will be made upon the basis hereinafter set out.

In the event that the Contractor's employees, equipment, or materials are used in prosecution of the work, or any part thereof, after default is declared, payment to the

Section 108

1 Contractor may be by contract unit or lump sum prices for the work performed, or, if the
2 Engineer determines that such prices do not represent the value of the work performed,
3 payment for the type of work or services performed will be made on a force account
4 basis, as set forth in Article 109-3, less any sums that may be due the Department; but in
5 no event shall payment exceed the contract unit or lump sum price for such work or
6 services. Determination of the method of payment shall be in the sole discretion of the
7 Engineer, and he will advise the Contractor, in writing, of his determination with
8 reference to the specific type of work or service to be performed.

9 If all costs and expenses incurred by the Department arising out of the breach and
10 imposition of sanctions, together with the total cost to the Department of securing the
11 performance of the work set forth in the contract, exceed the sum that would have been
12 payable under the contract, the Contractor and the Surety shall be liable to the
13 Department for such excess and shall pay such amount to the Department.

14 (E) Power of Engineer

15 The Engineer will exercise the powers and discretion vested in him by the contract in
16 carrying out the terms of this article. He will have full power and authority to carry out
17 any orders, directives, or resolutions issued by the Department in connection with
18 a declaration of default. In the event that the Department fails to specify the sanctions to
19 be imposed, the notice to be given or the method of completing the work, the Engineer
20 may, at his discretion, impose such sanctions, give such notice and select such methods
21 of completing the work, as are authorized by this article; and such actions shall have the
22 same effect and validity as if taken pursuant to an express order, directive or resolution of
23 the Department.

24 (F) Obligation of Contractor and Surety

25 No term or terms of this article and no action taken pursuant hereto by the Department of
26 Transportation, its agents, or employees, will be construed to release or discharge the
27 Contractor or the Surety upon the obligation set forth in the contract bonds, and the
28 Contractor and the Surety shall remain bound thereon unto the Department until the work
29 set forth in the contract has been completed and accepted by the Department and all
30 obligations of the Contractor and the Surety arising under the contract and contract bond
31 have been discharged.

32 (G) Provision Not Exclusive

33 The provisions shall be in addition to and not in place of, any other provisions relating to
34 default, breach of contract and sanctions to be imposed in connection therewith appearing
35 in the contract.

36 108-10 CONTRACT TIME AND INTERMEDIATE CONTRACT TIME

37 (A) General

38 The contract time will be as defined in Section 101. No extensions to the completion
39 date will be authorized except as allowed by this article. No modifications in the date of
40 availability will be made for any reason whatsoever.

41 Intermediate contract time, as defined in Section 101 will be that as allowed in the
42 contract to complete a part, portion or phase of the total work covered in the contract.
43 Intermediate completion dates and intermediate completion times set forth in the contract
44 may be extended on the same basis as completion dates and as described in this article.

45 When the liquidated damages stipulated in the contract are to be hourly, extensions, as
46 described in this article, will be considered on an hourly basis.

1 **(B) Completion Date, Intermediate Completion Date and Intermediate Completion**
2 **Time Extensions**

3 No extension of the completion date, intermediate completion date, or intermediate
4 completion time will be allowed for any reason except as provided for below:

5 (1) If the total dollar value of the final quantities adjusted as provided below, less the
6 dollar value of quantities represented by supplemental agreements that previously
7 extended the completion date, intermediate completion date or intermediate
8 completion time, exceeds the dollar value of the total amount bid, the completion
9 date, intermediate completion date, or intermediate completion time will be extended
10 by the number of calendar days or hours obtained by multiplying the contract time
11 (days), intermediate contract time (days), or intermediate contract time (hours) as set
12 forth in the contract by that percentage that such reduced final dollar value exceeds
13 the total amount bid. The total dollar value of the final quantities for pro-rata
14 computations shall be adjusted by excluding the following:

- 15 (a) Unit bid price changes caused by price adjustments to asphalt cement,
16 (b) Fuel adjustments,
17 (c) Unit price reductions under Article 105-3,
18 (d) Payment for trainees and
19 (e) Unit price changes due to pay factors established by the *Standard Specifications*.

20 (2) If supplemental agreements covering the performance of extra work include
21 provisions for an extension of the completion date, intermediate completion date, or
22 intermediate completion time and the final dollar value of the extra work exceeds the
23 estimated dollar value, the number of days or the number of hours by which the
24 completion date, intermediate completion date or intermediate completion time was
25 extended will be increased by the percentage that the final dollar value exceeds the
26 estimated value.

27 (3) If the Contractor's current controlling operation is delayed by circumstances
28 originating from work required under the contract and beyond his control and
29 without his fault or negligence, he may, at any time before payment of the final
30 estimate, make a written request to the Engineer on the Contractor Claim Submittal
31 Form, available through the Construction Unit, for an extension of the completion
32 date, intermediate completion date, or intermediate completion time. This request
33 shall include:

- 34 (a) The circumstances resulting in the alleged delay and documentation of said
35 circumstances as may be required by the Engineer,
36 (b) The controlling operation alleged to have been delayed,
37 (c) The calendar dates or calendar dates and times on which the controlling
38 operation was delayed and
39 (d) The number of calendar days or hours by which he is requesting the completion
40 date, intermediate completion date, or intermediate completion time to be
41 extended.

42 If the Engineer determines that the controlling operation was delayed because of
43 circumstances beyond the control of and without the fault or negligence of the
44 Contractor, and that the Contractor has pursued the work in accordance with
45 Article 108-1, he will extend the completion date, intermediate completion date, or
46 intermediate completion time unless otherwise precluded by other provisions of the
47 contract. No extension of the completion date, intermediate completion date, or
48 intermediate completion time will be allowed for delays caused by restrictions,
49 limitations or provisions contained in the contract.

Section 108

1 Consideration will be given for an extension in the completion date, intermediate
2 completion date, or intermediate completion time involving an intermediate contract
3 time of more than 96 hours if the Contractor's current controlling operation(s) is
4 delayed in excess of 40% of the total contract time (days), as defined in Section 101,
5 excluding the time between December 15 and March 16; the total intermediate
6 contract time (days), as defined in Section 101, excluding the time between
7 December 15 and March 16; or the total intermediate contract time (hours), as
8 defined in Section 101; due to weather or conditions resulting from weather. No
9 other consideration will be given for extensions in the completion date, intermediate
10 completion date, or intermediate completion time due to delays caused by weather.

11 Where the intermediate contract time is 96 hours or less, no consideration
12 whatsoever will be given for an extension in the intermediate completion time due to
13 weather or conditions resulting from weather.

14 (4) If changes in the work from that originally contemplated in the contract are ordered
15 by the Engineer and these changes result in reduction in quantities, elimination of
16 items, additional work or extra work, the Engineer will allow an extension in the
17 completion date, intermediate completion date, or intermediate completion time as
18 he may deem warranted by such changes. Pursuit of the work with adequate forces
19 and equipment and efficiency of the Contractor's operations will be considered by
20 the Engineer in determining an extension in the completion date, intermediate
21 completion date, or intermediate completion time. It is, however, the Contractor's
22 responsibility to show just cause for an extension in the completion date,
23 intermediate completion date, or intermediate completion time due to the aforesaid
24 conditions. If the Contractor elects to file a written claim or requests an extension of
25 contract time, it shall be submitted on the Contractor Claim Submittal Form available
26 through the Construction Unit.

27 (5) In the event accumulated authorized extensions in the completion date or
28 intermediate completion date resulting from Subarticles 108-10(B)(1) through
29 108-10(B)(4) above extend the completion date or intermediate completion date
30 beyond December 15 following expiration of the completion date or intermediate
31 completion date as established in the contract, the completion date will be further
32 extended by the number of calendar days between December 15 of one year and
33 March 16 of the following year. If any portion of such accumulated authorized
34 extensions are for delays that occurred after the original contract time or intermediate
35 contract time (days) expired and during the period between December 15 of one year
36 and March 16 of the following year, this portion of the extension will be deducted
37 from the number of additional calendar days awarded due to extension of the
38 completion date or intermediate completion date beyond December 15.

39 The Contractor's claim that insufficient contract time (days), intermediate contract
40 time (days), or intermediate contract time (hours) was specified in the contract will
41 not be considered as a valid reason for an extension in the completion date,
42 intermediate completion date, or intermediate completion time.

43 When all work on the project is totally complete, with the exception of an item or items on
44 which work is precluded by seasonal limitations set forth in the contract, the Engineer may,
45 provided that the Contractor has, as determined by the Engineer, diligently pursued the work
46 with adequate forces and equipment, waive the assessment of liquidated damages during the
47 period of time from the date all work other than that precluded by seasonal limitations was
48 completed until the date of expiration of the seasonal limitations. The Contractor shall make
49 the request to waive the assessment of liquidated damages in writing before the beginning
50 date of the requested waiver. The non-assessment of liquidated damages during the aforesaid
51 period shall not operate to waive any other liquidated damages that may be assessable, or any
52 other terms of the contract.

108-11 LIQUIDATED DAMAGES

The parties acknowledge that time is of the essence for the performance of the work under the contract. Time is an essential element of the contract. Delay in completing the work will result in damages including but not limited to public inconvenience, obstruction to traffic, interference with business and the increasing of engineering, inspection and administrative costs to the Department. It is therefore agreed that in view of the difficulty of making a precise determination of such damages, a sum of money in the amount stipulated in the contract, will be charged against the Contractor for each calendar day, each hour, or portion thereof that the work, or any portion of the work as described in the contract, remains uncompleted after the expiration of the completion date, intermediate completion date, or intermediate completion time shown in the contract, not as a penalty but as liquidated damages.

Should the Contractor or, in case of default, the Surety fail to complete the work or any portion of the work by any of the applicable completion dates, intermediate completion dates, or intermediate completion times shown in the contract, a deduction of the amount stipulated in the contract as liquidated damages will be made for each and every calendar day, for each and every hour, or portion thereof that the work or any portion of the work remains uncompleted after the expiration of any completion date, intermediate completion date, or intermediate completion time applicable to the uncompleted work. This amount will be deducted from any money due the Contractor or his Surety under the contract and the Contractor and his Surety will be liable for any liquidated damages in excess of the amount due.

In the event that the contract establishes one or more intermediate completion dates or times in addition to the completion date, each of the liquidated damages stipulated will be considered to be cumulative to any other liquidated damages stipulated.

In case of Contractor default of the contract and the completion of the work by the Department, the Contractor and his Surety will be liable for the liquidated damages under the contract, but no liquidated damages will be chargeable for any delay in the final completion of the work by the Department due to any action, negligence, omission, or delay of the Department.

In any suit for the collection of or involving the assessment of liquidated damages, the reasonableness of the amount stipulated in the contract will be presumed. The liquidated damages referred to herein are intended to be and are cumulative and will be in addition to every other remedy now or hereafter enforceable at law by statute or under the contract.

Permitting the Contractor to continue and finish the work or any part thereof after the expiration of the completion date, intermediate completion date, or intermediate completion time shall in no way operate as a waiver on the part of the Department of any of its rights under this contract.

108-12 EXTENSION OF CONTRACT TIME AND APPORTIONMENT OF LIQUIDATED DAMAGES

In accordance with Articles 108-10 and 108-11, when a contract is not completed by the completion date, intermediate completion date, or intermediate completion time, the Contractor shall be entitled to an extension of the completion date, intermediate completion date, or intermediate completion time and apportionment and remittance of liquidated damages to the extent that the failure to complete was due to the conditions set forth in Article 108-10. The Contractor, however, shall be entitled to an extension of the completion date, intermediate completion date, or intermediate completion time, or an apportionment and remittance of liquidated damages only to the extent and in the proportion that such delays were caused by the conditions set forth in Article 108-10, and it is understood that any extension granted shall not operate to waive any liquidated damages or any claim which the Department has or may have against the Contractor by reason of failure of the Contractor to

Section 108

1 complete the said contract by the completion date, intermediate completion date, or
2 intermediate completion time specified therein or as revised by authorized extensions.

3 **108-13 TERMINATION OF CONTRACT**

4 The Department may terminate the contract in accordance with the following provisions:

5 **(A)** The Department will consider termination of the contract upon written notification by the
6 Contractor that any of the following circumstances exist. The Contractor shall include
7 adequate documentation of these circumstances along with such notification:

8 (1) If it is impossible for the Contractor to obtain critical materials for completion of
9 the contract within a practical time limit, or

10 (2) If it is impossible for the Contractor to complete the work in accordance with the
11 contract by reason of unanticipated conditions at the site, including slides and
12 unstable subsoil, without a major change in the design of the project and the
13 Contractor will be unduly delayed in completing the project by reason of such
14 unanticipated conditions and changes in design, or

15 (3) If the Contractor is prevented from proceeding with the contract as a direct
16 result of an Executive Order of the President with respect to the prosecution of
17 war or in the interest of national defense, or

18 (4) If the Contractor is prevented from proceeding with the work required by the
19 contract as a direct result of a restraining order, or other court order, or by
20 reason of a permit requirement, and the Contractor will be unduly delayed in
21 completing the project by reason of such order or requirement, or

22 (5) If the Contractor is prevented from proceeding with the work due to the
23 unavailability of the site

24 **(B)** The Contract will be terminated under this article if:

25 (1) Request by Contractor

26 (a) The Department concurs in the determination by the Contractor of the
27 circumstances or makes an independent determination that such circumstances
28 herein above indicated exist, and

29 (b) The Department determines that such circumstances are beyond the control of
30 the Contractor, and the Contractor was not at fault in creating the circumstances,
31 and

32 (c) The Department determines that a termination of the contract is in the best
33 public interest.

34 (2) Authority of the Department

35 The Department determines that a termination of the contract is in the best public
36 interest.

37 **(C)** The Contractor will be notified in writing by the Engineer of the action of the
38 Department.

39 **(D)** After a contract is terminated in accordance with this termination provision, the following
40 provisions shall be applicable:

41 (1) When the contract is terminated before completion of all items of work in the
42 contract, payment will be made for the actual number of acceptably completed items
43 of work or acceptably completed portions thereof at the contract unit or lump sum
44 prices. When the contract is terminated before completion of all items of work in the
45 contract and items of work are partially completed or not begun, payment will be
46 made in accordance with Article 104-6.

(2) Payment for costs incurred in organization of the work will be based on verified actual costs and will be included in the adjusted contract lump sum price for Mobilization in accordance with Subarticle 108-13(D)(1). The Contractor shall demonstrate through submission of appropriate documentation that these costs were included in the bid item of Mobilization. After reviewing the submitted cost records and the submitted documentation, the Engineer will make such adjustments as he deems warranted.

(3) Upon request from the Contractor, materials meeting the requirements of the contract that were to have been incorporated into the work or were to remain the property of the Department but are not used in the work will be paid in accordance with Article 109-6.

(4) No claim for loss of anticipated profits will be considered and no payment will be made for loss of anticipated profits.

(5) Termination of a contract shall not relieve the Contractor of his responsibilities for any completed portion of the work, nor shall it relieve his Surety of its obligation for and concerning any just claims arising out of the work performed.

108-14 TERMINATION OF CONTRACTOR'S RESPONSIBILITY

After the project has been completed and accepted, as provided for in Article 105-17, the Contractor's responsibility will cease except as provided in Article 107-20 and as set forth in his contract bonds or any warranties provided for under the contract. The Contractor shall remain responsible for any amounts determined to be owed the Department in the processing of the final estimate and such amounts shall be paid by the Contractor upon notification by the Department before processing of the final estimate.

**SECTION 109
MEASUREMENT AND PAYMENT**

109-1 MEASUREMENT OF QUANTITIES

All work completed under the contract will be measured by the Engineer according to United States standard measures unless otherwise stated in the contract.

The method of measurement and computations used in the determination of quantities of material furnished and of work performed under the contract will be those methods generally recognized as conforming to accepted engineering practice.

The terms “gauge” and “thickness,” when used in connection with the measurement of plates, sheets and steel wire, shall be applied as follows:

Item	Test Method
Uncoated Steel Sheets and Light Plates	United States Standard Gauge
Galvanized Sheets	AASHTO M 218 or M 167
Aluminum Sheets	AASHTO M 196 or M 197
Steel Wire	AASHTO M 32

The term “ton” will mean short ton (mass) consisting of 2,000 pounds.

Trucks used to haul material being paid by weight will be either weighed empty before each loading or weighed empty daily. When trucks are weighed empty daily, each truck shall be weighed before hauling its first load of the day and shall bear a legible identification mark.

Where aggregates that are to be paid by weight have been stockpiled after being produced, measurement for purposes of payment will be made after the aggregates have been loaded on trucks for direct delivery to the project.

Section 109

1 When a complete structure or structural unit, as may be indicated by the unit, lump sum or
2 each, is specified as the unit of measurement, the unit will be construed to include all
3 necessary fittings and accessories.

4 When standard manufactured items are specified, and these items are identified by gauge, unit
5 weight, section dimensions or other dimensions, such identification will be considered to be
6 nominal weights or dimensions. Unless more stringently controlled by tolerances in cited
7 specifications, manufacturing tolerances established by the industries involved will be
8 accepted.

9 **109-2 SCOPE OF PAYMENT**

10 The Contractor shall receive and accept payment provided for in the contract as full payment
11 for furnishing all materials and performing all work under the contract in a complete and
12 acceptable manner and for all risk, loss, damage, or expense of whatever character arising out
13 of the nature of the work or the prosecution thereof, subject to the requirements of
14 Article 107-20. Payment to the Contractor will be made only for the actual quantities of the
15 various items that are completed and accepted in accordance with the terms of the contract.

16 If the Measurement and Payment clause in the specifications relating to any unit price or lump
17 sum price in the bid schedule requires that the said unit price or lump sum price cover and be
18 considered compensation for certain work or material essential to the item, this same work or
19 material will not be measured or paid under any other pay item that may appear elsewhere in
20 the contract.

21 **109-3 FORCE ACCOUNT WORK**

22 All force account work shall be performed as directed by the Engineer including the numbers
23 and types of equipment, the numbers and classifications of labor and foremen and material
24 requirements.

25 All work to be paid on a force account basis shall be paid in the following manner:

26 **(A) Labor**

27 For all authorized labor and foremen in direct charge of the specific operations, the
28 Contractor will receive the rate of base (actual) wages (or scale) actually being paid by
29 the contractor for each hour that the labor and foremen are actually engaged in the
30 specific force account work.

31 In addition to reimbursement for each hour that the labor and foremen are actually
32 engaged in the specific force account work, the Contractor may receive compensation for
33 travel time to and from the project if and only if the labor and foremen needed are outside
34 a 75 mile radius as included in Subarticle 109-3(B). The base location will be established
35 and approved by the Engineer before performing the specific force account work. If the
36 approved labor and foremen travel to another project upon completion of the specific
37 force account work, payment for travel time may not exceed the travel time that would
38 have been required to return to the point of origin in accordance with
39 Subarticle 109-3(B). When travel time is approved by the Engineer, it shall be included
40 in the total hours approved and worked for that specific week. The Engineer will approve
41 the mode of travel.

42 Before beginning the specific force account work, the Contractor will submit in writing
43 for the Engineer's approval a list of all wage rates applicable to the work. Approval will
44 not be granted where these wage rates are not actually representative of wages being paid
45 elsewhere on the project for comparable classes of labor performing similar work.

1 Payment for overtime will be allowed when approved by the Engineer before performing
2 the specific force account work. Overtime for labor and foremen will be paid based on
3 the company's policy for overtime payment. Verification of such payment will be
4 tracked by submission of weekly payrolls as required on federal projects and as requested
5 on all other projects. Failure to submit payrolls as required or requested shall act as a bar
6 to the Contractor for payment of overtime for labor and foremen. If the labor or foremen
7 is employed partly on specific force account work and partly on other work, the amount
8 of overtime to be reimbursed will be prorated based upon the number of hours worked on
9 the specific force account work during the payroll period.

10 An additive amount equal to the Contractor's actual labor burden rate, up to a maximum
11 of 60%, will be paid to the Contractor for all base (actual) wages paid to labor and
12 foremen for the specific force account work. No additive will be provided for overtime
13 payments. The labor burden rates will include costs associated with the employee's
14 actual base wages benefits, including Federal Insurance Contributions Act (FICA),
15 unemployment contributions, Social Security and Medicare taxes and company fringe
16 benefits. Company fringe benefits are the actual costs paid to, or on behalf of, workers
17 by reason of health and welfare benefits, pension fund benefits, or other benefits, when
18 such amounts are required by prevailing wage laws generally applicable to the classes of
19 labor employed on the work. The Contractor's actual labor burden rates will be
20 submitted to and approved by the Engineer before beginning the work. When the
21 Contractor cannot verify actual labor burden rates, an amount equal to 35% of the total
22 base (actual) wage paid labor and foremen will be added to the total base wages paid to
23 the Contractor. These percentage additives will be full compensation for overhead,
24 benefits, contingencies and all other costs associated with labor for the specific force
25 account work.

26 **(B) Subsistence and Travel Allowances**

27 The Contractor may receive payment for actual costs paid to, or on behalf of, labor and
28 foremen by reason of subsistence and travel allowances under certain circumstances.
29 When the Contractor is required to mobilize a crew for specific operations, the Engineer
30 may approve reimbursement of subsistence, including meals and overnight lodging, if the
31 specific force account work is determined to be outside of the scope of the original
32 contract and the distance from the Contractor's base location to the project is more than
33 75 miles. Should the Contractor use forces currently working at the location of the
34 specific force account work, the Engineer may approve the payment of subsistence,
35 including meals and overnight lodging, if the work is determined to be outside of the
36 scope of the original contract, the forces currently working at the location has routinely
37 stayed overnight during the life of the project, and the distance from the Contractor's
38 base location to the project is more than 75 miles. The Engineer will approve the mode
39 of travel.

40 Payment will be made to the Contractor for subsistence, including meals and overnight
41 lodging, paid in accordance with the Contractor's usual policy for authorized labor and
42 foremen in direct charge of the specific operations. Subsistence will be limited to the
43 lesser of actual amount paid or the current maximum in-state rate for State employees.
44 Verification of such costs paid to, or on behalf of, labor and foremen will be submitted to
45 the Engineer. If the labor or foremen are partly employed on specific force account work
46 and partly on other work, the amount of subsistence to be reimbursed will be prorated
47 based upon the number of hours worked on the specific force account work during the
48 payroll period.

Section 109

1 (C) Materials

2 For materials authorized and accepted by the Engineer and used, the Contractor will
3 receive the actual cost of such materials, including sales tax and transportation charges
4 paid by him (exclusive of equipment rentals as hereinafter set forth), to which costs 15%
5 will be added. The Contractor will furnish records to the Engineer to verify the quantities
6 of materials used in the specific force account work, prices of the materials, sales tax and
7 costs of transportation for the materials.

8 If materials used in the specific force account work are not specifically purchased for
9 such work but are taken from the Contractor's stock, the Contractor will furnish
10 an affidavit certifying that such materials were taken from his stock, the quantity was
11 actually used in the specific force account work and the price and transportation cost
12 claimed represent the actual cost to the Contractor.

13 (D) Equipment

14 For all equipment authorized by the Engineer to be used on the specific force account
15 work the Contractor will receive rental payment.

16 Hourly rental rates paid for equipment in use that is Contractor owned or rented from
17 another Contractor will not exceed 1/176 of the monthly rate listed in the
18 *EquipmentWatch Cost Recovery* that is current at the time the specific force account work
19 is performed.

20 In determining the hourly rate, the regional adjustment factor and the rate adjustment
21 factor for equipment age, as set forth in the *EquipmentWatch Cost Recovery*, will both be
22 applied to the basic rate. An additive payment equal to 100% of the *EquipmentWatch*
23 *Cost Recovery* estimated operating cost per hour will be paid for all hours that equipment
24 is in use. This additive payment will be full compensation for fuel, lubricants, repairs,
25 servicing (greasing, fueling and oiling), small tools and other incidentals.

26 If rental rates for the equipment actually being used in the work are not listed in the
27 *EquipmentWatch Cost Recovery*, the Contractor will receive the prevailing rental rates
28 being paid for such equipment in the area where the project is located. An additive
29 payment equal to 15% of the prevailing rental rate will be paid for all hours equipment is
30 in use. This additive payment will be full compensation for fuel, lubricants, repairs,
31 servicing (greasing, fueling and oiling), small tools and other incidentals.

32 Hourly rental rates for equipment held in ready as directed by the Engineer will be 50%
33 of the rate paid for equipment in use. An additive payment will not be made for
34 equipment held in ready. When equipment is in use less than 40 hours for any given
35 week and is held in ready as directed by the Engineer, payment for held in ready time will
36 be allowed for up to 40 hours, less hours in use. When payment is made for equipment
37 held in ready as directed by the Engineer, the payment for held in ready time will be
38 allowed for up to 8 hours in a day less hours in use.

39 Hourly rental rates for idle equipment that is held in ready in accordance with
40 Article 104-4 will be paid at 50% of the rate paid for equipment in use. Hourly rental
41 rates for idle equipment held in ready in accordance with Article 104-4 that is rented
42 from a commercial rental agency will be paid in accordance with the invoice rate for the
43 equipment. An additive payment will not be made for idle equipment. When equipment
44 is in use less than 40 hours for any given week and is held in ready as idle equipment in
45 accordance with Article 104-4, payment for idle equipment time will be allowed for up to
46 40 hours, less hours in use. When payment is made for idle equipment held in ready in
47 accordance with Article 104-4, the payment for idle equipment time held in ready will be
48 allowed for up to 8 hours in a day less hours in use.

1 In the event the Contractor does not possess or have readily available such equipment
2 necessary for the performance of the work and such equipment is rented from
3 a commercial rental agency, the Contractor will receive payment based on the approved
4 invoice rate for the equipment.

5 An additive payment equal to 15% of the calculated hourly invoice rate will be paid for
6 all hours equipment is in use. This additive payment will be full compensation for fuel,
7 lubricants, repairs, servicing (greasing, fueling and oiling), small tools and other
8 incidentals. The commercial rental agency cannot be the Contractor or an affiliate of the
9 Contractor.

10 No compensation will be made for the use of equipment not authorized by the Engineer.

11 The Contractor will be reimbursed for the actual transportation costs for equipment that
12 the Contractor is directed to furnish. Such payment will be limited to transportation costs
13 from the nearest source of available equipment. If equipment is not returned to the point
14 of origin, but is transported to another location, transportation costs will not exceed the
15 cost of return to the point of origin. Rental for such equipment will not be paid when the
16 equipment is being transported. The Contractor will furnish records to the Engineer to
17 verify the actual transportation costs for equipment.

18 The Contractor will provide to the Engineer, for approval, a listing of all equipment and
19 attachments to be used in the prosecution of the work. The list will include the
20 manufacturer's name, type, model, serial number and year of manufacture. The list will
21 include the invoice rate for equipment rented from a commercial rental agency. It will be
22 the Contractor's responsibility to verify the age of the equipment in a manner acceptable
23 to the Engineer. Where such verification is not available, the rate adjustment factor used
24 will be for the oldest equipment listed in the *EquipmentWatch Cost Recovery*.

25 The above prices and payments will be full compensation for fuel, lubricants, cutting
26 edges, all repairs and all other operating and maintenance costs other than operator's
27 wages.

28 **(E) Owner-Operated Equipment**

29 For all owner-operated equipment authorized by the Engineer to be used on the specific
30 force account work, the Contractor will receive rental payment equal to the existing
31 contract rates with no additive as provided in Subarticles 109-3(A), 109-3(B), 109-3(D)
32 and 109-3(H). When existing contract rates have not been established, the Contractor
33 will submit the proposed rates for the owner-operated equipment with sufficient
34 documentation as deemed necessary by the Engineer for approval.

35 For fully maintained and operated trucks used for the specific force account work, the
36 Contractor will receive rental payment equal to the existing contract rates with no
37 additive as provided in Subarticles 109-3(A), 109-3(B), 109-3(D) and 109-3(H). When
38 existing contract rates have not been established, the prevailing industry rates for fully
39 maintained and operated trucks will be used for the specific force account work with
40 approval of the Engineer.

41 For the purposes of force account work, owner-operated equipment, including fully
42 maintained and operated trucks, will be considered subcontractors. No additional
43 additives other than those allowed under Subarticle 109-3(G) will be allowed.

44 **(F) Miscellaneous**

45 No additional allowance will be made for general superintendence, the use of manually
46 powered tools or other costs for which no specific allowance is herein provided.

Section 109

1 **(G) Subcontracting**

2 For administrative costs of the Contractor in connection with approved subcontract work,
3 at any level, and the use of owner-operated equipment, at any level, the Contractor will
4 receive an additive amount in accordance with Table 109-1. The total cost of such
5 subcontracted work will include applicable labor and additive, bond and insurance,
6 materials and equipment costs incurred by the subcontractor; overhead and profit
7 computed in accordance with Subarticles 109-3(A) through 109-3(D), 109-3(F),
8 109-3(H) and 109-3(I); and costs for owner-operated equipment, including fully
9 maintained and operated trucks in accordance Subarticle 109-3(E). No additional
10 additives will be allowed.

TABLE 109-1	
RATE SCHEDULE FOR SUBCONTRACTING ADDITIVE	
Total Cost of Subcontract Work	Rate Schedule
\$0 - \$10,000	10%
Above \$10,000	\$1,000 + 5% Above \$10,000

11 **(H) Overhead And Profit**

12 An additive payment equal to 10% of the specific force account total will be paid to the
13 Contractor. This specific force account total is exclusive of the portion of the work
14 included with Subarticles 109-3(C), 109-3(E) and 109-3(G). This payment will be full
15 compensation for all costs including but not limited to home office and field overhead,
16 burdens and profit associated with the specific force account work.

17 An additive payment equal to 10% of the specific force account total for approved
18 subcontract work will be paid to the subcontractor for overhead and profit. This specific
19 force account total for subcontract work is exclusive of the portion of the work included
20 with Subarticles 109-3(C) and 109-3(E). This payment will be full compensation for all
21 costs including but not limited to home office and field overhead, burdens and profit
22 associated with the specific force account subcontracted work. No additional additives
23 will be allowed.

24 **(I) Bond And Insurance**

25 For property damage and liability insurance premiums and bond premiums on the
26 specific force account work the Contractor will receive the actual cost. The Contractor
27 will furnish satisfactory evidence to the Engineer of the rate or rates paid for such
28 insurance and bond.

29 An annualized composite percentage may be used to determine the cost for bond and
30 insurance. Insurance costs will be limited to the direct costs associated with the specific
31 force account work. The Contractor will furnish satisfactory evidence to the Engineer of
32 the annualized composite percentage for the bond and insurance.

33 **(J) General**

34 The Engineer will maintain the payment records of work performed on a force account
35 basis. The Contractor will compare records of work with the Engineer at the end of each
36 day on which such work is in progress.

37 Any contention the Contractor may have for an extension in the completion date,
38 intermediate completion date, or intermediate completion time, due to performance of
39 specific force account work will be considered as provided in Article 108-10.

109-4 PARTIAL PAYMENTS**(A) General**

Partial payments will be based upon progress estimates prepared by the Engineer at least once each month on the date established by the Engineer. Partial payments may be made twice each month if in the judgment of the Engineer the amount of work performed is sufficient to warrant such payment. No partial payment will be made when the total value of work performed since the last partial payment, excluding mobilization, amounts to less than \$10,000. Partial payments will be approximate only and will be subject to correction in the final estimate and payment.

Where lump sum items are included in the contract and the applicable section of the Specifications require that fixed percentages of the total amount bid included in partial pay estimates, the Engineer will determine amounts due on partial pay estimate in accordance with the applicable sections of the Specifications.

(B) Prompt Payments

Contractors at all levels, prime, subcontractor, or lower tier subcontractor, shall within seven calendar days of receipt of monies, resulting from the satisfactory completion of work performed, pay subcontractors, all lower tier subcontractors, or material suppliers. This seven-day period begins upon knowledgeable receipt by the contracting firm obligated to make a subsequent periodic or final payment. This prompt payment requirement will be met if each firm mails the payment to the next level firm by evidence of postmark within the seven-day period. For the purposes of this section, the satisfactory completion of work performed shall exist when a subcontractor, a lower tier subcontractor or material supplier completes tasks called for in the subcontract and are in conformance with the terms of the Contract as required by the Department. This specification for prompt payment shall be incorporated into each subcontract or lower tier subcontract issued for work performed on the project or for services provided.

The Contractor shall not withhold any payments to a subcontractor, lower tier subcontractor or material supplier for any claim or action arising outside the current contract with the Department. Notwithstanding the provisions of this section, the Contractor may withhold up to 3% retainage if any subcontractor does not obtain a payment and performance bond for their portion of the work. Additionally, this retainage may be increased to a maximum of 10% where the Contractor and any subcontractor have supplied to the Engineer a satisfactorily executed mutual agreement for an increased amount. If any retainage is held on subcontractors, all retainage shall be released within seven calendar days of satisfactory completion of all work. For release of retainage, satisfactory completion is defined as completion of all physical elements and corresponding documentation as defined in the subcontract, as well as agreement between the parties as to the final quantities for all work performed in the subcontract. The Department will provide internal controls to expedite the determination and processing of the final quantities for the satisfactorily completed subcontract portions of the project.

Failure of any entity to make prompt payment as defined herein may result in the Department:

- (1) Withholding money from the Contractor due for work performed by that entity in the next partial payment until the necessary assurances are made consistent with this specification; or
- (2) Removing an approved Contractor from the prequalified bidders' and subcontractors' list, or the removal of other entities from the prequalified subcontractors' list.

Section 109

1 (C) Unbalanced Bids

2 Any excess monies included in an unbalanced bid price that the Department determines
3 to be in excess of a reasonable unit or lump sum bid price for the work, shall be retained
4 by the Department until the last partial payment estimate, at which time these funds will
5 be paid to the Contractor. These retained funds will not be eligible for deposit in any
6 trust account established pursuant to this contract nor for interest for such delay in the
7 payment for the retained portion of the bid price. Partial payment for work performed on
8 an unbalanced bid item shall be at the reasonable unit or lump sum price determined in
9 accordance with this subarticle.

10 For purposes of this subarticle, a reasonable unit or lump sum price will be deemed to be
11 the average of the Engineer's Estimate and the individual balanced bid prices received
12 from the other bidders for the item in question.

13 **109-5 PAYMENT FOR MATERIAL TO BE USED IN THE WORK**

14 (A) Material Delivered on the Project

15 When so authorized by the Engineer, partial payments will be made up to 95% of the
16 delivered cost of materials on hand that are to be incorporated in the work, provided that
17 such materials have been delivered on or in close proximity to the project and stored in
18 an acceptable manner. Material payments will be allowed when 95% of the accumulated
19 costs of unpaid invoices are equal to or greater than \$10,000, materials have been
20 inspected and approved by the Engineer, and the documents listed in Subarticle 109-5(C)
21 have been furnished to the Engineer.

22 (B) Material Stored at Fabricator's Facilities or Contractor's Facilities

23 When so authorized by the Engineer, partial payments will be made up to 95% of the
24 invoiced cost, exclusive of delivery cost, for bulky materials requiring fabrication at
25 an off site location that are durable in nature and represent a significant portion of the
26 project cost, if it has been determined by the Engineer, that the material cannot be
27 reasonably stockpiled in the vicinity of the work. Material payments will be allowed
28 when the materials have been inspected and approved by the Engineer and the documents
29 listed in Subarticle 109-5(C) have been furnished to the Engineer.

30 (C) Required Documents

- 31 (1) Written consent of surety to make such partial payments,
- 32 (2) Bill of Sale from the Contractor to the Department, and
- 33 (3) Copy of invoice from material supplier verifying the cost of the material.

34 (D) General Requirements

35 The partial payments will be made on the conditional basis that the material meets the
36 requirements of the contract and will be incorporated into the project. The Contractor
37 shall reimburse the Department for all partial payments for material paid, but not
38 incorporated into the project.

39 Partial payments for materials on hand will not constitute acceptance, and any faulty
40 material will be rejected even though previous payment may have been made for same in
41 the estimates.

42 Partial payment will not be made for fuel, supplies, form lumber, falsework, or used
43 materials.

44 Partial payments will not be made on seed or any living or perishable plant materials
45 except that when such materials have been planted or otherwise incorporated in the work,
46 payment may be made, not as materials, but as work done as part of a contract item for
47 which a contract unit or lump sum price has been established.

1 Partial payments will not exceed 95% of the contract unit or lump sum prices for the
2 work.

3 **109-6 PAYMENT FOR LEFTOVER MATERIALS**

4 Payment will be made to the Contractor for materials meeting the requirements of the contract
5 that were to have been permanently incorporated into the work or were to remain the property
6 of the Department but due to revisions or elimination of items of work by the Engineer, due to
7 discrepancies in the contract or due to termination of the contract are not used in the work.
8 The Contractor, upon request, will be reimbursed for the verified actual cost of such material
9 delivered to a site designated by the Engineer, including any handling charges less any
10 discount, but in no event shall payment exceed that which would have been made at the
11 contract unit or lump sum price for the completed work.

12 The Contractor shall furnish invoices and cost records to the Engineer to verify the actual cost
13 of materials, handling charges, discounts that were taken and transportation charges. No
14 percentage additive will be added to the verified cost of such material.

15 No payment will be made for loss of anticipated profits and no other payment will be made
16 for leftover materials except as listed above.

17 **109-7 COMPENSATION PAID AT CONTRACT PRICES**

18 Except as provided for by this article, payment for work performed will be made at the
19 contract unit price or the contract lump sum price. Payment shall be made at the adjusted
20 contract unit price, as applicable, when a price adjustment or pay factor is provided for by the
21 contract or as determined by the Engineer in accordance with Article 105-3. In addition to the
22 compensation made at the unit or lump sum price, adjustment in compensation will be made
23 in accordance with Article 109-8. The Contractor shall not be paid for any work performed
24 for which there is not a contract price, nor shall the Contractor receive additional
25 compensation over and above the contract price for work performed or for extra work
26 performed, except for work performed pursuant to an executed supplemental agreement or
27 work performed in accordance with Section 104.

28 **109-8 FUEL PRICE ADJUSTMENTS**

29 Fuel price adjustments will be made to the payments due the Contractor for contract items
30 specified in the contract, or for extra work items specified in the supplemental agreement,
31 when the average terminal price has fluctuated from the Base Index Price contained in the
32 contract. The average terminal price is the average of the Freight on Board (F.O.B.) price for
33 diesel fuel at the terminals in Charlotte, Wilmington and Selma, North Carolina. When the
34 average terminal price fluctuates upward or downward from the Base Index Price, an amount
35 will be added to or deducted from the monies due the Contractor as follows.

36 The current quantity for the specified contract items for which partial payment is made will be
37 multiplied by the respective Diesel Fuel Usage Factor contained in the contract to determine
38 the theoretical diesel fuel usage for each specified contract item. The sum of the theoretical
39 diesel fuel usage for all specified contract items will be multiplied by the algebraic difference
40 between the average F.O.B. price for diesel fuel at the above specified terminals and the Base
41 Index Price contained in the contract to determine the fuel price adjustment to be made on the
42 partial payment estimate.

Section 109

1 The following formula will be used to calculate the appropriate payment or credit on the
2 estimate:

$$S = (A - B)(\sum QF)$$

Where:

- S = Fuel Price Adjustment for Partial Payment
- B = Base Index Price
- A = Average Terminal Price
- Q = Partial Payment Quantity for Contract Item
- F = Fuel Factor for Contract Item

3 The average terminal price in effect on the first day of the month in which the partial payment
4 period ends will be used to make payment adjustments for fuel whether or not more than one
5 price fluctuation has occurred within a single partial payment period.

6 The Engineer's estimate of quantities for contract items measured by cross sections shall be
7 used on the various partial payment estimates to determine fuel price adjustments. When the
8 Engineer determines after payment for all or a portion of such contract item that is subject to
9 a fuel price adjustment that the total quantity of work paid to date will be adjusted to reflect
10 more accurate quantity determinations, the Engineer will make a pro rata increase or decrease
11 in the fuel price adjustment proportionate to the adjustment in the total quantity of work paid.
12 The prorated fuel price adjustment for the contract item will be determined by multiplying the
13 cumulative fuel price adjustment made for that contract item for the previous estimate period
14 by the adjusted quantity for that contract item and divided by the total quantity of work paid
15 for the previous estimates for the contract item. Payment for the prorated fuel price
16 adjustment will be made accordingly on the partial payment estimate that includes the
17 adjustment in the quantity of work paid.

18 **109-9 FINAL PAYMENT**

19 Upon completion of the final estimate assembly, the Engineer will notify the Contractor
20 giving the final quantities and the apparent liquidated damages, if any are assessed. After the
21 Contractor reviews the final quantities and submits the documents listed in Article 109-10, the
22 entire sum found to be due after deducting all previous payments and all amounts to be
23 retained or deducted under the requirements of the contract will be paid to the Contractor.

24 **109-10 DOCUMENTS REQUIRED FOR THE PROCESSING OF THE FINAL** 25 **ESTIMATE**

26 Before the processing of the final estimate, the following documents shall have been
27 submitted to and accepted by the Engineer.

28 **(A)** Statement of Consent of Surety on the contract bonds for payment of money due the
29 Contractor.

30 **(B)** Affidavit of the Contractor that all obligations and debts arising out of the construction
31 have been satisfied or affidavit that shall include a list of obligations not satisfied.

32 **(C)** Written notice that the Contractor has no request for any extension in the completion date
33 or any adjustment in compensation from that shown in the final estimate or in lieu thereof
34 written notice presenting all request for adjustment of the final estimate setting forth full
35 justification for such requests.

36 **(D)** Any other documents that are required by the contract such as reports, statements and
37 other information necessary for compliance with applicable labor regulations of the
38 FHWA.

1 Submission of false information in the documents required by this section shall be a basis for
2 disqualifying the Contractor from further bidding in accordance with Article 102-15. If the
3 Contractor fails to submit the required documentation within the timeframe specified by the
4 Department, the Department may consider the Contractor to be nonresponsive and may
5 process the final estimate.

6 **109-11 INTEREST ON FINAL PAYMENT**

7 Should final payment on a project not be made within 120 calendar days after the project final
8 acceptance date, interest, at the average rate earned by the State Treasurer on the investment
9 within the State's Short Term Investment Fund during the month preceding the date interest
10 becomes payable, will be paid to the Contractor on the final payment for the period beginning
11 on the 121st day after final acceptance and extending to the date the final estimate is paid,
12 provided that the documents required by Article 109-10 have been submitted within
13 30 calendar days of the mailing of the notification outlined in Article 109-9. In the event the
14 Contractor fails to submit the required documents within the stipulated 30 calendar days, and
15 the final estimate is not paid until 120 calendar days following final acceptance of the project,
16 the number of days on which interest accrues will be reduced by the number of calendar days
17 in excess of 30 that the Contractor requires to submit the documents.

18 **SECTION 150**
19 **MAINTENANCE OF TRAFFIC**

20 The Contractor will be required to maintain traffic within the limits of the project, including
21 all existing roadways that cross or intersect the project, unless otherwise provided in the
22 contract or approved by the Engineer. Traffic shall be maintained from the time the
23 Contractor begins work on the project site until acceptance of the project, including any
24 periods during which the Contractor's operations are suspended, unless otherwise provided for
25 in the contract or approved by the Engineer. The Contractor shall conduct his work in a safe
26 manner that will create a minimum amount of inconvenience to traffic.

27 The Contractor shall be responsible for maintaining in a safe, passable and convenient
28 condition, such part or parts of existing roads as are being used by him to maintain traffic
29 within the limits of the project from the time the Contractor begins work on the project until
30 acceptance of the project. As an exception to the above, the Department will be responsible
31 for the removal of ice and snow from all portions of the project open to traffic.

32 Whenever it is necessary to use traffic control devices as shown in the contract, as determined
33 by the Engineer, or to conform to this section, the work of furnishing, erecting, operating,
34 maintaining, covering, relocating and removing traffic control devices shall be in accordance
35 with Divisions 11 and 12.

DIVISION 2 EARTHWORK

SECTION 200 CLEARING AND GRUBBING

200-1 DESCRIPTION

Perform the work of clearing and grubbing in all wooded areas between the construction limits. Perform the work of clearing and grubbing in all non-wooded areas between the construction limits and the limits of the project right of way or in easements shown on the project plans where seeding and mulching, sprigging, sodding or other work as indicated.

“Clearing” is defined as the cutting, removal and satisfactory disposal of all wooded vegetation and debris.

“Grubbing” is defined as the complete removal and satisfactory disposal of all grassy vegetative matter, root mat, ball and root, topsoil material high in organic content and surface debris.

200-2 MATERIALS

Refer to Division 10.

200-3 CONSTRUCTION METHODS

Perform the following as part of the work of clearing and grubbing:

(A) Remove and dispose of crops, weeds and other annual growth;

(B) Remove and dispose of surface debris such as fences, steps, walls, chimneys, column footings, other footings, foundation slabs, basements, other foundation components, signs, junked vehicles and other rubble and debris;

(C) Fill holes and depressions that exist or are created;

(D) Cut off and plug at the right-of-way or construction limits any private water or sewer line intercepted during the construction of the project;

(E) Cut off and remove from the right-of-way or construction area any septic tank or portion thereof encountered within the right-of-way or construction area during the construction of the project; and

(F) Remove materials in wetland areas to a depth of one foot below existing ground to be measured in accordance with Section 225.

Perform clearing and grubbing operations sufficiently before grading operations to prevent any debris from interfering with the excavation or embankment operations.

In environmentally sensitive areas shown on the original plans or permit drawings, perform grubbing operations no more than 7 calendar days before beginning continuous grading operations.

Perform all work under this section to minimize soil erosion and in accordance with Article 107-12. Coordinate the work with other operations such that no more than 17 acres of exposed, erodible surface area will be accumulated at any one time by the clearing and grubbing operation until erosion control measures are provided. Install temporary or permanent erosion control measures as soon as clearing and grubbing or land disturbing activities begin. Perform such erosion control work, temporary or permanent, as needed to minimize erosion resulting from clearing and grubbing operations.

Section 200

1 The Contractor may request an increase in the accumulated acres exposed by clearing and
2 grubbing. If approved, establish and maintain such erosion control measures as needed.

3 Failure on the part of the Contractor to perform the required erosion control measures will be
4 just cause for the Engineer to direct the suspension of clearing and grubbing operations in
5 accordance with Article 108-7. The suspension will be in effect until such time as the
6 Contractor has satisfactorily performed the required erosion control work. If the Contractor
7 fails to perform the directed work within a reasonable length of time, the Engineer may have
8 the work performed in accordance with Article 105-16.

9 **200-4 CLEARING**

10 Perform clearing within the limits established by the clearing method required by the plans
11 and as directed.

12 The Engineer will designate all areas of growth or individual trees that shall be preserved due
13 to their desirability for landscape or erosion control purposes. When the trees to be preserved
14 are located within the construction limits, they will be shown in the plans or designated by the
15 Engineer.

16 Trim or cut branches of trees that overhang the roadbed, utility easements or obstruct sight
17 distances and that are less than 16 feet above the elevation of the finished grade so as to not
18 endanger the health of the tree.

19 In embankment areas where the depth of the embankment measured under the roadbed
20 exceeds 6 feet in height, cut sound trees at a height of not more than 6 inches above natural
21 ground. When trees are to be cut outside the construction limits and the Engineer has
22 designated that the area is not to be grubbed, cut the trees reasonably close to the natural
23 ground surface. Cut trees to approximately 6 inches above low water level in swamp areas.

24 At a bridge site, clear the entire width of the right of way beginning at a station 3 feet back of
25 the beginning extremity of the structure and ending at a station 3 feet beyond the ending
26 extremity of the structure.

27 Prevent limb, bark or root injuries to trees, shrubs or other types of vegetation that are to
28 remain growing and prevent damage to adjacent property. Repair scarred areas in accordance
29 with generally accepted horticultural practice. Where plants are damaged by any construction
30 operations to such an extent as to destroy their value for shade or other landscape purposes,
31 cut and dispose of them.

32 **200-5 GRUBBING**

33 Perform grubbing on all areas cleared, with the following exceptions:

34 (A) In embankment areas, when the depth of embankment measured under the roadbed
35 exceeds 6 feet in height, cut off sound stumps not more than 6 inches above the existing
36 ground level and do not grub. Remove unsound or decayed stumps to a depth of
37 approximately 2 feet below the natural ground surface.

38 (B) When authorized, leave stumps outside of construction limits in place. Cut such stumps
39 off reasonably close to the natural ground surface.

40 (C) Cut off stumps in swamp areas to approximately 6 inches above low water level and do
41 not grub.

42 (D) Do not grub in areas where waste or unsuitable material is to be deposited unless such
43 areas are to become a part of a future roadway.

44 (E) Grub all areas where piles are to be driven regardless of fill height.

45 (F) Fill all holes and other depressions within the areas between the construction limits and
46 the limits of clearing and grubbing. Bring all areas to a uniform contour where later
47 mowing operations will take place.

200-6 DISPOSITION OF TIMBER, STUMPS AND DEBRIS

The property owner will have no right to use or reserve for their use any timber on the project. All timber cut during the clearing operations shall become the property of the Contractor and shall be removed from the project or shall be satisfactorily disposed of as provided hereinafter.

Do not cut any trees and vegetation beyond the clearing limits established. Do not cut any trees and vegetation that is to be preserved for landscape or erosion control purposes as shown in the plans and permit drawings.

Remove from the project and properly dispose of all vegetation, roots, stumps, tree laps, limbs and timber remaining on the project by a satisfactory method.

When vegetation is disposed of by burning, burn so as to prevent injury to property within or outside of the right of way. Comply with all Federal, State and local laws, ordinances and regulations when burning. Secure all necessary burning permits. Perform all burning under the constant care of a competent watchman. Do not allow smoldering or dense smoke to occur during burning.

Before trees or vegetation are disposed of in locations off the right of way and out of sight of the project, furnish the Engineer with verification that the site is permitted. If required, file an approved reclamation plan and furnish a written release from the property owner, or his authorized agent, granting the servitude of his lands.

If it is not burned, dispose of all debris including vegetation in accordance with Section 802.

200-7 SELECT TREE REMOVAL

When the contract includes the item of *Select Tree Removal* and the work of clearing and grubbing has been completed to the original clearing limits, the Engineer may elect to have select trees removed from the project. Trees removed in this manner shall have an average cross section diameter of at least 4 inches at a point 2 feet above the ground level.

Completely remove the select trees including the root ball and properly backfill unless otherwise directed.

200-8 MEASUREMENT AND PAYMENT

Clearing and Grubbing will be paid on a lump-sum basis and no measurement will be made of any clearing and grubbing performed within the limits originally staked and within the right of way or easements shown on the original plans.

Supplementary Clearing and Grubbing that is directed by the Engineer and is performed on areas outside the limits originally staked or beyond the limits of the right of way or easements or within environmentally sensitive areas shown on the original plans will be measured and paid at the contract unit price per acre. All measurement of clearing and grubbing will be made horizontally.

Once the root mat is removed, material that consists predominately of soils will be measured and paid in accordance with Section 225.

Materials used to fill depressions in accordance with Subarticle 200-5(F) will be measured and paid in accordance with Sections 225 or 230, depending on the source of the material.

When the Contractor is required to furnish borrow sources, material sources or waste areas, or when the Engineer permits the Contractor to obtain borrow or deposit waste on any area within the right of way instead of borrow and waste areas which were to have been furnished by the Contractor, no measurement of clearing and grubbing will be made for such areas.

When an increase in accumulated acres exposed by clearing and grubbing is requested by the Contractor and approved by the Engineer, no payment will be made for the temporary seeding and mulching required by the increase in accumulated exposed acres.

Section 205

1 *Select Tree Removal* will be measured and paid as the actual number of select trees removed
2 from the project.

3 Work performed in cleaning up non-wooded areas between the construction limits and the
4 limits of the project right of way or easements shown in the plans; work performed in the
5 dressing up of areas between the construction limits and the clearing limits; and the removal
6 of weeds, vines, plant stalks, loose rock and small scattered trees will be incidental to the
7 work of clearing and grubbing.

8 Where plants are damaged by construction operations, the work to cut and dispose of them
9 will be incidental to the work of clearing and grubbing.

10 Payment will be made under:

Pay Item	Pay Unit
Clearing and Grubbing	Lump Sum
Supplementary Clearing and Grubbing	Acre
Select Tree Removal	Each

SECTION 205

SEALING ABANDONED WELLS

205-1 DESCRIPTION

14 Seal abandoned wells at locations shown in the contract or as directed. Perform all work in
15 accordance with NCDEQ requirements.

205-2 CONSTRUCTION METHODS

17 Use a Well Contractor certified by the State of North Carolina to perform abandonment.

18 Environmental Ground Water Monitoring Well abandonment should be coordinated with the
19 GeoEnvironmental Section of NCDOT.

20 Seal each well before clearing and grubbing the well site. Check the well from land surface to
21 the entire depth of the well before it is sealed to ensure freedom from obstructions that may
22 interfere with sealing operations. Before sealing, place chlorine in the well in sufficient
23 quantities to produce a chlorine residual of at least 100 milligrams per liter in the well.

24 All casing and screen materials may be salvaged except casing that is cemented in place. In
25 the case of gravel-packed wells in which the casing and screens have not been removed,
26 perforate the casing opposite the gravel pack at intervals not exceeding 10 feet.

27 Completely fill bored wells with cement grout or dry clay compacted in place. Completely
28 fill wells constructed in unconsolidated formations with cement grout by introducing it
29 through a pipe extending to the bottom and raising it as the well is filled. Fill wells
30 constructed in consolidated rock formations or that penetrate zones of consolidated rock to at
31 least 5 feet below the top of the consolidated rock with sand, gravel or grout opposite the
32 zones of consolidated rock. Fill the remainder of the well with cement grout.

33 Complete a certified well abandonment record (Form GW-30) and submit to the Engineer.

205-3 MEASUREMENT AND PAYMENT

35 *Sealing Abandoned Wells* will be measured and paid in units of each for the actual number of
36 wells acceptably sealed. Work includes, but is not limited to, chlorinating the well before
37 sealing; perforating the well casing; filling the well with cement grout, dry clay, sand or
38 gravel; and furnishing all necessary records.

39 Payment will be made under:

Pay Item	Pay Unit
Sealing Abandoned Wells	Each

Section 215

1 steps, chimneys, column footings, other footings, foundation slabs, basements or other
2 foundation components.

3 Do not disturb any fencing, outbuilding or other obstruction that are entirely clear of the right
4 of way unless otherwise indicated in the plans or in the contract.

5 Conform to all applicable safety codes pertaining to the work, secure all permits that may be
6 required and pay all fees in connection therewith.

7 **210-3 UTILITIES**

8 Make all necessary arrangements with utility companies for the disconnecting of all services
9 and the removal of and recovery by them of all meters, telephones and any other utility
10 facilities or equipment owned by them. Arrange for and actually effect the disconnecting and
11 closing of water and sewer connections to buildings, including but not limited to any work
12 that shall be done in addition to that normally done by the utility company, in conformity with
13 all applicable codes and regulations of the local Boards of Health. Pay for all costs incurred
14 in connection with the above work. All refunds or deposits that may become due as a result
15 of the disconnection of service and the returning of equipment or facilities to any utility
16 company become the property of the Department.

17 **210-4 DISPOSAL**

18 Unless otherwise indicated in the contract, all materials recovered during demolition become
19 the property of the Contractor to remove from the project. Disposal by burning is permitted,
20 subject to all other applicable sections of these *Standard Specifications* and all State and local
21 ordinances.

22 Dispose of materials and debris in accordance with Section 802.

23 **210-5 MEASUREMENT AND PAYMENT**

24 There will be no direct payment for demolishing the buildings and appurtenances listed in the
25 contract. Payment for this work will be included in the contract lump sum price for *Clearing*
26 *and Grubbing* in accordance with Article 200-8.

27 Where underground storage tanks are indicated, there will be no direct payment for the
28 closure or assessment, as payment at the contract lump sum price for *Clearing and Grubbing*
29 will be full compensation for all costs of such closure or assessment.

30 As an exception to the above, when the description of the work covered by a particular
31 building demolition item does not contain information concerning the presence of asbestos
32 material or underground storage tanks and the asbestos material or underground storage tanks
33 are discovered after the opening of bids for the project, the Engineer may have the work
34 performed by others or the cost of removal and disposal of such asbestos material or
35 underground storage tanks will be paid in accordance with Article 104-7.

36 **SECTION 215**
37 **REMOVAL OF EXISTING BUILDINGS**

38 **215-1 DESCRIPTION**

39 Remove and dispose of all buildings, building components and appurtenances indicated in the
40 contract.

41 **215-2 CONSTRUCTION METHODS**

42 Buildings may be removed intact, removed in sections or demolished. Dispose of resulting
43 material and debris. All materials resulting from the removal of buildings, except such
44 materials as may be the property of utility companies providing service to the building,
45 become the property of the Contractor to dispose of or use or sell by him as his own property.

1 Provide all permits and dispose of all contaminated material encountered in connection with
2 the work. Before removal of any building, comply with the notification requirements of
3 40 CFR Part 61, Subpart M that applies to asbestos. Give notification to the North Carolina
4 Department of Health and Human Services, Division of Public Health Epidemiology Branch
5 and/or the appropriate county agency when the county performs enforcement of the Federal
6 Regulation. Submit a copy of the notification to the Engineer before the building removal.

7 Perform removal and disposal of asbestos in accordance with 40 CFR. Comply with all
8 Federal, State and local regulations when performing building removal; asbestos removal and
9 disposal; and UST removal and contaminated material disposal. Any fines resulting from
10 violations of any regulation are the sole responsibility of the Contractor and the Contractor
11 agrees to indemnify and hold harmless the Department against any assessment of such fines.

12 The Department will perform asbestos assessments and abatement for building items
13 identified in the contract. Copies of this report may be obtained through the
14 Division Right-of-Way Agent. When a building has had or will have asbestos removed and
15 the Contractor elects to remove the building such that it becomes a public area, the Contractor
16 is responsible for any additional costs incurred including final air monitoring.

17 Before removal of a regulated UST, comply with the notification requirements of
18 40 CFR Part 280.71(a). Notification is not required if the tank is unregulated. Give
19 notification to the appropriate regional office of NCDEQ, Division of Waste Management,
20 UST Section. Submit a copy of the notification to the Engineer before the removal of the
21 UST.

22 Permanently close UST systems by removal and disposal in compliance with the regulations
23 set forth in 40 CFR Part 280.71 and 15A NCAC 2N and any applicable local regulations.
24 Assess UST sites at closure for the presence of contamination as required in
25 15A NCAC 2N .0803 and as directed by the appropriate Regional Office of the Division of
26 Waste Management. Remove and dispose of UST systems and contents in a safe manner in
27 conformance with *American Petroleum Institute Bulletin 1604*, Removal and Disposal of
28 Used Underground Petroleum Storage Tanks, Chapters 3 through 6. As an exception to these
29 requirements, the filling of the tank with water as a means of expelling vapors from the tank
30 as described in Section 4.2.6.1 of *American Petroleum Institute Bulletin 1604*, will not be
31 allowed. Disposition of any contaminated material associated with UST will be made in
32 accordance with Article 107-25.

33 Completely clear from the right of way all buildings, including sheds, outbuildings or other
34 obstructions as indicated in the contract. Remove all shelters, porches, roofed areas and other
35 appurtenances that are attached to the building. Remove steps, chimneys, column footings,
36 other footings, foundation slabs, basements or other foundation components shall be removed.

37 Do not disturb any fencing, outbuildings or other obstruction, that is entirely clear of the right
38 of way unless otherwise indicated in the plans or in the contract.

39 Conform to all applicable safety codes pertaining to the work and secure all permits that may
40 be required and pay all fees in connection therewith.

41 **215-3 UTILITIES**

42 Make all necessary arrangements with utility companies for the disconnecting of service and
43 the removal of and recovery by them of all meters, telephones or any other utility facilities or
44 equipment owned by them. Arrange for and effect the disconnecting and closing of water and
45 sewer connections to the buildings, including but not limited to any work that shall be done in
46 addition to that normally done by the utility company, in conformity with all applicable codes
47 and regulations of the local Boards of Health. Pay for all costs incurred in connection with
48 the above work. All refunds or deposits that may become due as a result of the disconnection
49 of service and the returning of equipment or facilities to any utility company becomes the
50 property of the Department.

Section 220

1 **215-4 DISPOSAL**

2 Unless otherwise indicated in the contract, all materials recovered during demolition become
3 the property of the Contractor to remove from the project. Disposal by burning is permitted,
4 subject to applicable sections of the *Standard Specifications*, State and local ordinances.

5 Dispose of materials and debris in accordance with Section 802.

6 **215-5 MEASUREMENT AND PAYMENT**

7 There will be no direct payment for removing the buildings listed in the contract. Payment for
8 this work will be included in the contract lump sum price for *Clearing and Grubbing*.

9 Where underground storage tanks are indicated in the contract, there will be no direct
10 payment for the assessment or closure. Payment for this work will be included in the contract
11 lump sum price for *Clearing and Grubbing*.

12 As an exception to the above, when the description of the work covered by a particular
13 building removal item does not contain information concerning the presence of asbestos
14 material or UST and the asbestos material or UST are discovered after the opening of bids, the
15 Engineer may have the work performed by others or the cost of removal and disposal of such
16 asbestos material or UST will be paid in accordance with Article 104-7.

17 **SECTION 220**
18 **BLASTING**

19 **220-1 DESCRIPTION**

20 Use blasting as needed to excavate, break up or remove rock, construct stable rock cut slopes
21 and for other approved reasons. This section applies to all types of blasting including
22 production, controlled, pre-split, trim, trench and secondary blasting except blasting adjacent
23 to highway structures. See Article 410-9 for blasting adjacent to highway structures. Unless
24 required otherwise in the contract, design blasts for the vibration and air overpressure limits in
25 this section. Pre-split rock cuts at locations shown on the plans and as directed. Provide
26 blasting plans, blast monitoring and post-blast reports as necessary or required. Perform
27 blasting in accordance with the contract, accepted submittals and as directed. Use
28 a prequalified Blasting Contractor for blasting.

29 **220-2 MATERIALS**

30 Refer to Division 10.

Item	Section
Coarse Aggregate	1005

31 Use coarse aggregate (standard size No. 67 or 78M) for stemming.

32 **220-3 CONSTRUCTION METHODS**

33 Notify the Engineer and all occupants and owners of residences, businesses and utilities near
34 where blasting will occur of the intention to use explosives. Inform the Engineer, occupants
35 and owners of blasting at least 48 hours before each blast. When blasting in the vicinity of
36 an open travel way, provide traffic control in accordance with the contract and Section 1101.

37 Control blasting to avoid endangering lives or damaging property. The Contractor is
38 responsible for any injuries and damages due to blasting in accordance with Article 107-11
39 except for damage to wells and springs, unless the Contractor did not use reasonable care to
40 prevent such damage. Exercise the utmost care when blasting near sensitive environmental or
41 populated areas, urban or sensitive communities or historical structures. Comply with all the
42 latest applicable Federal, State and local codes, laws and regulations, as well as professional
43 society standards for the storage, transportation and use of explosives. Keep a copy of all
44 regulations on site and in case of conflict, the more stringent applies.

1 The Blaster-in-Charge has authority over the handling, use and security of explosives and is
 2 responsible for designing, planning, coordinating, supervising and monitoring blasting.
 3 Assign a Blaster-in-Charge to the project that has at least 5 years of experience with blasting
 4 similar to that anticipated for the project. Use a Blaster-in-Charge approved as a Blaster-in-
 5 Charge (key person) for the Blasting Contractor. The Blaster-in-Charge or designated
 6 Assistant Blaster-in-Charge shall be on site during blasting.

7 When blasts will be within 1,000 feet of a utility, house, residence, building, business or any
 8 other structure, a blasting plan and blast monitoring that meet Subarticles 220-3(B)
 9 and 220-3(C) are required. Otherwise, provide a blasting plan and monitor blasts as needed.

10 (A) Vibration and Air Overpressure Limits

11 Define “peak particle velocity” (PPV) as the maximum ground vibration velocity
 12 measured in any direction. Design blasts so the PPV at any utility or structure does not
 13 exceed the “Alternative Blasting Level Criteria” from Appendix B of the *U.S. Bureau of*
 14 *Mines Report of Investigations 8507*. Design blasts so the maximum air overpressure at
 15 any structure does not exceed 133 dB (linear).

16 If the PPV or air overpressure limits are exceeded at any utility or structure in any
 17 direction from blasts, the Engineer may suspend blasting until the post-blast report is
 18 reviewed and a new or revised blasting plan is accepted. Unless required otherwise in the
 19 contract or directed, design production, pre-split and trench blasts in accordance with the
 20 following:

21 (1) Production Blasting

- 22 (a) For 1.5:1 (H:V) rock cut slopes without pre-splitting, do not use production blast
 23 holes more than 4 inches in diameter within 10 feet of finished slope faces or
 24 neat lines.
- 25 (b) Do not drill production holes below bottom of adjacent pre-split blast holes
- 26 (c) Use delay blasting to detonate production blast holes towards a free face

27 (2) Pre-splitting

- 28 (a) Do not use pre-split blast holes more than 3 inches in diameter
- 29 (b) Space pre-split holes no more than 10 hole diameters apart (wider pre-split blast
 30 hole spacing may be approved by the Engineer if test blast results are
 31 satisfactory)
- 32 (c) Limit subdrilling to the offset width between lifts
- 33 (d) Do not subdrill more than 2 feet below finished grade
- 34 (e) Pre-split rock at least 30 feet beyond production blasting lifts or to the end of
 35 rock cuts
- 36 (f) Provide benches or lifts with a maximum height of 25 feet.
- 37 (g) Do not use ammonium nitrate fuel oil (ANFO) or other bulk loaded products
- 38 (h) Use cartridge explosives or other explosive types design for pre-splitting
- 39 (i) Use charges with a maximum diameter of half the pre-split blast hole diameter
 40 except for charges in bottom 2 feet holes
- 41 (j) If pre-split and production blast holes are fired in the same blast, fire pre-split
 42 holes at least 25 milliseconds before production holes

Section 220

1 (B) Blasting Plan

2 When required, submit the proposed blasting plan signed by the Blaster-in-Charge for all
3 blasting for acceptance. Acceptance of this plan does not relieve the Contractor of
4 responsibility and liability for blasting in accordance with the contract.

5 Submit the blasting plan to the Resident Engineer and the appropriate Geotechnical
6 Engineering Unit regional office at least 30 days before starting blasting. Do not deliver
7 explosives to the project site or begin blasting until a blasting plan is accepted. Provide
8 detailed project specific information in the blasting plan that includes the following:

9 (1) Work procedures and safety precautions for storage, transportation, handling and
10 detonation of explosives;

11 (2) Explosive products and devices for dry and wet blast holes including explosives,
12 primers and detonators with MSDS;

13 (3) Drilling equipment including methods for maintaining blast hole alignment;

14 (4) Typical plan, profile and sectional views for blasting showing blasting limits, blast
15 hole diameters, depths, inclinations and spacing, burden, subdrill depths and
16 minimum and maximum charge per delay;

17 (5) Initiation and delay methods and delay times;

18 (6) Equipment and procedures for blast monitoring with calibration certificates dated
19 within one year of submittal date; and

20 (7) Post-blast report format.

21 If alternate blasting procedures are proposed or necessary, a revised blasting plan
22 submittal may be required. If blasting deviates from the accepted submittal without prior
23 approval, the Engineer may suspend blasting until a revised plan is accepted.

24 (C) Blast Monitoring

25 If necessary or required, monitor blasts using seismographs capable of measuring air
26 overpressure and vibration in the vertical, longitudinal and transverse directions. At
27 a minimum, monitor vibration and air overpressure at the closest utility or structure to
28 each blast and the closest utility or structure in the direction of each blast in accordance
29 with the accepted blasting plan. Include the following in post-blast reports for each blast
30 monitoring location:

31 (1) Type, identification and specific location of seismograph,

32 (2) Distance and direction from blast,

33 (3) PPV in each direction and peak vector sum, and

34 (4) Maximum air overpressure level.

35 (D) Blasting Requirements

36 Before beginning drilling, a pre-blast meeting may be required to discuss the blasting and
37 if applicable, blast monitoring. Schedule this meeting after any blast plans have been
38 accepted. The Resident or District Engineer, Roadway Construction Engineer,
39 Geotechnical Operations Engineer, Contractor and Blaster-in-Charge will attend this pre-
40 blast meeting.

41 Drill and blast in accordance with the contract and if applicable, the accepted blast plan.
42 Use explosives in accordance with all applicable government regulations, professional
43 society standards and manufacturer guidelines and recommendations. Do not allow
44 ANFO to leach into bodies of water.

1 Before blasting for excavations, remove all overburden material along top of excavations
2 for at least 30 feet beyond blasting or rock limits, whichever is less. Inspect any free
3 faces to ensure adequate burden. Drill blast holes within 3 inches of plan location and
4 maintain hole alignment when drilling.

5 Pre-split rock cuts as required so irregularities between pre-split blast holes are less than
6 1 foot from finished slope faces. Alignment is crucial for pre-split holes. Maintain pre-
7 split hole alignment within 6 inches of rock cut slopes and parallel to adjacent pre-split
8 blast holes. Monitor and accurately measure pre-split hole alignment during drilling with
9 a method acceptable to the Engineer. When rock cut heights require multiple benches or
10 lifts, offset pre-split blast holes horizontally for each lift no more than the clearance
11 necessary for drilling equipment.

12 Cover blast holes after drilling to prevent unwanted backfill and identify and mark each
13 blast hole with hole number and depth. Blast holes shall be free of obstructions the entire
14 depth. Load blast holes without dislodging material or caving in hole walls. Stem blast
15 holes 5 inches or larger in diameter with No. 67 stone and blast holes smaller than
16 5 inches in diameter with No. 78M stone. Do not stem blast holes with drill cuttings.

17 Contain flyrock within construction limits. Use matting when blast monitoring or traffic
18 control is required. Soil cover may be used instead of matting, if approved. If flyrock
19 occurs outside the construction limits, the Engineer may suspend blasting until the post-
20 blast report is reviewed and a new or revised blasting plan is accepted. When traffic
21 control is required for blasting, have equipment standing by to remove material that
22 interferes with traffic flow. Check for misfires immediately after each blast before
23 signaling all clear.

24 Remove all loose, hanging and potentially dangerous material from rock cut slopes by
25 scaling. The Contractor is responsible for the stability of rock cuts. If rock cuts are
26 damaged during blasting, stabilize cuts to the satisfaction of the Engineer. Resume
27 drilling only after scaling is complete. Adjust blast hole alignments to account for any
28 drift occurring in preceding drilling or lifts.

29 Define "secondary blasting" as blasting to reduce the size of naturally occurring boulders
30 or those resulting from initial blasting. Use an approved method for secondary blasting
31 consisting of small explosive charges in small diameter blast holes. Define
32 "mudcapping" as placing unconfined explosive charges in contact with rock without blast
33 holes and covering charges with mud. Do not use mudcapping for blasting.

34 **(E) Post-Blast Report**

35 Submit a post-blast report within 3 days of each blast or before the next blast, whichever
36 is sooner. Provide post-blast reports signed by the Blaster-in-Charge that include the
37 following:

- 38 (1) Material data information about explosive products and devices including
39 explosives, primers and detonators;
- 40 (2) Scaled blast drawings with cross sections showing blasting limits, blast hole
41 diameters, depths, inclinations and spacing, burden, subdrill depth, free face location
42 and any joints, bedding planes, weathered zones, voids or other significant rock
43 structure information;
- 44 (3) Loading pattern diagram with location and amount of each type of explosive
45 including primers and detonators;
- 46 (4) Locations and depths of stemming, column heights and maximum charge per delay
47 for each type of loading;
- 48 (5) Delay and initiation diagram showing delay pattern, sequence and times;

Section 225

- 1 (6) Results and effectiveness of the blast and any proposed changes to subsequent
- 2 blasting;
- 3 (7) If applicable, blast monitoring results; and
- 4 (8) Blast damage report when necessary.

(F) Blast Damage Report

If damage occurs from blasting, notify the Engineer immediately and submit a blast damage report with the post-blast report that includes the following:

- 8 (1) Property owner’s and injured person’s, if any, names, addresses and telephone
- 9 numbers;
- 10 (2) Details and description of property damage and injury, if any, with photographs or
- 11 video; and
- 12 (3) Any associated tort claims, complaint letters and other applicable information.

220-4 MEASUREMENT AND PAYMENT

Pre-splitting of Rock will be measured and paid in square yards. Pre-splitting will be measured along the slope faces of pre-split rock cuts as the square yards of exposed pre-split rock. No payment will be made for unsatisfactory pre-splitting as determined by the Engineer.

No direct payment will be made for all other blasting including blasting plans, blast monitoring, post-blast reports, scaling and stabilizing rock cuts.

No direct payment will be made for blasting for roadway excavation. Blasting for roadway excavation will be incidental to the contract unit price for *Unclassified Excavation* in accordance with Article 225-7 or the lump sum price for *Grading* in accordance with Article 226-3.

No direct payment will be made for blasting for any pipe, utility or foundation excavation. Blasting for these items will be incidental to the compensation for the excavation. Where no direct payment is made for excavation, blasting will be incidental to the work and no separate payment for will be made for blasting.

Payment will be made under:

Pay Item	Pay Unit
Pre-splitting of Rock	Square Yard

**SECTION 225
ROADWAY EXCAVATION**

225-1 DESCRIPTION

Excavate, place and compact or satisfactorily dispose of all materials encountered within the limits of the work necessary for the construction of the roadway that are not to be removed under another contract item.

Perform all excavation in conformity with the lines, grades and cross sections shown in the plans or established by the Engineer.

Use care not to cause instability or displacement of the underlying or adjacent materials during construction. The Engineer reserves the right to effect the removal from the grading operation of any equipment that is causing instability or displacement of underlying or adjacent materials to the detriment of the section being constructed.

Construct false sumps in accordance with the details in the plans and at the locations shown in the plans or at other locations as directed.

1 Define “Unclassified Excavation” as all material excavated under this section, regardless of
2 its nature or composition, except for undercut excavation and material directed to be removed
3 beyond the limits of the original slope stakes.

4 Define “Undercut Excavation” as the excavation, placement and compaction and/or
5 satisfactory disposal of materials removed from a location below the finished graded roadway
6 cross section, except for the following:

7 (A) Rock in the bottom of roadway cuts that has been excavated one foot or less below the
8 roadbed and ditches, or

9 (B) In cut areas, excavation removed below the outside slopes of roadway ditches.

10 **225-2 EROSION CONTROL REQUIREMENTS**

11 Install erosion control measures as required by the plans before any kind of land-disturbing
12 activity.

13 Unless otherwise required by the plans, conduct operations so that final slopes are completely
14 graded in a continuous operation and permanently seeded and mulched in accordance with
15 Article 107-12.

16 Should the Contractor fail to comply with the requirements specified above within the time
17 frames established by the Sedimentation and Pollution Control Act, the Contractor shall
18 perform temporary seeding and mulching on any exposed areas at his own expense.

19 When the Contractor fails or neglects to coordinate grading with the permanent seeding and
20 mulching operation, the Engineer may suspend the Contractor’s grading operation in
21 accordance with Article 108-7 until the work is coordinated in a manner acceptable to the
22 Engineer. Failure to perform the directed work may result in the Engineer having the work
23 performed in accordance with Article 105-16.

24 **225-3 UNCLASSIFIED EXCAVATION**

25 Use all suitable material removed from the excavation as far as practicable in the formation of
26 embankments, subgrades, shoulders and places indicated in the plans or directed.

27 The wasting of suitable material removed as part of unclassified excavation before the
28 completion of embankments is permitted where the Contractor executes a supplemental
29 agreement documenting that he agrees to the following:

30 (A) Provide and incorporate into the project any material required to complete the project up
31 to the volume wasted. Bear all additional costs for providing and incorporating this
32 material into the work, including engineering costs, and

33 (B) Provide suitable replacement material either wasted from the project or approved borrow
34 material, at the Contractor's option, and

35 (C) Present no claim for any time arising from the wasting of excess unclassified excavation
36 or for having to replace material wasted from the project that the Department may require
37 to complete the work, and

38 (D) Waive rights to request additional compensation with regard to wasting unclassified
39 excavation under the compensation requirements of Section 104 as a result of wasting
40 suitable unclassified excavation and providing replacement material required to complete
41 the work except when unclassified excavation is a major contract item, as defined in
42 Section 101, and when unclassified excavation underruns by more than 25%.

43 Where the work required to complete the project is so phased by the plans to preclude using
44 suitable unclassified excavation, the Contractor will be permitted to waste suitable
45 unclassified excavation without having to execute the above required supplemental
46 agreement.

Section 225

1 Furnish disposal areas for the unsuitable material except where the Engineer permits or directs
2 the use of such material in the widening or flattening of fill slopes. The Engineer will
3 designate materials that are unsuitable.

4 Where suitable materials containing excessive moisture are encountered above grade in cuts,
5 construct above grade ditch drains before the excavation of the cut material when such
6 measures are necessary to provide proper drainage.

7 Upon execution of a supplemental agreement containing conditions listed below, the
8 Contractor may waste suitable unclassified excavation and replace it with approved borrow
9 material.

10 (A) Replace with approved borrow material all suitable unclassified excavation that was
11 wasted.

12 (B) Bear all additional costs associated with the wasting of the unsuitable unclassified
13 excavation and the replacing of it with borrow material, including any additional
14 engineering costs to the Department.

15 (C) The execution of a supplemental agreement allowing the Contractor to waste suitable
16 unclassified excavation and replace it with approved borrow material bars the Contractor
17 from any claim for any time extensions related to the wasting and replacement operation
18 described in the agreement.

19 (D) The Contractor specifically waives his rights to request additional compensation with
20 regard to wasting unclassified excavation under the compensation requirements of
21 Section 104 as result of substituting suitable borrow material and wasting suitable
22 unclassified excavation.

23 Where the contract includes earth shoulder construction, stockpile suitable surplus material
24 for use in the shoulders. To the extent possible, salvage topsoil from within the limits of the
25 slope stake lines and store in stockpiles. Before the topsoil is removed, clear the areas of all
26 weeds, brush, stumps, stones and other debris. Remove the topsoil from only such areas and
27 to only such depths as required by the contract or as directed. Exercise care to avoid mixing
28 subsoil or other unsuitable material with the topsoil. Stockpile an adequate quantity of
29 material to construct the proposed shoulder before wasting any suitable surplus material.
30 Locate the stockpiles along the project at approved locations. Neatly dress each stockpile,
31 when completed. Perform temporary or permanent seeding on the stockpiles where directed
32 or when necessary to prevent erosion. Remove and dispose of any surplus material remaining
33 in the stockpile after the shoulders are completed as provided below for waste matter.

34 Dispose of waste material in accordance with Section 802.

35 Uniformly round the intersection of slopes with natural ground surfaces, including the
36 beginning and ending of cut slopes, as shown in the plans. Concurrent with the excavation of
37 cuts, construct intercepting berm ditches or earth berms along and on top of the cut slopes at
38 locations shown in the plans or as designated. Finish all slopes to reasonably uniform
39 surfaces acceptable for seeding and mulching operations. Leave no rock or boulders in
40 place that protrude more than one foot within the typical section cut slope lines.
41 Clean all rock cuts of loose and overhanging material. Remove all protruding roots and other
42 objectionable vegetation from the slopes.

43 Where a cut has been finished and the slopes dressed in accordance with the plans and slope
44 stakes, the Contractor will not be required to flatten or widen the slopes of a completed cut
45 unless otherwise directed before beginning the work. When rock is unexpectedly
46 encountered, transition any widening or flattening already begun to leave the cut with
47 a pleasing appearance.

48 If required, investigate the top 12 inches of the subgrade in cut sections to determine the
49 necessity for rock undercut.

- 1 Unless otherwise directed, excavate rock in the bottom of roadway cuts to a depth of 1 foot
2 below the roadbed and ditches. Lower ditches if necessary so that water will drain from the
3 rock surface to the ditches. Upon completion of the rock excavation below the level of the
4 roadbed and ditches, backfill the areas where such rock has been removed with suitable
5 material, compact, and shape to the required grade and cross section.
- 6 Before any work beginning on the structure, excavate all rock under and adjacent to structure
7 sites as directed.
- 8 Bring all cuts to the grade and cross section shown in the plans before final inspection and
9 acceptance.
- 10 Remove and dispose of slides and overbreaks that occur before final acceptance of the project.
11 Where slides and overbreaks occur due to negligence or carelessness on the part of the
12 Contractor, the removal and disposal of said slides and overbreaks will be at no cost to the
13 Department.
- 14 Shape old roadways to produce an acceptable appearance in accordance with Section 808.
- 15 Conduct earthwork operations in a manner that will not disturb staking, utility poles or guy
16 wires required to remain in their original location.
- 17 Cut off and plug all private utility lines, remove existing shoulder drain and subdrain pipe and
18 remove all underground tanks intercepted within the typical section or in conflict with
19 construction.
- 20 Where it is necessary to remove existing sidewalks or driveways, furnish a neat edge along
21 the pavement retained by sawing a neat line approximately 2 inches deep with a concrete saw
22 before breaking the adjacent pavement away.
- 23 When excavation operations encounter graves, temporarily discontinue operations in the
24 vicinity of the graves and do not resume until directed.
- 25 When excavation operations encounter contaminated soils, temporarily discontinue operations
26 in the vicinity of the contamination and do not resume until directed.
- 27 When excavation operations encounter artifacts of historical or archeological significance,
28 temporarily discontinue operations in the vicinity of the artifacts and do not resume until
29 directed. Disposition of the artifacts shall be in accordance with the requirements of the
30 Division of Archives and History.

31 **225-4 UNDERCUT EXCAVATION**

- 32 When the Engineer determines that the natural soil materials in areas where fills are to be
33 placed are undesirable in their location or condition, the Engineer may require the Contractor
34 to remove the undesirable material and backfill with approved, properly compacted material.
- 35 When the Engineer determines that the finished graded roadway cross section contains
36 materials that are undesirable in their location or condition, the Engineer may require the
37 Contractor to remove the materials and backfill with approved, properly compacted material
38 to the finished graded section.
- 39 Where undercutting is required adjacent to or beneath the location of the proposed drainage
40 structure, perform undercut and backfill a sufficient distance adjacent to the installation to
41 prevent future operations from disturbing the completed drainage structure.
- 42 Use equipment in undercutting and backfilling operations of such weight, size and capability
43 to efficiently remove and replace the material within the limits established. Use equipment of
44 a size and weight that will not displace the underlying or adjacent material.
- 45 All material removed in the work of undercut excavation will be classified by the Engineer as
46 either suitable for other use without excessive manipulation and used elsewhere in the work,
47 or unsuitable for further use and disposed of by the Contractor.

Section 225

1 Conduct undercut operations so that the Engineer can take the necessary measurements before
2 any backfill is placed. Place backfill in undercut areas in a continuous operation concurrent
3 with the undercutting operation. Do not place backfill material in water unless otherwise
4 permitted by the Engineer.

5 **225-5 TOLERANCES**

6 A tolerance of ± 0.10 foot from the established grade will be permitted in the roadbed after it
7 has been graded to a uniform surface.

8 **225-6 MAINTENANCE**

9 Maintain all work covered by this section during construction until final acceptance. Provide
10 the drainage of surface runoff along and throughout the length of the cut, construct temporary
11 ditches and use any other methods necessary to control excessive soil erosion during
12 construction and until final acceptance of the project.

13 **225-7 MEASUREMENT AND PAYMENT**

14 *Excavation* will be measured and paid in cubic yards of materials, measured in their original
15 position and computed by the average end area method, acceptably excavated in accordance
16 with the contract. The Engineer may elect to use Digital Terrain Modeling (DTM) for
17 determining the earthwork quantities or other technology that has been proven accurate.
18 Original cross sections for the determination of excavation quantities will be taken before any
19 grading begins. Final cross sections will be taken after the excavation has been completed.
20 Final plan cross sections can be used for the final cross sections where, in the opinion of the
21 Engineer, the work has been constructed in reasonably close conformity to the plan typical
22 section.

23 Original and final cross sections will be taken by either ground or aerial survey methods, as
24 determined by the Engineer.

25 All materials excavated from a location below the graded roadway cross section are classified
26 as *Undercut Excavation* and will be measured separately except for the following:

27 (A) Rock in the bottom of roadway cuts excavated 1 foot or less below the roadbed and
28 ditches;

29 (B) In cut areas, undercut excavation is limited to excavation removed below the roadbed
30 sub-grade, removed below the inside slopes of roadway ditches and removed below the
31 bottom of flat bottom roadway ditches; or

32 (C) Root mat other than grass, removed as a part of clearing and grubbing.

33 When the contract does not include *Drainage Ditch Excavation*, measurement will be made in
34 accordance with Article 240-4 and payment for this class of excavation will be made at the
35 contract unit price per cubic yard for *Unclassified Excavation*.

36 Measurement of materials excavated from overbreaks or slides will be made except where the
37 overbreaks or slides were due to the negligence or carelessness of the Contractor.

38 No measurement will be made of any materials excavated outside of authorized excavation
39 limits established by the Engineer or any materials excavated before slope stakes were set.

40 Article 104-5 will not apply for any underruns in the quantity of *Unclassified Excavation*
41 resulting from the permitted use of such material as select granular material.

42 *Berm Ditch Construction* will be measured and paid in accordance with Article 240-4.

43 Materials excavated from stockpiles and used to construct earth shoulders will be paid as
44 *Shoulder Borrow* in accordance with Article 560-4. No payment will be made for the
45 removal and disposal of any surplus material remaining in the stockpile after the shoulders
46 have been completed.

- 1 Payment for material that the Engineer directs to be removed beyond the limits of the original
 2 slope stakes will be made in accordance with Article 104-3.
- 3 If needed, investigative work within the top 12 inches of the subgrade to determine the
 4 necessity for rock undercut will be paid in accordance with Article 104-7.
- 5 Payment includes, but is not limited to, excavation, blasting, hauling anywhere along the
 6 project both within and across balance points shown in the plans, removal of undesirable
 7 material, removal of sidewalk, driveways, curb and gutter, endwalls, traffic islands and
 8 drainage structures, disposal of materials, formation and compaction of embankments,
 9 subgrades and shoulders, the cutting off, plugging and removal of private utility lines and
 10 underground tanks, any backfilling required, removing any existing shoulder drain or subdrain
 11 pipe and maintaining the work.
- 12 Payment for false sumps will be classified as *Unclassified Excavation*, *Borrow Excavation* or
 13 included in *Grading-Lump Sum*. Payment as *Unclassified Excavation* or *Borrow Excavation*
 14 will be at the contract unit price per cubic yard.
- 15 Excavation done in the shaping of old roadways in accordance with Section 808 is paid as
 16 *Unclassified Excavation*.
- 17 Where slides and overbreaks occur due to negligence or carelessness on the part of the
 18 Contractor, the removal and disposal of said slides and overbreaks will be incidental to the
 19 work of this section.
- 20 Payment will be made under:

Pay Item	Pay Unit
Unclassified Excavation	Cubic Yard
Undercut Excavation	Cubic Yard

21 **SECTION 226**
 22 **COMPREHENSIVE GRADING**

23 **226-1 DESCRIPTION**

24 The work covered by this section consists of all elements of work covered by Sections 200,
 25 225, 230, 235, 250, 500 and 560, except that the requirements of the above-referenced
 26 sections pertaining to measurement and payment will not apply unless specific reference is
 27 made to such.

28 **226-2 CONSTRUCTION METHODS**

29 Perform the work in accordance with Sections 200, 225, 230, 235, 250, 500 and 560.

30 **226-3 MEASUREMENT AND PAYMENT**

31 Seeding and mulching of all borrow sources will be measured and paid at the contract unit
 32 prices for such items established in the contract.

33 Payment for material that the Engineer directs the Contractor to obtain from borrow sources
 34 to backfill box culverts, drainage structures or structure bents will be made in accordance with
 35 Article 104-7.

36 Payment for material that the Engineer directs to be removed beyond the limits of the original
 37 slope stakes will be made in accordance with Article 104-3.

38 *Grading* will be paid at the contract lump sum price. Partial payments will be equal to the
 39 percentage of such item that is complete as estimated by the Engineer. No separate payment
 40 will be made for clearing and grubbing, shoulder and fill slope material or draining borrow
 41 sources as such work will be incidental to the work covered by this section.

Section 230

1 Clearing and grubbing work that is directed to be performed on areas outside the limits
2 originally staked or beyond the limits of the right of way or easements shown on the original
3 plans will be measured and paid at the contract unit price per acre for *Supplementary Clearing*
4 *and Grubbing*. All measurements will be made horizontally. Where the contract does not
5 include this item, a unit price per acre will be established by supplemental agreement.

6 *Undercut Excavation* will be measured and paid at the contract unit price per cubic yard. No
7 separate payment will be made for materials used in backfilling the undercut areas, shoulders
8 and slope areas as payment at the contract unit price per cubic yard for *Undercut Excavation*
9 will be full compensation for furnishing such material. Where the contract does not include
10 a pay item for *Undercut Excavation*, payment for such excavation will be made in accordance
11 with Article 104-7.

12 Payment will be made under:

Pay Item	Pay Unit
Grading	Lump Sum
Supplementary Clearing and Grubbing	Acre
Undercut Excavation	Cubic Yard

13 **SECTION 230**
14 **BORROW EXCAVATION**

15 **230-1 DESCRIPTION**

16 Excavate approved material from borrow sources. Haul and use such material as required in
17 the plans or as directed. Do not use borrow excavation until all available suitable unclassified
18 excavation has been incorporated into the embankments, subgrades and shoulders except by
19 execution of a supplemental agreement documenting the conditions prescribed below.

20 (A) All suitable unclassified excavation wasted as a result of the early use of borrow material
21 will be deducted from the total volume of borrow excavation paid under the contract.

22 (B) Reimburse the Department for all additional costs, including additional engineering cost,
23 associated with the wasting of suitable unclassified excavation.

24 (C) Any claim for contract time extensions related to the early use of borrow is waived
25 should the Contractor use borrow material before all suitable unclassified excavation
26 being incorporated into the project pursuant to a supplemental agreement.

27 (D) The Contractor specifically waives rights to request additional compensation with regard
28 to the early use of borrow under the compensation requirements of Section 104 except
29 when unclassified excavation is a major contract item and that unclassified excavation
30 overruns by more than 25%.

31 Where the work required to complete the project is so phased by the plans to preclude using
32 suitable unclassified excavation, the Contractor will be permitted to construct the required
33 embankments, subgrades or shoulders so controlled by the phasing from approved borrow
34 materials without having to execute the above required supplemental agreement.

35 **230-2 COORDINATION WITH SEEDING OPERATIONS**

36 Coordinate the work in this section with the construction of embankments in accordance with
37 Article 225-2.

38 **230-3 MATERIALS**

39 Refer to Division 10.

Item	Section
Borrow Material	1018
Shoulder and Slope Material	1019

230-4 CONSTRUCTION METHODS**(A) General**

Thoroughly clear and grub and clean the surface of the borrow area of all unsuitable material before beginning the excavation and, where applicable, before cross sections are taken. Dispose of material resulting from clearing and grubbing in accordance with Article 200-6. Remove and dispose of overburden in accordance with Section 802.

Do not accumulate exposed, erodible slope area in each borrow operation in excess of 1 acre at any one time without beginning permanent seeding and mulching of the borrow source or installing other erosion control measures as may be approved.

Remove and stockpile topsoil at locations that will not interfere with the borrow operations and that meet the approval of the Engineer. Install temporary erosion control measures as needed to prevent the erosion of the stockpile material. Once all borrow has been removed from the source or portion thereof, uniformly spread the stockpiled topsoil over the area and permanently seed and mulch the area.

Where payment is made by cross section, notify the Engineer sufficiently before beginning excavation of the borrow material so that the area may be staked and cross sectioned. Excavate the material to the lines and slopes as staked in an orderly manner to facilitate measurement at any time.

Where payment is to be made by truck measurement, furnish trucks with bodies suitable for accurate measurement. Load trucks uniformly and load to prevent spillage.

When necessary to haul borrow material over existing roads or streets, comply with Article 105-15. Use all necessary precautions to prevent damage to the existing structures or pavement. Conduct hauling operations so as to not interfere with the normal flow of traffic and keep the traffic lanes free from spillage at all times.

Furnish borrow sources except where otherwise indicated in the contract.

(B) Contractor Furnished Sources

Before the approval of any borrow sources developed for use on any project, obtain certification from the State Historic Preservation Officer of the State Department of Cultural Resources certifying that the removal of the borrow material from the borrow sources will have no effect on any known district, site building, structure or object, architectural and/or archaeological that is included or eligible for inclusion in the National Register of Historic Places. Furnish a copy of this certification to the Engineer before performing any work on the proposed borrow source.

Borrow sources will not be allowed in any area under the Corps of Engineers regulatory jurisdiction until the Contractor has obtained a permit for such borrow sources from the Corps District Engineer having jurisdiction and has furnished a copy of this permit to the Engineer. Requests for additional contract time, additional compensation or for work stoppage due to permit violations will not be considered.

The approval of borrow sources furnished by the Contractor is subject to the following conditions:

(1) Proof of Rights

Provide written proof of the right to take the material and any rights of access that may be necessary, for locating and developing the source and any clearing and grubbing and drainage ditches necessary. The proof shall include an agreement with the owner that the borrow source be dressed, shaped, seeded, mulched and drained as required by these Specifications after all borrow has been removed.

Section 230

1 (2) Sampling and Testing

2 Sampling and testing of contractor furnished borrow material will be in accordance
3 with procedures set forth in the *Borrow Pit Sampling Manual* in effect on the date of
4 advertisement for the project. Copies of this document are available from the
5 Materials and Tests Unit. The criteria for acceptance of the proposed contractor
6 furnished borrow material is shown in Section 1018.

7 (3) Reclamation Plan

8 Except where borrow is to be obtained from a commercial source, jointly submit
9 with the property owner a borrow source development, use and reclamation plan to
10 the Engineer for his approval before engaging in any land disturbing activity on the
11 proposed source other than material sampling that may be necessary. The
12 Department's borrow and waste site reclamation procedures for contracted projects
13 is available on the website and shall be used for all borrow and waste sites on this
14 project. Address the following in the plan:

15 (a) Topography

16 Detail the existing topography and locations of the proposed access and egress
17 haul roads. Detail the proposed final topography of the waste or disposal area
18 showing any proposed drainage systems. Excavate the source according to the
19 plan and dress and shape it in a continuous manner to contours that are
20 comparable to and blend in with the adjacent topography. Grade the source to
21 drain such that no water will collect or stand. Provide a functioning drainage
22 system for the source. If drainage is not practical and the source is to serve as
23 a pond, the minimum depth shall be a least 4 feet as determined from the water
24 table at the time the reclamation plan is executed. The slope of the soil below
25 the water shall be between 5:1 and 2:1. The slope of the sides above the water
26 line shall be 2:1 or flatter.

27 (b) Erosion Control

28 Detail the temporary and permanent erosion control measures, along with design
29 calculations, that are intended during use of the site and as part of the
30 reclamation. Unless considered impractical due to special circumstances,
31 provide in the plan for the use of staged permanent seeding and mulching and
32 appropriate fertilizer topdressing continually during site use and the immediate
33 total reclamation of the site when the site is no longer needed. Define the seed
34 mixture proposed for establishing temporary and permanent vegetation.
35 Establish permanent stand of vegetation before acceptance of the project.

36 (c) Buffer Zones

37 Allocate sufficient area between the nearest property line and the tie-in of the
38 slope to natural ground to allow for the operation of excavation, hauling and
39 seeding equipment and for the installation of any and all erosion control devices
40 required. Leave additional undisturbed area between the source and any water
41 course or body to prevent siltation of the water course or body and the
42 movement of the shore line either into the water course or body or into the waste
43 areas. Determine if the adjoining property owners or other government agencies
44 require any additional buffer zones and comply with those requirements.
45 Suggested minimum distances are 10 feet from property lines and 50 feet from
46 water bodies or water courses. Where it is necessary to drain the borrow source,
47 perform work in accordance with Section 240.

1 (d) Evaluation for Potential Wetlands and Endangered Species

2 Hire an experienced environmental consultant from the approved list to perform
3 an assessment of the borrow site for potential conflicts with wetlands, Areas of
4 Environmental Concern designated by the Coastal Area Management Act and
5 federally protected species. This evaluation will not be required for permitted
6 commercial sites.

7 Delineate the boundaries of any wetlands, jurisdictional surface waters and
8 streams encountered. Follow the standard practice for documenting the wetland
9 delineation including completion of the Army Corps of Engineers' Approved
10 Jurisdictional Determination Form. Document information including data
11 regarding soil, vegetation and hydrology. Maintain a minimum 25 foot buffer
12 adjacent to all sides of the wetland boundary and a minimum 50 foot buffer
13 adjacent to any stream. Depict the limits of the delineated wetland and
14 surrounding buffer on the Reclamation Plan. Do not remove borrow material in
15 any area under the Corps of Engineers' or any other environmental agencies'
16 regulatory jurisdiction unless and until the Department permit has been modified
17 to allow such disposal activity in the jurisdictional area.

18 Perform a site assessment for federally listed threatened or endangered species
19 to include habitats that may support these species. Provide a detailed technical
20 report on the assessment findings. If federally listed threatened or endangered
21 species or habitat that may support such species exist on the proposed borrow
22 site, notify the Engineer before continued pursuit of such site.

23 (4) Approval

24 Obtain written approval from the Engineer before excavating any material within the
25 proposed borrow source area.

26 Submit a revised or additional reclamation plan if the non-permitted waste or
27 disposal area is expanded by more than one acre or is significantly changed from the
28 previously approved submittal.

29 If the Contractor proposes a borrow source, the environmental assessment shall
30 include wetland and stream delineation extending 400 feet beyond the proposed
31 borrow source limits.

32 (a) If wetlands or streams are present within 400 feet of the borrow source, submit
33 a hydrologic analysis (Skaggs Method) or equivalent to determine if lateral
34 effects will permanently impact or cause degradation to wetlands or streams.
35 Perform analysis with an environmental or hydraulics engineer with expertise in
36 this discipline and include:

- 37 (i) Hydric soil type,
- 38 (ii) Average profile depth to restrictive soil layer,
- 39 (iii) Effective hydraulic conductivity or permeability,
- 40 (iv) Average drainable porosity or available water capacity and
- 41 (v) Required buffer width, including safety factor.

42 (b) If wetlands or streams are present within 400 feet and the Contractor does not
43 propose to excavate below the seasonal high water table or the water level in the
44 adjacent stream, no documentation will be required.

45 (c) If wetlands or streams are not present within 400 feet, no additional
46 documentation will be required.

47 During Department review of the proposed borrow area, the hydrologic analysis will
48 be submitted to the U.S. Army Corps of Engineers for evaluation. Obtain copy of
49 *Skaggs Method for Determining Lateral Effects of a Borrow Pit on Adjacent*
50 *Wetlands* from the Department's website.

Section 230

1 (C) Maintenance

2 During construction and until final acceptance, use any methods approved by the
3 Engineer that are necessary to maintain the work covered by this section so that the work
4 will not contribute to excessive soil erosion.

5 230-5 MEASUREMENT AND PAYMENT

6 *Borrow Excavation* will be measured and paid in cubic yards. Borrow excavation will be
7 measured in place in its original position except that truck measurement will be made where
8 called for in the contract.

9 If the quantity of borrow excavation used is excessive as evidenced by the presence of surplus
10 suitable material from the roadway excavation, the measured quantity of borrow excavation
11 will be reduced by the quantity of such surplus suitable material.

12 (A) In-Place Measurement

13 *Borrow Excavation* to be paid will be the actual number of cubic yards of approved
14 material, measured in its original position by cross sectioning and computed by the
15 average end area method, that has been excavated from the borrow source and
16 incorporated into the completed and accepted work. No measurement will be made of
17 any overburden, unsuitable material removed from the source or any material excavated
18 before cross sections are taken.

19 (B) Truck Measurement

20 *Borrow Excavation* to be paid will be the actual number of cubic yards of approved
21 material, measured in trucks excavated from the borrow source and incorporated into the
22 completed and accepted work. Each truck will be measured and shall have a legible
23 identification mark indicating its capacity. Load each truck to at least its measured
24 capacity at the time it arrives at the point of delivery. The recorded capacity will be
25 adjusted by making a 25% deduction to allow for shrinkage and the adjusted capacity will
26 be the quantity to be paid.

27 Topsoil that is stockpiled and placed back on the source as part of the reclamation effort will
28 be measured in the stockpile by cross sectioning and computed by the average end area
29 method and paid per cubic yard for *Borrow Excavation*. No in-place measurement will be
30 made of the topsoil.

31 Seeding, mulching and establishment of temporary erosion control for all borrow sources will
32 be paid at the contract unit prices for the items established in the contract as payment for
33 *Seeding and Mulching* in Section 1660.

34 Payment includes, but is not limited to, furnishing the source of the borrow; providing and
35 implementing a development, use and reclamation plan, evaluation of potential wetlands and
36 endangered species, building, maintaining and obliterating haul roads, clearing and grubbing
37 or draining the borrow source; removing, stockpiling and replacing topsoil, removing and
38 disposing of overburden and other unsuitable material, excavation, hauling, formation of
39 roadway embankments, subgrades and shoulders, restoration of the source and haul roads to
40 an acceptable condition, obtaining permits and certifications and maintaining the work.

41 Payment will be made under:

Pay Item

Borrow Excavation

Pay Unit

Cubic Yard

SECTION 235 EMBANKMENTS

235-1 DESCRIPTION

Place suitable material excavated under Sections 225, 226, 230 and 240 in embankments, backfills and earth berms, to conform with the lines, grades and typical cross sections shown in the plans. Fill and compact holes, pits and other depressions when unsuitable material has been removed. Work includes preparation, formation, compaction and maintenance of the embankment area as well as the formation of benches in the existing ground with rises less than 60 inches.

Surcharges and waiting periods may be required for embankments and retaining walls to minimize and control the effects of settlement on structures, approach slabs, pavements, pipes, utilities, etc. Settlement gauges may be required to monitor settlement at approximate locations shown in the plans and as directed.

235-2 MATERIALS

Refer to Division 10.

Use soil consisting of loose, friable, sandy material free of subsoil admixtures, refuse, stumps, rocks, roots, root mats or other unsatisfactory material. Do not use material that meets AASHTO M 145 for soil classification A-2-5 and A-5 with a PI of less than 8 within 12 inches of the subgrade.

Wet, dry or frozen material may be suitable when dried, wetted or thawed, respectively. Aerate and dry material containing moisture content in excess of what is required to achieve embankment stability and specified density. Waste suitable material only with written authorization.

Provide Schedule 40 black steel pipes and couplers with steel or wood bases for settlement gauges. Use steel plates with yield strength of at least 36 ksi and pressure treated wood boards for bases of settlement gauges.

235-3 CONSTRUCTION METHODS

Coordinate work with excavation operations in accordance with Articles 107-12 and 225-2.

(A) Preparation for Embankment

Finish clearing and grubbing within an area before starting embankment in accordance with Section 200. Remove and waste organic or other unsuitable material unless otherwise directed.

Plow mowed sod and leave in place where the height of embankment to be constructed is greater than 6 feet measured under the roadbed. Plow or scarify and break up cleavage planes of all underlying road surfaces. Remove or break up existing pavement in accordance with Section 250.

Bench existing slopes steeper than 4:1 measured at right angles to the roadway. Provide rises of at least 12 inches and no more than 60 inches as embankment is brought up in layers. Provide sufficient width for the operation of placing and compaction equipment. Begin bench cut at the intersection of the original ground and the vertical side of the previous cut. Construct benches greater than 60 inches in height only when shown in the plans. Such benches will be paid in accordance with the contract.

Section 235

1 (B) Embankment Formation

2 Uniformly spread material in successive, approximately horizontal layers of not more
3 than 10 inches depth, loose measurement, for the full width of the cross section.
4 Compact each layer in accordance with Subarticle 235-3(C).

5 Shape embankment surface to properly drain at all times.

6 Route construction equipment uniformly over the full width of the embankment and
7 prevent deep rutting.

8 May construct the first layer of embankments across saturated or unstable material that
9 does not support the weight of hauling equipment, by successively dumping a uniformly
10 distributed layer of a thickness not greater than necessary to support hauling equipment
11 while placing subsequent layers.

12 When placing material in swamp or in water, keep unsuitable surge material in a fluid
13 state or remove to prevent trapping in or under embankment.

14 When shown in the plans or allowed by the contract, form a satisfactory base by end or
15 side dumping in valleys, ravines and at the foot of slopes on side hills.

16 Where embankments are being constructed principally of rock or broken pavement, place
17 in uniform layers with a maximum depth of 36 inches. Place rock or broken pavement so
18 larger pieces are evenly distributed and are no larger than 36 inches in any dimension.
19 Fill all voids. Place rock or broken pavement lifts at least 2 feet below finished subgrade
20 or finished grade whichever is lower.

21 Place select material where indicated in the contract. Construct the top 6 inches of
22 shoulder and fill slopes with material that meets Article 1019-2. Construct stabilized
23 embankment when required by the contract.

24 Install pipe culverts as specified in Section 300. Construct subsurface drains adjacent to
25 structures as required by Article 414-8 for box culverts, except for that portion of the
26 drain located below the elevation of the original ground. Do not disturb existing utilities
27 within the project construction limits until released by the Engineer.

28 Do not place rock or broken pavement in embankment areas where piles or drilled shaft
29 foundations are to be constructed or where underground utilities exist. This requirement
30 shall include, but not be limited to, piles and foundations for structures, metal signal
31 poles, overhead sign structures and high mount lighting.

32 (C) Embankment Compaction

33 Compact each layer for its full width to a density equal to at least 95% of that obtained by
34 compacting a sample of the material in accordance AASHTO T 99 as modified by the
35 Department. Copies of these modified procedures are available upon request from the
36 Department's Materials and Tests Unit.

37 Uniformly bond all layers to preceding layers. Compact all surfaces on embankment
38 slopes, principally constructed of soil, that are flatter than 1.5:1 using tracked equipment
39 or other approved methods.

40 Increase or decrease moisture content of the material before compacting to produce the
41 maximum density that will provide a stable grade. Exempt portions of rock
42 embankments that cannot be tested by approved methods, from density requirements.

(D) Maintenance

Maintain all embankments made under the contract until final acceptance. Construct and maintain adequate drainage of surface runoff to prevent soil erosion. Replace damaged or displaced embankment.

(E) Surcharges and Waiting Periods

Place surcharges at locations shown in the plans. Unless required otherwise in the contract, surcharge embankments after embankments are constructed to the grade and cross section shown in the plans. Construct surcharges with side slopes as directed, 2:1 (H:V) end slopes outside of surcharge limits and surcharge heights shown in the plans. Place and compact surcharge material in accordance with Subarticles 235-3(B) and 235-3(C). Construct and maintain adequate drainage of surface runoff to prevent erosion of surcharge material.

Waiting period durations are in accordance with the contract and as directed. Surcharge waiting periods apply to surcharge locations shown in the plans and begin after surcharges are constructed to the height shown in the plans.

Unless required otherwise in the contract, bridge waiting periods are required in accordance with the following:

(1) Apply to bridge embankments and retaining walls within 100 feet of end bent and bent locations shown in the plans and

(2) Begin after bridge embankments and retaining walls are constructed to the elevations noted in the plans. Department's Materials and Tests Unit.

Unless required otherwise in the contract, embankment waiting periods are required in accordance with the following:

(1) Apply to embankment locations shown in the plans and retaining walls for embankments with waiting periods and

(2) Begin after embankments and retaining walls are constructed to the elevations, grade and cross section shown in the plans. Department's Materials and Tests Unit.

Except for maintaining embankments, do not perform any work on embankments or structures with waiting periods until waiting periods end unless otherwise approved. Place and compact additional material in accordance with Subarticles 235-3(B) and 235-3(C) to maintain embankment grade elevations during waiting periods. Remove surcharges to the grade and cross section shown in the plans after surcharge waiting periods end.

(F) Embankment Monitoring

Fabricate and install settlement gauges in accordance with the contract and the *Roadway Standard Drawings*. Make settlement gauges highly visible so gauges are not disturbed while monitoring settlement. Use only hand operated compaction equipment to compact fill material around gauges.

Do not damage settlement gauges. Damaged settlement gauges may require replacement or additional gauges and waiting period extensions as determined by the Engineer.

Bring all embankments to the grade and cross section shown in the plans before final inspection and acceptance.

235-4 TOLERANCES

Finish subgrade surface within ± 0.10 feet from the established grade after it has been graded to a uniform surface.

Section 240

1 **235-5 MEASUREMENT AND PAYMENT**

2 Payment will not be made for embankment construction. Payment at the contract unit prices
3 for the various items covered by Sections 225, 226, 230 and 240 will be full compensation for
4 all work covered by this section. Repairs to embankments caused by Contractor carelessness
5 or negligence will be incidental to the work of Sections 225, 226, 230 and 240. Repairs to
6 embankments as a result of natural causes will be at the contract unit price for the excavated
7 material required to make the necessary repairs.

8 *Borrow Excavation* for surcharge material and additional material for maintaining
9 embankment grade elevations will be measured and paid in accordance with Article 230-5.

10 *Unclassified Excavation* for surcharge material, additional material for maintaining
11 embankment grade elevations and removing surcharges will be measured and paid in
12 accordance with Article 225-7. When there is no pay item for *Borrow Excavation* or
13 *Unclassified Excavation* in the contract, surcharge material and removing surcharges will be
14 included in the lump sum payment for *Grading*. Additional material for maintaining
15 embankment grade elevations will be paid as extra work in accordance with Article 104-7.

16 *Embankment Settlement Gauges* will be measured and paid in units of each. Settlement
17 gauges will be measured as one per gauge location. The contract unit price for *Embankment*
18 *Settlement Gauges* will be full compensation for fabricating and installing settlement gauges
19 including placing and compacting fill material around gauges, adding pipes and couplers until
20 embankment monitoring ends and any incidentals necessary to monitor settlement. No
21 payment will be made for interfering with the Contractor’s operations due to embankment
22 monitoring or damaged settlement gauges as determined by the Engineer.

23 Payment will be made under:

Pay Item	Pay Unit
Embankment Settlement Gauges	Each

24 **SECTION 240**
25 **DITCH EXCAVATION**

26 **240-1 DESCRIPTION**

27 Excavate and satisfactorily dispose of all materials excavated in the construction of ditches
28 except silt ditches.

29 **(A) Drainage Ditches**

30 Define “drainage ditches” as inlet and outlet ditches for pipe culverts and structures,
31 changes in channels of streams, ditches draining borrow and material sources and parallel
32 or lateral ditches when such ditches are separated from the roadway slope by an area of
33 natural ground or berm.

34 Unless otherwise classified in the plans, parallel or lateral ditches constructed as
35 an integral part of the graded roadbed, having a continuous slope from the outer limit of
36 the shoulder to the bottom of the ditch, will be considered to be within the roadway
37 grading limits and will be part of the work covered by Section 225.

38 **(B) Berm Ditches**

39 Define “berm ditches” as ditches constructed by either excavation or the construction of
40 earth berms along the top of cut slopes. The location of berm ditches will be as shown in
41 the plans or as directed.

42 **240-2 GENERAL**

43 Excavate to the lines, grades, typical sections and details shown in the plans or established.
44 Coordinate all work covered by this section with the grading, construction of drainage

1 structures, excavation of borrow and material sources and other work along the project and
 2 maintain in a satisfactory condition so that adequate drainage is provided at all times.
 3 Maintain the ditches until the final acceptance of the project. Trim flush with the sides of the
 4 ditch any roots that protrude into the ditch. Complete inlet and outlet ditches for pipelines
 5 before the pipe is installed unless otherwise permitted.

6 **240-3 DISPOSAL OF MATERIALS**

7 Use all excavated materials in the construction of roadway embankments except where
 8 otherwise directed. Deposit materials that are excess to the needs of the project alongside the
 9 ditch and spread to form a low, flat, inconspicuous spoil bank of sufficient regular contour to
 10 permit seeding and mowing, provided no drainage into the ditch is blocked.

11 **240-4 MEASUREMENT AND PAYMENT**

12 *Drainage Ditch Excavation* will be measured and paid in cubic yards, measured in the
 13 original position by the average end area method of all materials excavated within the limits
 14 established by the plans or directed. Work includes, but is not limited to, excavation, shaping
 15 of the ditches, disposal of all materials, construction of earth berms and the maintenance of
 16 the work in an acceptable condition until final acceptance.

17 No measurement and payment will be made where excavation has been performed beyond the
 18 above limits; made solely for the convenience of the Contractor; for temporary drainage of the
 19 project; or for any excavation to provide drainage of borrow or material sources furnished by
 20 the Contractor.

21 Where the contract does not include a pay item for *Drainage Ditch Excavation*, all work of
 22 drainage ditch excavation will be treated as *Unclassified Excavation* and will be paid in
 23 accordance with Section 225.

24 *Berm Ditch Construction* will be measured and paid in linear feet, measured along the flow
 25 line of the ditch within the pay limits shown in the plans, completed and accepted. Work
 26 includes, but is not limited to, excavation, shaping of the ditches, disposal of all materials,
 27 construction of earth berms and the maintenance of the work in an acceptable condition until
 28 final acceptance.

29 Payment will be made under:

Pay Item	Pay Unit
Drainage Ditch Excavation	Cubic Yard
Berm Ditch Construction	Linear Foot

30 **SECTION 250**

31 **REMOVAL OF EXISTING PAVEMENT**

32 **250-1 DESCRIPTION**

33 Break up, remove and satisfactorily dispose of the Portland cement concrete or asphalt
 34 components of an existing roadway pavement structure, including paved shoulders, within the
 35 limits shown in the plans or as directed. This work includes the removal of any temporary
 36 roadway pavement structure placed during construction to serve as a detour.

37 **250-2 PAVEMENT REMOVAL AND DISPOSAL**

38 Break up and remove the pavement for its entire depth. Where concrete or asphalt pavement
 39 is to be removed, provide a neat edge along the pavement being retained by sawing the
 40 pavement approximately 2 inches deep before breaking the adjacent pavement away.
 41 Properly dispose of all materials resulting from the pavement removal as provided herein.

42 When existing pavement is located where embankment is to be constructed and the depth of
 43 the embankment is greater than 1 foot exclusive of base and pavement, do not remove
 44 existing pavement, but break up the existing pavement into pieces with the longest dimension

Section 250

1 no larger than 3 feet. Use all materials in the construction of embankments, unless otherwise
2 directed. Stockpile materials that the Department desires to use, as indicated in the plans at
3 approved locations.

4 Where the Contractor requests permission to use salvageable material in other parts of the
5 work and such material has been intended for use in the construction of embankments, the
6 Engineer may permit such use provided the Contractor furnishes at no cost to the Department
7 an adequate quantity of material for embankment construction to replace the material used in
8 all other parts of the work.

9 Dispose of all materials that cannot be used in the work in accordance with Section 802.

10 **250-3 MEASUREMENT AND PAYMENT**

11 *Removal of Existing Asphalt Pavement* will be measured and paid in square yards of existing
12 asphalt pavement actually removed and disposed of properly. Removal of existing asphalt
13 pavement will be measured by actual surface measurement of the asphalt pavement before its
14 removal.

15 *Removal of Existing Concrete Pavement* will be measured and paid in square yards of existing
16 concrete pavement actually removed and disposed of properly. Removal of existing concrete
17 pavement will be measured by actual surface measurement of the concrete pavement before
18 its removal.

19 *Breaking of Existing Concrete Pavement* will be measured and paid in square yards of
20 existing concrete pavement actually broken up and left in place. The quantity will be
21 determined by actual surface measurement of the pavement before breaking it up.

22 *Breaking of Existing Asphalt Pavement* will be measured and paid in square yards of existing
23 asphalt pavement actually broken up and left in place. The quantity will be determined by
24 actual surface measurement of the pavement before breaking it up.

25 Where the pavement removed or broken up is a combination of layers of both asphalt and
26 concrete pavement, payment will be made at the contract unit price per square yard for
27 *Removal of Existing Concrete Pavement* or *Breaking of Existing Concrete Pavement*.

28 Where the pavement removed is a combination of layers of both asphalt and concrete
29 pavement and an item is not established for concrete pavement removal, the cost of removing
30 the combination of layers of asphalt and concrete will be made in accordance with
31 Article 104-7.

32 Payment includes, but is not limited to, breaking up, removing and disposing of existing
33 concrete or asphalt pavement, including paved shoulders and removing any temporary
34 roadway pavement structure placed during construction to serve as a detour.

35 This work does not include pavement removal for pipe installation; removing and disposing
36 of sidewalks, driveways, curb and gutter; traffic islands and parking areas; or any other
37 incidental paved structures that are not part of a roadway pavement structure.

38 Payment will be made under:

Pay Item	Pay Unit
Removal of Existing Asphalt Pavement	Square Yard
Removal of Existing Concrete Pavement	Square Yard
Breaking of Existing Concrete Pavement	Square Yard
Breaking of Existing Asphalt Pavement	Square Yard

SECTION 260 PROOF ROLLING

260-1 DESCRIPTION

Furnish and operate at the direction of the Engineer, heavy pneumatic tired compaction equipment for compacting the roadbed and testing the roadbed for stability and uniformity of compaction.

260-2 EQUIPMENT

Provide equipment with the following features:

(A) Four rubber tired wheels mounted on a rigid steel frame,

(B) Wheels evenly spaced in one line across the width of the roller and arranged so that all wheels will carry approximately equal loads when operated over an uneven surface,

(C) Maximum center to center spacing between adjacent wheels is 32 inches,

(D) Load capacity from 48 to 50 tons unless otherwise permitted in writing,

(E) Cover or construct the loaded roller to not trap water that will add weight to the ballast,

(F) Other equipment of equal or better effectiveness may be substituted with written permission, and

(G) Tire pressures shall be between 68 and 72 lb/sq.in. unless otherwise permitted in writing. Inflate tires with air only; use no liquid.

Provide ballasts consisting of bulk sand, bulk stone, bags of sand, stone or other materials of known unit weight such that the total weight of the ballast used can be readily determined at all times. Provide a sufficient amount of ballast to load the equipment to a maximum gross weight of 50 tons.

Use rubber tired or other types of tractive equipment for operation of this equipment on the roadbed. The entire assembly including motivating equipment shall be capable of executing a 180° turn on a 27 feet wide area.

260-3 CONSTRUCTION METHODS

After the roadbed has been completed within 0.5 feet of final grade, compact and test the roadbed with one coverage, unless otherwise directed, with a heavy pneumatic tired roller in accordance with Article 260-2. Coverage is considered that stage in the rolling procedure when the entire width of the area being proof rolled has been in contact with the pneumatic tires of the roller. Operate the roller systematically so the number of coverages over all areas to be proof rolled can be readily determined and recorded.

Operate the equipment at a speed between 225 feet per minute and 300 feet per minute. Perform proof rolling only in the presence of the Engineer. Proof roll areas again following the completion of the necessary corrections.

Protect all structural facilities on the project, such as, but not limited to, bridges, box culverts, pipe culverts and utilities, from damage by the proof rolling equipment. Protection may include unloading and reloading of the roller, detouring, protective earth pads or other suitable measure to avoid damage.

260-4 MEASUREMENT AND PAYMENT

Proof Rolling will be measured and paid as the actual number of hours, measured to the nearest 0.1 hour, during which the heavy pneumatic tired roller has been engaged in proof rolling in the presence of the Engineer, exclusive of hours of proof rolling performed following corrective action made necessary by the negligence of the Contractor or by weather.

Section 265

1 Corrective work necessary, as determined by proof rolling, and not due to negligence of the
2 Contractor or to weather, will be paid at the applicable contract unit prices or as extra work,
3 whichever may apply.

4 Proof rolling after corrective work will be at no cost to the Department if the corrections are
5 necessary due to the negligence of the Contractor or weather.

6 Payment includes furnishing all labor, equipment, fuel and ballast for loading, loading and
7 unloading ballast as directed and increasing and decreasing tire pressure as directed.

8 Payment will be made under:

Pay Item	Pay Unit
Proof Rolling	Hour

9 **SECTION 265**
10 **SELECT GRANULAR MATERIAL**

11 **265-1 DESCRIPTION**

12 Furnish and place select granular material in accordance with the contract and as directed.

13 **265-2 MATERIALS**

14 Refer to Division 10.

Item	Section
Select Material, Class II	1016
Select Material, Class III	1016

15 Use Class II or III select material for select granular material except when contract includes
16 pay item for *Select Granular Material, Class III*. When this occurs, use only Class III select
17 material for select granular material.

18 **265-3 CONSTRUCTION METHODS**

19 Use only Class III select material for embankments in water.

20 Place select granular material up to 3 feet above geotextile for soil stabilization and the water
21 level.

22 **265-4 MEASUREMENT AND PAYMENT**

23 Select granular material will be paid as *Select Granular Material* or *Select Granular Material,*
24 *Class III* unless the material is obtained from the same source as the borrow material and the
25 contract includes a pay item for *Borrow Excavation*. When this occurs, select granular
26 material will be paid at the lower bid price per cubic yard for either *Borrow Excavation* or
27 *Select Granular Material / Select Granular Material, Class III*.

28 *Select Granular Material and Select Granular Material, Class III* will be measured and paid
29 in cubic yards. When undercut excavation is in accordance with Section 226 and the
30 Engineer requires undercut to be backfilled with select granular material, the second sentence
31 of the sixth paragraph of Article 226-3 will not apply, as payment for the backfill will be
32 made as described in this article.

33 Select granular material will be measured by in place measurement in accordance with
34 Article 230-5 or by weighing material in trucks in accordance with Article 106-7 as
35 determined by the Engineer. When select granular material is weighed in trucks, a unit
36 weight of 135 pcf will be used to convert the weight of select granular material to cubic yards.
37 At the Engineer’s discretion, truck measurement in accordance with Article 230-5 may be
38 used instead of weighing material in trucks.

1 The contract unit prices for *Select Granular Material, Select Granular Material, Class III* and
 2 *Borrow Excavation* as described above will be full compensation for providing, transporting,
 3 handling, placing, compacting and maintaining select granular material.

4 Payment will be made under:

Pay Item	Pay Unit
Select Granular Material	Cubic Yard
Select Granular Material, Class III	Cubic Yard

5

6

7

**SECTION 270
 GEOTEXTILE FOR SOIL STABILIZATION**

8

270-1 DESCRIPTION

9 Supply and install geotextile for soil stabilization in accordance with the contract and as
 10 directed.

11

270-2 MATERIALS

12

Refer to Division 10.

Item	Section
Geotextile for Soil Stabilization, Type 4	1056

13

270-3 CONSTRUCTION METHODS

14 Grubbing may not be required in areas where geotextile for soil stabilization will be used.
 15 Minimize the use of heavy equipment in these areas to limit rutting. Cut trees flush with the
 16 ground surface and place geotextiles on relatively undisturbed ground as directed.

17

18

19

20

21

22

Do not leave geotextiles exposed for more than 7 days before covering geotextiles with
 backfill material except geotextiles for erosion control devices. Place geotextiles on surfaces
 free of obstructions, debris and soft pockets. Install geotextiles with the long dimension
 parallel to the roadway centerline. Overlap adjacent geotextiles at least 18 inches unless
 otherwise directed to sew seams together. Overlap geotextiles in the direction that material
 will be placed to prevent lifting the edge of the top geotextile.

23

24

25

26

27

Pull geotextiles taut so that they are in tension and free of kinks, folds, wrinkles or creases.
 Hold geotextiles in place as needed with wire staples or anchor pins. Provide backfill
 material in accordance with the contract. Do not operate equipment on geotextiles until
 covered with material as directed. Do not use vibratory compaction equipment on initial lifts
 of backfill.

28

270-4 MEASUREMENT AND PAYMENT

29

30

31

32

33

34

Geotextile for Soil Stabilization will be measured and paid in square yards. Geotextiles will
 be measured along the ground surface as the square yards of exposed geotextiles before
 placing backfill material. No measurement will be made for overlapping geotextiles or
 sewing seams. The contract unit price for *Geotextile for Soil Stabilization* will be full
 compensation for providing, transporting and installing geotextiles, wire staples and anchor
 pins and sewing geotextiles.

35

Payment will be made under:

Pay Item	Pay Unit
Geotextile for Soil Stabilization	Square Yard

Section 275

SECTION 275 ROCK PLATING

275-1 DESCRIPTION

Place rip rap on slopes in accordance with the contract and *Roadway Standard Drawings*. Rock plating is required to stabilize slopes at locations shown in the plans and as directed.

275-2 MATERIALS

Refer to Division 10.

Item	Section
Geotextile for Rock Plating, Type 2	1056
Plain Rip Rap	1042
Select Material, Class IV	1016
Subsurface Drainage Materials	1044

Provide Type 2 geotextile for filtration geotextiles. Use Class IV select material (standard size No. ABC) over rip rap and Class 1, 2 or B rip rap unless required otherwise in the plans. Provide subdrain coarse aggregate (standard size No. 78M) and PVC subdrain pipes, fittings and outlet pipes for subsurface drainage materials.

275-3 CONSTRUCTION METHODS

Construct embankments in accordance with the contract. Compact fill slopes to the satisfaction of the Engineer with tracked equipment or other approved methods. Excavate materials as need to install rock plating on cut slope faces or embed rock plating below the ground line.

Do not leave filtration geotextiles exposed for more than 7 days before covering with rip rap or ABC. Unroll geotextiles down slopes, i.e., perpendicular to the roadway centerline. Bury filtration geotextiles at top of slopes and embed geotextiles at toe of slopes as shown in the plans. Filtration geotextiles should be continuous down slopes. If geotextile roll length is too short, overlap ends of geotextile rolls at least 5 feet with the upper geotextile over the lower as shown in the plans. Filtration geotextiles may be discontinuous down slopes in the direction perpendicular to the roadway centerline only once per roll width.

Overlap adjacent filtration geotextiles along slopes at least 18 inches as shown in the plans. Pull geotextiles taut so that they are in tension and free of kinks, folds, wrinkles or creases. Hold geotextiles in place as needed with wire staples or anchor pins. Do not displace or damage filtration geotextiles while placing rip rap. When shown in the plans, install 6 inch diameter perforated subdrain pipes and No. 78M stone at toe of slopes in accordance with Article 815-3.

Place rip rap so smaller stones are uniformly distributed throughout rip rap. Install rip rap with mechanical methods and if necessary, by hand to form a well graded, dense, neat layer of rip rap.

When shown in the plans, place filtration geotextiles and 18 inches of ABC over rip rap at top of slopes. Compact ABC to 92% of AASHTO T 180 as modified by the Department or to the highest density that can be reasonably obtained.

275-4 MEASUREMENT AND PAYMENT

Rock Plating will be measured and paid in square yards. Rock plating will be measured along slope faces of rock plated slopes as the square yards of exposed rip rap and if applicable, ABC. No measurement will be made for portions of rock plating embedded below the ground line. The contract unit price for *Rock Plating* will be full compensation for providing, transporting and installing filtration geotextiles, wire staples, anchor pins, rip rap and ABC. The contract unit price for *Rock Plating* will be full compensation for excavating materials to install rock plating on cut slope faces and embed rock plating below the ground line.

- 1 *Subsurface Drainage* will be measured and paid in accordance with Section 815.
- 2 Payment will be made under:

Pay Item
Rock Plating

Pay Unit
Square Yard

DIVISION 3 PIPE CULVERTS

SECTION 300 PIPE INSTALLATION

300-1 GENERAL

Excavate, undercut, provide material, condition foundation, lay pipe, joint and couple pipe sections and furnish and place all backfill material as necessary to install the various types of pipe culverts and fittings required to complete the project.

Install pipe in accordance with the details in the plans.

Do not waste excavation unless permitted. Use suitable excavated material as backfill; or in the formation of embankments, subgrades and shoulders; or as otherwise directed. Furnish disposal areas for the unsuitable material. The Engineer will identify excavated materials that are unsuitable.

Where traffic is to be maintained, install pipe in sections so half the roadway width is available to traffic.

300-2 MATERIALS

Refer to Division 10.

Item	Section
Flowable Fill, Excavatable	1000-6
Grout, Type 2	1003
Geotextiles, Type 4	1056
Joint Materials	1032-6(F)
Select Materials	1016

Provide foundation conditioning material in accordance with Article 1016-3 for Class V or VI select material as shown in the contract.

Provide bedding material in accordance with Article 1016-3 for Class II (Type 1 only) or Class III select material as shown in contract.

Provide backfill material in accordance with Article 1016-3 for Class II (Type 1 for flexible pipe) or Class III select material as shown in the contract.

Provide filtration geotextile in accordance with Section 1056 for any type of geotextile.

Provide foundation conditioning geotextile and geotextile to wrap pipe joints in accordance with Article 1056 for Type 4 geotextile.

Do not use corrugated steel pipe in counties listed in Article 310-2.

300-3 UNLOADING AND HANDLING

Unload and handle pipe with reasonable care. Do not roll or drag metal pipe or plates over gravel or rock during handling. Take necessary precautions to ensure the method used in lifting or placing the pipe does not induce stress fatigue in the pipe. Use a lifting device that uniformly distributes the weight of the pipe along its axis or circumference. Repair minor damage to pipe when permitted. Remove pipe from the project that is severely damaged or is rejected as being unfit for use. Undamaged portions of a joint or section may be used where partial lengths are required.

Section 300

1 **300-4 PREPARATION OF PIPE FOUNDATION**

2 Prepare the pipe foundation in accordance with the applicable method as shown in the
3 contract documents, true to line and grade and uniformly firm.

4 Where material is found to be of poor supporting value or of rock and when the Engineer
5 cannot make adjustment in the location of the pipe, undercut existing foundation material
6 within the limits established in the plans. Backfill the undercut with foundation conditioning
7 material. Encapsulate the foundation conditioning material with foundation conditioning
8 geotextile before placing bedding material. Overlap all transverse and longitudinal joints in
9 the geotextile at least 18 inches.

10 Maintain the pipe foundation in a dry condition.

11 **300-5 INVERT ELEVATIONS**

12 The proposed pipe culvert invert elevations shown on the Drainage Summary Sheets are
13 based upon information available when the plans were prepared. If proposed invert elevations
14 are adjusted during construction based upon actual conditions encountered, no claim for an
15 extension of time for any reason resulting from this information will be allowed.

16 When a pipe culvert is to be installed in a trench and the average actual elevation of the pipe
17 between drainage structures deviates from the average proposed elevation shown on the
18 Drainage Summary Sheets by more than one foot, a pay adjustment will be made as follows:

$$\text{Pay Adjustment (per linear foot)} = [(APE - AAE) \pm 1](0.15 \times CUP)$$

Where:

$$APE = \text{Average Plan Elev.} = \frac{(\text{Plan Inlet Elev.} + \text{Plan Outlet Elev.})}{2}$$

$$AAE = \text{Average Actual Elev.} = \frac{(\text{Actual Inlet Elev.} + \text{Actual Outlet Elev.})}{2}$$

$$CUP = \text{Contract Unit Price of Pipe Culvert}$$

19 When the actual location of a pipe culvert is changed from the location shown in the plans,
20 the Engineer will make a pay adjustment deemed warranted based upon the relation of the
21 pipe culvert as shown in the plans to the finished roadway and the relation of the pipe culvert
22 as constructed to the finished roadway.

23 The top elevation column on the drainage summary sheet indicates the flow elevation at the
24 top of structures intended to collect surface water.

25 The top elevation column on drainage structures not intended to collect surface water
26 indicates the elevation at the top of the cover.

27 **300-6 LAYING PIPE**

28 The Department reserves the right to perform forensic testing on any installed pipe.

29 **(A) Rigid Pipe**

30 Concrete and welded steel pipe will be considered rigid pipe. Lay pipe on prepared
31 foundation, bell or groove end upgrade with the spigot or tongue fully inserted. Check
32 each joint for alignment and grade as the work proceeds.

33 Use flexible plastic joint material except when material of another type is specified in the
34 contract documents. Joint material of another type may be used when permitted.

1 Repair lift holes in concrete pipe, if present. Thoroughly clean and soak the lift hole and
2 completely fill the void with grout. Submit alternate details for repairing lift holes to the
3 Engineer for review and approval.

4 For all pipes 42 inches in diameter and larger, wrap geotextile around all pipe joints.
5 Extend geotextile at least 12 inches beyond each side of the joint. Secure geotextile
6 against the outside of the pipe by methods approved by the Engineer.

7 **(B) Flexible Pipe**

8 Corrugated steel, corrugated aluminum, corrugated HDPE and PVC pipe will be
9 considered flexible pipe. Place flexible pipe carefully on the prepared foundation starting
10 at the downstream end with the inside circumferential laps pointing downstream and with
11 the longitudinal laps at the side or quarter points.

12 Handle coated corrugated steel pipe with special care to avoid damage to coatings.

13 Join pipe sections with coupling band, fully bolted and properly sealed. Provide coupling
14 bands for annular and helical corrugated metal pipe with circumferential and longitudinal
15 strength sufficient to preserve the alignment, prevent separation of the sections and
16 prevent backfill infiltration. Match-mark all pipe 60 inches or larger in diameter at the
17 plant for proper installation on the project.

18 At locations indicated in the plans, join corrugated steel pipe sections together with rod
19 and lug coupling bands, fully bolted. Use sleeve gaskets in conjunction with rod and lug
20 couplings and seal the joints properly. Provide coupling bands with circumferential and
21 longitudinal strength sufficient to preserve the alignment, prevent separation of the
22 sections and prevent infiltration of backfill material.

23 **300-7 BACKFILLING**

24 Loosely place bedding material, in a uniform layer, a depth equal to the inside diameter of the
25 pipe divided by 6 or 6 inches, whichever is greater. Leave bedding material directly beneath
26 the pipe uncompacted and allow pipe seating and backfill to accomplish compaction.
27 Excavate recesses to receive the bells where bells and spigot type pipe is used.

28 Place fill around the pipe in accordance with the applicable method shown in the plans in
29 layers not to exceed 6 inches loose unless otherwise permitted. Compact to the density
30 required by Subarticle 235-3(C). Approval of the backfill material is required before its use.
31 Use select material as shown in the contract documents.

32 Take care during backfill and compaction operations to maintain alignment and prevent
33 damage to the joints. Keep backfill free from stones, frozen lumps, chunks of highly plastic
34 clay or other objectionable material.

35 Grade and maintain all pipe backfill areas in such a condition that erosion or saturation will
36 not damage the pipe foundation or backfill.

37 Flowable fill may be used for backfill when approved by the Engineer. When using flowable
38 fill, ensure that the pipe is not displaced and does not float during backfill. Submit methods
39 for supporting the pipe and material placement to the Engineer for review and approval.

40 Do not operate heavy equipment over any pipe until it has been properly backfilled with at
41 least 3 feet of cover. Place, maintain and finally remove the required cover that is above the
42 proposed finished grade. Remove and replace pipe that becomes misaligned, shows excessive
43 settlement or has been otherwise damaged by the Contractor's operations.

Section 300

1 **300-8 INSPECTION AND MAINTENANCE**

2 Before final acceptance, the Engineer will perform random video camera and or mandrel
3 inspections to ensure proper jointing and that deformations do not exceed allowable limits.
4 Replace pipes having cracks greater than 0.1 inch or deflections greater than 7.5%. Repair or
5 replace pipes with cracks greater than 0.01 inch, exhibiting displacement across a crack,
6 exhibiting bulges, creases, tears, spalls or delamination. Maintain all pipe installations in
7 a condition such that they will function continuously from the time the pipe is installed until
8 the project is accepted.

9 **300-9 MEASUREMENT AND PAYMENT**

10 No measurement will be made of any work covered by this section except as listed below.
11 Removal and disposal of existing pavement and unsuitable material above the pipe invert are
12 a part of the excavation for the new pipe culvert installation. Repair of the pavement will be
13 made in accordance with Section 654. Placing, maintaining and removing the required cover
14 is incidental to the work of this section. Removing and replacing pipe that becomes
15 misaligned, shows excessive settlement or has been otherwise damaged by the Contractor's
16 operations is incidental to the work of this section.

17 **(A) Using Local Material**

18 *Undercut Excavation* is all excavation removed by undercutting below the bottom of the
19 trench as staked. *Undercut Excavation* will be measured as the actual number of cubic
20 yards of undercut excavation, measured in its original position and computed by the
21 average end area method, that has been removed as called for in the contract and will be
22 paid at double the contract unit price for *Unclassified Excavation* in accordance with
23 Article 225-7.

24 Local material used for conditioning the foundation will be measured and paid in
25 accordance with Article 225-7 for *Unclassified Excavation* or in accordance with
26 Article 230-5 for *Borrow Excavation* depending on the source of the material.

27 Local material used to replace pipe undercut excavation will be measured and paid in
28 accordance with Article 225-7 or Article 230-5.

29 **(B) Using Other than Local Material**

30 No measurement and payment will be made for *Undercut Excavation*. The material used
31 to replace pipe undercut excavation will be classified as foundation conditioning material.

32 *Foundation Conditioning Material, Minor Structures* will be measured and paid as the
33 actual number of tons of this material weighed in trucks on certified platform scales or
34 other certified weighing devices.

35 No direct payment will be paid for *Undercut Excavation*. Payment at the contract unit
36 price for *Foundation Conditioning Material, Minor Structures* will be full compensation
37 for all work of pipe undercut excavation.

38 **(C) Foundation Conditioning Geotextile**

39 *Foundation Conditioning Geotextile* will be measured and paid in square yards. The
40 measurement will be based on the theoretical calculation using length of pipe installed
41 and two times the standard trench width. No separate measurement will be made for
42 overlapping geotextile or the vertical geotextile dimensions required to encapsulate the
43 foundation conditioning material.

1 **(D) Bedding and Backfill with Select Material**

2 No measurement will be made for select bedding and backfill material required in the
3 contract documents. The select bedding and backfill material will be included in the cost
4 of the installed pipe.

5 Where unclassified excavation or borrow material meets the requirements for select
6 bedding and backfill and is approved for use by the Engineer, no deductions will be made
7 to these pay items to account for use in the pipe installation.

8 Payment will be made under:

Pay Item	Pay Unit
Foundation Conditioning Material, Minor Structures	Ton
Foundation Conditioning Geotextile	Square Yard

9 **SECTION 305**
10 **DRAINAGE PIPE**

11 **305-1 DESCRIPTION**

12 Where shown in the plans, the Contractor may use reinforced concrete pipe, aluminum alloy
13 pipe, aluminized corrugated steel pipe, HDPE pipe or PVC pipe in accordance with the
14 following requirements.

15 **305-2 MATERIALS**

16 Refer to Division 10.

Item	Section
Aluminized Corrugated Steel Pipe	1032-3(A)(7)
Corrugated Aluminum Alloy Pipe	1032-2(A)
Corrugated HDPE Pipe	1032-7
Elbows	1032
PVC Pipe	1032-8
Reinforced Concrete Pipe, Class II or III	1032-6(B)

17 Corrugated steel pipe will not be permitted in counties listed in Article 310-2.

18 Only pipe with smooth inside walls will be allowed for storm drain systems. Define "storm
19 drain systems" as pipe under curb and gutter, expressway gutter and shoulder berm gutter that
20 connects drainage structures and is not open ended.

21 **305-3 CONSTRUCTION METHODS**

22 Install pipe culverts in accordance with Section 300. Where allowed by the plans, use any of
23 the several alternate pipes shown herein, but only one type of pipe and elbow will be
24 permitted between drainage structures or for the entire length of a cross line pipe.

25 **305-4 MEASUREMENT AND PAYMENT**

26 ___" *Drainage Pipe* will be measured and paid as the actual number of linear feet of pipe that
27 has been incorporated into the completed and accepted work. Measurement of pipe will be
28 made by counting the number of joints used and multiplying by the length of the joint to
29 obtain the number of linear feet of pipe installed and accepted. Measurements of partial joints
30 will be made along the longest length of the partial joint to the nearest 0.1 foot. Select
31 bedding and backfill material will be included in the cost of the installed pipe.

32 ___" *Drainage Pipe Elbow* will be measured and paid in units of each.

Section 310

1 Payment will be made under:

Pay Item

- ___" Drainage Pipe
- ___" Drainage Pipe Elbows

Pay Unit

- Linear Foot
- Each

2 **SECTION 310**
 3 **PIPE CULVERTS**

4 **310-1 DESCRIPTION**

5 Furnish and install drainage pipe at locations and size called for in the contract documents.
6 The work includes construction of joints and connections to other pipes, endwalls and
7 drainage structures.

8 **310-2 MATERIALS**

9 Refer to Division 10.

Item

Section

Concrete Pipe Tees and Elbows	1032-6(D)
Corrugated Aluminum Alloy Pipe Culvert	1032-2(A)
Corrugated Aluminum Alloy Pipe Tees and Elbows	1032-2(B)
Corrugated Steel Culvert Pipe and Pipe Arch	1032-3(A)
Corrugated Steel Eccentric Reducers	1032-3(D)
Corrugated Steel Pipe Tees and Elbows	1032-3(C)
HDPE Smooth Lined Corrugated Plastic Pipe	1032-7
Precast Concrete Pipe End Sections	1032-6(C)
Prefabricated Corrugated Steel Pipe End Sections	1032-3(B)
PVC Pipe	1032-8
Reinforced Concrete Culvert Pipe	1032-6(B)

10 Use suppliers of metal pipe culverts, fittings and all other accessories covered by this section
11 that meet the Department’s Brand Certification program requirements for metal pipe culverts
12 and are listed on the Materials and Tests Unit’s pre-approved list for suppliers of metal pipe
13 culvert. The pre-approved list is available on the Department’s website.

14 Do not use plain galvanized or aluminized corrugated steel pipe in the following counties:

- 15 Beaufort, Bertie, Bladen, Brunswick, Camden, Carteret, Chowan, Columbus,
- 16 Craven, Currituck, Dare, Gates, Hertford, Hyde, Jones, Martin, New Hanover,
- 17 Onslow, Pamlico, Pasquotank, Pender, Perquimans, Tyrell and Washington.

18 **310-3 PIPE INSTALLATION**

19 Install pipe, pipe tees and elbows according to Section 300.

20 **310-4 SIDE DRAIN PIPE**

21 Define “side drain pipe” as storm drain pipe running parallel to the roadway to include pipe in
22 medians, outside ditches, driveways and under shoulder berm gutter along outside shoulders
23 greater than 4 feet wide.

24 Where shown in the plans, side drain pipe may be Class II reinforced concrete pipe,
25 aluminized corrugated steel pipe, corrugated aluminum alloy pipe, HDPE pipe or PVC pipe.
26 Use of corrugated steel pipe is restricted in the counties listed in Article 310-2. Install side
27 drain pipe in accordance to Section 300. Cover for side drain pipe shall be at least one foot.

1 **310-5 PIPE END SECTIONS**

2 Choose which material to use for the required end sections. Both corrugated steel and
 3 concrete pipe end sections will work on concrete pipe, corrugated steel pipe and HDPE
 4 smooth lined corrugated plastic pipe.

5 **310-6 MEASUREMENT AND PAYMENT**

6 *Pipe* will be measured and paid as the actual number of linear feet of pipe that has been
 7 incorporated into the completed and accepted work. Measurement of pipe will be made by
 8 counting the number of joints used and multiplying by the length of the joint to obtain the
 9 number of linear feet of pipe installed and accepted. Measurements of partial joints will be
 10 made along the longest length of the partial joint to the nearest 0.1 feet. Select bedding and
 11 backfill material will be included in the cost of the installed pipe.

12 *Pipe End Sections, Tees, Elbows and Eccentric Reducers* will be measured and paid as the
 13 actual number of each of these items incorporated into the completed and accepted work.

14 Payment will be made under:

Pay Item	Pay Unit
___" R.C. Pipe Culverts, Class ____	Linear Foot
___" x ___" x ___" R.C. Pipe Tees, Class ____	Each

15 **SECTION 330**
 16 **WELDED STEEL PIPE**

17 **330-1 DESCRIPTION**

18 This work shall consist of furnishing and installing welded steel pipe by trenchless methods as
 19 shown in the contract and as directed.

20 **330-2 MATERIALS**

21 Refer to Division 10.

Item	Section
Welded Steel Pipe	1032-5

22 Use suppliers of metal pipe culverts, fittings and all other accessories covered by this section
 23 that meet the Department's Brand Certification program requirements for metal pipe culverts
 24 and are listed on Department's pre-approved list for suppliers of metal pipe culvert. The pre-
 25 approved list is available on the Department's website.

Section 340

1 **330-3 PIPE INSTALLATION**

2 Install the pipe by trenchless construction, true to line and grade and so settlement does not
3 occur. Fill all voids around the pipe. Replace installations that become damaged or have to
4 be abandoned.

5 Conduct a pre-construction meeting in the presence of the Engineer at least 48 hours before
6 the beginning of the pipe installation. The meeting shall consist of, but not be limited to:

- 7 (A) Reviewing all installation methods to install the pipe true to the line and grade given,
- 8 (B) Methods to insure there is no settlement of the pipe or of the completed roadway section,
9 and
- 10 (C) Methods for filling any potential voids around the pipe.

11 **330-4 MEASUREMENT AND PAYMENT**

12 ___" *Welded Steel Pipe, ___" Thick, Grade B in Soil* will be measured and paid as the actual
13 number of linear feet of pipe measured along the flow line to the nearest foot, which has been
14 installed in soil.

15 ___" *Welded Steel Pipe, ___" Thick, Grade B Not in Soil* will be measured and paid as the actual
16 number of linear feet of pipe measured along the flow line to the nearest foot which has been
17 installed in non-soil, as observed and confirmed by the Engineer. Non-soil is defined as all
18 material other than soil. The Contractor shall request and obtain the Engineer’s observation
19 and confirmation of the limits of the installation not in soil before and during the installation
20 of the pipe or portion of the pipe not in soil.

21 Failure of the Contractor to request and obtain the Engineer’s observation and confirmation of
22 the limits of the pipe not in soil before and during the installation will result in the payment at
23 the unit price for ___" *Welded Steel Pipe, ___" Thick, Grade B in Soil*.

24 Such payment will include, but is not limited to, furnishing all labor, tools, equipment,
25 materials and incidentals, miscellaneous grading or excavation necessary to complete the
26 work. Installations that become damaged or are abandoned will be replaced at no cost to the
27 Department.

28 Payment will be made under:

Pay Item	Pay Unit
___" <i>Welded Steel Pipe, ___" Thick, Grade B in Soil</i>	Linear Foot
___" <i>Welded Steel Pipe, ___" Thick, Grade B Not in Soil</i>	Linear Foot

29 **SECTION 340**
30 **PIPE REMOVAL**

31 **340-1 DESCRIPTION**

32 Remove and dispose of all existing roadway drainage pipe, including flared end sections,
33 where the removal of the existing pipes is required by the plans or as directed. Unless
34 otherwise indicated in the plans, this work excludes the removal and disposal of any existing
35 public or private water or sewage pipe or subsurface and shoulder drain pipe.

36 The Contractor has the option of leaving pipes in place and filling with flowable fill.

1 **340-2 MATERIALS**

2 Refer to Division 10.

Item	Section
Chemical Admixtures	1024-3
Fine Aggregate	1014-1
Flowable Fill	1000-6
Fly Ash	1024-5
Portland Cement	1024-1
Type IP Blended Cement	1024-1
Type IS Blended Cement	1024-1
Water	1024-4

3 For fine aggregate, bottom ash may be used with permission of the Engineer.

4 For chemical admixtures, high-air generators or foaming agents may be used instead of
5 conventional concrete air-entraining agents with the permission of the Engineer.6 For fly ash, certain requirements of this article and ASTM C618 may be waived with the
7 permission of the Engineer.8 **340-3 CONSTRUCTION METHODS**9 Remove existing pipe when so designated in the plans or as directed. When an existing pipe
10 is encountered that is not shown in the plans, do not remove until the Engineer is notified of
11 its presence and has directed its removal.12 Remove pipe in sections so traffic is maintained. Remove existing pipe so nearby facilities
13 will not be damaged.14 Backfill the area disturbed by the removal of an existing pipe in accordance with the *Standard*
15 *Specifications* applicable to the adjacent construction.

16 Salvaged pipe is the property of the Contractor unless otherwise indicated by the contract.

17 Discharge flowable fill material directly from the truck into the space to be filled or by other
18 approved methods. The mix may be placed full depth or in lifts as site conditions warrant.19 **340-4 MEASUREMENT AND PAYMENT**20 *Pipe Removal* will be measured and paid as the actual number of linear feet of pipe and flared
21 end sections, measured to the nearest 0.1 feet that has been removed in accordance with this
22 section. No measurement and payment will be made for pipe removal when a new pipe is
23 placed back in the same trench.24 *Flowable Fill* will be measured and paid as the item for which it was substituted. In no case
25 will payment for the use of flowable fill as a substitute be made for more than one deleted
26 item of work.27 Any additional backfill material that is necessary will be paid at the contract unit price for
28 *Unclassified Excavation* in accordance with Article 225-7 or at the contract unit price for
29 *Borrow Excavation* in accordance with Article 230-5, depending on the source of the material.30 Payment includes but is not limited to removing pipe, hauling pipe and all excavating and
31 backfilling that may be necessary.

32 Payment will be made under

7
8
9
10
11
12
13
14

350-1 DESCRIPTION

Clean out silt accumulations and other debris from existing drainage pipes at locations shown in the plans and as directed.

350-2 CONSTRUCTION METHODS

Use a pipe clean out method that does not damage the existing pipe.

350-3 MEASUREMENT AND PAYMENT

Pipe Clean Out will be measured and paid as the actual number of existing pipes, structure to structure, cleaned out and accepted, except where the work of cleaning out the pipe was made necessary by the Contractor's negligence in taking appropriate erosion control measures. Such price and payment will be full compensation for cleaning out existing pipe and disposing of all silt and debris.

Payment will be made under:

Pay Item	Pay Unit
Pipe Clean Out	Each

DIVISION 4 MAJOR STRUCTURES

SECTION 400 TEMPORARY STRUCTURES

400-1 DESCRIPTION

Furnish any design calculations and drawings required; furnish members and deck materials for structures and any other materials necessary; erect, maintain, remove and dispose of temporary structures required for the maintenance of pedestrian, highway and other traffic. Construct temporary structures in accordance with the contract.

400-2 MATERIALS

Use materials for temporary structures that conform to Division 10 or previously used materials conforming to the contract. Obtain approval for the use of salvaged materials and materials not covered by Division 10 before their use. Unless otherwise specified, untreated timber is allowed.

400-3 PLANS

(A) Furnishing Plans

Use the plans for the structure furnished by the Department or submit a design in accordance with Subarticle 400-3(B).

Design the structure when the plans furnished by the Department do not include detail plans for the structure. For all Contractor designs, submit design calculations and detail drawings of the structure in accordance with Subarticle 400-3(B) for review and comment.

Do not perform any work until the detail drawings are accepted. Acceptance of such drawings does not relieve the Contractor of any responsibility for safely and continuously maintaining traffic.

(B) Design Requirements for Contractor Furnished Drawings

Provide temporary structures of such carrying capacity, dimensions, grades and alignment as required by the contract or as directed. Design temporary structures carrying highway and pedestrian traffic in accordance with the *AASHTO LRFD Bridge Design Specifications*. Ensure an engineer licensed by the State of North Carolina designs and details the temporary structure. Construct the temporary structure in accordance with this design.

Indicate in the plans, the specifications for the materials used in the temporary structure.

400-4 CONSTRUCTION METHODS

Construct and maintain temporary structures to adequately and safely carry traffic during the entire period for which they are required.

Remove and dispose of the temporary structures after they are no longer required in accordance with Article 402-2.

Upon removal of the temporary structure, all material furnished by the Contractor for use in this structure shall remain the property of the Contractor unless otherwise provided in the contract.

Unless otherwise specified in the contract, remove temporary piling to the streambed level or to one foot below existing ground.

Section 402

1 **400-5 MEASUREMENT AND PAYMENT**

2 The price and payment below will be full compensation for all work required to provide
3 temporary structures including, but not limited to, those items contained in Article 400-1.

4 The work covered by this section will be paid at the contract lump sum price for *Construction,*
5 *Maintenance and Removal of Temporary Structure at Sta. _____.*

6 Payment will be made under:

Pay Item	Pay Unit
Construction, Maintenance and Removal of Temporary Structure at Sta. _____	Lump Sum

7 **SECTION 402**
8 **REMOVAL OF EXISTING STRUCTURES**

9 **402-1 DESCRIPTION**

10 Excavate as necessary to remove the structure. Dismantle, salvage and stockpile materials and
11 components of the structure and preserve those portions that should remain intact. Dispose of
12 waste and debris.

13 Maintain traffic on the existing structure unless otherwise stipulated by the contract. Do not
14 exceed the posted load limits or damage the existing structure while maintaining traffic.
15 Maintenance of the existing structure, if required, will be performed by Department forces.

16 **402-2 REMOVAL OF EXISTING STRUCTURE**

17 **(A) General**

18 Use approved methods and operations for removal of structures. Upon removal, all
19 materials become the property of the Contractor unless otherwise indicated in the contract.
20 Dispose of waste and debris from the structures in accordance with Section 802.

21 Perform removal operations while preventing damage to adjacent property. Protect new
22 construction during blasting or other operations necessary for the removal of the existing
23 structure.

24 Unless otherwise required by the contract, remove substructures down to the streambed or
25 one foot below the natural ground surface. Remove the substructure as necessary to avoid
26 interference with construction of the proposed structure.

27 Prevent erosion of soil and silting of rivers, streams, lakes, reservoirs, water impoundment,
28 ground surfaces or other property. Do not deposit excavated materials and do not construct
29 earth dikes or other temporary earth structures in rivers, streams or impoundment, or so
30 near to such waters that they are carried into any river, stream or impoundment by stream
31 flow or surface runoff. Do not use equipment in any body of water unless it is impossible
32 or impractical to perform specific operations in any other way. When this occurs, these
33 operations are specifically allowed through applicable environmental permits and controls
34 to minimize erosion and siltation through best management practices. Submit a plan for
35 bridge demolition for bridges over water for approval before beginning removal. Do not
36 drop components of structures into any body of water. Remove these existing bridges by
37 sawing or other non-shattering methods. Remove any component of a structure from the
38 water so as to minimize siltation.

39 **(B) Requirements for Materials Which Remain the Property of the Department**

40 Pile materials salvaged from the structure neatly on the right of way at locations as directed.

41 Do not use any materials, either temporarily or permanently, which are removed from the
42 structure unless so permitted by the contract.

- 1 Remove structural materials carefully without damage.
- 2 Do not use explosives to remove concrete floor slabs from steel superstructures that remain
- 3 the property of the Department.

4 **(C) Requirements for Partial Removal**

5 Perform partial removal to the lines indicated in the plans. Submit a plan for partial
 6 removal of bridges for approval before beginning removal. Do not remove concrete by
 7 blasting or other method that may cause damage to the concrete or reinforcement that is
 8 used in the completed structure.

9 Use equipment and methods to remove portions of a concrete structure undergoing
 10 widening which are sufficient to obtain plan lines and slopes without undue spalling at
 11 edges of the concrete. Do not use an iron ball or pile hammer to remove portions of
 12 a concrete structure undergoing widening.

13 **402-3 MEASUREMENT AND PAYMENT**

14 The price and payment below will be full compensation for all items required to remove existing
 15 structures including, but not limited to, those items contained in Article 402-1.

16 When the contract includes the item of *Removal of Existing Structure at Station ____*, the work
 17 of removing the structure will be paid at the contract lump sum price for this item.

18 When the contract includes the item of *Removal of Existing Structures at Station ____*, the work
 19 of removing the structures will be paid at the contract lump sum price for this item.

20 Payment will be made under:

Pay Item	Pay Unit
Removal of Existing Structure at Station ____	Lump Sum
Removal of Existing Structures at Station ____	Lump Sum

21 **SECTION 410**
 22 **FOUNDATION EXCAVATION**

23 **410-1 DESCRIPTION**

24 Excavate any material as necessary for the construction of foundations and end bent caps for
 25 bridges, retaining walls of reinforced concrete or reinforced masonry, arch culverts and box
 26 culverts without floor slabs in accordance with the contract or as directed. Excavate, perform
 27 exploratory drilling at footings to a depth not to exceed 5 feet, blast, drain, divert water, bail
 28 and pump. Provide and remove bracing, shoring, sheeting, cribbing and cofferdams;
 29 substructure scour protection, subsurface drainage and drawings; and backfill including hauling
 30 and disposal of materials.

31 Do not deposit excavated materials or construct earth dikes or other temporary earth structures
 32 in rivers, streams or impoundment or so near to such waters that they are carried into any river,
 33 stream or impoundment by stream flow or surface runoff. As an exception to the above, obtain
 34 written approval for the use of confined earth materials in cofferdams for structure foundations.

35 **410-2 MATERIALS**

36 Refer to Division 10.

Item	Section
Subsurface Drainage Materials	1044

37 **410-3 FOUNDATION EXCAVATION**

38 Notify the Engineer a sufficient time before beginning the excavation to allow measurements
 39 of the undisturbed ground.

Section 410

1 Where necessary for safety, slope, shore, brace or protect by cofferdams the foundation
2 openings in accordance with State and local safety standards. Perform foundation excavation
3 and related work in such sequence that no portion of the structure is endangered by subsequent
4 operations. Adequately protect completed portions of a structure during blasting operations.

5 Consider the dimensions and elevations of footings, as shown in the plans as approximate only.
6 The Engineer may order, in writing, such changes in dimensions or elevations of footings as
7 necessary to secure a satisfactory foundation.

8 Notify the Engineer after excavating each foundation. Do not place concrete before obtaining
9 approval for the excavation depth, the character of the foundation and permission to proceed.
10 Perform drilling as may be required by the Engineer to obtain information as to the depth to
11 which the rock or other hard foundation material extends below the bottom of the footing.

12 Clean all rock or other hard foundation material of all loose material and cut to a firm surface,
13 either level, stepped or serrated, as directed. Clean out all seams and fill with concrete, mortar
14 or grout. Remove all loose and disintegrated rock and thin strata. Leave the rock surface in a
15 rough condition to form an adequate key against lateral movement of the footing.

16 When the footing rests on an excavated surface other than rock, take special care not to disturb
17 the bottom of the excavation until immediately before placing reinforcing steel and concrete.
18 Remove foundation material softened and weakened by exposure and inundation down to
19 sound, solid material before placing steel and concrete.

20 When using piles or drilled piers, complete the excavation of each pit before installing piles or
21 piers.

22 When water or other unsuitable material is encountered, pile driving liquefies the soil, or the
23 bed is otherwise unsuitable as determined by the Engineer, remove the material as required and
24 backfill to the required elevation with subdrain fine or coarse aggregate. Such work will be
25 paid as extra work in accordance with Article 104-7.

26 **410-4 COFFERDAMS**

27 **(A) General**

28 The term cofferdam designates any temporary or removable structure constructed to hold
29 the surrounding earth, water or both, out of the excavation. It includes timber cribs, any
30 type of sheet piling, removable steel shells or similar structures, all necessary bracing and
31 the use of pumping wells or well points for the same purpose. Ensure cofferdams located
32 in bodies of water are designed, detailed and sealed by an engineer licensed by the State of
33 North Carolina when the distance from the water surface to the bottom of the excavation
34 is 5 feet or greater.

35 **(B) Construction**

36 Design and construct cofferdams to adequate depths and heights, safely and as watertight
37 as is necessary for the proper performance of the work. Provide interior dimensions of
38 cofferdams as to give sufficient clearance for the construction and inspection of forms and
39 to permit pumping outside the forms. Provide at least 5 feet of clearance between the
40 proposed edge of footing and inside face of cofferdam when a keyed footing is required
41 and at least 3 feet when a keyed footing is not required. Right, rest or enlarge cofferdams
42 that are tilted or moved laterally during the process of sinking to provide the necessary
43 clearance.

44 Construct cofferdams to protect plastic concrete against damage from a sudden rising of
45 the stream and to prevent damage to the foundation by erosion. Do not leave timber or
46 bracing in cofferdams that could extend into the substructure concrete without permission.

(C) Removal

After the completion of the substructure, unless otherwise provided in the contract, remove cofferdams with all sheeting and bracing to the stream bed or one foot below existing ground. Take care not to disturb or damage the finished concrete.

410-5 PUMPING

Perform pumping operations in accordance with Article 414-5.

410-6 PRESERVATION OF CHANNEL

Unless otherwise required by the contract or permitted by the Engineer, do not excavate in stream channels outside of cofferdams. Do not disturb the natural stream bed adjacent to the structure without permission. Backfill any excavation or dredging made at the site of the structure outside of the cofferdam limits to the original ground surface or river bed with approved material.

Remove materials placed within the stream area and leave the stream in its original condition, unless otherwise permitted.

410-7 UTILIZATION OF EXCAVATED MATERIAL

Use suitable excavated material as backfill. Use suitable material that is not required for backfill to form embankments, subgrades or shoulders. Furnish disposal areas for excavated unsuitable materials and suitable materials not required in connection with other work included in the contract. Do not place excavated material in a stream or other body of water or wetland.

Do not deposit excavated material at any time so as to endanger the partly finished structure, either by direct pressure, indirectly by overloading banks adjacent to the operations or in any other manner.

410-8 BACKFILLING AND FILLING

Use approved material for backfill that is free from large or frozen lumps, wood or other undesirable material. Where there is not an adequate quantity of suitable backfill material available from the excavation, provide suitable backfill material compensated in accordance with Article 410-10.

Refill all excavated spaces, not filled with permanent work, with earth up to the ground surface existing before the excavation. Place backfill to provide adequate drainage as soon as concrete surfaces are finished in accordance with Subarticle 420-17(B) and the concrete has been inspected and approved. The Engineer has the authority to suspend all operations until such backfilling is acceptably completed.

Eliminate any slope adjacent to the excavation for abutments, wingwalls and retaining walls by stepping or serrating to prevent wedge action.

Place and compact all portions of the backfill that become a part of roadway typical sections or their foundations in accordance with Subarticles 235-3(B) and 235-3(C). Place all other portions of the backfill in layers not more than 10 inches in depth of loose measure and compact to a density comparable to the adjacent undisturbed material.

Place backfill or embankment material simultaneously to approximately the same elevation on both sides of an abutment, pier or wall. If conditions require placing backfill or embankment higher on one side, do not place the additional material on the higher side until the concrete develops the minimum specified strength for the class of concrete required for the structure as specified in Table 1000-1.

Do not place backfill or embankment behind abutments of rigid frame structures such as arch culverts and box culverts without floor slabs, until the top slab is placed and has developed the minimum compressive strength of the class of concrete required for the structure. Place backfill and embankment simultaneously behind opposite abutments of rigid frames.

Section 410

1 Place backfill to not cause excess lateral forces against the structure by heavy equipment or
2 from earth masses transmitting pressures caused by earth moving equipment. Place backfill
3 immediately adjacent to the structure by hand operated mechanical tampers. Do not operate
4 heavy earth moving equipment within 10 feet of the structure in backfilling operations.

5 **410-9 BLASTING ADJACENT TO HIGHWAY STRUCTURES**

6 Conduct blasting operations adjacent to highway structures in accordance with the following
7 requirements.

8 Submit a blasting plan for approval before conducting any blasting operation.

9 Do not conduct blasting operations within 60 feet of any structure until the concrete strength
10 reaches 2,400 psi. After the concrete achieves a strength of 2,400 psi, limit the maximum PPV
11 to 4 in/sec measured at the closest structure extremity.

12 For multi-column bents with column heights up to 40 feet and a combined span length for the
13 2 adjacent spans of 160 feet or less, adhere to the following criteria:

14 (A) Do not blast within 6 feet without obtaining prior written approval.

15 (B) At distance of 6 feet to 10 feet, do not use a quantity of explosives more than 0.5 lbs. per
16 delay period.

17 (C) From 11 feet to 60 feet, use a maximum charge weight per delay of 0.5 lb. and 0.5 lb. of
18 explosives per foot of distance over 10 feet.

19 No vibration measurements are required if the above criteria are met. If unable to meet the
20 above criteria, monitor the structure for vibrations. If the 4 in/sec limit is exceeded, the
21 Engineer will evaluate each subsequent blast, and if deemed necessary, will apply more
22 restrictive controls than those above to prevent damage.

23 **410-10 MEASUREMENT AND PAYMENT**

24 Payment of blasting operations is included in the bid price for *Foundation Excavation* at the
25 affected substructure unit.

26 (A) **Foundation Excavation on a Cubic Yard Basis**

27 When the contract calls for payment of *Foundation Excavation* on a cubic yard basis, it
28 will be measured and paid as the actual number of cubic yards of materials, measured in
29 their original position within the limits described below and computed by the average end
30 area method, that are acceptably excavated.

31 The upper limits for measurement are the actual ground surface at the time of starting work,
32 except where the excavation is performed in cut areas excavated under Section 225, the
33 upper limits are the roadway plan typical section. For keyed footings the upper limits of
34 the keyed section are as shown in the plans. Define a "keyed footing" as a footing placed
35 without forms for the keyed depth in an excavation whose sides, as near as practical, are
36 located at the neat line dimensions of the footing and are vertical.

37 When the foundation material is other than rock, the lower limits for measurement are the
38 elevation of the bottom of footing as established by the plans or as directed. When the
39 foundation material is rock, the lower limits for measurement are the actual rock elevations
40 after the foundation is approved.

41 As an exception to the lower limits established above, when in the opinion of the Engineer
42 excess excavation is performed due to carelessness or negligence on the part of the
43 Contractor, the Engineer notifies the Contractor of that portion of the excavation which is
44 not measured for payment.

45 Horizontal limits for measurement are established by vertical planes located 18 inches
46 outside of the neat line dimensions of the footing as established by the plans or directed in

1 writing by the Engineer. For keyed footings the horizontal limits for measurement of the
2 keyed section are established by vertical planes located at the neat line dimensions of the
3 footing as established by the plans or directed in writing.

4 Measurement includes mud, muck or similar semi-solid material within the limits
5 described above provided such material is present at the time excavation begins and cannot
6 be drained away or pumped without the use of a jet or nozzle.

7 (1) No measurement is made of the following excavation, as such excavation is incidental
8 to the work being performed:

- 9 (a) Excavation necessary to construct end bent caps and the berm adjacent to the cap.
- 10 (b) Excavation necessary to construct pile encasement.
- 11 (c) Excavation outside of the limits described in this subarticle.
- 12 (d) Excavation necessary from heaving of a foundation due to the driving of piles.
- 13 (e) Excavation necessary from overbreaks or slides.
- 14 (f) Mud, muck or similar semi-solid material which can be drained away or pumped
15 without the use of a jet or nozzle.
- 16 (g) Excavation made before the Engineer makes measurements of the undisturbed
17 ground.
- 18 (h) Excavation necessary due to exposure or inundation allowed by the Contractor or
19 negligence on the part of the Contractor.

20 (2) *Foundation Excavation* will be paid at the contract unit price per cubic yard for
21 *Foundation Excavation* except where the Engineer directs the Contractor in writing to
22 excavate below the original plan elevation of the bottom of the footing. Payment for
23 such excavation will be made as follows:

- 24 (a) For excavation made below the original plan elevation of the bottom of the footing
25 to an elevation 3 feet below such plan elevation, payment will be made at the
26 contract unit price per cubic yard for *Foundation Excavation*.
- 27 (b) For excavation made below an elevation 3 feet below the original plan elevation
28 of the bottom of the footing but not more than 6 feet below such plan elevation,
29 payment will be made at 150% of the contract unit price per cubic yard for
30 *Foundation Excavation*.
- 31 (c) For excavation made below an elevation 6 feet below the original plan elevation
32 of the bottom of the footing, payment will be made as extra work in accordance
33 with Article 104-7.
- 34 (d) In areas where piles have been driven, removal of material and backfilling with
35 subdrain fine or coarse aggregate in accordance with Article 410-3 will be paid as
36 extra work in accordance with Article 104-7.

37 **(B) Foundation Excavation on a Lump Sum Basis**

38 When the contract calls for payment of *Foundation Excavation* on a lump sum basis, no
39 measurement will be made of any foundation excavation made at such locations.

40 The prices and payments below will be full compensation for all items required to complete
41 foundation excavation.

- 42 (1) When the contract calls for payment on a lump sum basis, payment will be made at
43 the contract lump sum price for *Foundation Excavation for Bent No. ____ at*
44 *Station ____ or Foundation Excavation for End Bent No. ____ at Station ____* except
45 as otherwise provided below.

Section 411

1 (2) Where the Engineer directs the Contractor to excavate below the original plan
2 elevation of the bottom of the footing by a distance which is less than 3 feet the
3 character of the work will not be considered to be materially changed and no additional
4 compensation will be allowed for the foundation excavation at such location.

5 (3) Where the Engineer directs the Contractor in writing to excavate more than 3 feet
6 below the original plan elevation of the bottom of the footing, payment for such
7 excavation will be made as extra work in accordance with Article 104-7.

8 **(C) Furnishing and Hauling Backfill Material**

9 Where it is necessary to provide backfill material from sources other than excavated areas
10 or borrow sources used in connection with other work in the contract, payment for
11 furnishing and hauling such backfill material will be paid as extra work in accordance with
12 Article 104-7. Placing and compacting such backfill material is not extra work but is
13 incidental to the work being performed.

14 When the Contractor has been directed by the Engineer to drill in the vicinity of a footing
15 to obtain subsurface information, such drilling in excess of a 5 foot depth will be paid as
16 extra work in accordance with Article 104-7.

17 When so used, no additional payment will be made for use of the material under other pay
18 items or for stockpiling the material for use under other pay items.

19 Payment will be made under:

Pay Item	Pay Unit
Foundation Excavation	Cubic Yard
Foundation Excavation for Bent No. ____ at Station ____	Lump Sum
Foundation Excavation for End Bent No. ____ at Station ____	Lump Sum

20 **SECTION 411**
21 **DRILLED PIERS**

22 **411-1 DESCRIPTION**

23 Construct drilled piers consisting of CIP reinforced concrete cylindrical sections in excavated
24 holes typically stabilized with casings or slurry. Provide permanent casings, standard
25 penetration tests, integrity testing and assistance with the shaft inspection device as noted in the
26 plans. Construct drilled piers with the required resistances and dimensions in accordance with
27 the contract and accepted submittals. Use a prequalified Drilled Pier Contractor to construct
28 drilled piers.

29 Define “excavation” and “hole” as a drilled pier excavation and “pier” as a drilled pier. Define
30 “permanent casing” as a casing that remains in the excavation and acts as a form for Drilled
31 Pier concrete and “temporary casing” as any casing that is not permanent. Define “rock” as a
32 continuous intact natural material with a standard penetration resistance of 0.1 foot or less per
33 60 blows or a rock auger penetration rate of less than 2 inches per 5 minutes of drilling at full
34 crowd force or as determined by the Engineer when rock is not encountered as expected based
35 on these criteria. This definition excludes discontinuous loose natural materials such as
36 boulders and man-made materials such as concrete, steel, timber, etc. and is not for
37 measurement and payment purposes. See Article 411-7 for measurement and payment of
38 drilled piers.

1 **411-2 MATERIALS**

2 Refer to Division 10.

Item	Section
Grout, Type 2	1003
Portland Cement Concrete, Class Drilled Pier	1000
Reinforcing Steel	1070

3 Provide Type 3 material certifications in accordance with Article 106-3 for permanent casings
 4 and roller, chair, steel pipe and cap materials. Store steel materials on blocking at least
 5 12 inches above the ground and protect it at all times from damage; and when placing in the
 6 work make sure it is free from dirt, dust, loose mill scale, loose rust, paint, oil or other foreign
 7 materials. Load, transport, unload and store drilled pier materials so materials are kept clean
 8 and free of damage.

9 **(A) Steel Casing**

10 Define "casing" as a temporary or permanent casing. If permanent casing is required for
 11 an excavation, the largest diameter casing in the hole is the permanent casing. This does
 12 not apply to working casings around permanent casings as approved by the Engineer. Use
 13 smooth non-corrugated clean watertight steel casings of ample strength to withstand
 14 handling and installation stresses and pressures imposed by concrete, earth, backfill and
 15 fluids.

16 (1) Temporary Casings

17 Provide temporary casings with a nominal wall thickness of at least 0.375 inch and an
 18 outside diameter equal to or larger than the design pier diameter for which temporary
 19 casing is used.

20 (2) Permanent Casings

21 Use permanent casings with a yield strength of at least 36 ksi and a nominal wall
 22 thickness that meets Table 411-1.

TABLE 411-1 MINIMUM PERMANENT CASING WALL THICKNESS	
Casing Diameter	Nominal Wall Thickness
< 48"	0.375"
48" - 78"	0.500"
> 78"	0.625"

23 Provide permanent casings with an outside diameter equal to the design pier diameter
 24 for which permanent casing is used unless larger diameter permanent casings are
 25 approved.

26 **(B) Slurry**

27 Define "slurry" as bentonite or polymer slurry. Mix bentonite clay or synthetic polymer
 28 with water to make bentonite or polymer slurry.

29 (1) Bentonite Slurry

30 Provide bentonite slurry that meets Table 411-2.

Section 411

Property	ANSI/API RP^B 13B-1	Requirement
Density ^C (Mud Weight)	Section 4 Mud Balance	64.3 - 72.0 lb/cf
Viscosity	Section 6.2 Marsh Funnel	28 - 50 sec/qt
Sand Content	Section 9	≤ 4 % ^D
		≤ 2 % ^E
pH	Section 11 Glass Electrode pH Meter ^F	8 - 11

- 1 **A.** Slurry temperature of at least 40°F required.
- 2 **B.** American National Standards Institute/American Petroleum Institute
- 3 Recommended Practice,
- 4 **C.** Increase density requirements by 2 lb/cf in saltwater,
- 5 **D.** In tanks before pumping slurry into excavations,
- 6 **E.** In excavations immediately before placing concrete,
- 7 **F.** pH paper is also acceptable for measuring pH,

8 (2) Polymer Slurry

9 Use polymer slurry products qualified by the Department. Provide polymer slurry

10 with density, viscosity, sand content and pH properties that meet the product

11 requirements. The polymer slurry QPL with the property requirements for each

12 qualified polymer slurry product is available on the Geotechnical Engineer Unit's

13 website.

14 (C) Rollers and Chairs

15 Use rollers and chairs that are non-metallic and resistant to corrosion and degradation.

16 Provide rollers with the necessary dimensions to maintain the minimum required concrete

17 cover shown in the plans and center rebar cages within excavations. Use chairs of sufficient

18 strength to support rebar cages in excavations and of the size necessary to raise cages off

19 bottom of holes to maintain the minimum required distance shown in the plans.

20 (D) Steel Pipes and Caps

21 Use Schedule 40 black steel pipes for access tubes for crosshole sonic logging (CSL).

22 Provide CSL tubes with an inside diameter of at least 1.5 inches. Use CSL tubes with a

23 round, regular inside diameter free of defects and obstructions, including any pipe joints,

24 in order to permit free, unobstructed passage of probes for CSL testing. Provide watertight

25 CSL tubes free of corrosion with clean internal and external faces to ensure a good bond

26 between concrete and tubes. Fit CSL tubes with watertight plastic caps on the bottom and

27 removable caps on top.

28 411-3 PRECONSTRUCTION REQUIREMENTS

29 (A) Drilled Pier Construction Plan

30 Submit the proposed drilled pier construction plan for all drilled piers for acceptance.

31 Provide 2 copies of this plan at least 30 days before starting drilled pier construction. Do

32 not begin drilled pier construction until a construction plan is accepted. Provide detailed

33 project specific information in the drilled pier construction plan that includes the following:

- 34 (1) Overall description and sequence of drilled pier construction;
- 35 (2) List and sizes of equipment including cranes, drill rigs, vibratory and downhole
- 36 hammers, Kelly bars, augers, core barrels, casings (diameters, thicknesses and
- 37 lengths), cleanout buckets, air lifts, pumps, slurry equipment, tremies, pump pipes and
- 38 other equipment;

- 1 (3) Procedures for casing installation and temporary casing removal including how
2 telescoping temporary casings will be removed;
- 3 (4) If applicable, details of slurry testing and use including intended purpose, product
4 information and additives, manufacturer’s recommendations for use, name and contact
5 information for slurry manufacturer’s technical representative, mixing and handling
6 procedures and how slurry level will be maintained above the highest piezometric
7 head;
- 8 (5) Methods for drilling and cleaning holes including how cores will be removed and
9 drilling spoils and slurry will be handled and disposed of;
- 10 (6) Details of CSL tubes, caps and joints including pipe size and how tubes will be
11 attached to reinforcing steel;
- 12 (7) Procedures for lifting and setting reinforcing steel including how rebar cages will be
13 supported and centralized;
- 14 (8) Procedures for placing concrete including how tremies and pump pipes will be
15 controlled and contaminated concrete will be contained;
- 16 (9) Concrete mix design that meets Section 1000;
- 17 (10) Approved packaged grout or grout mix design that meets Section 1003;
- 18 (11) CSL Consultant including Field and Project Engineer; and
- 19 (12) Other information shown in the plans or requested by the Engineer.

20 If alternate construction procedures are proposed or necessary, a revised drilled pier
21 construction plan submittal may be required. If the work deviates from the accepted
22 submittal without prior approval, the Engineer may suspend drilled pier construction until
23 a revised plan is accepted.

24 **(B) Preconstruction Meeting**

25 Before starting drilled pier construction, hold a preconstruction meeting to discuss the
26 installation, monitoring and inspection of the drilled piers. Schedule this meeting after the
27 Drilled Pier Contractor mobilizes to the site. If this meeting occurs before all drilled pier
28 submittals have been accepted, additional preconstruction meetings may be required before
29 beginning construction of drilled piers without accepted submittals. The Resident or Bridge
30 Maintenance Engineer, Bridge Construction Engineer, Geotechnical Operations Engineer,
31 Contractor and Drilled Pier Contractor Superintendent will attend preconstruction
32 meetings.

33 **411-4 CONSTRUCTION METHODS**

34 Do not excavate holes, install piles or allow equipment loads or vibrations within 20 feet of
35 completed piers until 16 hours after drilled pier concrete reaches initial set.

36 When drilling from a barge, use a fixed template that maintains hole position and alignment
37 during drilled pier construction. Do not use floating templates or templates attached to barges.

38 Check for correct drilled pier alignment and location before beginning drilling. Check
39 plumbness of Kelly bars before beginning and frequently during drilling.

40 For drilled piers constructed with slurry or permanent casings, the pier diameter may be 2 inches
41 less than the design pier diameter shown in the plans. For all other drilled piers, construct piers
42 with the minimum required diameters shown in the plans except for portions of drilled piers in
43 rock with may be 2 inches less than the design pier diameter.

44 Install drilled piers with tip elevations no higher than shown in the plans or approved by the
45 Engineer. Provide piers with the minimum required tip resistance and, when noted in the plans,
46 penetration into rock.

Section 411

1 (A) Excavation

2 Excavate holes with equipment of the sizes required to construct drilled piers. Use
3 equipment and methods accepted in the drilled pier construction plan or approved by the
4 Engineer. Inform the Engineer of any deviations from the accepted plan.

5 Use drill rigs with sufficient capacity to drill through soil, rock, boulders, timbers, man-
6 made objects and any other materials encountered and drill 20 feet deeper or 20% longer
7 than the maximum drilled pier length shown in the plans, whichever is greater. Drilling
8 below pier tip elevations shown in the plans may be required to attain sufficient resistance.

9 Do not use blasting to advance drilled pier excavations. Blasting for core removal is only
10 permitted when approved by the Engineer. See Articles 107-11 and 107-12 for protection
11 of public and private property and control of siltation, dust and air and water pollution from
12 blasting, drilling and excavating with down-the-hole hammers. Contain and dispose of
13 drilling spoils and waste concrete as directed and in accordance with Section 802. Drilling
14 spoils consist of all materials and fluids removed from excavations.

15 Stabilize excavations with only casings or slurry and casings except, as approved by the
16 Engineer, portions of excavations in rock. Use casings or slurry in rock if unstable material
17 is anticipated or encountered. Stabilize excavations from beginning of drilling through
18 concrete placement. If excavations become unstable, the Engineer may suspend drilling
19 and require a revised drilled pier construction plan. If it becomes necessary to replace a
20 casing during drilling, backfill the excavation, insert a larger casing around the casing to
21 be replaced or stabilize the excavation with slurry before removing the casing.

22 When noted in the plans, do not dewater drilled pier excavations. Otherwise, if excavations
23 are in rock, dewater excavations to the satisfaction of the Engineer.

24 (B) Casings

25 Provide temporary casings to stabilize holes and protect personnel entering excavations.
26 Permanent casings may be required as noted in the plans. Install permanent casings with
27 tip elevations no deeper than shown in the plans or approved by the Engineer. Additional
28 drilled pier length and reinforcing steel may be required if permanent casings are installed
29 below elevations noted in the plans.

30 Install casings in continuous sections. Overlap telescoping casings at least 24 inches.
31 Remove portions of permanent casings above the ground line or top of piers, whichever is
32 higher, after placing concrete. Do not cut off permanent casings until Drilled Pier concrete
33 attains a compressive strength of at least 3,000 psi.

34 When using slurry construction without permanent casings, temporary casings at least
35 10 feet long are required at top of excavations. Maintain top of casings at least 12 inches
36 above the ground line.

37 (C) Slurry Construction

38 Unless noted otherwise in the plans, slurry construction or polymer slurry is at the
39 Contractor's option.

40 Use slurry and additives to stabilize holes in accordance with the manufacturer's
41 recommendations. Provide a technical representative employed by the slurry manufacturer
42 to assist and guide the Drilled Pier Contractor onsite during the construction of the first
43 drilled pier. If problems are encountered during drilled pier construction, the Engineer may
44 require the technical representative to return to the site.

45 Provide documentation that mixing water is suitable for slurry. Use slurry equipment that
46 is sufficient for mixing, agitating, circulating and storing slurry. Thoroughly premix slurry
47 with water in tanks before pumping into excavations. Allow bentonite slurry to hydrate at
48 least 24 hours in tanks before use.

1 Pump slurry into excavations before encountering water. Maintain slurry level at least
2 5 feet or one pier diameter, whichever is greater, above the highest piezometric head along
3 the drilled pier length. The highest piezometric head is anticipated to be the static water or
4 groundwater elevation. However, the Drilled Pier Contractor is responsible for
5 determining the highest piezometric head for each pier.

6 Maintain the required slurry properties at all times except for sand content. Desand or
7 replace slurry as needed to meet the required sand content in tanks before pumping slurry
8 into excavations and in excavations immediately before placing concrete.

9 (1) Time

10 Agitate bentonite slurry in holes at least every 4 hours. If this 4-hour time limit is
11 exceeded, the Engineer may require holes to be overreamed at least 1 inch and no more
12 than 3 inches below casings. Overream holes with grooving tools, overreaming
13 buckets or other approved methods.

14 Construct drilled piers so the maximum time slurry is in contact with uncased portions
15 of holes from drilling through concrete placement does not exceed 36 hours. If this
16 36 hour time limit is exceeded, the Engineer may require the hole diameter to be
17 enlarged at least 6 inches. If the enlarged hole diameter is greater than the permanent
18 casing diameter, replace casing with a larger permanent casing with an outside
19 diameter equal to the diameter of the enlarged hole.

20 (2) Slurry Testing

21 Define a “sample set” as slurry samples collected from mid-height and within 2 feet
22 of the bottom of slurry tanks or holes. Take a sample set from slurry tanks to test
23 slurry before beginning drilling. Do not pump slurry into excavations until both slurry
24 samples from tanks meet the required slurry properties. Take sample sets from
25 excavations to test slurry at least every 4 hours and immediately before placing
26 concrete. Do not place Drilled Pier concrete until both slurry samples from
27 an excavation meet the required slurry properties. If any slurry test results do not meet
28 the requirements, the Engineer may suspend drilling until both samples from a sample
29 set meet the required slurry properties.

30 Sign, date and submit slurry test reports upon completion of each pier. The
31 Department reserves the right to perform comparison slurry tests at any time.

32 (3) Disposal

33 Comply with all Federal, State and local regulations, as well as the project permits and
34 commitments, when disposing of slurry and drilling spoils mixed with slurry. Contain
35 slurry and drilling spoils and keep out of water at all times.

36 **(D) Cleaning and Inspection**

37 Provide clean holes with level bottoms so elevations within bottom of holes do not vary by
38 more than 12 inches. Remove soft and loose material from bottom of holes using methods
39 accepted in the drilled pier construction plan or approved by the Engineer. When bottom
40 of holes are not hand cleaned, remove sediment from holes with cleanout buckets, air lifts
41 or pumps.

42 After cleaning is complete, provide all equipment, personnel and assistance required for
43 the Engineer to visually inspect holes from above or by entering excavations. Remove all
44 cleaning and drilling equipment from holes during inspections and do not interfere with
45 inspections.

Section 411

1 (1) Tip Resistance

2 If the Engineer determines that the material below an excavation does not provide the
3 minimum required tip resistance, increase the drilled pier length and lengthen
4 reinforcing steel as directed. One of the following methods may be required to check
5 the conditions and continuity of material below excavations.

6 (a) Test Hole

7 If excavations are in rock, drill a 1.5 inch diameter test hole at least 6 feet below
8 bottom of holes for the Engineer to determine the continuity of rock below holes.

9 (b) Standard Penetration Test

10 Standard penetration tests (SPT) may be required as noted in the plans. When
11 required, drive a split-barrel sampler 18 inches below bottom of holes or to refusal
12 in accordance with ASTM D1586. Perform SPT in holes at least 12 inches away
13 from casing walls and support drill rods so rods remain vertical and straight.
14 Report the number of blows applied in each 6 inch increment and provide
15 recovered samples to the Engineer. The Engineer will determine the standard
16 penetration resistance required.

17 (2) Bottom Cleanliness

18 Holes are clean if at least 50% of bottom of holes has less than 0.5 inch of sediment
19 and no portions of bottom of holes have more than 1.5 inches of sediment. If bottom
20 of holes does not meet this cleanliness criteria, remove sediment from holes until the
21 Engineer determines holes are clean. One or more of the following methods may be
22 required to inspect the bottom cleanliness of holes.

23 (a) Steel Probe

24 If drilled pier excavations are not dewatered or as directed, provide a #10 rebar
25 steel probe that is 24 inches long with a flat tip on one end and a non-stretch cable
26 connected to the other end. Provide a cable long enough to lower the steel probe
27 to the bottom of holes for the Engineer to determine the amount of sediment in
28 holes.

29 (b) Shaft Inspection Device

30 The Engineer may use the shaft inspection device (SID) as noted in the plans. The
31 Engineer provides the SID and personnel to operate it. Notify the Engineer at
32 least 2 days before finishing holes that will be inspected with the SID.

33 Assist the Engineer in handling the SID and associated equipment and supporting
34 the SID during inspections. Provide working areas large enough for the SID,
35 associated equipment and SID personnel within reach of the SID cables and clear
36 view of holes being inspected. If necessary, provide a secure location to store the
37 SID and associated equipment onsite overnight.

38 Approximately one hour is required to inspect a hole with the SID after the SID
39 and associated equipment are set up. The Engineer will use the SID to measure
40 the amount of sediment at 5 locations around the bottom of holes.

41 (E) Reinforcing Steel and Concrete

42 Assemble rebar cages consisting of bar and spiral reinforcing steel shown in the plans.
43 Securely cross tie reinforcing steel at each intersection with double wire. Attach a chair
44 under each reinforcing bar and rollers near the top and bottom of rebar cages and every
45 10 feet along cages in between. The number of rollers required at each location along rebar
46 cages is one roller per foot of design pier diameter with at least 4 rollers per location. Space
47 rollers equally around rebar cages at each location. Attach rollers so rollers are supported

1 across 2 adjacent reinforcing bars and will freely rotate when rebar cages are lowered into
2 excavations.

3 If CSL tubes are required, securely attach CSL tubes to spiral reinforcing steel on the inside
4 of rebar cages with at least 3 inches of clearance to reinforcing bars. Extend CSL tubes
5 from 6 inches above pier tip elevations to at least 2 feet above the ground line or top of
6 permanent casings, whichever is greater. The number of CSL tubes required for each
7 drilled pier is one tube per foot of design pier diameter with at least 4 tubes per pier. Space
8 CSL tubes equally around rebar cages so distances between tubes measured around spiral
9 reinforcing steel are uniform. Install CSL tubes as straight and parallel to each other as
10 possible. Fit caps on top and bottom of CSL tubes.

11 After the Engineer determines that the material below excavations provides the minimum
12 required tip resistance and holes are clean, place rebar cages and then concrete in
13 excavations. Do not rack or distort rebar cages and CSL tubes when lifting and handling
14 cages. Set rebar cages directly on bottom of holes or, as approved by the Engineer, hang
15 cages from permanent casings. When hanging rebar cages, leave devices supporting cages
16 in place until Drilled Pier concrete attains a compressive strength of at least 3,000 psi.

17 Do not delay placing cages or concrete unless excavations are cased to rock or otherwise
18 approved. If delays occur, the Engineer may require removal of rebar cages to reinspect
19 bottom cleanliness of holes. If bottom of holes does not meet the cleanliness criteria in
20 Subarticle 411-4(D)(2), remove sediment from holes until the Engineer determines holes
21 are clean before resetting rebar cages.

22 After placing rebar cages with CSL tubes, remove top caps, fill tubes with clean water and
23 reinstall caps before placing concrete. Check for correct cage position before placing
24 concrete and keep rebar cages plumb during concrete placement. Maintain cage position
25 so rebar cages do not move vertically more than 6 inches and columns or footings have the
26 minimum required concrete cover shown in the plans.

27 Remove all temporary casings during concrete placement. Do not twist, move or otherwise
28 disturb temporary casings until the concrete depth inside casings is at least 10 feet or half
29 the head, whichever is greater, above the bottom of casing being disturbed. Define "head"
30 as the difference between the highest piezometric head along the drilled pier length and the
31 static water elevation inside the excavation.

32 When removing temporary casings, maintain the required concrete depth above the bottom
33 of casing being removed except when the concrete level is at or above top of piers. Sustain
34 sufficient concrete depths to overcome pressures imposed by earth, backfill and fluids. As
35 temporary casings are withdrawn, ensure fluids trapped behind casings is displaced upward
36 and discharged out of excavations without contaminating or displacing concrete.

37 Pour concrete in excavations to form uniform jointless monolithic drilled piers. Do not
38 trap soil, air, fluids or other contaminants in concrete. Remove contaminated concrete from
39 top of piers at time of concrete placement.

40 Inform the Engineer of the volume of concrete placed for each pier. For piers constructed
41 with slurry or as directed, record a graphical plot of depth versus theoretical and actual
42 concrete volumes.

43 Dry or wet placement of concrete is at the Contractor's option for piers constructed with
44 only casings if the water inflow rate into excavations is less than 6 inches per half hour
45 after removing any pumps from holes. Wet placement of concrete is required for all other
46 drilled pier construction.

47 (1) Dry Placement

48 If holes are filling with water for dry placement of concrete, dewater excavations as
49 much as possible before placing concrete. For drilled piers less than 80 feet long, pour
50 concrete down the center of excavations so concrete does not hit reinforcing steel or

Section 411

1 excavation sidewalls. For piers longer than 80 feet, place concrete with a tremie or
2 pump pipe down the center of excavations so length of free fall is less than 80 feet.

3 (2) Wet Placement

4 For wet placement of concrete, maintain static water or slurry levels in holes before
5 placing concrete. Place concrete through steel tremies or pump pipes. Use tremies
6 with watertight joints and a diameter of at least 10 inches. Pump concrete in
7 accordance with Article 420-5. Use approved devices to prevent contaminating
8 concrete when tremies or pump pipes are initially placed in excavations. Extend
9 tremies or pump pipes into concrete at least 5 feet at all times except when the concrete
10 is initially placed.

11 When the concrete level reaches the static water elevation inside the excavation, dry
12 placement of concrete is permitted. Before changing to dry placement, pump water or
13 slurry out of holes and remove contaminated concrete from the exposed concrete
14 surface.

15 411-5 INTEGRITY TESTING

16 Define “integrity testing” as crosshole sonic logging (CSL) and pile integrity testing (PIT).
17 Integrity testing may be required as noted in the plans or by the Engineer. The Engineer will
18 determine how many and which drilled piers require integrity testing. Do not test piers until
19 Drilled Pier concrete cures for at least 7 days and attains a compressive strength of at least 3,000
20 psi.

21 (A) Crosshole Sonic Logging

22 If CSL testing is required, use a prequalified CSL Consultant to perform CSL testing and
23 provide CSL reports. Use a CSL Operator approved as a Field Engineer (key person) for
24 the CSL Consultant. Provide CSL reports sealed by an engineer approved as a Project
25 Engineer (key person) for the same CSL Consultant.

26 (1) CSL Testing

27 Perform CSL testing in accordance with ASTM D6760. If probes for CSL testing will
28 not pass through to the bottom of CSL tubes, the Engineer may require coring to
29 replace inaccessible tubes. Do not begin coring until core hole size and locations are
30 approved. Core at least 1.5 inches diameter holes the full length of piers. Upon
31 completion of coring, fill holes with clean water and cover to keep out debris. Perform
32 CSL testing in core holes instead of inaccessible tubes.

33 For piers with 4 or 5 CSL tubes, test all tube pairs. For piers with 6 or more CSL tubes,
34 test all adjacent tube pairs around spiral reinforcing steel and at least 50% of remaining
35 tube pairs selected by the Engineer. Record CSL data at depth intervals of 2.5 inches
36 or less from the bottom of CSL tubes to top of piers.

37 (2) CSL Reports

38 Submit 2 copies of each CSL report within 7 days of completing CSL testing. Include
39 the following in CSL reports:

40 (a) Title Sheet

- 41 (i) Department’s TIP number and WBS element number
- 42 (ii) Project description
- 43 (iii) County
- 44 (iv) Bridge station number
- 45 (v) Pier location
- 46 (vi) Personnel
- 47 (vii) Report date

- 1 (b) Introduction
- 2 (c) Site and Subsurface Conditions (including water table elevation)
- 3 (d) Pier Details
- 4 (i) Pier and casing diameters, lengths and elevations
- 5 (ii) Drilled Pier concrete compressive strength
- 6 (iii) Installation methods including use of casings, slurry, pumps, tremies, dry or
- 7 wet placement of concrete, etc.
- 8 (e) CSL Results
- 9 (i) Logs with plots of signal arrival times and energy vs. depth for all tube pairs
- 10 tested
- 11 (f) Summary/Conclusions
- 12 (i) Table of velocity reductions with corresponding locations (tube pair and
- 13 depth) for all tube pairs tested
- 14 (ii) List of suspected anomalies with corresponding locations (tube pair(s) and
- 15 depth range)
- 16 (g) Attachments
- 17 (i) Boring log(s)
- 18 (ii) Field inspection forms and concrete curves (from Engineer)
- 19 (iii) CSL tube locations, elevations, lengths and identifications
- 20 (iv) CSL hardware model and software version information
- 21 (v) PDF copy of all CSL data

22 **(B) Pile Integrity Testing**

23 If required, the Engineer will perform PIT. Provide access to and prepare top of piers for

24 PIT as directed. See ASTM D5882 for PIT details.

25 **(C) Further Investigation**

26 Define “further investigation” as any additional testing, excavation or coring following

27 initial integrity testing. Based on concrete placement and initial integrity testing results,

28 the Engineer will determine if drilled piers are questionable and require further

29 investigation within 7 days of receiving CSL reports or completing PIT. For initial CSL

30 testing, the Engineer will typically determine whether further investigation is required

31 based on Table 411-3.

TABLE 411-3 DRILLED PIER FURTHER INVESTIGATION CRITERIA (For Initial CSL Testing)	
Velocity Reductions	Further Investigation Required?
< 20%	No
20 - 30%	As Determined by the Engineer
> 30%	Yes

32 If further investigation is necessary, the Engineer will typically require one or more of the

33 following methods to investigate questionable piers.

34 (1) CSL Testing

35 If required, use CSL testing as described above to retest questionable piers and as

36 directed, perform testing with probes vertically offset in CSL tubes. CSL offset data

37 will typically be required for all locations (tube pair and depth) with velocity

38 reductions greater than 30% and at other locations as directed. Record offset data at

39 depths, intervals and angles needed to completely delineate anomalies.

Section 411

1 Provide CSL reports that meet Subarticle 411-5(A)(2). When CSL offset data is
2 required, perform tomographic analysis and provide 3 dimensional color coded
3 tomographic images of piers showing locations and sizes of anomalies.

4 (2) Excavation

5 If required, excavate around questionable piers and remove permanent casing as
6 needed to expose Drilled Pier concrete. Do not damage piers when excavating or
7 removing casings. The Engineer will determine the portions of piers to expose.

8 (3) Coring

9 If required, core questionable piers and provide PQ size cores that meet ASTM D2113.
10 The Engineer will determine the number, location and depth of core holes required.
11 Handle, log and store concrete cores in accordance with ASTM D5079. Provide cores
12 to the Engineer for evaluation and testing. Sign, date and submit core logs upon
13 completion of each core hole.

14 (D) Defective Piers

15 For questionable piers that are exposed or cored, the Engineer will determine if piers are
16 defective based on the results of excavation or coring. For questionable piers that are not
17 exposed or cored, the Engineer will determine if piers are defective based on the results of
18 integrity testing. Questionable piers with only CSL testing will be considered defective if
19 any velocity reductions between any tube pairs are greater than 30%.

20 411-6 DRILLED PIER ACCEPTANCE

21 Drilled pier acceptance is based in part on the following criteria:

22 (A) Temporary casings and drilling tools are removed from the drilled pier excavation or the
23 Engineer determines that a temporary casing may remain in the excavation.

24 (B) Drilled Pier concrete is properly placed and does not have any evidence of segregation,
25 intrusions, contamination, structural damage or inadequate consolidation (honeycombing).

26 (C) Center of pier is within 3 inches of plan location and 2% of plumb. Top of pier is within
27 1 inch above and 3 inches below the elevation shown in the plans or approved by the
28 Engineer.

29 (D) Rebar cage is properly placed and top and center of cage is within tolerances for center of
30 pier. Tip of permanent casing does not extend below the elevation noted in the plans or
31 approved by the Engineer.

32 (E) Drilled pier is not defective or the Engineer determines the defective pier is satisfactory.
33 A pier will be considered defective based on Subarticle 411-5(D).

34 Do not grout CSL tubes or core holes, backfill around a pier or perform any work on a drilled
35 pier until the Engineer accepts the pier. If the drilled pier is accepted, dewater and grout
36 CSL tubes and core holes, and backfill around the pier with approved material to finished grade.
37 If the Engineer determines a pier is unacceptable, remediation is required. Remediation may
38 include, but is not limited to grouting, removing part or all of unacceptable piers, modifying
39 pier designs or providing replacement or additional piers or piles. Submit working drawings
40 and design calculations for acceptance in accordance with Article 105-2. Ensure remediation
41 submittals are designed, detailed and sealed by an engineer licensed by the State of North
42 Carolina. Do not begin remediation work until remediation plans are approved. When repairing
43 unacceptable piers, perform post repair testing to gauge success of the repair. No extension of
44 completion date or time will be allowed for remediation of unacceptable drilled piers or post
45 repair testing.

1 **411-7 MEASUREMENT AND PAYMENT**

2 ____ *Dia. Drilled Piers in Soil*, ____ *Dia. Drilled Piers Not in Soil* and ____ *Dia. Drill Piers*
3 will be measured and paid in linear feet. Acceptable drilled piers will be measured as the
4 difference between the specified top of pier and pier tip elevations or revised elevations
5 approved by the Engineer.

6 For bents with a not in soil pay item shown in the plans, drilled piers will be paid as ____ *Dia.*
7 *Drilled Piers in Soil* and ____ *Dia. Drilled Piers Not in Soil*. Define “not in soil” as material
8 with a rock auger penetration rate of less than 2 inches per 5 minutes of drilling at full crowd
9 force. When not in soil is encountered, seams, voids and weathered rock less than 3 feet thick
10 with a rock auger penetration rate of greater than 2 inches per 5 minutes of drilling at full crowd
11 force will be paid at the contract unit price for ____ *Dia. Drilled Piers Not in Soil*. Seams,
12 voids and weathered rock greater than 3 feet thick will be paid at the contract unit price for
13 ____ *Dia. Drilled Piers in Soil* where not in soil is no longer encountered. For bents with a not
14 in soil pay item shown in the plans, drilled piers through air or water will be paid at the contract
15 unit price for ____ *Dia. Drilled Piers in Soil*.

16 For bents without a not in soil pay item shown in the plans, drilled piers will be paid as
17 ____ *Dia. Drill Piers*. The contract unit price for ____ *Dia. Drilled Piers* will be full
18 compensation for drilling through any materials encountered.

19 The contract unit prices for ____ *Dia. Drilled Piers in Soil*, ____ *Dia. Drilled Piers Not in Soil*
20 and ____ *Dia. Drill Piers* will also be full compensation for spoils and slurry containment and
21 disposal, slurry construction including a slurry manufacturer representative and overreaming
22 and enlarging piers and any concrete removal, miscellaneous grading and excavation. No
23 additional payment will be made for excess Drilled Pier concrete due to caving or sloughing
24 holes or telescoping casings.

25 Reinforcing steel will be measured and paid in accordance with Article 425-6.

26 *Permanent Steel Casing for ____ Dia. Drilled Pier* will be measured and paid in linear feet.
27 Permanent casings will only be paid for when required by the Engineer or shown in the plans.
28 Permanent casings will be measured as the difference between the ground line or specified top
29 of pier elevation, whichever is higher, and the specified permanent casing tip elevation or
30 revised elevation approved by the Engineer. If a permanent casing cannot be installed to the
31 tip elevation shown in the plans, up to 3 feet of casing cut-off will be paid at the contract unit
32 price for *Permanent Steel Casing for ____ Dia. Drilled Pier*.

33 *SID Inspections* will be measured and paid in units of each. *SID Inspections* will be measured
34 as one per pier. The contract unit price for *SID Inspections* will be full compensation for
35 inspecting holes with the SID the first time. No additional payment will be made for subsequent
36 inspections of the same hole.

37 The Contractor is responsible for any damage to the SID equipment due to the Contractor’s
38 fault or negligence. Replace any damaged equipment at no additional cost to the Department.

39 *SPT Testing* will be measured and paid in units of each. *SPT Testing* will be measured as the
40 number of standard penetration tests performed except no payment will be made for *SPT*
41 *Testing* to determine if temporary casing is necessary.

42 *CSL Testing* will be measured and paid in units of each. *CSL Testing* will be measured as one
43 per pier. The contract unit price for *CSL Testing* will be full compensation for performing initial
44 CSL testing and providing CSL reports. Subsequent CSL testing of and CSL reports for the
45 same pier will be considered further investigation. No separate payment will be made for CSL
46 tubes. CSL tubes including coring for inaccessible tubes and grouting will be incidental to the
47 contract unit prices for drilled piers.

48 No payment will be made for stuck temporary casings that cannot be removed from drilled pier
49 excavations or additional drilled pier length and reinforcing steel required due to temporary
50 casings that remain in excavations. No payment will be made for PIT. No payment will be

Section 412

1 made for further investigation of defective piers. Further investigation of piers that are not
2 defective will be paid as extra work in accordance with Article 104-7. No payment will be
3 made for remediation of unacceptable drilled piers or post repair testing.

4 Payment will be made under:

Pay Item	Pay Unit
____ Dia. Drilled Piers in Soil	Linear Foot
____ Dia. Drilled Piers Not in Soil	Linear Foot
____ Dia. Drilled Piers	Linear Foot
Permanent Steel Casing for ____ Dia. Drilled Piers	Linear Foot
SID Inspections	Each
SPT Testing	Each
CSL Testing	Each

5 **SECTION 412**

6 **UNCLASSIFIED STRUCTURE EXCAVATION**

7 **412-1 DESCRIPTION**

8 Excavate any material not classified as foundation excavation, box culvert excavation or
9 channel excavation whose removal is required for the construction of bridges, retaining walls
10 of reinforced concrete or reinforced masonry, arch culverts and box culverts without floor slabs,
11 and which is classified as unclassified structure excavation in the plans, in accordance with the
12 contract or as directed. Excavate, blast, brace, shore, provide sheeting and cribbing, backfill,
13 haul and dispose of materials.

14 Do not deposit excavated materials, nor construct earth dikes or other temporary earth
15 structures, in rivers, streams or impoundment or so near to such waters that they are carried into
16 any river, stream or impoundment by stream flow or surface runoff.

17 Dispose of all timber, stumps and debris in accordance with Article 200-6.

18 **412-2 PRESERVATION OF CHANNEL**

19 Unless otherwise required by the contract, do not excavate in stream channels. Do not disturb
20 the natural stream bed adjacent to the structure without permission.

21 Do not place material in a stream without approval. Remove materials placed within the stream
22 area and leave the stream in its original condition, unless otherwise permitted.

23 **412-3 UTILIZATION OF EXCAVATED MATERIAL**

24 Use and place suitable excavated material in accordance with Articles 410-7 and 410-8.

25 Notify the Engineer a sufficient time before beginning the excavation so measurements may be
26 taken of the undisturbed ground.

27 **412-4 MEASUREMENT AND PAYMENT**

28 The price and payment below will be full compensation for all items required to complete
29 unclassified structure excavation including, but not limited to, those items contained in
30 Article 412-1.

31 *Unclassified Structure Excavation at Station ____* will be paid at the contract lump sum price.

32 Payment will be made under:

Pay Item	Pay Unit
Unclassified Structure Excavation at Station ____	Lump Sum

SECTION 414
BOX CULVERT EXCAVATION

414-1 DESCRIPTION

Excavate all material necessary for the construction of box culverts with floor slabs in accordance with the contract or as directed. Excavate, blast, drain and divert water, bail, pump, brace, shore, provide sheeting, cribbing, cofferdams, culvert foundation conditioning, subsurface drainage and drawings; backfill, haul and dispose of materials.

Do not deposit excavated materials, nor construct earth dikes or other temporary earth structures in rivers, streams or impoundment or so near to such waters that they are carried into any river, stream or impoundment by stream flow or surface runoff. As an exception to the above, obtain written approval for the use of confined earth materials in cofferdams for structure foundations.

414-2 MATERIALS

Refer to Division 10.

Item	Section
Select Material	1016
Subsurface Drainage Materials	1044

Use Class V or VI select material for foundation conditioning material.

414-3 FOUNDATION EXCAVATION

Notify the Engineer a sufficient time before beginning the excavation so measurements may be taken of the undisturbed ground. Do not disturb the existing ground at the culvert site without permission.

Where necessary for safety, slope, shore, brace or protect by cofferdams the foundation openings in accordance with State and local safety standards. Perform foundation excavation and related work in such sequence that no portion of the culvert will be endangered by subsequent operations. Protect completed portions of a culvert from blasting.

Remove and dispose of boulders, vegetative matter and any other objectionable material.

Notify the Engineer after excavating each foundation. Do not place any concrete until obtaining approval of the excavation depth, the character of the foundation material and permission to proceed.

Take special care not to disturb the bottom of the excavation until immediately before placing reinforcing steel and concrete.

414-4 CONDITIONING CULVERT FOUNDATION

Excavate to a depth as directed below the bottom of the barrel or wing footing and replace the excavated material with foundation conditioning material.

When the foundation material beneath a portion of the barrel or wing footing is rock or incompressible material and softer material is beneath the remainder of the barrel or wing footing, excavate the rock material within the neat lines of the barrel or footing to a depth of 12 inches below the bottom of the barrel and footings and backfill with foundation conditioning material.

414-5 PUMPING

Pump from the interior of any foundation enclosure to preclude the possibility of the movement of water over or through any fresh concrete. Do not pump while placing concrete or for at least 24 hours thereafter, unless done from a suitable sump separated from the concrete work by a substantially watertight wall.

Section 414

1 **414-6 UTILIZATION OF EXCAVATED MATERIAL**

2 Use suitable excavated material in accordance with Article 410-7.

3 **414-7 BACKFILLING AND FILLING**

4 As soon as practical after completing the box culvert, place the backfill and redirect the stream
5 through the culvert.

6 Use approved material for backfill that is free from large or frozen lumps, wood or other
7 undesirable material. Where there is not an adequate quantity of suitable backfill material
8 available from culvert excavation, provide suitable backfill material compensated in accordance
9 with Subarticle 410-10(C).

10 Eliminate any excavated slope adjacent to backfill areas by stepping or serrating to prevent
11 wedge action.

12 Place and compact all portions of the backfill that become a part of roadway typical sections or
13 their foundations in accordance with Subarticles 235-3(B) and 235-3(C). Place all other
14 portions of the backfill in layers not more than 10 inches in depth of loose measure and compact
15 to a density comparable to the adjacent undisturbed material. Refill all excavated spaces not
16 filled with permanent work with earth up to the ground surface existing before the excavation.

17 Place backfill or embankment material simultaneously to approximately the same elevation on
18 both sides of the culvert. Do not place backfill or embankment behind the walls of culverts to
19 an elevation higher than one foot above the top of footing or bottom slab until after placing the
20 top slab and until the concrete develops the minimum required strength for the class of concrete
21 specified as listed in Table 1000-1.

22 **414-8 SUBSURFACE DRAINAGE AT WEEP HOLES**

23 Place a stone drain consisting of one cubic foot of subdrain coarse aggregate contained in a bag
24 of Type 1 geotextile at each weep hole. Place subdrain fine aggregate beneath, around and over
25 the stone drain, so the drain is covered by a layer of subdrain fine aggregate at least 1 foot thick.
26 Connect all drains with a horizontal drain of subdrain fine aggregate at least 1 foot square in
27 cross section. In the case of abutments and retaining walls, in addition to the above
28 requirements, place a vertical drain of subdrain fine aggregate at least 1 foot square in cross
29 section at each weep hole to an elevation 2 feet below the subgrade or surface of the
30 embankment.

31 **414-9 MEASUREMENT AND PAYMENT**

32 The prices and payments below will be full compensation for all items required to complete
33 box culvert excavation including, but not limited to, those items in Article 414-1.

34 *Foundation Conditioning Material, Box Culvert* will be measured and paid in tons of material
35 that is placed within the established limits. The number of tons of material is determined by
36 weighing the material in trucks in accordance with Article 106-7. No deduction will be made
37 for any moisture contained in the material at the time of weighing. Such price and payment
38 will be full compensation for all excavation made below the bottom of the barrel and wing
39 footings in addition to furnishing, hauling and placing the foundation conditioning material.

40 *Culvert Excavation, Sta. ____* will be paid at the contract lump sum price. No measurement
41 for payment will be made for this pay item, and no adjustment in the contract lump sum price
42 will be made unless the size, length, elevation or location of the culvert is revised. If the size,
43 length, elevation or location of the culvert is revised, such revision will be an alteration of plans
44 or details of construction in accordance with Article 104-3.

45 Where it is necessary to provide backfill material from sources other than excavated areas or
46 borrow sources used in connection with other work in the contract, payment for furnishing and
47 hauling such backfill material will be paid as extra work in accordance with

1 Article 104-7. Placing and compacting such backfill material is not extra work but is incidental
2 to the work being performed.

3 Payment will be made under:

Pay Item	Pay Unit
Culvert Excavation, Sta. ____	Lump Sum
Foundation Conditioning Material, Box Culvert	Ton

4 **SECTION 416**
5 **CHANNEL EXCAVATION**

6 **416-1 DESCRIPTION**

7 Excavate any material outside of the pay limits of foundation excavation, unclassified structure
8 excavation or box culvert excavation, which is classified as channel excavation in the plans.
9 Place suitable excavated material as directed, drain and divert water, pump, blast, haul, dispose
10 of materials and backfill.

11 Do not deposit excavated materials, nor construct earth dikes or other temporary earth structures
12 in rivers, streams or impoundment or so near to such waters that they are carried into any river,
13 stream or impoundment by stream flow or surface runoff.

14 **416-2 CONSTRUCTION METHODS**

15 Notify the Engineer a sufficient time before beginning the excavation so measurements may be
16 taken of the undisturbed ground. Do not disturb the existing ground without permission.

17 Remove and dispose of boulders, vegetative material and any other objectionable material.

18 Use and place suitable excavated material in accordance with Articles 410-7 and 410-8.

19 **416-3 MEASUREMENT AND PAYMENT**

20 Channel excavation will be measured and paid on a cubic yard basis. Materials will be
21 measured in their original position within the limits described below and computed by the
22 average end area method, that are acceptably excavated in accordance with the contract or as
23 directed. The upper limits for measurement are the actual ground surface at the time of starting
24 work. The lower limits for measurement are established by the plans or as directed in writing.

25 No measurement is made of the following excavation:

26 (A) Mud, muck or similar semi-solid material which can be drained away or pumped without
27 the use of a jet or nozzle.

28 (B) Excavation before the Engineer makes measurements of the undisturbed ground.

29 (C) Excavation that is within the pay limits of other excavation.

30 (D) Excavation that is outside of the limits shown in the plans or as directed in writing.

31 Where the item *Channel Excavation* is not included in the contract, no measurement or payment
32 is made of any channel excavation, as payment at the contract unit or lump sum price for the
33 various items in the contract will be full compensation for the work covered by this section.

34 This price and payment will be full compensation for all items required to complete channel
35 excavation.

36 Payment will be made under:

Pay Item	Pay Unit
Channel Excavation	Cubic Yard

Section 420

**SECTION 420
CONCRETE STRUCTURES**

420-1 DESCRIPTION

Construct CIP concrete structures and the CIP concrete portions of composite structures in conformity with the lines, grades and dimensions shown in the contract. Furnish and place concrete, joint filler and sealer, curing agents, epoxy protective coating, deck drains, expansion anchors and any other material; erect and remove all falsework and forms; protect concrete in wind, rain, low humidity, high temperatures or other unfavorable weather; construct joints and weep holes; finish and cure concrete; protect concrete from rust stains; and groove bridge floors. For reinforced concrete deck slabs, in addition to the above, furnish and place reinforcing steel and bridge scuppers; and design, furnish, erect and remove all bridge deck forms including any appurtenances required by the Engineer to stabilize exterior girders during overhang construction.

420-2 MATERIALS

Refer to Division 10.

Item	Section
Calcium Nitrite Corrosion Inhibitor	1000-4(K)
Curing Agents	1026
Deck Drains	1054-1
Epoxy Protective Coating	1081
Expansion Anchors	1074-2
Grout, Type 2	1003
Joint Fillers	1028-1
Joint Sealers	1028
Metal Stay-in-Place Forms	1074-12
Portland Cement Concrete	1000
Reinforcing Steel	1070

420-3 FALSEWORK AND FORMS

(A) General

Submit detailed drawings for falsework or forms for bridge superstructure and other components as required by the contract for review, comments and acceptance before beginning construction of the falsework or forms. This review does not relieve the Contractor of full responsibility for the safety, alignment, quality or finish of the work.

Design falsework and forms to carry the full loads upon them, including a dead load of 150 lb/cf for concrete, loads caused by equipment and personnel, and for lateral pressures resulting from rate of pours, setting times and effects of vibration on the concrete, so the finished concrete surface conforms to the proper dimensions and contours and has an even appearance.

Use lumber and other material for forms and falsework that is sound and in good condition.

Set falsework and forms to give the correct elevation shown on the drawings making proper allowance for shrinkage, deflections and settlement, and maintain true to lines and grades designated until the concrete sufficiently hardens.

Where falsework or forms appear to be unsatisfactorily built in any respect either before or during placing of concrete, the Engineer will order the work stopped until the defects are acceptably corrected.

Keep the falsework and forms in place after placing of concrete for the periods specified in Article 420-16. Remove falsework and forms in an acceptable manner. Do not leave forms or falsework permanently in place without written approval.

1 Provide a means, satisfactory to the Engineer, to check any settlement or deflection that
2 may occur during the placing of concrete in the various portions of the work.

3 **(B) Falsework**

4 Build falsework on foundations of sufficient strength to carry the applied loads without
5 appreciable settlement. Support falsework that cannot be founded on solid footings on
6 ample falsework piling.

7 Use an acceptable method to compensate for shrinkage, deflection and settlement. Use
8 jacks to readily effect adjustment, if necessary, before or during placing of concrete, if
9 required by the Engineer.

10 **(C) Forms**

11 (1) General

12 Use forms made of wood or steel except where other materials are specified by the
13 contract or accepted by the Engineer.

14 (2) Wood Forms

15 Build forms mortar-tight of material sufficient in strength with ample studding,
16 walling and bracing to effectively prevent any appreciable horizontal and vertical
17 deflection.

18 Provide forms with interior dimensions such that the finished concrete is of the form
19 and dimensions shown in the plans.

20 Line forms, except for surfaces permanently in contact with earth fill, with plywood
21 or other approved material. Provide a lining with a smooth and uniform texture and
22 of such thickness and rigidity that a concrete surface of uniform texture and even
23 appearance results. Provide joints between form liners that are mortar tight and even
24 and maintain to prevent the opening of joints due to the shrinkage of the lumber.

25 Fillet forms at all sharp corners unless otherwise noted in the plans. Mill wood
26 chamfer strips from straight grained lumber and surface on all sides. Maintain an
27 acceptable alignment and no broken edges on all chamfer strips.

28 Give forms for all projections a bevel or draft to insure easy removal.

29 At all times, maintain the shape, strength, rigidity, watertightness and surface
30 smoothness of reused forms. Resize any warped or bulged lumber before reusing. Do
31 not reuse any forms that are unsatisfactory in any respect. Do not use plywood sheets
32 showing torn grain, worn edges, patches, holes from previous use or other defects that
33 impair the texture of concrete surfaces exposed to view.

34 Thoroughly clean forms previously used of all dirt, mortar and foreign material before
35 reusing. Before placing concrete in forms to be removed, thoroughly coat all inside
36 surfaces of the forms with commercial quality form oil or other equivalent coating
37 which permits the ready release of the forms and does not discolor the concrete.

38 Construct or install metal spacers or anchorages, required within the forms for their
39 support or to hold them in correct alignment and location, in such a way that the metal
40 work can be removed to a depth of at least 1 inch from the exposed surface of the
41 concrete without injury to such surface by spalling or otherwise. Limit the diameter
42 to not greater than 1.5 times its depth for the recess formed in the concrete. Cut back
43 all such metal devices in exposed surfaces, upon removal of the forms, to a depth of
44 at least 1 inch from the face of the concrete. Carefully fill cavities produced by the
45 removal of metal devices with cement mortar of the same mix used in the body of the
46 work immediately upon removal of the forms, and leave the surface smooth, even and
47 as nearly uniform in color as possible. As an option, break off flush with the concrete

Section 420

1 surface those metal devices with cross-sectional area not exceeding 0.05 square inches
2 on surfaces permanently in contact with earth fill.

3 Do not weld metal devices to either reinforcing steel or structural steel that is
4 a permanent part of the structure without written approval.

5 (3) Steel Forms

6 Apply Subarticle 420-3(C)(2) in regards to design, mortar tightness, filleted corners,
7 beveled projections, bracing, alignment, texture and evenness of appearance of the
8 resulting concrete surface, removal, re-use and oiling to steel forms. Use steel for
9 forms of such thickness that the forms remain true to shape. Counter-sink bolt and
10 rivet heads. Design clamps, pins or other connecting devices to hold the forms rigidly
11 together and allow removal without injury to the concrete. Do not use steel forms that
12 do not present a smooth surface or line up properly. Exercise care to keep steel forms
13 free from rust, grease or other foreign matter that will tend to discolor the concrete.

14 (D) Forms for Concrete Bridge Decks

15 In addition to Subarticles 420-3(C)(1) through 420-3(C)(3), the following requirements
16 apply to falsework and forms used to construct reinforced concrete bridge decks on girders.
17 Furnish all materials, labor, equipment and incidentals necessary for the proper installation
18 of falsework and forms for concrete bridge deck slabs.

19 For prestressed girder spans, the plans for the concrete deck slab are detailed for the use of
20 a CIP slab using either precast prestressed concrete panels or fabricated metal stay in place
21 forms. Optionally, construct a CIP slab using removable forms.

22 For structural steel spans, plans for the concrete deck slab are detailed for the use of metal
23 stay in place forms. Optionally, construct a CIP slab using removable forms. Do not use
24 precast prestressed concrete panels on structural steel spans.

25 Where reinforced concrete deck slab with sand lightweight concrete is required by the
26 contract, do not use precast prestressed concrete panels.

27 If using a form system other than that detailed in the plans, do so at no additional cost to
28 the Department. Changes in slab design to accommodate the use of optional forms are the
29 responsibility of the Contractor. Submit these changes for review and approval. Before
30 using optional forms, submit detailed checked plans of the system and checked design
31 calculations for the composite slab complying with the latest *AASHTO LRFD Bridge*
32 *Construction Specifications*, *AASHTO LRFD Bridge Design Specifications* and *NCDOT's*
33 *Structures Management Design Manual*. After the drawings are reviewed and, if
34 necessary, the corrections made, submit final drawings of the deck system to become the
35 revised plans. Ensure that the plans and design calculations are checked and sealed by an
36 engineer licensed by the State of North Carolina.

37 Unless otherwise shown in the plans, use the same forming system for all of the same type
38 superstructure spans within the bridge. Construct the slab overhang from the exterior
39 girder to the outside edge of superstructure using removable forms.

40 (1) Precast Prestressed Concrete Panels

41 Prestressed concrete panels are subject to the requirements for prestressed concrete
42 members as specified in Section 1078 and the plans.

43 Design prestressed panels subject to review by the Engineer. Before using prestressed
44 panels, submit detailed plans of the panels for review. Submit with the checked plans
45 one set of checked design calculations for the panels complying with the latest
46 *AASHTO LRFD Bridge Design Specifications*, requirements detailed herein and the
47 plans. Ensure the plans and design calculations are checked and sealed by an engineer
48 licensed by the State of North Carolina. If corrections to the drawings are necessary,
49 submit one set of corrected drawings. The drawings become part of the plans.

1 Design the prestressed concrete panels in accordance with the following criteria:

- 2 (a) Design details to provide a mating surface joint or a draft not exceeding 1/8 inch
3 resulting in a joint that is closed at the top and no more than 1/4 inch open at
4 bottom of panel. Detail the joints filled with grout or other methods approved by
5 the Engineer to prevent leakage of the concrete. Place a chamfer or fillet, with
6 a 3/4 inch horizontal width, along the top edges of the panel parallel with the
7 prestressed girder.
- 8 (b) Design panels to support the dead load of the panel, reinforcement, plastic
9 concrete and a 50 lb/sf construction load. Design the panel and slab acting
10 compositely to support design live loads and dead loads acting on the composite
11 section. Include in the design dead load acting on the composite section
12 an additional load of 30 lb/sf for a future asphalt wearing surface. For bridges up
13 to 44 feet in width, distribute equally to all deck panels superimposed dead loads
14 for such permanent bridge items as barrier rails, medians or any dead load which
15 is applied after the deck is cast. In the case of bridges over 44 feet wide, distribute
16 these loads equally to the first 2 1/2 panels adjacent to each side of the load.
- 17 (c) The design span of the prestressed concrete panel is the clear distance between
18 edges of girders plus 2 inches measured parallel to the panel edges.
- 19 (d) Limit tension in the precompressed tensile zone to 424 psi unless the plans require
20 0 psi tension.

21 (2) Fabricated Metal Stay-In-Place Forms

22 Furnish metal stay-in-place forms with closed tapered ends to form the concrete deck
23 slabs as shown in the plans. Submit complete fabrication and erection drawings for
24 review, comments and acceptance. Indicate on these plans the grade of steel, the
25 physical and section properties for all permanent steel bridge deck form sheets and a
26 clear indication of locations of form supports. Do not fabricate the forming material
27 until drawings are accepted.

28 When required by the design plans, detail stay-in-place forms with excluder plates to
29 exclude concrete from the valleys in the forms. Foam insulation void fillers may be
30 used in stay-in-place metal forms. Adhesive shall be used on all 3 contacting sides of
31 the foam insulation void fillers rather than on the bottom only. The adhesive shall be
32 compatible with the foam insulation material to not cause decomposition. Duct tape
33 shall not be used to hold the foam insulation in place. Foam insulation shall be placed
34 in one piece across each bay and be trimmed to not extend over the girder. Foam
35 insulation damaged during placement of reinforcing steel shall be replaced.

36 Design metal stay-in-place forms in accordance with the following criteria:

- 37 (a) Accommodate the dead load of the form, reinforcement and the plastic concrete,
38 including the additional weight of concrete due to the deflection of the metal
39 forms, plus 50 lb/sf for construction loads. Do not allow the unit working stress
40 in the steel sheet to exceed 72.5% of the specified minimum yield strength of the
41 material furnished nor 36 ksi.
- 42 (b) Limit the horizontal leg of the support angle to 3 inches. Design the support angle
43 as a cantilever.
- 44 (c) Limit the deflection under the weight of the forms, the plastic concrete and
45 reinforcement to 1/180 of the form span or 1/2 inch whichever is less. Do not
46 design for a total loading less than 120 lb/sf.
- 47 (d) Base the permissible form camber on the actual dead load condition. Do not use
48 camber to compensate for deflection in excess of the foregoing limits.

Section 420

- 1 (e) The design span of the form sheets is the clear distance between edges of beam or
2 girder flanges minus 2 inches measured parallel to the form flutes. Design and
3 provide form sheets with a length at least the design span of the forms.
- 4 (f) Compute physical design properties in accordance with requirements of the
5 American Iron and Steel Institute *Specification for the Design of Cold-Formed*
6 *Steel Structural Members*.
- 7 (g) Provide a minimum concrete cover of 1 1/4 inches clear above metal stay-in-place
8 form to the bottom mat of reinforcement.
- 9 (h) Maintain the plan dimensions of both layers of primary deck reinforcement from
10 the top of the concrete deck.
- 11 (i) Do not weld to flanges in tension or to structural steel bridge elements fabricated
12 from non-weldable grades of steel.
- 13 (j) Weld metal stay-in-place forms for prestressed concrete girders to embedded clips
14 in the girder flanges. The embedded clips shall be at least 2 inches x 3 inches and
15 2 inches long. The clips shall be galvanized, 10 gauge ASTM A653 steel and
16 have a 3/4 inch or 1 inch diameter hole in the 2 inch leg. The spacing of the clips
17 shall be 12 inches. All submitted metal stay-in-place form designs shall be able
18 to use the standard size and spacing of the clip described above.
- 19 Do not unload or handle fabricated metal stay-in-place forming materials so as to
20 damage or alter the configuration of the forms. Replace damaged materials at no
21 additional cost to the Department.
- 22 Store fabricated metal stay-in-place forms that are stored at the project site at least 4
23 inches above the ground on platforms, skids or other suitable supports and protect
24 against corrosion and damage from any source.
- 25 Install all forms in accordance with detailed fabrication plans submitted to the
26 Engineer for review. Clearly indicate on the fabrication plans the locations where the
27 forms are supported by steel beam flanges subject to tensile stresses. Do not weld to
28 the flanges within these locations. Do not allow form sheets to rest directly on the top
29 of the beam or girder. Securely fasten sheets to form supports with a minimum bearing
30 length of 1 inch at each end. Center sheets between the form supports. Place form
31 supports in direct contact with the flange of girder or beam. Make all attachments by
32 permissible welds, bolts, clips or other approved means. Weld in accordance with
33 Article 1072-18 except 1/8 inch fillet welds are permitted.
- 34 In the areas where the form sheets lap, securely fasten the form sheets to one another
35 by screws at a maximum spacing of 18 inches. Securely attach the ends of the form
36 sheets to support angles with screws at a maximum spacing of 18 inches.
- 37 Where the galvanized coating is damaged, repair in accordance with Article 1076-7.
38 Minor heat discoloration in areas of welds is not damage and does not require the
39 above repair.
- 40 Locate transverse construction joints at the bottom of a flute and field drill 1/4 inch
41 weep holes at not more than 12 inches on center along the line of the joint.
- 42 Use a saw for all cuts. Do not flame cut forms.

43 (E) Falsework and Forms Over or Adjacent to Traffic

- 44 In addition to the applicable sections in Subarticle 420-3(A) through 420-3(D), the
45 following requirements apply to falsework and forms including metal stay-in-place forms
46 and precast concrete deck panels erected over vehicular, pedestrian or railroad traffic, or
47 vessel traffic on navigable waterways. It also covers falsework and forms for those parts

1 of a substructure unit constructed within 20 feet of the edge of a travelway or railroad track
2 and more than 25 feet above the ground line at the time of substructure construction.

3 (1) Submittals

4 Submit detailed drawings as required by the contract and one set of design calculations
5 for falsework and forms for review and acceptance before beginning construction of
6 the falsework or forms. Ensure the drawings and design calculations are prepared,
7 signed and sealed by an engineer licensed by the State of North Carolina. These
8 submittal requirements apply to all falsework and form systems covered by this
9 section.

10 (2) Design

11 Design falsework and forms for the combined effects of dead load and live load and
12 with appropriate safety factors in accordance with this section and the respective
13 design codes of the materials used. Include the weight of concrete, reinforcing steel,
14 forms and falsework in the dead load. Live load includes the actual weight of any
15 equipment the falsework supports, applied as concentrated loads at the points of
16 contact and a uniform load of at least 20 lb/sf applied over the supported area.
17 In addition, apply a line load of 75 lb/ft along the outside edge of deck overhangs.

18 (3) Inspection

19 Before the form or falsework system is loaded, inspect the erected falsework and forms
20 and submit a written statement certifying that the erected falsework system complies
21 with the accepted detailed drawings. Submit a separate certification for each span,
22 unit or bridge component. Any condition that does not comply with the accepted
23 drawings, or any other condition deemed unsatisfactory by the Engineer, is cause for
24 rejection until corrections are made.

25 **420-4 PLACING CONCRETE**

26 Do not place concrete until the depth of the excavation, character of the foundation material,
27 adequacy of the forms and falsework, placement of reinforcement and other embedded items
28 are inspected and approved. Do not place concrete without the Department's inspector present.

29 Place concrete in daylight or obtain approval for an adequate lighting system for construction
30 and inspection of the work.

31 In preparation for the placing of concrete, remove all sawdust, chips and other construction
32 debris and extraneous matter from the interior of forms. Remove hardened concrete and foreign
33 matter from tools, screeds and conveying equipment.

34 Ensure that the concrete temperature at the time of placement in the forms is at least 50°F and
35 no more than 95°F, except where other temperatures are required by Articles 420-7
36 and 420-14.

37 Do not use concrete that does not reach its final position in the forms within the time stipulated
38 in Subarticle 1000-4(E).

39 Thoroughly clean and wet surfaces, other than foundation surfaces, immediately before placing
40 concrete to help bonding to those surfaces.

41 Regulate the placement of concrete so the pressures caused by the wet concrete do not exceed
42 those used in the design of the forms.

43 Thoroughly work the external surface of all concrete during the placing with approved tools.
44 During the placing of concrete, take care to use methods of compaction that result in a surface
45 of even texture free from voids, water or air pockets, and that force the coarse aggregate away
46 from the forms to leave a mortar surface.

47 Place concrete to avoid segregation of the materials and the displacement of the reinforcement.

Section 420

1 Equip chutes on steep slopes with baffle boards or provide chutes in short lengths that reverse
2 the direction of movement.

3 Use all chutes, troughs and pipes made from suitable materials other than aluminum and keep
4 them clean and free from coating of hardened concrete by thoroughly flushing with water after
5 each run. Discharge the water used for flushing clear of the structure.

6 Confine concrete dropped more than 5 feet by closed chutes or pipes, except in walls of box
7 culverts or retaining walls unless otherwise directed.

8 Take care to fill each part of the form by depositing the concrete as near to its final position as
9 possible. Work the coarse aggregate back from the forms and around the reinforcement without
10 displacing the bars. After initial set of the concrete, do not jar the forms and do not place strain
11 on the projecting reinforcement or other items embedded in the concrete.

12 Compact all concrete required to be vibrated with approved high frequency internal vibrators
13 or other approved type of vibrators immediately after depositing concrete in the forms. In all
14 cases, have available at least 2 vibrators in good operating condition and 2 sources of power at
15 the site of any structure in which more than 25 cubic yard of concrete is required. Do not attach
16 or hold the vibrators against the forms or the reinforcing steel. When vibrating concrete
17 containing epoxy coated reinforcing steel, use a vibrator with a protective rubber head as
18 approved by the Engineer. Vibrate with care and avoid displacement of reinforcement, ducts
19 or other embedded elements. Vibrate in the appropriate location, manner and duration to secure
20 maximum consolidation of the concrete without causing segregation of the mortar and coarse
21 aggregate and without causing water to flush to the surface. When placing concrete to a depth
22 in excess of 12 inches and containing one or more horizontal layers of reinforcing steel, place
23 the concrete in horizontal layers not more than 12 inches thick. Place and compact each layer
24 before the preceding layer takes initial set such that there is no surface of separation between
25 layers. Do not taper layers of concrete in wedge-shaped slopes but instead place them with
26 reasonably square ends and level tops.

27 If placing additional concrete against hardened concrete, take care to remove all laitance and to
28 roughen the surfaces of the concrete to ensure that fresh concrete is deposited upon sound
29 concrete surfaces and an acceptable bond is obtained. Thoroughly wet the existing concrete for
30 at least 2 hours before placing additional concrete.

31 Deposit and compact to form a compact, dense, impervious concrete of uniform texture which
32 shows smooth faces on exposed surfaces. Repair, remove and replace in whole or in part as
33 directed and at no additional cost to the Department, any section of concrete found to be porous,
34 cracked, plastered or otherwise defective.

35 Protect beams and girders during concreting operations. Remove any concrete that gets on
36 beams or girders immediately by an approved method to restore the surface to the specified
37 condition.

38 **420-5 PUMPING CONCRETE**

39 Placement of concrete by pumping is permitted only when approved. Use and locate suitable
40 pumping equipment that is adequate in capacity for the work and so no vibrations result which
41 might damage freshly placed concrete. Do not use pumping equipment, including the conduit
42 system, which contains any aluminum or aluminum alloy that comes in contact with the
43 concrete.

44 Waste all grout used to lubricate the inner surfaces of the conduit system.

45 Pump so a continuous stream of concrete without air pockets is delivered. For test purposes,
46 take concrete from the discharge end of the pump.

1 420-6 SLUMP TESTS

2 The slump of the concrete is determined in accordance with AASHTO T 119.

3 When a slump test is made and the results of the test exceed the specified maximum, a check
4 test is made immediately from the same batch or truck load of concrete. If a passing result
5 cannot be produced on the check test the load will be rejected.

6 420-7 PLACING CONCRETE IN COLD WEATHER**7 (A) General**

8 Do not place concrete when the air temperature, measured at the location of the concreting
9 operation in the shade away from artificial heat, is below 35°F without permission. When
10 such permission is granted, uniformly heat the aggregates and water to a temperature not
11 higher than 150°F. Place the concrete when the temperature of the heated concrete is at
12 least 55°F and not more than 80°F.

13 Use aggregates that are free of ice, frost and frozen particles. Do not place concrete on
14 frozen foundation material.

15 Protect all concrete with heated enclosures or by insulation whenever any of the following
16 conditions occur:

17 (1) The concrete is placed when the air temperature, measured at the location of the
18 concreting operation in the shade away from artificial heat, is below 35°F.

19 (2) The air temperature, measured at the location of the freshly placed concrete in the
20 shade away from artificial heat, is below 35°F and the concrete has not yet attained an
21 age of 72 hours or an age of 48 hours when using high early strength Portland cement
22 concrete. If the mix contains fly ash or ground granulated blast furnace slag, protect
23 the concrete for 7 days.

24 Provide and place, at directed locations, a sufficient number of maximum-minimum
25 recording thermometers to provide an accurate record of the temperature surrounding the
26 concrete during the entire protection period.

27 Assume all risks connected with the placing of concrete under the cold weather conditions
28 referred to herein. Permission given to place concrete when the temperature is below 35°F
29 and the subsequent protection of the concrete as required herein does not relieve the
30 Contractor in any way of the responsibility for obtaining the required results.

31 (B) Heated Enclosures

32 Immediately enclose Portland cement concrete that is placed when the air temperature is
33 below 35°F and Portland cement concrete that has not yet attained an age of 72 hours.
34 Enclose the concrete before the air temperature falls below 35°F with a housing consisting
35 of canvas or other approved material supported by an open framework. Maintain the air
36 surrounding the concrete at a temperature of at least 50°F and no more than 90°F for the
37 remainder of the 72-hour period. Apply these same requirements to high early strength
38 Portland cement concrete except reduce the 72-hour period to 48 hours. Do not begin these
39 time periods until completing manipulation of each separate mass of concrete.

40 Provide such heating apparatuses as stoves, salamanders or steam equipment and the
41 necessary fuel. When using dry heat, provide means of preventing loss of moisture from
42 the concrete.

43 (C) Insulation

44 As an alternate to the heated enclosure specified in Subarticle 420-7(B), use insulated
45 forms or insulation meeting all requirements of this subarticle to protect concrete. Use
46 insulation under the same conditions that require heated enclosures. Place the insulation
47 on the concrete as soon as initial set permits.

Section 420

1 When using insulation for cold weather protection, batch concrete for sections 12 inches
2 or less in thickness or diameter as outlined below. Use Type III Portland cement without
3 any increase in cement content, or use Type I or II Portland cement with the cement content
4 increased to 1.80 barrels per cubic yard. When the mix includes fly ash, use a mix
5 containing 572 lb/cy of cement and at least 172 lb/cy of fly ash. When the mix includes
6 ground granulated blast furnace slag, use a mix containing 465 lb/cy of cement and
7 250 lb/cy of ground granulated blast furnace slag.

8 Use insulated materials with a minimum thickness of 1 inch. Insulate overhang forms both
9 on the outside vertical faces and on the underside with a 1 inch minimum thickness of either
10 rigid or blanket type insulation. Use insulating materials which provide a minimum system
11 R value of 4.0 in the up mode as determined by ASTM C1363 with a 15 mph wind over
12 the cold side of the material and a minimum differential of 50°F. Furnish results of tests
13 conducted in accordance with ASTM C1363 by an acceptable commercial testing
14 laboratory for review, comments and acceptance. Obtain such acceptance before use of
15 the material. Face or cover insulating blankets, top and bottom, with polyethylene or
16 similar waterproofing material meeting Article 1026-3 except for the length and color
17 requirements. Place blankets on the concrete to form a waterproof surface for the protected
18 concrete. Do not use blankets with rips and tears in the waterproofing material unless
19 acceptably repaired. When the anticipated low temperature expected during the protection
20 period is less than 10°F, provide 2 inches of insulation. Overlap blanket insulation mats at
21 the edges by at least 6 inches. Tightly butt rigid type insulation sheets together and seal.
22 Take particular care to provide effective protection of curbs, corners and around protruding
23 reinforcing steel.

24 Should the air under the insulation fall below 50°F during the protection period,
25 immediately cover the concrete with canvas and framework or other satisfactory housing
26 and apply heat uniformly at a rate such that the air surrounding the concrete is at least 50°F
27 for the remainder of the protection period.

28 If insulating materials are removed from the concrete before the expiration of the curing
29 period, cure the concrete for the remainder of the period in accordance with
30 Article 420-15.

31 **420-8 CONSTRUCTION JOINTS**

32 Provide construction joints only where located in the plans or shown in the placing schedule,
33 unless otherwise approved in writing.

34 Place the concrete in each integral part of the structure continuously. Do not start work on any
35 such part unless the concrete supply, forces and equipment are sufficient to complete the part
36 without interruption in the placing of the concrete.

37 In case of emergency, make construction joints or remove the concrete as directed.

38 Make construction joints without keys, except when required in the plans. Rough float surfaces
39 of fresh concrete at horizontal construction joints sufficiently to thoroughly consolidate the
40 concrete at the surface.

41 After placing concrete to the construction joint and before placing fresh concrete, thoroughly
42 clean the entire surface of horizontal and vertical construction joints of surface laitance, curing
43 compound and other materials foreign to the concrete. Thoroughly clean and wet concrete
44 surfaces for at least 2 hours before placing additional concrete to help bonding.

45 **420-9 WIDENING EXISTING STRUCTURES**

46 Where plans call for widening existing concrete structures or otherwise require bonding new
47 concrete to old, remove portions of the existing structures as indicated in the plans.

48 When extending an existing culvert, remove the following portions of the existing culvert: the
49 portions that interfere with the proposed extension, headwalls only as necessary to clear

1 proposed subgrade by at least 18 inches and wingwalls to square surfaces the full thickness of
2 the new sidewalls. Cut existing wingwall reinforcing steel off flush with the concrete surface.
3 Thoroughly roughen, clean off loose material and wet connecting surfaces of the old concrete
4 at least 2 hours before placing new concrete.

5 **420-10 EXPANSION JOINTS**

6 **(A) General**

7 Locate and construct all joints as shown in the plans.
8 Chamfer or edge the edges of joints as shown in the plans or as directed.
9 Immediately after removing the forms, inspect the expansion joint carefully.
10 Neatly remove any concrete or mortar in the joint.

11 **(B) Filled Joints**

12 Use cork, bituminous fiber, neoprene or rubber in accordance with Article 1028-1 in all
13 expansion joint material. Use an optional second layer to obtain the required thickness,
14 when a thickness of more than 1 inch is required.
15 Cut the joint filler to the same shape and size as the area to be covered except cut it
16 1/2 inch below any surface that is exposed to view in the finished work. As an option, cut
17 the joint filler the same size and shape as that of the adjoining surfaces and neatly cut back
18 the material 1/2 inch on the surfaces that are exposed to view after the concrete hardens.
19 Cut the joint filler out of as few pieces as practical and, except as noted above, completely
20 fill the space provided. Fasten the pieces in any one joint together in an approved manner.
21 Do not use loose fitting or open joints between sections of filler or between filler and forms.
22 Do not use joints made up with small strips. Place 2-ply roofing felt over all joints in the
23 filler material in vertical expansion joints below top of curbs. Place the felt on the side of
24 the joint adjacent to the new pour.
25 In accordance with Article 1028-3, seal all expansion joints with a low modulus silicone
26 sealant.

27 **420-11 DRAINS IN WALLS AND CULVERTS**

28 Construct drain holes and weep holes in abutment walls, wing walls, retaining walls and the
29 exterior walls of culverts as shown in the plans unless otherwise directed and backfill in
30 accordance with Articles 414-7 and 414-8.
31 Cover drain holes and weep holes at the back face of the wall with hardware cloth of commercial
32 quality, approximately No. 4 wire reinforcement, of aluminum or galvanized steel wire.

33 **420-12 ANCHOR BOLTS AND BEARING AREAS**

34 **(A) Anchor Bolts**

35 Accurately set all necessary anchor bolts in piers, abutments or pedestals either while
36 placing concrete, in formed holes or in holes cored or drilled after the concrete sets.
37 If set in the concrete, position the bolts with templates and rigidly hold in position while
38 placing the concrete.
39 Form holes by inserting in the fresh concrete oiled wooden plugs, metal pipe sleeves or
40 other approved devices, and withdrawing them after the concrete partially sets. Provide
41 holes formed in this manner that are at least 4 inches in diameter.
42 Core holes at least 1 inch larger in diameter than the bolt used. Use approved equipment
43 for coring concrete. Do not use impact tools. Place reinforcing steel to provide adequate
44 space to core bolt holes without cutting the reinforcing steel.
45 During freezing conditions, protect anchor bolt holes from water accumulation at all times.

Section 420

1 Completely fill the holes with an approved grout compatible with the concrete.

2 (B) Bearing Areas

3 Finish bridge seat bearing areas to a true level plane to not vary perceptibly from
4 a straightedge placed in any direction across the area.

5 Place bearing plates in accordance with Article 440-4.

6 420-13 ADHESIVELY ANCHORED ANCHOR BOLTS OR DOWELS

7 (A) Description

8 The work covered by this section consists of furnishing all necessary labor, equipment and
9 materials and performing all operations necessary for installing anchor bolts/dowels in
10 concrete using an adhesive bonding system in accordance with the details shown in the
11 plans and with Article 1081-2.

12 The use of adhesive anchors for overhead installments is not permitted.

13 Submit a description of the proposed adhesive bonding system to the Engineer for review,
14 comments and acceptance. Include in the description the bolt type and its deformations,
15 equipment, manufacturer's recommended hole diameter, embedment depth, material
16 specifications and any other material, equipment or procedure not covered by the contract.
17 List the properties of the adhesive, including density, minimum and maximum temperature
18 application, setting time, shelf life, pot life, shear strength and compressive strength. If
19 bars/dowels containing a corrosion protective coating are required, provide an adhesive
20 that does not contain any chemical elements that are detrimental to the coating and include
21 a statement to this effect in the submittal concerning the contents as required by Federal or
22 State laws and regulations.

23 (B) Procedure

24 (1) Drilling of Holes into Concrete

25 When directed, use a jig or fixture to ensure the holes are positioned and aligned
26 correctly during the drilling process. Upon approval, adjusting hole locations to avoid
27 reinforcing steel is permitted.

28 Drill the holes with a pneumatic drill unless another drilling method is approved.
29 Follow the manufacturer's recommendations regarding the diameter of the drilled
30 hole.

31 Immediately after completion of drilling, blow all dust and debris out of the holes with
32 oil-free compressed air using a wand extending to the bottom of the hole. Remove all
33 dust from the sides of the holes by brushing the holes with a stiff-bristled brush of
34 a sufficient size and then blow the hole free of dust. Repeat this procedure until the
35 hole is completely clean. Check each hole with a depth gauge to ensure proper
36 embedment depth.

37 Repair spalled or otherwise damaged concrete using approved methods.

38 (2) Inspection of Holes

39 Inspect each hole immediately before placing the adhesive and the anchor
40 bolts/dowels. Ensure all holes are dry and free of dust, dirt, oil and grease. Rework
41 any hole that does not meet the requirements of the contract.

42 (3) Mixing of Adhesive

43 Mix the adhesive in strict conformance with the manufacturer's instructions.

1 (4) Embedment of Anchor Bolt/Dowel

2 Clean each anchor bolt/dowel so it is free of all rust, grease, oil and other contaminants.

3 Unless otherwise shown in the plans, the minimum anchor bolt/dowel embedment
4 depth is such that the adhesive develops at least 125% of the anchor bolt/dowel yield
5 load as determined by the manufacturer.

6 Installation of the adhesive anchors shall be in accordance with manufacturer's
7 recommendations and shall occur when the concrete is above 40°F and has reached its
8 28 day strength. The anchors shall be installed before the adhesive's initial set (gel
9 time).

10 Insert the anchor bolt/dowel the specified depth into the hole and slightly agitate it to
11 ensure wetting and complete encapsulation. After insertion of the anchor bolt/dowel,
12 strike off any excessive adhesive flush with the concrete face. Should the adhesive
13 fail to fill the hole, add additional adhesive to the hole to allow a flush strike-off. Do
14 not disturb the anchor bolts/dowels while adhesive is hardening.

15 **(C) Field Testing**

16 When specified in the plans, test the installed anchor bolts/dowels for adequate adhesive
17 as specified below. Inform the Engineer when the tests will be performed at least 2 days
18 before testing. Conduct the tests in the presence of the Engineer.

19 Use a calibrated hydraulic centerhole jack system for testing. Place the jack on a plate
20 washer that has a hole at least 1/8 inch larger than the hole drilled into the concrete.
21 Position the plate washer on center to allow an unobstructed pull. Position the anchor
22 bolts/dowels and the jack on the same axis. Ensure an approved testing agency calibrates
23 the jack within 6 months before testing. Supply the Engineer with a certificate of
24 calibration.

25 In the presence of the Engineer, field test the anchor bolt or dowel in accordance with the
26 test level shown in the plans and the following:

27 (1) Level 1 Field Testing

28 Test a minimum of 1 anchor but at least 10% of all anchors to 50% of the yield load
29 shown in the plans. If less than 60 anchors are to be installed, install and test the
30 required number of anchors before installing the remaining anchors. If more than
31 60 anchors are to be installed, test the first 6 anchors before installing the remaining
32 anchors, then test 10% of the number in excess of 60 anchors.

33 (2) Level 2 Field Testing

34 Test a minimum of 2 anchors but at least 10% of all anchors to 80% of the yield load
35 shown in the plans. If less than 60 anchors are to be installed, install and test the
36 required number of anchors before installing the remaining anchors. If more than
37 60 anchors are to be installed, test the first 6 anchors before installing the remaining
38 anchors, then test 10% of the number in excess of 60 anchors.

39 Testing should begin only after the manufacturer's recommended cure time has been
40 reached. For testing, apply and hold the test load for 3 minutes. If the jack experiences
41 any drop in gauge reading, the test shall be restarted. For the anchor to be deemed
42 satisfactory, the test load shall be held for 3 minutes with no movement or drop in gauge
43 reading.

44 Record data for each anchor bolt or dowel tested on the report form entitled Installation
45 Test Report of Adhesively Anchored Anchor Bolts or Dowels. Obtain this form from the
46 Department's Materials and Tests Engineer. Submit a copy of the completed report form
47 to the Engineer.

Section 420

1 Final acceptance of the adhesively anchored system is based on the conformance of the
2 pull test. Failure to meet the criteria of this specification is grounds for rejection.

3 Remove all anchors or dowels that fail the field test without damage to the surrounding
4 concrete. Redrill holes to remove adhesive bonding material residue and clean the hole in
5 accordance with specifications. For reinstalling replacement anchors or dowels, follow the
6 same procedures as new installations. Do not reuse failed anchors or dowels unless
7 approved by the Engineer.

8 **420-14 PLACING AND FINISHING BRIDGE DECKS**

9 **(A) Placing Concrete**

10 Unless otherwise noted in the plans, use Class AA CIP concrete conforming to Section
11 1000. When noted in the plans, use sand lightweight concrete conforming to Section 1000.

12 Place concrete in accordance with these specifications. Properly vibrate concrete to avoid
13 honeycombs and voids. Ensure pouring sequences, procedures and mixes are approved by
14 the Engineer.

15 For metal stay-in-place forms, do not place concrete on the forms to a depth greater than
16 12 inches above the top of the forms. Do not drop concrete more than 3 feet above the top
17 of the forms, beams or girder. Keep the top surface of prestressed concrete panels clean.
18 Thoroughly inspect panels and remove any foreign matter, oil, grease or other
19 contaminants either with a high pressure water blast or sand blast. Saturate the top surface
20 of the prestressed concrete panels by thoroughly wetting the top surface with water for at
21 least 2 hours before placing the CIP concrete slab. Do not allow the wetted panel surface
22 to dry and remove all puddles and ponds of water from the surface of the panels and top of
23 girder flanges before placing the CIP concrete slab.

24 Obtain a smooth riding surface of uniform texture, true to the required grade and cross
25 section, on all bridge decks.

26 Do not place bridge deck concrete until the Engineer is satisfied that adequate personnel
27 and equipment are present to deliver, place, spread, finish and cure the concrete within the
28 scheduled time; that experienced finishing machine operators and concrete finishers are
29 employed to finish the deck; and that weather protective equipment and all necessary
30 finishing tools and equipment are on hand at the site of the work and in satisfactory
31 condition for use. Between April 15 and October 15, begin placing the bridge deck
32 concrete as early as practical to allow the work to be accomplished during the cooler hours
33 when forms, beams and reinforcing steel are at ambient air temperatures.

34 Unless otherwise permitted, set the rate of concrete placement and use a set retarder such
35 that the concrete remains workable until the entire operation of placing, screeding,
36 rescreeding, surface testing and corrective measures where necessary are complete. Use
37 of a set retarder is waived when conditions clearly indicate it is not needed.

38 Place concrete in the deck when the concrete temperature at the time of placement is at
39 least 50°F and no more than 90°F, except where other temperatures are required by
40 Article 420-7.

41 Place concrete at a minimum rate of 35 cubic yards per hour.

42 Place and firmly secure supports for screeds or finishing machines before beginning
43 placement of concrete. Set supports to elevations necessary to obtain a bridge roadway
44 floor true to the required grade and cross section, and make allowance for anticipated
45 settlement. Use supports of a type that upon installation, no springing or deflection occurs
46 under the weight of the finishing equipment. Locate the supports such that finishing
47 equipment operates without interruption over the entire bridge deck.

48 Immediately before placing bridge deck concrete, check all falsework and make all
49 necessary adjustments. Provide suitable means such as telltales to permit ready

1 measurement by the Engineer of deflection as it occurs. Unless otherwise permitted, do
2 not adjust the profile grade-line for any of the forming types used.

3 Cast the concrete in accordance with the pour sequence shown in the plans, unless
4 otherwise approved by the Engineer. Place concrete in a continuous manner between
5 headers. Use approved screeds, screed supports and screeding methods.

6 **(B) Finishing**

7 Unless otherwise specified or permitted, use self-propelled mechanically operated
8 longitudinal or transverse screeds for finishing bridge deck. Do not use vibratory screeds
9 unless specifically approved. Use readily adjustable screeds with sufficient rigidity and
10 width to strike-off the concrete surface at the required grade. Do not use aluminum strike-
11 off elements of screeds and hand tools used for finishing concrete.

12 Furnish personnel and equipment necessary to verify the screed adjustment and operation
13 before beginning concrete placement.

14 Unless otherwise permitted, do not use longitudinal screeds for pours greater than 85 feet
15 in length. Place sufficient concrete ahead of the screeded area to assure all dead load
16 deflection occurs before final screeding.

17 When using a transverse screed on a span with a skew angle less than 75° or more than
18 105°, orient and operate the truss or beam supporting the strike-off mechanism parallel to
19 the skew. Position the strike-off parallel to the centerline of bridge and make the leading
20 edge of concrete placement parallel to the skew. If approved, operate at a reduced skew
21 angle on very wide or heavily skewed spans where the distance between screed supports
22 exceeds 100 feet.

23 Orient and operate transverse screeds used on spans with skew angles between 75° and
24 105° parallel to the skew or perpendicular to the centerline of bridge. Position the strike-
25 off parallel to the centerline of bridge. Before placing concrete, verify the adjustment and
26 operation of the screed as directed by operating the screed over the entire area and across
27 all end bulkheads. Check the floor thickness and cover over reinforcing steel shown in the
28 plans and make adjustments as necessary. For crowned decks that are finished on a skew,
29 use the manufacturer's recommended skew correction device and procedures.

30 During the screeding operation, keep an adequate supply of concrete ahead of the screed
31 and maintain a slight excess immediately in front of the screed. Operate the screed to
32 obtain a substantially uniform surface finish over the entire bridge deck. Do not allow
33 workmen to walk on the concrete after screeding. Use at least 2 approved work bridges to
34 provide adequate access to the work for finishing, testing, straightedging, making
35 corrections, fogging, applying curing medium and for other operations requiring access to
36 the bridge deck. Support the work bridges outside the limits of concrete placement.

37 The Engineer will take random depth checks of deck thickness and cover over reinforcing
38 steel over the entire placement area and directly behind the screed in the fresh concrete. If
39 depth checks indicate variations from plan dimensions in excess of 1/2 inch, take corrective
40 action immediately.

41 Immediately following the screed and while the concrete is still workable, test the floor
42 surface for irregularities with a 10 foot straightedge. Test by holding the straightedge in
43 successive positions parallel to the centerline of bridge and in contact with the floor surface.
44 Test the surface approximately 18 inches from the curb line, at the centerline of each lane
45 and at the centerline of 2 lane bridges. Advance along the bridge in stages of not more than
46 half the length of straightedge. Test the surface transversely at the ends, quarter points and
47 center of the span as well as other locations as directed.

48 Immediately correct areas showing depressions or high spots of more than 1/8 inch in
49 10 feet by filling depressions with fresh concrete or by striking off high spots. Make
50 corrections with hand tools or a combination of hand tools and rescreeding. Do not use the

Section 420

1 straightedge as a finishing tool. Give surfaces adjacent to expansion joints special attention
2 to assure they meet the required smoothness.

3 Provide on-site fogging equipment which is capable of applying water to the concrete in
4 the form of a fine fog mist in sufficient quantity to curb the effects of rapid evaporation of
5 mixing water from the concrete on the bridge deck resulting from wind, high temperature,
6 low humidity or a combination of these factors. Do not apply the moisture from the nozzle
7 under pressure directly upon the concrete and do not allow it to accumulate on the surface
8 in a quantity sufficient to cause a flow or wash the surface. Maintain responsibility for
9 determining when to apply the fog mist but apply it when directed.

10 Keep readily available on site an adequate supply of suitable coverings that will protect the
11 surface of the freshly placed bridge deck from rain. After the water sheen disappears from
12 the surface and before the concrete becomes non-plastic, finish the surface of the floor
13 further by burlap dragging, fine bristle brooming, belting or other acceptable method which
14 produces an acceptable uniform texture.

15 Do not use membrane curing compound unless approved. Cure the concrete using the
16 water method in accordance with Subarticle 420-15(B), with the following exceptions.
17 Before reaching initial set, place a curing medium consisting of burlap under polyethylene
18 sheets or another approved material on the deck and keep moist for at least 7 curing days.
19 Wet the burlap or other approved curing medium before placing on the deck. Apply water
20 to the curing medium through soaker hoses or another approved method. Apply water in
21 amounts to keep the medium moist but do not allow the water to flow or pond on the deck.

22 After curing the concrete, test the finished surface with an approved rolling straightedge
23 designed, constructed and adjusted to accurately indicate or mark all floor areas which
24 deviate from a plane surface by more than 1/8 inch in 10 feet. Remove all high areas in
25 the hardened surface in excess of 1/8 inch in 10 feet with an approved grinding or cutting
26 machine. Where variations are such that the corrections will extend below the limits of the
27 top layer of grout, seal the corrected surface with an approved sealing agent as required. If
28 approved, correct low areas in an acceptable manner. Produce corrected areas that have a
29 rough, uniform texture and present neat patterns. In all cases, maintain at least 2 inches of
30 concrete cover over reinforcement.

31 Unless otherwise indicated in the plans, groove bridge decks. Produce grooves
32 perpendicular to the centerline of bridge. Do not start grooving until final straightedging
33 and, when necessary, acceptable corrective measures are complete. Cut grooves into the
34 hardened concrete using a mechanical saw device, which leaves rectangular grooves
35 1/8 inch wide and 3/16 inch deep. Produce grooves that have a center to center spacing of
36 3/4 inch. Do not groove the deck surface within 18 inches of the gutter lines and 2 inches
37 of expansion joints or elastomeric concrete in expansion joint blockouts. On skewed
38 bridges, ungrooved triangular areas adjacent to the joint are permitted, provided the
39 distance from the centerline joint to the nearest groove, as measured parallel to the
40 centerline of roadway, does not exceed 18 inches. Between expansion joints on
41 horizontally curved bridges, periodically adjust the grooving operation such that adjacent
42 grooves are separated by no more than 3 inches along the outer radius of the bridge deck.

43 Continuously remove all slurry or other residue resulting from the grooving operation from
44 the bridge deck by vacuum pick-up or other approved methods. Prevent slurry from
45 flowing into deck drains or onto the ground or body of water under the bridge. Dispose of
46 all residue by an approved method.

47 (C) Inspection

48 After the deck concrete is in place for a minimum period of 2 days, test the concrete for
49 soundness and bonding of the metal stay-in-place forms by sounding with a hammer as
50 directed. For at least 25% of the individual form panels, as selected by the Engineer,
51 hammer test over the entire area of the panel. If areas of doubtful soundness are disclosed

1 by this procedure, remove the forms from such areas for visual inspection after the pour
2 attains a minimum compressive strength of 2,400 psi. Remove the stay-in-place forms.

3 At locations where sections of the forms are removed, do not replace the forms, but repair
4 the adjacent metal forms and supports to present a neat appearance and assure their
5 satisfactory retention. As soon as the forms are removed, allow the Engineer to examine
6 for cavities, honeycombs and other defects. If irregularities are found, and in the opinion
7 of the Engineer these irregularities do not justify rejection of the work, repair the concrete
8 as directed. If the concrete where the forms are removed is unsatisfactory, remove
9 additional forms, as necessary, to inspect and repair the slab. Modify the methods of
10 construction as required to obtain satisfactory concrete in the slabs. Remove and repair all
11 unsatisfactory concrete as directed.

12 Provide all facilities as are reasonably required for the safe and convenient conduct of the
13 Engineer's inspection procedures.

14 **420-15 CURING CONCRETE**

15 **(A) General**

16 Unless otherwise specified in the contract, use any of the following methods except for
17 membrane curing compounds on bridge deck and approach slab, or on concrete which is
18 to receive epoxy protective coating in accordance with Article 420-18. Advise the
19 Engineer before using the proposed method. Ensure all material, equipment and labor
20 necessary to promptly apply the curing are on the site before placing any concrete. Cure
21 all patches in accordance with this article. Improperly cured concrete is considered
22 defective.

23 Define "curing temperature" as the atmospheric temperature taken in the shade away from
24 artificial heat, with the exception that it is the temperature surrounding the concrete where
25 the concrete is protected in accordance with Article 420-7.

26 Define a "curing day" as any consecutive 24-hour period, beginning when the manipulation
27 of each separate mass is complete, during which the air temperature adjacent to the mass
28 does not fall below 40°F.

29 After placing the concrete, cure it for 7 full curing days.

30 Take all reasonable precautions to prevent plastic shrinkage cracking of the concrete,
31 including the provision of wind screens, fogging, application of an approved temporary
32 liquid moisture barrier or the early application of temporary wet coverings to minimize
33 moisture loss.

34 Repair, remove or replace as directed concrete containing plastic shrinkage cracks.

35 **(B) Water Method**

36 Keep the concrete continuously wet by the application of water, through soaker hoses or
37 another approved method, for a minimum period of 7 curing days after placing the
38 concrete.

39 When using cotton mats, rugs, carpets, earth blankets or sand blankets to retain the
40 moisture, keep the entire surface of the concrete damp by applying water with a nozzle that
41 so atomizes the flow that a mist and not a spray is formed, until the surface of the concrete
42 is covered with the curing medium. Do not apply the moisture from the nozzle under
43 pressure directly upon the concrete and do not allow it to accumulate on the concrete in a
44 quantity sufficient to cause a flow or wash the surface. At the expiration of the curing
45 period, clear the concrete surfaces of all curing mediums.

Section 420

1 (C) Membrane Curing Compound Method

2 Spray the entire surface of the concrete uniformly with a curing compound that is on the
3 NCDOT APL. Use clear curing compound to which a fugitive dye is added for color
4 contrast on bridge superstructures, substructures and retaining walls. Use either white
5 pigmented or clear curing compound on culverts.

6 Apply the membrane curing compound after the surface finishing is complete and
7 immediately after the free surface moisture disappears. During the finishing period, protect
8 the concrete by applying water with the fogging equipment specified in Subarticle 420-
9 15(B).

10 Seal the surface with a single uniform coating of the specified type of curing compound
11 applied at the rate of coverage recommended by the manufacturer or as directed, but at
12 least one gallon per 150 square feet of surface area.

13 At the time of use, thoroughly mix the compound with the pigment uniformly dispersed
14 throughout the vehicle. If the application of the compound does not result in satisfactory
15 coverage, stop the method and begin water curing, as set out above, until the cause of the
16 defective work is corrected.

17 At locations where the coating shows discontinuities, pinholes or other defects, or if rain
18 falls on the newly coated surface before the film dries sufficiently to resist damage, apply
19 an additional coat of the compound at the same rate specified herein immediately after the
20 rain stops.

21 Completely remove any curing compound adhering to a surface to which new concrete is
22 to be bonded by sandblasting, steel wire brushes, bush hammers or other approved means.

23 Protect the concrete surfaces to which the compound is applied from abrasion or other
24 damage that results in perforation of the membrane film for 7 curing days after placing the
25 concrete. If the film of membrane compound is damaged or removed before the expiration
26 of 7 curing days, immediately cure the exposed concrete by the water method until the
27 expiration of the 7 curing days or until applying additional curing compound.

28 If the application of curing compound is delayed, immediately start applying water as
29 provided in Subarticle 420-15(B) and continue until resuming or starting application of the
30 compound.

31 (D) Polyethylene Sheeting Method

32 Wet the exposed finished surface of concrete with water, using a nozzle that so atomizes
33 the flow to form a mist and not a spray, until the concrete sets, after which place the white
34 opaque polyethylene sheeting. Continue curing for 7 curing days after the concrete is
35 placed. If the sheeting is damaged or removed before the expiration of 7 curing days,
36 immediately cure the exposed concrete by the water method until placing additional
37 sheeting or until after 7 curing days.

38 Use sheeting which provides a complete continuous cover of the entire concrete surface.
39 Lap the sheets at least 12 inches and securely weigh down or cement them together to
40 provide a waterproof joint.

41 If any portion of the sheets is broken or damaged before the expiration of the curing period,
42 immediately repair the broken or damaged portions with new sheets properly secured in
43 place.

44 Do not use sections of sheeting damaged to such an extent as to render them unfit for curing
45 the concrete.

1 **(E) Forms-in-Place Method**

2 As an option, cure surfaces of concrete by retaining the forms in place for at least 7 curing
3 days after placing the concrete.

4 If electing to leave forms in place for a part of the curing period and using one of the other
5 methods of curing included in this article for the remainder of the curing period, keep the
6 concrete surfaces wet during transition between curing methods.

7 **420-16 REMOVAL OF FORMS AND FALSEWORK**

8 Do not remove forms and falsework for the portions of structures listed in Table 420-1 until the
9 concrete attains the compressive strength shown, as evidenced by approved, nondestructive test
10 methods or by conducting compressive strength tests in accordance with AASHTO T 22 and
11 T 23. Furnish approved equipment used for nondestructive tests.

TABLE 420-1 MINIMUM CONCRETE STRENGTH FOR REMOVAL OF FORMS AND FALSEWORK	
Portion of Structure	Minimum Compressive Strength, psi
Bridge Deck Slabs and overhangs for beam and girder bridges	3,000
Arch culverts, top slabs of box culverts, walls of box culverts when cast monolithically with the top slab or when the wall is 10 ft or more in height, caps and struts of substructures, diaphragms and other members subject to dead load bending	2,400

12 Remove forms for ornamental work, railing, parapets, walls less than 10 feet in height, curb
13 faces on bridge superstructures and vertical surfaces that do not carry loads, any time after
14 3 hours if the concrete is set sufficiently to permit form removal without damage to the member.

15 Do not remove forms used for insulation before the expiration of the minimum protective period
16 required in Article 420-7.

17 Do not remove formwork for bent diaphragms until after casting deck concrete and allowing
18 the concrete to attain a strength of 2,400 psi. As an option, to remove support from bent
19 diaphragms before casting deck concrete, submit for approval a method to prevent the
20 possibility of bent diaphragms slipping downward.

21 When removing forms before the end of the required curing period, use other curing methods
22 to complete the required curing. When removing forms from underneath slabs before the end
23 of the curing period, complete the curing in accordance with Subarticle 420-15(C).

24 **420-17 SURFACE FINISH**

25 **(A) General**

26 Finish all concrete as required by this article except for bridge decks. Use the type of finish
27 called for in Subarticles 420-17(B) through 420-17(D), except where the contract requires
28 a Class 1 or Class 2 surface finish. Apply epoxy protective coating as required by
29 Article 420-18.

30 **(B) Ordinary Surface Finish**

31 Apply ordinary surface finish to all formed concrete surfaces either as a final finish or
32 preparatory to a higher class finish. On surfaces backfilled or otherwise covered, or
33 enclosed surfaces, the removal of fins and form marks, the rubbing of grouted areas to
34 a uniform color, and the removal of stains and discoloration, is not required. Use
35 an ordinary surface finish, unless otherwise required, as final finish on all surfaces.

Section 420

1 During the placing of concrete, take care to use methods of compaction that result in
2 a surface of even texture free from voids, water or air pockets, and that the coarse aggregate
3 is forced away from the forms to leave a mortar surface.

4 Immediately after removing the forms, clean and fill with grout all pockets, depressions,
5 honeycombs and other defects as directed. Remove all form ties or metal spacers to a depth
6 of at least 1 inch below the surface of the concrete then clean and fill the resulting holes or
7 depressions with grout. As an option, break off flush with the concrete surface those metal
8 devices with exposed cross-sectional area not exceeding 0.05 square inches on surfaces
9 permanently in contact with earth fill. Unless otherwise required, remove fins and other
10 projections flush with the concrete surface. Remove stains and discoloration.

11 Use grout for patching which contains cement and fine aggregate from the same sources
12 and in the same proportions as used in the concrete. Cure the grout in accordance with
13 Article 420-15. After the grout has thoroughly hardened, rub the surface with
14 a carborundum stone as required to match the texture and color of the adjacent concrete.

15 Obtain the final finish for railing in one of the following ways:

16 (1) Brush Finish

17 After striking off the concrete as described above, have skilled and experienced
18 concrete finishers thoroughly work and float the surface with a wooden, canvas or cork
19 float. Before this last finish sets, lightly stroke the surface with a fine brush to remove
20 the surface cement film, leaving a fine grained, smooth, but sanded texture.

21 (2) Float Finish

22 Finish the surface with a rough carpet float or other suitable device leaving the surface
23 even, but distinctly sandy or pebbled in texture.

24 **(C) Unformed Surfaces Not Subjected to Wear**

25 Finish all unformed surfaces not subjected to wear by placing an excess of material in the
26 forms and removing or striking off such excess with a wooden template, forcing the coarse
27 aggregate below the mortar surface. Do not use mortar topping for concrete railing caps
28 and other surfaces falling under this classification.

29 **(D) Sidewalk, Islands or Stairways on Bridges**

30 Strike off and compact fresh concrete until a layer of mortar is brought to the surface.
31 Finish the surface to grade and cross section with a float, trowel smooth and finish with
32 a broom. If water is necessary, apply it to the surface immediately before brooming.
33 Broom transverse to the line of traffic.

34 **(E) Class 1 Surface Finish**

35 In addition to Subarticle 420-17(B), as soon as the pointing sets sufficiently to permit,
36 thoroughly wet the entire surface with a brush and rub with a coarse carborundum stone or
37 other equally good abrasive, bringing the surface to a paste. Continue rubbing to remove
38 all form marks and projections, producing a smooth dense surface without pits or
39 irregularities.

40 Carefully spread or brush uniformly over the entire surface the material ground to a paste
41 by rubbing and allowing it to take a reset. After rubbing, cure the surface for 7 curing days.
42 Obtain the final finish by thoroughly rubbing with a fine carborundum stone or other
43 equally good abrasive. Continue this rubbing until the entire surface is of a smooth texture
44 and uniform color.

45 **(F) Class 2 Surface Finish**

46 In addition to Subarticle 420-17(B), after the pointing sets sufficiently to permit,
47 thoroughly wet and rub the entire surface with a coarse carborundum stone or other equally

1 good abrasive to bring the surface to a smooth texture and remove all form marks. Finish
 2 the paste formed by rubbing as described above by carefully stroking with a clean brush,
 3 or spread it uniformly over the surface and allow it to take a reset, then finish it by floating
 4 with a canvas, carpet-faced or cork float; or rub down with dry burlap.

5 **420-18 EPOXY COATING**

6 **(A) General**

7 Use a Type 4A flexible and moisture insensitive epoxy coating in accordance with
 8 Section 1081. Provide a Type 3 material certification in accordance with Article 106-3
 9 showing the proposed epoxy meets Type 4A requirements.

10 **(B) Surfaces**

11 Apply the epoxy protective coating to the top surface area, including chamfer area of bent
 12 caps under expansion joints and of end bent caps, excluding areas under elastomeric
 13 bearings. For cored slab and box beam bridges, do not apply the epoxy protective coating
 14 to the bent or end bent caps.

15 Use extreme care to keep the area under the elastomeric bearings free of the epoxy
 16 protective coating. Thoroughly clean all dust, dirt, grease, oil, laitance and other
 17 objectionable material from the concrete surfaces to be coated. Air blast all surfaces
 18 immediately before applying the protective coating.

19 Use only cleaning agents approved by the Engineer.

20 **(C) Application**

21 Apply epoxy protective coating only when the air temperature is at least 40°F and rising,
 22 but less than 95°F and the surface temperature of the area to be coated is at least 40°F, and
 23 in accordance with the manufacturer's recommendations. Remove any excess or free
 24 standing water from the surfaces before applying the coating. Apply one coat of epoxy
 25 protective coating at a rate such that it covers between 100 and 200 square feet per gallon.

26 Under certain combinations of circumstances, the cured epoxy protective coating may
 27 develop an oily condition on the surface due to amine blush. This condition is not
 28 detrimental to the applied system.

29 Apply the coating so the entire designated surface of the concrete is covered and all pores
 30 are filled. To provide a uniform appearance, use the exact same material on all visible
 31 surfaces.

32 **420-19 PROTECTION OF SUBSTRUCTURE CONCRETE FROM RUST STAINS**

33 To prevent unpainted structural steel from staining substructure concrete, protect all final
 34 exposed areas of the concrete from rust stains until casting the bridge deck and sealing the
 35 expansion joints. Use an approved method for protecting the concrete.

36 Instead of the above, remove the stains by approved methods and cleaning agents.

37 **420-20 PLACING LOAD ON STRUCTURE MEMBERS**

38 Do not place beams or girders on concrete substructures until the concrete in the substructure
 39 develops a minimum compressive strength of 2,400 psi.

40 In addition to Article 410-8, do not place backfill or fill for retaining walls, abutments, piers,
 41 wing walls or other structures that will retain material to an elevation higher on one side than
 42 the other until the concrete develops the minimum specified strength for the class of concrete
 43 required for the structure as listed in Table 1000-1.

44 In addition to Article 414-7, do not place backfill or embankment behind the walls of culverts
 45 to an elevation higher than one foot above the top of footing or bottom slab until after placing

Section 420

- 1 the top slab and until the concrete develops the minimum required strength for the class of
2 concrete specified as listed in Table 1000-1.
- 3 Do not pour walls of culverts until floor slabs develop a minimum compressive strength of
4 2,400 psi. Unless independently supported, do not pour roof slabs of culverts until the concrete
5 in the culvert walls develops a minimum compressive strength of 2,400 psi.
- 6 Do not operate heavy equipment over any culvert type until properly backfilling with a
7 minimum cover of 3 feet.
- 8 Adhere to the following time and strength requirements for erection of forms and construction
9 of superimposed bridge substructure elements:
- 10 (A) Wait at least 12 hours between placing footing or Drilled Pier concrete and erecting column
11 forms.
- 12 (B) Wait at least 24 hours between placing footing or Drilled Pier concrete and placing column
13 concrete.
- 14 (C) Wait at least 72 hours between placing column concrete and beginning erection of cap
15 forms or until column concrete attains a compressive strength of at least 1,500 psi.
- 16 (D) Wait at least 96 hours between placing column concrete and placing cap concrete or until
17 column concrete attains a compressive strength of at least 2,000 psi.
- 18 Do not place vehicles or construction equipment on a bridge deck until the deck concrete
19 develops the minimum specified 28 day compressive strength and attains an age of at least
20 7 curing days. The screed may be rolled across a previously cast bridge deck if the entire pour
21 has not achieved initial set. If any portion of the deck concrete has achieved initial set, the
22 screed cannot be rolled across the bridge deck until the concrete develops a compressive
23 strength of at least 1,500 psi. Construction equipment is allowed on bridge approach slabs after
24 the slab concrete develops a compressive strength of at least 3,000 psi and attains an age of at
25 least 7 curing days. See Subarticle 420-15(A) for the definition of “curing day.”
- 26 Provide evidence that the minimum compressive strengths referred to above are satisfied by
27 nondestructive test methods approved in writing or by compressive strength tests made in
28 accordance with AASHTO T 22 and T 23. Furnish approved equipment for use in
29 nondestructive tests.
- 30 Do not place construction equipment, materials or other construction loads on any part of the
31 structure without permission. Submit the proposed plans for placing construction loads on the
32 structure for review, comments and acceptance.
- 33 Do not abruptly start or stop concrete trucks on bridge deck. Do not mix concrete in the truck
34 while on the deck. While machine forming concrete barrier rail or parapet, do not place any
35 equipment on the deck except one concrete truck and the equipment necessary to place the
36 concrete. Allow concrete barrier rail and parapet to attain a compressive strength of 3,000 psi
37 before placing any traffic on the deck other than equipment referenced above necessary to
38 construct any remaining barrier rail or parapet.
- 39 **420-21 MEASUREMENT AND PAYMENT**
- 40 *Class ____ Concrete* will be measured and paid as the number of cubic yards of each class that
41 is incorporated into the completed and accepted structure except as indicated below. The
42 number of cubic yards of concrete is computed from the dimensions shown in the plans or from
43 revised dimensions authorized by the Engineer. When the foundation material is rock, the
44 number of cubic yards of footing concrete is computed by the average end area method using
45 the lower limits established for foundation excavation. The volume of concrete displaced by
46 piles other than steel piles is not included in the quantity to be paid.

Section 420

1 *Grooving Bridge Floors* will be measured and be paid as the actual number of square feet shown
2 in the plans. Where the plans are revised, the quantity to be paid is the quantity shown on the
3 revised plans.

4 *Reinforced Concrete Deck Slab and Reinforced Concrete Deck Slab (Sand Lightweight*
5 *Concrete)* will be measured and paid as the number of square feet shown in the plans. No
6 separate payment will be made for furnishing and incorporating calcium nitrite corrosion
7 inhibitor when required by the plans.

8 The plan quantity is determined from the horizontal surface area using the nominal dimensions
9 and configuration shown in the Layout Sketch for computing surface area as shown in the plans.
10 Measure the transverse dimension out to the slab including raised median and sidewalk sections.
11 Consider concrete diaphragms a portion of the slab. When required by the plans, consider
12 curtain walls, raised medians, sidewalks, pavement brackets, end posts, sign mounts, luminaire
13 brackets and any other concrete appurtenances or expansion joint material a portion of the slab.
14 Concrete barrier rail (including curved end blocks for the concrete barrier rail, when used) is
15 not considered a portion of the slab.

16 For structural steel spans, the quantities of concrete and reinforcing steel shown in the plans are
17 based on a metal stay-in-place forming method. These quantities include amounts for
18 1 inch additional concrete due to the corrugation of the metal forms, concrete diaphragms and,
19 when required by the plans, curtain walls, pavement brackets, end posts, raised medians,
20 sidewalks and other required attachments based on the profile grade and plan camber of the
21 girders.

22 For prestressed concrete girder spans, the quantities of concrete and reinforcing steel shown in
23 the plans are based on the forming method detailed in the plans. These quantities include
24 concrete diaphragms, and, when required by the plans, curtain walls, pavement brackets, end
25 posts, raised medians, sidewalks and other required attachments based on the profile grade and
26 plan camber of girders. The quantities include either CIP slab concrete when the plans are
27 detailed for the prestressed concrete panel forming method or amounts for 1 inch additional
28 concrete due to the corrugation of the metal forms when the plans are detailed for the fabricated
29 metal stay-in-place form forming method and based on the profile grade and plan camber of the
30 girders.

31 No measurement will be made for concrete or reinforcing steel due to a variation in camber of
32 the girders from the plan camber or for additional quantities required by optional methods of
33 forming.

34 No separate measurement or payment will be made for furnishing, installing and testing anchor
35 bolts or dowels. Payment at the contract unit prices for the various pay items will be full
36 compensation for all materials, equipment, tools, labor and incidentals necessary to complete
37 the work.

38 These prices and payments will be full compensation for all items required to construct concrete
39 structures. Remove forms and repair, remove or replace, as directed, concrete containing plastic
40 shrinkage cracks or other defects at no cost to the Department.

41 Payment will be made under:

Pay Item	Pay Unit
Class ____ Concrete	Cubic Yard
Grooving Bridge Floors	Square Foot
Reinforced Concrete Deck Slab	Square Foot
Reinforced Concrete Deck Slab (Sand Lightweight Concrete)	Square Foot

Section 422

**SECTION 422
BRIDGE APPROACH SLABS**

422-1 DESCRIPTION

Construct reinforced concrete slabs at bridge approaches, including curbs and sidewalks; furnish and place temporary slope drains; remove existing pavement or approach slab; furnish and place concrete, reinforcing steel, joint filler, sealer and other materials; finish and cure concrete.

Construct the approach slabs after the adjacent bridge deck is cast and before constructing concrete barrier rails or sidewalks.

422-2 MATERIALS

Refer to Division 10.

Item	Section
Curing Agents	1026
Joint Filler	1028-1
Joint Sealer	1028-3
Portland Cement Concrete	1000
Reinforcing Steel	1070

422-3 CONSTRUCTION METHODS

Construct the subgrade and approach fills in accordance with the contract.

Apply Section 420 to all concrete except as otherwise provided herein. Use Class AA concrete.

Finish and groove the reinforced concrete bridge approach slabs in accordance with Article 420-14; however, for approach slabs with a length of 15 feet or less, the contractor may submit an alternate screed type for approval. Do not groove the approach slabs when grooving the bridge deck is not required.

When grooving is not required, apply a broomed texture to the approach slabs before the concrete becomes non-plastic. Cure bridge approach slabs in the same manner as specified for bridge decks in Subarticle 420-15(B).

Temporarily cover or fill the opening in the joint at the end bent until installation of the joint seal, if applicable. Make sure that the covering or filler provides for drainage off the bridge deck and keeps debris out of the joint and off the end bent cap.

When shown in the plans, construct sidewalks on bridge approach slabs in accordance with plan details. Do not construct sidewalks until sawing the joint at the end bent. Finish the concrete in accordance with Subarticle 420-17(D).

Construct temporary slope drains in accordance with Section 1622. Locate this erosion control item as shown in the Structure plan detail.

Backfill around the approach slabs as soon as practical to prevent erosion adjacent to the slab.

422-4 MEASUREMENT AND PAYMENT

The price and payment below will be full compensation for all items required to construct bridge approach slabs including, but not limited to, those items contained in Article 422-1.

Temporary Slope Drains will be paid in accordance with Article 1622-4.

Bridge Approach Slabs, Sta. ____ will be paid at the contract lump sum price.

Grooving bridge approach slabs will be paid at the contract unit price per square foot for *Grooving Bridge Floors* as provided in Article 420-21.

1 Payment will be made under:

Pay Item	Pay Unit
Bridge Approach Slabs, Sta. _____	Lump Sum

2 **SECTION 425**
3 **FABRICATING AND PLACING REINFORCEMENT**

4 **425-1 DESCRIPTION**

5 Furnish, fabricate and place steel reinforcement other than wire reinforcement, including all
6 related materials such as tie wire, separators, wire bar supports, mechanical butt splices for
7 reinforcing steel, and other material for fastening the reinforcing steel in place; galvanize and/or
8 coat where required; and fabricate, cut, bend, place and splice the reinforcement in conformity
9 with the shape and dimensions shown in the plans and as specified in these *Standard*
10 *Specifications*. Provide epoxy coated reinforcing steel where indicated in the plans.

11 **425-2 MATERIALS**

12 Refer to Division 10.

Item	Section
Epoxy Coated Reinforcing Steel	1070-7
Epoxy Coated Spiral Column Reinforcing Steel	1070-8
Mechanical Butt Splices for Reinforcing Steel	1070-9
Reinforcing Wire	1070-3
Spiral Column Reinforcing Steel	1070-8
Steel Bar Reinforcement	1070-2
Wire Bar Supports	1070-4
Wire Reinforcement	1070-3

13 **425-3 PROTECTION OF MATERIALS**

14 Protect steel reinforcement at all times from damage and make sure it is free from dirt, dust,
15 loose mill scale, loose rust, paint, oil or other foreign materials at the time of placement in the
16 work.

17 Store epoxy coated reinforcing steel bars at the project site at least one foot above the ground
18 on wooden or padded supports placed 10 feet apart, and completely cover with an opaque cloth,
19 canvas or woven fiber reinforced polyethylene white tarp. Do not use solid plastic sheeting.
20 Cover the bars such that adequate ventilation is provided to prevent condensation from forming
21 on the material during storage, and completely protect the bars from direct sunlight. Do not
22 allow water to pond under the epoxy coated reinforcing steel.

23 Store epoxy coated bars as close as possible to their final location in the structure to prevent
24 coating damage from unnecessary handling.

25 Do not store epoxy coated bars at the project site from one construction season until the
26 following construction season unless stored in a waterproof enclosure.

27 **425-4 PLACING AND FASTENING**

28 Accurately place reinforcement as shown in the plans and secure firmly in position by wiring
29 at intersections and using metal bar supports, precast mortar blocks or other approved devices
30 of sufficient strength and location to resist distortion.

31 Tie reinforcing bars at all intersections except where spacing is less than one foot in both the
32 longitudinal and transverse directions, in which case tie at alternate intersections, as an option.
33 Securely tie each intersection of vertical reinforcing steel and spiral reinforcement for drilled
34 piers. Use plastic or epoxy coated spiral spacers with epoxy coated spiral column reinforcing
35 steel.

Section 425

1 Provide wire bar supports for reinforcing steel in accordance with Article 1070-4 of the proper
2 height to provide the distance from the forms and the proper spacing between rows of steel as
3 indicated in the plans. When required by the plans, epoxy coat bar supports in accordance with
4 Article 1070-7. Provide rust-proofed supporting legs for wire bar supports that rest on the forms
5 as provided in Article 1070-4. When providing rust proofing by plastic protection, make sure
6 that the dipped plastic coating or premolded plastic tips are intact on each bar support leg while
7 concrete is placed.

8 Cast blocks, of approved shape and dimensions, for holding vertical reinforcement in position
9 from 1:2 mortar or concrete of the same mix used in the member being cast. Cure precast
10 blocks in accordance with Article 420-15 for the water method or the polyethylene sheeting
11 method. To hold vertical bars in position, use precast blocks which have embedded wires
12 extending from the block a sufficient distance to tie to the bar.

13 Roll wire reinforcement flat before placing concrete, unless otherwise shown in the plans. Hold
14 wire reinforcement firmly in place against vertical and transverse movement by acceptable
15 means.

16 Weld reinforcing steel in accordance with the American Welding Society's *Reinforcing Steel*
17 *Welding Code AWS D1.4* and only where required in the contract. Obtain written approval for
18 additional welding. Do not use tack welds unless approved.

19 Exercise extreme care when transporting, handling, placing and tying epoxy coated reinforcing
20 steel to prevent damage to the coating.

21 Immediately before placing epoxy coated reinforcing steel bars in the forms, visually inspect
22 each bar for coating damage. Ensure that all coating damaged by any cause is satisfactorily
23 repaired, including hairline cracks and that each bar, including bar ends, is completely
24 encapsulated in epoxy coating or patching material at the time of concrete placement. Make
25 coating repairs as described in Subarticle 1070-7. Do not coat more than 5% of surface area on
26 each bar with patching material including patching due to damage to the coating by the coater,
27 fabricator, transporter or contractor. The patching limits do not include holiday repairs,
28 overspray and coated ends of bars.

29 Do not expose epoxy coated reinforcing steel to the weather for more than 30 days after placing
30 in the forms. If the concrete is not placed within 30 days, cover the epoxy coated reinforcing
31 steel as required by Article 425-3.

32 Do not place reinforcement while placing concrete in the member involved.

33 Place, allow inspection and obtain approval for reinforcement in any member before placing
34 concrete.

35 **425-5 SPLICING**

36 **(A) General**

37 Furnish all reinforcement in the full lengths indicated in the plans.

38 Do not splice bars without written approval except where shown in the plans.

39 Provide splice lengths as shown in the plans.

40 Overlap sheets of wire reinforcement with each other as shown in the plans or approved
41 working drawings to maintain a uniform strength and securely fastened to each other at the
42 ends and edges. Lap at least the dimension of one wire reinforcement.

43 **(B) Mechanical Butt Splices**

44 Provide mechanical butt splices for reinforcing steel in accordance with Article 1070-9
45 when called for in the plans.

1 Splice the bars in accordance with the manufacturer's recommendations using the
 2 manufacturer's required accessories as approved by the Engineer. Use mechanical butt
 3 splices only where specified in the plans. Any additional splices require approval.

4 **425-6 MEASUREMENT AND PAYMENT**

5 *Reinforcing Steel or Epoxy Coated Reinforcing Steel* will be measured and paid as the number
 6 of pounds of steel bar reinforcement, reinforcing wire and plain rods shown in the plans as
 7 being necessary to complete the work. Where the plans are revised, the quantity to be paid is
 8 the quantity shown on the revised plans. Where directed to deviate from the plans; changing
 9 the quantities of steel bar reinforcement, reinforcing wire and plain rods necessary to complete
 10 the project; the quantity shown in the plans is increased or decreased by the theoretical
 11 computed weight of reinforcing steel added or subtracted by the change.

12 *Spiral Column Reinforcing Steel or Epoxy Coated Spiral Column Reinforcing Steel* will be
 13 measured and paid as the number of pounds of spiral column reinforcing shown in the plans as
 14 being necessary to complete the work. Where the plans are revised, the quantity to be paid is
 15 the quantity shown on the revised plans. Where directed to deviate from the plans; changing
 16 the quantities of steel bar reinforcement, reinforcing wire and plain rods necessary to complete
 17 the project; the quantity shown in the plans is increased or decreased by the theoretical
 18 computed weight of spiral column reinforcing steel added or subtracted by the change.

19 The quantity of reinforcing steel or spiral column reinforcing steel shown in the plans is
 20 an estimate based on the theoretical computed weight of the steel necessary to complete the
 21 work and will be used for pay purposes. No revision in this pay quantity nor any adjustment in
 22 the contract unit price for *Reinforcing Steel or Spiral Column Reinforcing Steel* will be made
 23 except where revisions in the plans affect the quantity of reinforcing steel or spiral column
 24 reinforcing steel necessary to complete the work or where an error has been found in the
 25 estimate of steel shown in the plans.

26 If the elevation of the top of a footing or the tip of a drilled pier is raised by a distance not
 27 exceeding 3 feet, and the reinforcing steel or spiral column reinforcing steel for the substructure
 28 unit has been fabricated before the elevation was raised, no decrease in the quantity of steel to
 29 be paid will be made from the theoretical weight of steel shown in the plans for the original
 30 substructure unit. Under the above circumstances the provisions of Article 109-6 will not apply
 31 as the steel not used in the work shall remain the property of the Contractor and payment for
 32 such steel will be made as provided above. No separate payment will be made for the cost of
 33 cutting off reinforcing steel or spiral column reinforcing steel as payment at the contract unit
 34 price per pound for the item of Reinforcing Steel or Spiral Column Reinforcing Steel will be
 35 full compensation for cutting the steel.

36 There will be no direct payment for reinforcing steel when the basis of payment or
 37 compensation clause applicable to a particular section of the Specifications states that payment
 38 at the contract unit or lump sum prices for the work covered by such section will be full
 39 compensation for furnishing and placing reinforcing steel.

40 No separate payment will be made for the work of furnishing and placing wire reinforcement
 41 as payment at the contract unit price for the item or items covering the structure containing the
 42 wire reinforcement will be full compensation for such work.

43 These prices and payments will be full compensation for all items required to fabricate and
 44 place reinforcement.

45 Payment will be made under:

Pay Item	Pay Unit
Reinforcing Steel	Pound
Epoxy Coated Reinforcing Steel	Pound
Spiral Column Reinforcing Steel	Pound
Epoxy Coated Spiral Column Reinforcing Steel	Pound

1 Before welding, grind the galvanized surface of the portion of the embedded plate and sole plate
2 that require welding. After welding, repair damaged galvanized surfaces in accordance with
3 Article 1076-7.

4 Internal holding pins are required for all shim plates when the contract plans indicate the
5 structure contains the necessary corrosion protection for a corrosive site.

6 Laminated (reinforced) bearing pads shall be repaired utilizing external holding pins via
7 vulcanization. Product data for repair material and a detailed application procedure shall be
8 submitted to the Materials and Tests Unit for approval before use and annually thereafter.

9 **430-6 ERECTION AND INSTALLATION**

10 **(A) General**

11 Erect prestressed concrete members by methods that satisfy the handling requirements
12 specified in Article 430-3.

13 Perform field welding in accordance with Article 1072-18 only when required in the plans.

14 When indicated in the plans, recess the ends of tie rods used in intermediate diaphragms of
15 prestressed concrete girders. Fill these recesses with an approved Type 3 grout to match
16 the neat lines of the girders.

17 When concrete is cast in contact with prestressed members, thoroughly clean and wet the
18 surface of the prestressed member which contacts the fresh concrete for at least 2 hours
19 just before casting the fresh concrete.

20 After casting and finishing all concrete, thoroughly clean the prestressed members.

21 **(B) Cored Slabs**

22 When erecting prestressed cored slabs, place the 0.6 inch diameter transverse post
23 tensioning strands and tension to 43,950 lbs. in each span. Grease the transverse strands
24 and place in a non-corrosive 0.6 inch diameter, 1/16 inch minimum wall thickness black
25 polyethylene pipe meeting ASTM D2239. Do not apply grease or extend the pipe in the
26 area of the recesses at the ends of the tensioning strands where grout is applied. Position
27 the jack and tension along the same axis as the strand. Utilize a double acting jack which
28 tensions the strand and properly seats the wedges after achieving tension. Monitor slabs
29 during tensioning operation. If uplift at bearing location occurs at the bearing location,
30 discontinue tensioning and consult the Engineer. After tensioning the 0.6 inch diameter
31 transverse strand in a span and before placing any equipment, material or barrier rail on the
32 span, fill the shear key, dowel holes and recesses at the ends of transverse strands with an
33 approved Type 3 grout.

34 After tensioning and curing, obtain approval before placing material and equipment on the
35 cored slab spans. Support cranes or other equipment exceeding the legal load limit on
36 mats. Submit for review a detailed drawing for the mats that are intended for use on the
37 cored slabs. Provide a complete description of the equipment that is intended for placement
38 on the mats. Supply and construct mats at no additional cost to the Department.

39 **(C) Box Beams**

40 The post tensioning system shall use 0.6 inch diameter strands. Strands shall be tensioned
41 to 43,950 lb. Strands shall be placed in a non-corrosive 0.6 inch diameter, 1/16 inch
42 minimum wall thickness black polyethylene pipe meeting ASTM D2239.

43 Grease the strands and place in the polyethylene pipe. Do not apply grease or extend the
44 pipe in the area of the recesses at the ends of the tensioning strands where grout is applied.
45 Tension the strands in the diaphragm nearest mid-span first. Proceed to tension strands in
46 the adjacent diaphragms. Continue the tensioning operation in a symmetric manner along
47 the length of the span. At each diaphragm location, maintain a symmetric tension force

Section 440

1 between each pair of strands in the diaphragm. Position the jack and tension along the same
2 axis as the strand. Utilize a double acting jack which tensions the strand and properly seats
3 the wedges after achieving the required tension. Monitor beams during tensioning
4 operation. If uplift of the slab occurs at bearing location, discontinue tensioning and
5 consult the Engineer. After all tensioning in a span is completed and before placing any
6 equipment, material or barrier rail on the span, fill the shear key, dowel holes and recesses
7 at the ends of the diaphragm with an approved Type 3 grout.

8 After tensioning and curing, obtain approval before placing material and equipment on the
9 box beam spans. Support cranes or other equipment exceeding the legal load limit on mats.
10 Submit for review a detailed drawing for the mats that are intended for use on the box
11 beams. Provide a complete description of the equipment that is intended for placement on
12 the mats. Supply and construct mats at no additional cost to the Department.

13 **430-7 PAINTING**

14 Clean, by hand or with power tools, and paint with 2 coats of non-aerosol organic zinc repair
15 paint all ungalvanized steel surfaces, such as tie rod ends, not encased in concrete in accordance
16 with Section 442. Provide a minimum dry thickness of each coat of paint of 1.5 mils.

17 **430-8 MEASUREMENT AND PAYMENT**

18 ___" *Prestressed Concrete Girders* will be measured and paid as the number of linear feet of
19 prestressed concrete girders estimated in the plans as being necessary to complete the project.

20 3'-0" x ___'-___" *Prestressed Concrete Cored Slabs* will be measured and paid as the number of
21 linear feet of prestressed concrete cored slabs estimated in the plans as being necessary to
22 complete the project.

23 3'-0" x ___'-___" *Prestressed Concrete Box Beams* will be measured and paid as the number of
24 linear feet of prestressed concrete box beams estimated in the plans as being necessary to
25 complete the project.

26 *Concrete Box Beams* will be measured and paid as the number of linear feet of concrete box
27 beams estimated in the plans as being necessary to complete the project.

28 *Elastomeric Bearings* will be paid at the contract lump sum price.

29 These prices and payments will be full compensation for all items required to erect prestressed
30 concrete members, including, but not limited to, those items contained in Article 430-1.

31 Payment will be made under:

Pay Item	Pay Unit
___" Prestressed Concrete Girders	Linear Foot
3'-0" x ___'-___" Prestressed Concrete Cored Slabs	Linear Foot
3'-0" x ___'-___" Prestressed Concrete Box Beams	Linear Foot
Concrete Box Beams	Linear Foot
Elastomeric Bearings	Lump Sum

32 **SECTION 440**

33 **STEEL STRUCTURES**

34 **440-1 DESCRIPTION**

35 Construct steel structures and steel structure portions of composite structures in conformity with
36 the lines, grades and dimensions shown in the plans and as specified in these specifications.

37 Furnish, fabricate, galvanize, deliver, place, erect, clean, shop paint and field paint structural
38 metals and all other materials; furnish, erect and remove falsework; set bearings and anchorage;
39 weld and furnish all materials for and assemble all structural joints. Structural metals include

1 structural steels, metallic electrodes, steel forgings and castings, gray iron and malleable iron
2 castings, drain pipes and any incidental metal construction.

3 Before starting work, inform the Engineer as to the proposed method of erection.

4 **440-2 MATERIALS**

5 Refer to Division 10.

Item	Section
Anchor Bolts	1072-4
Bearing Plate Assemblies	1072-3
Elastomeric Bearings	1079-2
High Strength Bolts, Nuts, Washers and Direct Tension Indicators	1072-5
Organic Zinc Repair Paint	1080-9
Preformed Bearing Pads	1079-1
Steel Pipe	1074-6
Structural Steel	1072
Welded Stud Shear Connectors	1072-6

6 **440-3 HANDLING AND STORING MATERIALS**

7 Move, handle and store all structural steel, in the shop, in the field and while being transported
8 in accordance with Article 1072-9.

9 **440-4 BEARINGS AND ANCHORAGES**

10 Supply preformed bearing pads and elastomeric bearings, as required by the plans and in
11 accordance with Section 1079.

12 Set steel masonry plates level in exact position with full and even bearing on the preformed
13 bearing pad.

14 Accurately set anchor bolts in accordance with Subarticle 420-12(A).

15 Make sure that the location of anchors and setting of bearings take into account any variation
16 from mean temperature at time of setting and anticipated lengthening of bottom flange due to
17 dead load after setting, so at mean temperature and under dead load the bearings are in a vertical
18 position and anchor bolts at expansion bearings center in their slots. Mean temperature is 60°F
19 unless otherwise stipulated in the plans. Do not restrict full and free movement of the
20 superstructure at the movable bearings by improperly setting or adjusting bearings or anchor
21 bolts and nuts.

22 Internal holding pins are required for all shim plates when the contract plans indicate the
23 structure contains the necessary corrosion protection for a corrosive site.

24 Laminated (reinforced) bearing pads shall be repaired utilizing external holding pins via
25 vulcanization. Product data for repair material and a detailed application procedure shall be
26 submitted to the Materials and Tests Unit for approval before use and annually thereafter.

27 **440-5 STRAIGHTENING BENT MATERIAL, HEAT CURVING AND HEAT**
28 **CAMBERING**

29 Straighten bent material, heat curve and heat camber as approved and in accordance with
30 Article 1072-10.

31 **440-6 FIELD ERECTION**

32 Report immediately any error in the shop fabrication or deformation resulting from handling
33 and transporting, which prevents the proper assembling and fitting up of parts by more than the
34 moderate use of drift pins or by more than a moderate amount of reaming, chipping or cutting.
35 Correct errors in the presence of the Engineer by approved methods.

36 Do not perform hammering which injures or distorts the members.

Section 440

1 Limit the drifting during assembly to only that needed to bring the parts into position, and not
2 sufficient to enlarge the holes or distort the metal. If any holes require enlarging to admit the
3 bolts, ream or correct them by approved methods. Do not enlarge the holes more than 1/16 inch
4 over the nominal size hole called for without written approval.

5 Before assembling the members, clean and dry to touch all bearing surfaces and permanently
6 contacting surfaces.

7 For bolted splices and field connections, fill 25% of the holes with bolts and 25% of the holes
8 with cylindrical erection pins, before placing permanent fasteners. For continuous units, pin
9 and bolt all beam and girder splices and bring the splices to the correct elevations before
10 permanently fastening. For bolted connections use fit-up bolts and optional shipping bolts with
11 the same nominal diameter as the permanent fasteners, and use cylindrical erection pins which
12 are 1/32 inch larger. Use permanent bolts as fit-up bolts if desired.

13 Use temporary bolts, including, but not limited to, shipping and fit-up bolts, supplied with
14 square or hexagon heads and square or hexagon nuts. The use of hexagon head temporary bolts
15 and nuts is allowed, but paint both the head and nut with a durable yellow paint before
16 installation.

17 Do not reuse permanent bolts for final installation unless the nut is easily turned onto the bolt
18 for the full threaded length by hand and without use of tools.

19 The use of erection bolts for field welded joints is allowed. Use erection bolts that are
20 galvanized when the finish paint is applied in the structural steel fabrication shop and meet
21 ASTM F3125 Grade A325. Supplement these bolts with clamps as necessary to meet the
22 AWS Specifications. Where unpainted AASHTO M 270 Grade 50W structural steel is used,
23 use erection bolts meeting ASTM F3125 A325.

24 After field welding the connection, leave the erection bolt in place with at least the minimum
25 bolt tension shown in Table 440-1. Use holes that are 3/16 inch larger than the nominal erection
26 bolt diameter.

27 **440-7 FIELD WELDING**

28 Perform field welding only when called for in the plans and in accordance with
29 Article 1072-18.

30 Remove paint, galvanizing or other coating at the location of field welds by blast cleaning
31 (SSPC SP-6 finish) or power tool cleaning to bare metal, (SSPC SP-11 finish) just before
32 welding. Clean sufficiently to bare metal to prevent contamination of the weld by the coating.

33 **440-8 CONNECTIONS USING HIGH STRENGTH BOLTS**

34 **(A) General**

35 This article covers the assembly of structural joints using plain or galvanized high strength
36 carbon steel bolts with suitable nuts and washers tightened to a high tension. Use bolt holes
37 that conform to Article 1072-16.

38 Protect bolts, nuts and washers from moisture during storage and so they show no signs of
39 rust at the time of installation.

40 Make sure that plain bolts and washers have a thin coat of lubricant at the time of
41 installation.

42 Use nuts that are pre-waxed by the producer or supplier before shipping to the project.

43 Apply beeswax, stick paraffin or other approved lubricant to the threads of galvanized bolts
44 just before installing the bolts.

45 Use bolt, nut and washer (when required) combinations from the same rotational-capacity
46 lot.

1 Perform the rotational capacity test described in Subarticle 1072-5(D)(4) on each
 2 rotational-capacity lot before the start of bolt installation. Use hardened steel washers as
 3 required by the test.

4 (B) Bolted Parts

5 Make sure that the slope of surfaces of bolted parts in contact with the bolt head and nut
 6 does not exceed 1:20 with respect to a plane normal to the bolt axis. Make sure bolted
 7 parts fit solidly together when assembled and are not separated by gaskets or any other
 8 interposed compressible material. Provide contact surfaces, including those adjacent to the
 9 bolt heads, nuts or washers, that are free of scale, dirt, burrs, oil, lacquer, loose rust, rust
 10 inhibitor, other foreign material and other defects that prevent solid seating of the parts.

11 (C) Installation

12 (1) Bolt Tensions

13 Tighten each fastener to provide at least the minimum bolt tension shown in
 14 Table 440-1. Tighten fasteners with direct tension indicators in accordance with
 15 Subarticle 440-8(C)(5), or if permitted, by the use of load indicating bolts as provided
 16 in Subarticle 440-8(C)(3).

Bolt Size, Inches	Minimum Bolt Tension, Pounds
1/2	12,050
5/8	19,200
3/4	28,400
7/8	39,250
1	51,500
1 1/8	64,900
1 1/4	82,400
1 3/8	98,200
1 1/2	119,500

17 In situations where the nut cannot be properly accessed due to lack of clearance,
 18 tighten by turning the bolt while preventing the nut from rotating. Use impact
 19 wrenches, if necessary, with adequate capacity and sufficiently supplied with air to
 20 perform the required tightening of each bolt in approximately 10 seconds.

21 (2) Washers

22 Make sure all fasteners have a hardened washer under the element, nut or bolt head,
 23 turned in tightening. Use galvanized washers when galvanized nuts and bolts are
 24 required. As an exception to the above, use special washers for oversize, short-slotted
 25 and long-slotted holes in accordance with Subarticle 1072-16(H).

26 Where an outer face of the bolted parts has a slope of more than 1:20 with respect to
 27 a plane normal to the bolt axis, use a smooth beveled washer to compensate for the
 28 lack of parallelism.

29 (3) Load Indicating Bolts

30 Tightening by use of a load indicating bolt system is permitted provided it can be
 31 demonstrated by an accurate direct measurement procedure that the bolt is tightened
 32 in accordance with Table 440-1. Tighten by approved methods and procedures.

33 (4) Galvanized High Strength Bolts

34 Use mechanically galvanized high strength bolts in all bolted connections for painted
 35 structural steel.

Section 440

1 Install galvanized high strength bolts carefully so shop painted surfaces are not scarred
2 or otherwise damaged.

3 Repair galvanized surfaces that are abraded or damaged by thoroughly wire brushing
4 the damaged area and removing all loose and cracked coating, after which give the
5 cleaned area 2 coats of non-aerosol organic zinc repair paint, in accordance with
6 Article 1076-7.

7 (5) Direct Tension Indicators

8 Supply direct tension indicators in accordance with ASTM F959 and Article 1072-5.

9 Furnish the Engineer with at least two 0.005 inch metal feeler gauges for each
10 container of direct tension indicators shipped before beginning installation.

11 Make sure that the lot number on the containers of direct tension indicators is for the
12 same lot number tested as indicated on the test documents.

13 Furnish to the Engineer 3 samples of load indicating washers from each lot number,
14 each size and type for tests and 2 each of the metal feeler gauges required for
15 performing the tests.

16 Install the direct tension indicator under the bolt head. If it is necessary to install the
17 direct tension indicator under the nut, or if the bolt head shall be turned, install
18 additional hardened washers between the nut or bolt head and the direct tension
19 indicator.

20 Provide a tension indicating device on the project for determining the tension imposed
21 on a fastener when the protrusions on direct tension indicator are properly compressed.

22 Test 3 samples from each lot of direct tension indicators in the presence of the
23 Engineer. Achieve a minimum bolt tension of 5% greater than that required by
24 Table 440-1 of Article 440-8.

25 Do not substitute direct tension indicators for hardened steel washers required with
26 short slotted or oversized holes. If desired, use direct tension indicators in conjunction
27 with hardened steel washers.

28 Install direct tension indicators initially to a snug tight condition. Snug tight is defined
29 as being attained after a few impacts of an impact wrench or the full effort of an
30 ironworker with an ordinary spud wrench. After initial tightening, fully tighten
31 beginning at the most rigid part of the joint and continuing toward its free edges.

32 For tightening fasteners containing direct tension indicators, use a clean and lubricated
33 wrench. Maintain air supply and hoses in good condition and provide air pressure of
34 at least 100 psi at the wrench.

35 When tightening the fasteners, ensure that the part of the fastener being restrained from
36 turning does not rotate during the tightening process. Ensure that no portion of the
37 direct tension indicator protrusions is accidentally partially flattened before installing
38 in the structural steel joints.

39 Do not reuse direct tension indicators. If it is necessary to loosen a bolt previously
40 tensioned, discard and replace the direct tension indicator.

41 (D) Inspection

42 Allow the Engineer the opportunity to observe installation of bolts to determine that the
43 selected tightening procedure is properly used. The Engineer determines when bolts are
44 properly tightened and in the case of direct tension indicator bolts that the correct indication
45 of tension is achieved. After properly tightening bolts, make sure that the end of the bolt
46 is flush with or extended beyond the outer face of the nut.

- 1 Do not begin painting in the area of tightened bolts until after bolt inspection is complete.
- 2 When using direct tension indicators, proper tension of bolts is inspected by the Engineer
- 3 by inserting a 0.005 inch thickness feeler gauge provided by the Contractor into the
- 4 openings between adjacent flattened protrusions of the direct tension indicator. Proper
- 5 tension is obtained when the number of spaces for which the gauge is refused is equal to
- 6 or greater than the value shown in Table 440-2.

Number of Spaces in Washer	Number of Spaces Gauge is Refused
4	2
5	3
6	3
7	4

- 7 The gauge shall be refused in all spaces when the direct tension indicator is used under the
- 8 turned element.

- 9 When using direct tension indicators, do not tighten bolts to a no visible gap condition.

- 10 At least 10%, but no less than 2 of the bolts in each connection are inspected with feeler
- 11 gauges. Additionally, all remaining bolts in each connection are visually inspected for
- 12 proper tightening.

13 **440-9 SURFACE PREPARATION AND PROTECTION OF WEATHERING STEEL**

- 14 After fabrication, shop clean all weathering steel remaining in the unpainted condition in the
- 15 completed structure to a SSPC SP-6 finish. Provide a contact surface condition in accordance
- 16 with Subarticle 442-7(B) at the time of bolt installation.

- 17 Protect the structural steel during concreting and any other operations that are particularly
- 18 hazardous with respect to soiling the steel. Remove any foreign matter which gets on the steel
- 19 as soon as possible by either solvent cleaning, hand tool cleaning, power tool cleaning, blast
- 20 cleaning or a combination thereof, as necessary to restore the surfaces to the specified condition.

21 **440-10 MEASUREMENT AND PAYMENT**

- 22 *Approx. ____ Lbs. Structural Steel* will be measured and paid at the contract lump sum price.
- 23 The approximate quantity shown in the contract pay item is an estimate based on the computed
- 24 weight of the structural steel necessary to complete the work. No measurement for payment
- 25 will be made for this pay item, and no adjustment in the contract lump sum price will be made
- 26 for any variation from the approximate quantity shown except for revisions in the plans which
- 27 affect the quantity of structural steel necessary to complete the work.

- 28 When revisions in the plans have been made which affect the quantities of structural steel,
- 29 adjustments in compensation will be made by supplemental agreement.

- 30 When the contract includes the item of *Painting of Structural Steel*, all work of painting except
- 31 for shop painting will be paid as provided in Article 442-15 and payment for shop painting will
- 32 be included in the contract lump sum price for *Approx. ____ Lbs. Structural Steel*. When the
- 33 contract excludes the item of *Painting of Structural Steel*, payment at the contract lump sum
- 34 price for *Approx. ____ Lbs. Structural Steel* will be full compensation for both shop and field
- 35 painting.

- 36 *Elastomeric Bearings* will be paid as provided in Article 430-8.

- 37 The price and payment will be full compensation for all items required to construct steel
- 38 structures including, but not limited to, those items contained in Article 440-1.

Section 442

1 Payment will be made under:

Pay Item	Pay Unit
Approx. ____ Lbs. Structural Steel	Lump Sum

SECTION 442 PAINTING STEEL STRUCTURES

442-1 DESCRIPTION

5 Paint steel structures and properly prepare metal surfaces; apply, protect and dry paint coatings;
6 protect pedestrian, vehicular, water or other traffic upon or underneath the structure; protect all
7 portions of the structure and adjacent work against disfigurement by splatters, splashes,
8 overspray and smirches of paint or of paint materials; apply paint in the shop and field; and
9 furnish blast cleaning equipment, paint spraying equipment, brushes, rollers, paint cleaning
10 abrasives, cleaning solvents, tools, tackle, scaffolding, labor and any other materials, hand or
11 power tools, inspection equipment and personal protective and safety equipment necessary for
12 the entire work.

442-2 MATERIALS

14 Refer to Division 10.

Item	Section
Abrasive Materials for Blast Cleaning	1080-6
Paint and Paint Materials	1080

442-3 DEFINITIONS

16 Define “corner” as the intersection of 2 surfaces that are not in the same plane. Define
17 “inaccessible areas” as partially or completely enclosed surfaces, the majority of which are not
18 visible without the use of special devices such as mirrors. Define “sharp edge” as a corner on
19 a steel section that ends in a point or edge and appears able to cut human flesh. Define “raised
20 weld” as fillet welds or groove welds that have not been ground flush. Define “stripe coat” as
21 an additional coat of paint applied to the edges, raised welds, outside corners and areas difficult
22 to coat by spray before or after a full coat is applied to the surface.

442-4 SUBMITTALS

24 Submit the facilities quality control plan for process control that identifies the material stage,
25 inspection ratio, production verification, inspection interval, minimum acceptable level of
26 quality, quality control verification documentation, and work schedule. Submit blast media
27 certificates of conformance in accordance with the requirements of SSPC AB-1 and or SSPC
28 AB 3 as supplied by the abrasive supplier or the laboratory, including results of testing to
29 substantiate the certification.

30 Submit Department test reports for each batch of paint to be used on the project, product data
31 sheets and MSDS sheets for paint and solvents used.

32 Submit repair procedures conforming to the coating manufacturer’s written recommendations
33 for the Owner’s approval. Repairs to the final coat must result in acceptable, uniform gloss
34 and color on visible surfaces. The Owner shall have final authority concerning the coating’s
35 uniformity and acceptable appearance.

36 These submittals may be generic in nature to address in-process non-conforming findings and
37 should address at a minimum the following conditions: excessive surface profile, excessive
38 millage, low millage, pinholing, runs, drips, sags, curtains and physically damaged areas.

39 All repair procedures shall comply with the requirements of SSPC PA-1 and SSPC PA-2 as
40 applicable and distinguish between localized (one square foot or less) and non-localized areas.

442-5 PROTECTION OF WORK

Protect all parts of the structure against disfigurement by splatters, splashes, overspray and smirches of paint or of paint materials. Assume responsibility for any damage or disfigurement caused by operations to vehicles, persons or property, including plants and animals; and provide protective measures to prevent such damage.

Thoroughly clean and restore any surface or surfaces disfigured by splatter, overspray, splashes, smirches or other defects to its original condition.

Restore any damaged structure or surface to its original condition.

If traffic dust or other airborne particulates originating from earthen and/or gravel shop floors, abrasive blasting equipment and/or as determined by the Engineer is considered to be detrimental to the work; the shop shall take necessary precautions to prevent the accumulation of dust and dirt on blasted and freshly painted surfaces.

442-6 QUALITY CONTROL (QC)

Shop and field applicators are required to conduct and document quality control inspection of the painting, including measurements of temperature, dew point, surface profile and paint thickness. Quality control personnel shall have access to applicable project specific requirements applicable to the coating system being applied. Personnel performing or overseeing the QC tests for this work shall be qualified in accordance with the *Structural Steel Shop Coatings* Program. All referenced standards outlined in the *Structural Steel Shop Coatings* Program including appendices (as determined by the Engineer) are considered mandatory for shop and field applications.

442-7 SURFACE PREPARATION**(A) Blast Cleaning**

The blast profile shall be angular and between 1.0 and 3.0 mils when measured on a smooth steel surface. The degree of cleaning required shall be SSPC SP-10 unless otherwise noted. SSPC VIS-1 shall be used as a visual standard. In any dispute, the written definition set forth in the SSPC SP-10 standard shall take precedence over reference photographs and comparators shown in SSPC VIS-1.

Check abrasives daily for contaminants or as otherwise directed by the Engineer. Prior to any surface preparation the Quality Control inspector shall verify that abrasive material meets the cleanliness requirements of SSPC AB-1, SSPC AB-2 and or SSPC AB-3 depending on the abrasive material used.

Blast clean by centrifugal or forced air blasters. When using forced air blasters use blast nozzles with a minimum 5/16" orifice and operate at no less than 100 psi when measured with a needle gauge at the nozzle. Use dry blasting for all blast cleaning. Select a size or grade of abrasive that provides the specified finish and profile meeting Article 1080-6.

Perform blast cleaning operations so no damage is done to partially or entirely completed portions of the work.

After blasting, brush the surface with clean brushes made of hair, bristle or fiber; blow off with compressed air; or clean by vacuum so any traces of blast products from the surface and any abrasive from pockets and corners are removed. Perform surface inspection once all blast abrasive and dust is removed from surface to be coated.

Use compressed air for nozzle blasting that is free of detrimental amounts of water or oil. Provide adequate separators and traps. Verify cleanliness of air before blasting operations in accordance with ASTM D4285.

Examine the blast cleaned surface for any traces of oil, grease or smudges deposited in the cleaning operations. If present, remove them by SSPC SP-1 or an approved method.

Section 442

1 Ensure the degree of cleanliness and profile are approved before painting. Verify the
2 removal of oil and grease in accordance with ASTM F22.

3 Seal all journals, bearings, motors and moving parts to the Engineer's satisfaction against
4 entry of abrasive dust before blast cleaning near bridge machinery.

5 Prime all blast cleaned surfaces to be painted no later than 8 hours after blast cleaning is
6 complete. Re-clean the cleaned surfaces that contain rust or are contaminated with foreign
7 material before painting or bolting to the original surface preparation specifications.

8 (B) Hand or Power Tool Cleaning

9 Thoroughly remove loose paint, rust, scale, dirt, oil, grease and other detrimental
10 substances by hand cleaning (SSPC SP-2), power tool cleaning (SSPC SP-3) or any
11 combination of these methods. Hand cleaning includes the use of metal brushes, grinders,
12 sanders or any approved combination of these tools. Use bristle or wood fiber brushes to
13 remove loose dust.

14 442-8 PAINT SYSTEMS

15 Department approved paint systems are found in the *Structural Steel Shop Coatings Program*.

16 Use all paints and solvents for shop and field application that are produced by the same
17 manufacturer.

18 Use approved/qualified paint products found in Section 1080. Apply the paint system required
19 by the plans.

20 442-9 APPLICATION OF PAINT

21 (A) General

22 Unless otherwise permitted, apply all paint by spraying, except apply the stripe coat by
23 brush or roller. The use of a brush or roller is permitted to make minor repairs to the primer.

24 Make sure each coat of paint is in a proper state of cure or dryness before applying the
25 succeeding coat.

26 Before successive coating application remove all contaminates, dry spray/overspray, paint
27 splatter and other non-adherent paint shall be removed before applying successive coating
28 layers. When necessary, clean each coat of paint in accordance with Subarticle 442-7(B).

29 When a stripe coat is required, apply a 2 inch stripe by brush or roller to all exposed edges
30 of steel before applying the finish coat. Locate the edge or corner in the approximate center
31 of the paint stripe.

32 Mechanically or hot dip-galvanized fasteners that exhibit damage during installation or
33 coating operations shall be spot primed with a Department approved zinc rich coating
34 compatible with subsequent coatings.

35 If personnel performing the coating operations does not exhibit reasonable conformance to
36 protect the work during application, storage and/or construction, the Engineer may require
37 a finish coat at no additional cost to the Department. The final acceptances of all repairs,
38 to include aesthetics, will be approved at the Engineer's discretion.

39 (B) Application Conditions

40 Unless the paint manufacturer's application instructions are more restrictive, obtain written
41 permission to apply paint if the following conditions exist: temperature of the air or metal
42 is not at least 40°F and rising for inorganic zinc primers or 50°F and rising for acrylic paint
43 or coal tar epoxies, when freezing weather is forecast during the drying period, or when
44 the metal is hot enough to cause the paint to blister or produce a porous paint film.

1 Do not apply paint or perform any surface preparation without the Engineer's approval
2 when the air is misty; in the rain, snow, fog, when wind velocity is continuously greater
3 than 10 mph or when the steel surface temperature is less than 5°F above the dew point.
4 The humidity shall be less than 85% and lower when applying acrylic paints or until the
5 paint is dry and/or cured or until weather conditions permit its exposure in the open.

6 Obtain written permission from the Engineer to apply field coats of paint between
7 November 15 of one year and April 15 of the following year inclusive. Do not apply any
8 coating above or below the manufacturers recommended application temperatures or
9 during a period when an ambient temperature outside the recommended range is predicted
10 during the drying and curing period of the paint.

11 Harsh environments as determined by the Engineer may necessitate re-cleaning during or
12 between paint applications.

13 (C) Storage Conditions

14 Provide adequate and safe storage for all paint and equipment. Do not expose paint
15 materials to rain, excessive condensation, long periods of direct sunlight or temperatures
16 above 110°F or below 40°F. Follow the manufacturer's storage requirements if more
17 restrictive. In addition, the Quality Control inspector shall place a device which records the
18 high, low and current temperatures inside the storage location and maintain a daily record
19 and made available to the Engineer. Replace paint damaged by any cause.

20 Coating material shall arrive at the coating facility in sealed containers clearly marked with
21 the type, batch and/or lot numbers properly labeled on the container. There shall be no
22 modification of the coating except upon and in accordance with the express written
23 stipulation by an authorized representative of the coating manufacturer and with specific
24 approval of the Engineer. At the Department's option, the inspector may randomly collect
25 a sample of the coating used on the project if the material has been exposed to extremely
26 high/low temperatures and/or exhibits excessive skinning in the container.

27 (D) Mixing Paint

28 Mix paint in accordance with the manufacturer's instructions and Article 1080-1. Do not
29 mix partial kits.

30 (E) Thinning

31 Thinning of zinc and coal tar products shall be in accordance with the coating
32 manufacturer's recommendations. For acrylic applications, there shall be no thinning of
33 coating products. The paint products specified in Section 1080 do not require thinning
34 when applied under normal conditions. Obtain written approval for any thinning
35 necessitated by weather conditions or other causes. Only those thinners approved by the
36 paint manufacturer as described in the application instructions are permitted.

37 (F) Spray Application

38 Use equipment for spray application of paint that is suitable for the intended purpose,
39 capable of properly atomizing the paint, and equipped with suitable pressure regulators and
40 gauges. Use air caps, nozzles and needles recommended by the manufacturer of the
41 equipment for the material being sprayed. Keep the equipment in satisfactory condition to
42 permit proper paint application. In closed or recirculating paint spray systems where gas
43 under pressure is used over the liquid, use an inert gas, such as nitrogen.

44 Provide and drain periodically during operations. Use adequately sized traps or separators
45 to remove oil and water from the compressed air. Make sure that the air from the spray
46 gun impinging against the surface shows no water or oil.

47 Use a continuously agitated spray pot. Adjust the agitator to reach within 2 inches of the
48 bottom of the spray pot and be in motion at all times during paint application. Provide
49 sufficient motion to keep the paint well mixed.

Section 442

1 (G) Stripe Coat

2 When a stripe coat is required, apply a 2 inch stripe by brush or roller to all exposed edges
3 of steel before applying the finish coat. Locate the edge or corner in the approximate center
4 of the paint stripe. Brush apply stripe coat application on bolts, nuts, raised welds and other
5 obstructed locations. Roller apply stripe coat only on structural shape edges.

6 442-10 SHOP PAINTING

7 Shop painting is the painting of structural steel in an enclosed shop or plant before shipment to
8 the site of erection. Use only NCDOT approved shop coating facilities meeting the
9 requirements outlined in the current edition of the *Structural Steel Shop Coatings Program*.
10 This program is available on the Materials and Tests website. The work in this section applies
11 to previously uncoated steel and includes the proper preparation of the metal surfaces and the
12 application, protection and cure/drying of coatings. Complete all shop fabrication, including
13 welding and attachment of shear connectors, before painting is started.

14 442-11 THERMAL SPRAYED COATINGS

15 Thermal sprayed coatings (TSC) and sealer are those coatings applied to metal surfaces in a
16 shop environment. Use only NCDOT approved shop coating facilities meeting the
17 requirements outlined in the current edition of the *Thermal Sprayed Coatings (Metallization)*
18 Program. This program is available on the Materials and Tests website.

19 442-12 FIELD PAINTING

20 (A) General

21 Field painting is conducted after erection, or when damage to a shop applied coating system
22 is repaired or when steel is otherwise painted outside an enclosed shop environment. The
23 *Structural Steel Shop Coatings Program* shall be considered in conjunction with the Project
24 Special Provisions for field applications.

25 Pre-construction meetings as determined by the Engineer may be required prior to
26 beginning field painting operations.

27 When blast cleaning structures open to traffic, provide suitable protective enclosures to
28 prevent damage to public and private property. Do not blast directly over traffic without
29 prior approval of the Engineer. If the containment system is not effective in restricting
30 blasting emissions, blasting operations shall cease and deficiencies corrected before work
31 resuming.

32 (B) Submittals

33 Prior to beginning work, the Contractor shall furnish the Engineer for review and approval
34 a containment plan for bridge washing, coating inspection plan, bridge protection plan,
35 surface preparation and coating operations.

36 Disposal of construction materials to include but not limited to paint products, abrasives
37 and wash water shall be in accordance with all current Federal and State regulations. Refer
38 to NCDOT *Guidelines for Managing Bridge Wash Water*.

39 Do not apply paint over traffic without prior written approval from the Engineer.

40 Touch-up of painted steel consists of painting with primer and finish paint over all the
41 previously uncoated exposed metal surfaces. When the repair area exceeds one square
42 foot, clean, prime and topcoat damaged areas in accordance with Subarticle 442-7(A);
43 otherwise, clean, prime and topcoat damaged areas in accordance with Subarticle 442-7(B).
44 For systems with shop applied topcoats, apply an additional field appearance coat of finish
45 paint to the outside surface of all exterior beams on steel bridges over highways and
46 navigable waterways.

1 When an appearance coat of finish paint is required, paint the portion of galvanized high
2 strength bolts on the outside face of exterior beams or girders with primer and appearance
3 coat of the finish paint. Apply the primer to the galvanized high strength bolts by brush,
4 so the primer is not applied to the adjacent finish paint.

5 At the location of field welds, satisfactorily remove all paint or galvanizing in accordance
6 with SSPC SP-6 (Commercial Blast Cleaning) or SSPC SP-11 (Power Tool Cleaning to
7 Bare Metal). The surface profile after cleaning and prior to coating application shall be a
8 minimum of 1.0 mil.

9 Final acceptance by the Engineer will be after erection of the structure, when the final coat
10 has been applied, and all repairs effected.

11 Clean all contaminants such as soil, concrete, weld splatter, grease or any other deleterious
12 material from the steel or shop coated surfaces before any painting operations begin. Harsh
13 environments may necessitate re-cleaning during or between paint applications.

14 **(C) Certification**

15 SSPC QP-1 certified contractor shall perform work that is not associated with Hazardous
16 Coating Removal operations.

17 **(D) Quality Control**

18 Field applicators are required to conduct and document quality control inspection as
19 specified in Article 442-6. Personnel performing the QC tests for this work shall possess
20 NACE Coatings Inspection Program (CIP) Level I or SSPC Bridge Coating Inspector
21 (BCI) Level I and have successfully completed the Department's Bridge Coating
22 Inspection Level I course.

23 Quality Control inspectors are required to maintain and record inspections that are required
24 by the contract and as outlined in the *Structural Steel Shop Coatings Program*.

25 These records shall be available for review and submitted to the Engineer or their
26 representative at the end of each work week or as directed.

27 **442-13 PREPARATION FOR PAINTING GALVANIZED SURFACES**

28 When painting galvanized surfaces is required in the plans, smooth, clean and prepare in
29 accordance with Section 1080 and this section. Provide shop certification in accordance with
30 *Structural Steel Shop Coatings Program* (Shop facilities that are currently certified and in good
31 standing with the American Institute Steel Construction (AISC) /Sophisticated Paint
32 Endorsement (SPE) and/or the Society of Protective Coatings (SSPC) Qualification Procedure
33 Three (QP-3).

34 Do not paint portions of galvanized piles encased in concrete below ground.

35 Prior to coating operations submit for review and approval to the Engineer the specific
36 procedure to be utilized for this work. This procedure at a minimum shall address the surface
37 preparation outlined below and meet the ASTM D6386 standard.

38 Smooth high spots and rough edges, such as metal drip lines, of galvanized surfaces in
39 accordance with ASTM D6386. Clean galvanized surfaces to be painted with a 2,500 psi
40 pressure washer. Allow surfaces to dry completely before beginning surface preparation.

41 Prepare galvanized surfaces to be painted by sweep blasting in accordance with ASTM D6386.
42 Use an abrasive material and technique that roughens the surface while leaving base zinc layers
43 intact. After sweep blasting, blow down blasted surfaces with clean, dry, compressed air free
44 of contamination.

45 Apply paint to clean, dry surfaces free of visible zinc oxides or zinc hydroxides within 8 hours
46 of surface preparation.

Section 442

1 **442-14 REPAINTING OF EXISTING STEEL STRUCTURES**

2 **(A) Pollution Control**

3 During field painting operations, use all necessary precautions to prevent dispersion of
4 surface preparation debris, paint or any other material outside the work area due to wind or
5 any other reason.

6 **(B) Hazardous Paint Removal**

7 Should the existing paint system include toxic substances such as red lead oxide, which is
8 considered hazardous if improperly removed, furnish a containment and spill control plan
9 for surface preparation and painting operations and await review and approval of said plan
10 before beginning work. This plan shall meet Class 2A in accordance with SSPC Guide 6.
11 This work shall be performed by a SSPC QP-2 certified contractor.

12 Monitor air quality. Any visible emissions outside the containment structure or air quality
13 monitoring results exceeding the permissible OSHA action level are justification for
14 suspension of the work. Monitor air quality at random locations within 1 foot to 5 feet
15 from the enclosure in accordance with National Institute of Occupational Safety and Health
16 (NIOSH) Method 7082.

17 Immediately collect and retain any spilled dust or paint debris in approved containers. If
18 a spill results in soil or water contamination, take all necessary actions to remediate the site
19 to its original state.

20 **(C) Waste Handling**

21 Clean and dispose of any incidental material or equipment that is contaminated as the result
22 of work performed.

23 **(D) Health and Safety Responsibility**

24 In addition to Article 105-11 and Sections 106 and 107, provide effective engineering and
25 work practice controls to insure adequate protection.

26 Before beginning work, certify to the Engineer that all personnel involved with lead paint
27 removal operations (including rigging and material handling personnel) are properly
28 trained and understand the applicable parts of EPA, 40 CFR Part 745, OSHA Standards,
29 29 CFR Part 1910 and 29 CFR Part 1926 including any amendments in force at the time
30 of this contract.

31 **442-15 MEASUREMENT AND PAYMENT**

32 When the contract excludes the item of *Painting of Structural Steel*, there will be no direct
33 payment for the work covered by this section.

34 When the contract includes the item of *Painting of Structural Steel*, all work covered by this
35 section, except for shop painting, will be paid at the contract lump sum price for this item.
36 Payment at the contract lump sum price for *Approx. ____ Lbs. Structural Steel* as provided in
37 Article 440-10 will be full compensation for the work of shop painting.

38 Repair or replacement of paint damaged by any cause will be incidental to the work of this
39 section.

40 These prices and payments will be full compensation for all items required to paint steel
41 structures including, but not limited to, those items contained in Article 442-1.

42 *Pollution Control* will be paid as the contract lump sum price.

1 When provided for in the contract, payment will be made under:

Pay Item	Pay Unit
Painting of Structural Steel	Lump Sum
Pollution Control	Lump Sum

2 **SECTION 450**
3 **PILES**

4 **450-1 DESCRIPTION**

5 Furnish and install piles in accordance with the contract and accepted submittals. Provide steel
6 and prestressed concrete piles and composite piles with both concrete and steel sections shown
7 in the plans. Drive and drill in piles and use pile tips and accessories as shown in the plans.
8 Galvanize, restrike, redrive, splice, cut off and build up piles and perform predrilling, spudding
9 and pile driving analyzer testing as necessary or required.

10 Define "pile embedment" as the required pile embedment in the cap or footing and "pile
11 penetration" as the minimum required pile tip elevation or penetration into natural ground,
12 whichever is deeper. Define "natural ground" as below the ground or mud line before
13 constructing any embankments.

14 The estimated pile lengths shown in the plans are for bid purposes only. Provide piles of
15 sufficient lengths for the required driving resistance, pile embedment and pile penetration.
16 Determine required pile lengths by performing subsurface investigations, as needed.

17 **450-2 MATERIALS**

18 Refer to Division 10.

Item	Section
Flowable Fill, Non-Excavatable	1000-6
Neat Cement Grout, Type 1	1003
Portland Cement Concrete, Class A	1000
Reinforcing Steel	1070
Steel and Prestressed Concrete Piles	1084-1
Steel Pipe Pile Plates	1072

19 For drilled-in piles, Class A concrete shall meet Article 1000-4 except as modified herein.
20 Provide concrete with a slump of 6 inches to 8 inches. Use an approved high-range water
21 reducer to achieve this slump.

22 For composite piles with both prestressed concrete and steel H-pile sections, use prestressed
23 concrete piles and steel H-piles that meet Section 1084. Use steel pile points and splicers that
24 are on the NCDOT APL.

25 **450-3 CONSTRUCTION METHODS**

26 **(A) Handling and Storing Piles**

27 Handle, transport and store piles so piles are kept clean and undamaged. Do not use chains,
28 cables or hooks that can damage or scar piles. Do not damage coatings on steel piles.
29 When handling prestressed concrete piles, support piles at pick-up points shown in the
30 plans.

31 Protect steel piles from corrosion. Store piles above ground upon platform skids, or other
32 supports, and keep free from dirt, grease, vegetation and other foreign material.

33 **(B) Pile Installation**

34 If applicable, completely excavate for caps or footings before installing piles. If applicable
35 and unless noted otherwise in the plans, construct embankments to bottom of cap or footing

Section 450

1 elevations for a horizontal distance of 50 feet from any pile except where fill slopes are
2 within 50 feet of a pile.

3 Install piles with the following tolerances:

4 (1) Axial alignment within 1/4 in/ft of vertical or batter shown in the plans,

5 (2) Horizontal alignment within 3 inches of plan location, and

6 (3) Pile embedment within 3 inches more and 2 inches less of the embedment shown in
7 the plans.

8 If necessary, build up prestressed concrete piles or splice steel piles as shown in the plans.
9 Do not use more than 3 sections (2 splices) of steel piling per pile. Cut off piles at required
10 elevations along a plane normal to the axis of the pile as necessary. Do not damage or spall
11 piles when cutting off prestressed concrete piles.

12 (C) Pile Accessories

13 When required, use pile accessories including pipe pile plates and steel pile points and
14 splicers shown in the plans. Weld pipe pile plates to steel pipe piles as shown in the plans.

15 Attach steel pile points to steel piles in accordance with the manufacturer's instructions.
16 Weld a minimum length of twice the flange width for steel H-piles.

17 Use steel pile tips with prestressed concrete piles as shown in the plans. Use steel pile
18 splicers for splicing steel H-pile tips and composite piles. Attach steel pile splicers in
19 accordance with the manufacturer's instructions.

20 (D) Driven Piles

21 Do not drive piles within 50 feet of CIP concrete until the concrete cures for at least 3 days.
22 Do not use vibratory hammers to install prestressed concrete piles.

23 When predrilling, spudding and installing the initial portions of steel piles with vibratory
24 hammers, submit these pile installation methods with the proposed pile driving methods
25 and equipment for acceptance. Define "spudding" as driving or dropping a steel H-pile
26 and then removing it. The Engineer will approve the spudding depth and H-pile size,
27 predrilling depth and diameter and depth of pile installation with a vibratory hammer.

28 Limit driving stresses in accordance with the *AASHTO LRFD Bridge Design*
29 *Specifications*. Use AASHTO driving stress limits for severe corrosive environments when
30 calcium nitrite corrosion inhibitor is required for prestressed concrete piles. If a tip
31 elevation is noted in the plans, drive steel and prestressed concrete piles to the minimum
32 required driving resistance and tip elevation. Otherwise, drive steel and prestressed
33 concrete piles to the minimum required driving resistance and at least 10 feet into natural
34 ground. Drive composite piles to the minimum required driving resistance and the
35 prestressed concrete and steel H-pile sections to their respective minimum required tip
36 elevations noted in the plans.

37 Drive piles continuously to the required pile penetration unless stopped due to exceeding
38 the maximum blow count or driving stresses, insufficient pile length or other approved
39 reasons. Redrive piles raised or moved laterally due to driving adjacent piles.

40 Protect coatings in an approved manner when driving coated steel piles through templates.
41 Repair damaged galvanizing in accordance with Article 1076-7.

1 (1) Predrilling and Spudding

2 If necessary or required, perform predrilling and spudding as noted in the plans and in
3 accordance with the accepted submittals. Predrill pile locations to elevations noted in
4 the plans or approved by the Engineer. When noted in the plans and at the Contractor's
5 option, spudding may be used instead of predrilling. Do not perform spudding below
6 predrilling elevations noted in the plans or approved by the Engineer.

7 When noted in the plans or predrilling in water or wetlands, use temporary steel
8 casings that meet Subarticle 450-3(E)(1), except use steel casings with inside
9 diameters no more than 2 inches larger than predrilling diameters. Use temporary
10 casings from at least 2 feet above the static water elevation or ground line, whichever
11 is higher, to at least 5 feet below the ground or mud line. More than 5 feet embedment
12 may be necessary if temporary casings are not stable or predrilling or spudding
13 disturbs material outside casings.

14 Perform predrilling and spudding so spoils are minimized, large ground movements
15 and voids below ground do not occur and piles can be driven to the required resistance
16 and pile penetration. Do not deposit spoils in water or wetlands. Remove all
17 temporary casings before driving piles.

18 (2) Driving Equipment

19 Submit the proposed pile driving methods and equipment (pile driving equipment data
20 form) including the pile driving hammer, hammer cushion, pile helmet and cushion
21 for all piles for acceptance in accordance with Article 105-2. Do not submit more than
22 2 pile driving hammers per pile type per submittal. Provide 2 copies of each data form
23 at least 30 days before driving piles. All equipment is subject to satisfactory field
24 performance.

25 Drive piles with accepted driving equipment and operate pile driving hammers in
26 accordance with the manufacturer's recommendations. Use hammers that will not
27 overstress piles and attain the required driving resistance between 30 and 180 blows
28 per foot. Use variable energy hammers to drive prestressed concrete piles.

29 Operate air and steam hammers within 10% of the manufacturer's rated speed or a rate
30 approved by the Engineer. Use a plant and equipment for air or steam hammers with
31 sufficient capacity to maintain, under working conditions, the manufacturer's
32 recommended volume and pressure. Equip the plant and equipment with accurate
33 pressure gauges that are easily accessible. Provide striking parts of air and steam
34 hammers weighing at least 2,750 lbs. and one-third the pile helmet and pile weight.

35 Equip open-end (single acting) diesel hammers with a graduated scale (jump stick)
36 extending above the ram cylinder, graduated rings or grooves on the ram or an electric
37 sound activated remote measuring instrument to determine the hammer stroke during
38 driving. Equip closed-end (double acting) diesel hammers with a calibrated bounce
39 chamber pressure gauge mounted near the ground and provide a current calibrated
40 chart or graph equating bounce chamber pressure and gauge hose length to equivalent
41 energy. Submit this chart or graph with the proposed pile driving methods and
42 equipment for closed-end diesel hammers.

43 The Engineer may inspect the hammer cushion before beginning and occasionally
44 during driving. Expose the hammer cushion for inspection as directed. Replace or
45 repair any hammer cushion that is less than 25% of its original thickness.

46 Hold pile heads in position with pile helmets that closely fit over pile heads and extend
47 down the sides of piles a sufficient distance. Protect pile heads of prestressed concrete
48 piles from direct impact with accepted pile cushions. Use pile cushions made of pine
49 plywood with a thickness of at least 4 inches. Provide a new pile cushion for each

Section 450

1 prestressed concrete pile. Replace pile cushions during driving when a cushion is
2 compressed more than 50% of its original thickness or begins to burn.

3 (3) Required Driving Resistance

4 The Engineer will determine if the proposed pile driving methods and equipment are
5 acceptable and provide the blows per foot and equivalent set for the required driving
6 resistance noted in the plans, i.e., "pile driving criteria" except for structures with pile
7 driving analyzer (PDA) testing. For structures with PDA testing, provide pile driving
8 criteria for any bents and end bents with piles in accordance with Subarticle 450-
9 3(F)(4).

10 Stop driving piles when refusal is reached. Define "refusal" as 240 blows per foot or
11 any equivalent set.

12 (4) Restriking and Redriving Piles

13 After reaching the required pile penetration, the Contractor may choose to or the
14 Engineer may require the Contractor to stop driving, wait and restrike or redrive piles
15 to attain the required driving resistance. When the Engineer requires restrikes or
16 redrives, the Engineer will determine the number of restrikes or redrives and the time
17 to wait after stopping driving and between restrikes and redrives. The time to wait
18 will range from 4 to 24 hours.

19 Use the same pile driving methods, equipment and compressed pile cushion from the
20 previous driving to restrike or redrive piles unless the cushion is unacceptable due to
21 deterioration. Do not use cold diesel hammers for restrikes or redrives, unless it is
22 impractical to do otherwise as determined by the Engineer. In general, warm up
23 hammers by applying at least 20 blows to a previously driven pile or timber mats on
24 the ground.

25 (E) Drilled-in Piles

26 Perform pile excavation to elevations shown in the plans or approved by the Engineer.
27 Excavate holes at pile locations with diameters that will result in at least 3 inches of
28 clearance all around piles. Before filling holes, support and center piles in excavations and
29 when noted in the plans, drive piles to the required driving resistance. Remove any fluids
30 from excavations and, at the Contractor's option, fill holes with concrete, grout or flowable
31 fill unless required otherwise in the contract.

32 (1) Pile Excavation

33 Use equipment with sufficient capacity to drill through soil, rock, boulders, timbers,
34 man-made objects and any other materials encountered. Do not use blasting to
35 advance pile excavations. Blasting for core removal is only permitted when approved
36 by the Engineer. Contain and dispose of drilling spoils as directed and in accordance
37 with Section 802. Drilling spoils consist of all materials and fluids removed from pile
38 excavations.

39 If unstable, caving or sloughing soils are anticipated or encountered, use slurry or
40 temporary steel casings to stabilize holes. When using slurry, submit slurry details
41 including product information and additives, manufacturer's recommendations for
42 use, slurry equipment details and documentation that mixing water is suitable for
43 slurry before beginning drilling. When using temporary casings, use smooth non-
44 corrugated clean watertight steel casings of ample strength to withstand handling and
45 installation stresses and pressures imposed by concrete, earth, backfill and fluids. Use
46 steel casings with an outside diameter equal to the hole size and a wall thickness of at
47 least 1/4 inch.

1 (2) Filling Holes

2 Check the water inflow rate at the bottom of holes after all pumps have been removed.
3 If the water inflow rate is greater than 6 inches per half hour or holes are stabilized
4 with slurry, use an approved method for placing concrete, grout or flowable fill.
5 Otherwise, remove any fluids and free fall concrete, grout or flowable fill into holes.
6 Ensure that concrete, grout or flowable fill flows completely around piles. Place
7 concrete, grout or flowable fill continuously and remove all temporary casings.

8 **(F) Pile Driving Analyzer**

9 When required, test piles in accordance with ASTM D4945 using a pile driving analyzer
10 (PDA) manufactured by Pile Dynamics, Inc. Analyze PDA data with the CAsE Pile Wave
11 Analysis Program (CAPWAP) manufactured by Pile Dynamics, Inc. Use a prequalified
12 PDA Consultant to perform PDA testing and CAPWAP analyses and provide PDA reports.
13 Use a PDA Operator approved as a Field Engineer (key person) for the PDA Consultant.
14 Provide PDA reports sealed by an engineer approved as a Project Engineer (key person)
15 for the same PDA Consultant.

16 The Engineer will determine how many and which piles require PDA testing. Provide piles
17 for PDA testing that are at least 5 feet longer than the estimated pile lengths shown in the
18 plans. Do not drive piles until the proposed pile driving methods and equipment have been
19 preliminarily accepted. Notify the Engineer of the pile driving schedule at least 7 days in
20 advance.

21 The Engineer will complete the review of the proposed pile driving methods and equipment
22 within 7 days of receiving PDA reports and pile driving criteria. Do not place concrete for
23 caps or footings on piles until PDA reports and pile driving criteria have been accepted.

24 (1) PDA Testing

25 If necessary, provide a shelter to protect the PDA Operator and equipment from
26 conditions of sun, water, wind and temperature. The shelter should have a floor size
27 of at least 6 feet x 6 feet and a roof height of at least 8 feet. If necessary, heat or cool
28 the shelter to maintain a temperature between 50°F and 85°F. Place the shelter within
29 reach of the PDA cables and clear view of piles being driven.

30 Drill holes for PDA instruments as directed. Place piles in leads and templates before
31 attaching PDA instruments. Use only preliminarily accepted pile driving methods and
32 equipment to drive piles. Drive piles as directed and in accordance with Subarticle
33 450-3(D). The PDA Operator or Engineer may require modified pile installation
34 procedures during driving. Dynamic measurements will be recorded and used to
35 evaluate the hammer performance, driving resistance and stresses, energy transfer, pile
36 integrity and various soil parameters such as quake and damping.

37 If required, reattach PDA instruments and restrike or redrive piles in accordance with
38 Subarticle 450-3(D)(4). Obtain the required stroke and at least 6 inches of pile
39 movement as directed. Dynamic measurements will be recorded during restriking and
40 redriving. The Engineer will determine when PDA testing has been satisfactorily
41 completed.

42 (2) CAPWAP Analysis

43 CAPWAP analysis is required for at least a hammer blow near the end of initial drive
44 and each restrike and redrive. Additional CAPWAP analyses may be required as
45 determined by the PDA Consultant or Engineer.

46 (3) PDA Reports

47 Submit 2 copies of each PDA report within 7 days of completing PDA testing. Include
48 the following in PDA reports:

Section 450

- 1 (a) Title Sheet
- 2 (i) Department's TIP number and WBS element number
- 3 (ii) Project description
- 4 (iii) County
- 5 (iv) Bridge station number
- 6 (v) Pile location
- 7 (vi) Personnel
- 8 (vii) Report date
- 9 (b) Introduction
- 10 (c) Site and Subsurface Conditions (including water table elevation)
- 11 (d) Pile Details (including driving dates and times)
- 12 (i) Pile type and length
- 13 (ii) Required driving resistance and resistance factor
- 14 (iii) Concrete compressive strength or steel yield strength
- 15 (iv) Pile splice type and locations
- 16 (v) Pile batter
- 17 (vi) Installation methods including use of predrilling, spudding, vibratory
- 18 hammer, template, barge, etc.
- 19 (e) Driving Details
- 20 (i) Hammer make, model and type
- 21 (ii) Hammer and pile cushion type and thickness
- 22 (iii) Pile helmet weight
- 23 (iv) Hammer efficiency and operation data including fuel settings, bounce
- 24 chamber pressure, blows per minute, equipment volume and pressure
- 25 (v) Driving data (ram stroke, blows/ft and set for last 10 hammer blows)
- 26 (vi) Ground or mud line, template reference and final pile tip elevations
- 27 (vii) Restrike and redrive information
- 28 (f) PDA Field Work Details
- 29 (g) CAPWAP Analysis Results
- 30 (i) Table showing percent skin and tip, skin and toe damping, skin and toe quake
- 31 and match quality
- 32 (h) Summary/Conclusions
- 33 (i) Attachments
- 34 (i) Boring log(s)
- 35 (ii) Pile driving equipment data form (from Contractor)
- 36 (iii) Field pile driving inspection data (from Engineer)
- 37 (iv) Accelerometer and strain gauge serial numbers, calibration and locations
- 38 (v) PDA hardware model and CAPWAP software version information
- 39 (vi) PDF copy of all PDA data and executable CAPWAP input and output files
- 40 (4) Pile Driving Criteria
- 41 Analyze pile driving with the GRL Wave Equation Analysis Program (GRLWEAP)
- 42 manufactured by Pile Dynamics, Inc. Use the same PDA Consultant that provides
- 43 PDA reports to perform GRLWEAP analyses and develop pile driving criteria.
- 44 Provide driving criteria sealed by an engineer approved as a Project Engineer (key
- 45 person) for the same PDA Consultant.
- 46 Analyze pile driving so driving stresses, energy transfer, ram stroke and blows per foot
- 47 from PDA testing and resistances from CAPWAP analyses correlate to GRLWEAP

1 models. Provide pile driving criteria for each combination of required driving
 2 resistance and pile length installed for all pile types and sizes. Submit 2 copies of pile
 3 driving criteria with PDA reports. Include the following for driving criteria.

- 4 (a) Project information in accordance with Subarticle 450-3(F)(3)(a)
- 5 (b) Table showing blows per foot and equivalent set vs. either stroke for multiple
 6 strokes in increments of 6 inches or bounce chamber pressure for multiple
 7 pressures in increments of 1 psi
- 8 (c) Maximum stroke or blows per foot or pile cushion requirements to prevent
 9 overstressing piles as needed
- 10 (d) GRLWEAP software version information
- 11 (e) PDF copy of all pile driving criteria and executable GRLWEAP input and output
 12 files

13 **450-4 MEASUREMENT AND PAYMENT**

14 No additional payment will be made for subsurface investigations to determine required pile
 15 lengths or larger caps or footings due to piles out of position.

16 *Pile Driving Equipment Setup for ____ Prestressed Concrete Piles, Pile Driving Equipment*
 17 *Setup for ____ Steel Piles and Pile Driving Equipment Setup for ____ Galvanized Steel Piles*
 18 will be measured and paid in units of each. Setting up equipment to drive piles will be measured
 19 as one per pile. No payment will be made for pile driving equipment setup for installed piles
 20 that are not driven. The contract unit price for *Pile Driving Equipment Setup for ____*
 21 *Prestressed Concrete Piles, Pile Driving Equipment Setup for ____ Steel Piles and Pile Driving*
 22 *Equipment Setup for ____ Galvanized Steel Piles* will be full compensation for mobilizing and
 23 demobilizing pile driving equipment, personnel, supplies and incidentals, setting up and
 24 breaking down pile driving equipment, e.g., pile hammer, crane, template, etc. and submitting
 25 the proposed pile driving methods and equipment.

26 *____ Prestressed Concrete Piles, ____ Steel Piles and ____ Galvanized Steel Piles* will be
 27 measured and paid in linear feet. Steel and prestressed concrete piles will be measured as the
 28 pile length before installation minus any pile cut-offs. No payment will be made for pile
 29 cut-offs or cutting off piles. No payment will be made for damaged, defective or rejected piles
 30 or any piles for false work, bracing, templates or temporary work bridges. The contract unit
 31 prices for *____ Prestressed Concrete Piles, ____ Steel Piles and ____ Galvanized Steel Piles*
 32 will be full compensation for furnishing and installing piles except for the items paid for
 33 separately in this article.

34 Composite piles will be measured as the pile length of the prestressed concrete and steel
 35 H-pile sections before installation minus any pile cut-offs. The concrete and steel sections will
 36 be measured and paid at the contract unit prices for *____ Prestressed Concrete Piles and ____*
 37 *Steel Piles*, respectively. No payment will be made for portions of steel H-pile sections
 38 embedded in prestressed concrete sections or steel pile splicers and any associated hardware or
 39 welding.

40 After piles attain the required resistance and pile penetration and at the Contractor's option,
 41 drive piles to grade instead of cutting off piles provided the remaining portions of piles do not
 42 exceed 5 feet and piles can be driven without damage or reaching the maximum blow count or
 43 refusal. When this occurs, the additional pile length driven will be measured and paid at the
 44 contract unit prices for *____ Prestressed Concrete Piles, ____ Steel Piles and ____ Galvanized*
 45 *Steel Piles*.

46 For prestressed concrete piles that are built up, the build-up will be measured and paid at the
 47 contract unit price for *____ Prestressed Concrete Piles*. Steel pile tips are not included in the
 48 measurement of prestressed concrete piles. No separate payment will be made for steel pile

Section 450

1 tips or splicers and any associated hardware or welding. Steel pile tips and steel pile splicers
2 will be incidental to the contract unit price for ____ *Prestressed Concrete Piles*.

3 *Steel Pile Points* and *Pipe Pile Plates* will be measured and paid in units of each. *Steel Pile*
4 *Points* and *Pipe Pile Plates* will be measured as one per pile.

5 *Predrilling for Piles* will be measured and paid in linear feet. For bents with a predrilling pay
6 item shown in the plans, predrilling will be paid as *Predrilling for Piles* and measured per pile
7 location as the depth from the ground or mud line to the specified predrilling elevation or
8 revised elevation approved by the Engineer. The contract unit price for *Predrilling for Piles*
9 will also be full compensation for using temporary casings. For bents without a predrilling pay
10 item shown in the plans, predrilling will be incidental to the contract unit prices for
11 ____ *Prestressed Concrete Piles*, ____ *Steel Piles* and ____ *Galvanized Steel Piles*.

12 No direct payment will be made for spudding. Spudding will be incidental to the contract unit
13 prices for ____ *Prestressed Concrete Piles*, ____ *Steel Piles* and ____ *Galvanized Steel Piles*.

14 *Pile Redrives* will be measured and paid in units of each. *Pile Redrives* will be measured as the
15 number of restrikes or redrives required by the Engineer. No payment will be made for restrikes
16 or redrives when the Contractor chooses to restrike or redrive piles.

17 *Pile Excavation in Soil* and *Pile Excavation Not in Soil* will be measured and paid in linear feet.
18 Pile excavation will be measured as the depth from the ground line to the specified pile
19 excavation elevation or revised elevation approved by the Engineer. Define "not in soil" as
20 material with a rock auger penetration rate of less than 2 inches per 5 minutes of drilling at full
21 crowd force. When not in soil is encountered, seams, voids and weathered rock less than 3 feet
22 thick with a rock auger penetration rate of greater than 2 inches per 5 minutes of drilling at full
23 crowd force will be paid at the contract unit price for *Pile Excavation Not in Soil*. Seams, voids
24 and weathered rock greater than 3 feet thick will be paid at the contract unit price for *Pile*
25 *Excavation in Soil* where not in soil is no longer encountered. The contract unit prices for *Pile*
26 *Excavation in Soil* and *Pile Excavation Not in Soil* will be full compensation for stabilizing and
27 filling holes with concrete, grout or flowable fill.

28 *PDA Testing* will be measured and paid in units of each. *PDA Testing* will be measured as one
29 per pile. The contract unit price for *PDA Testing* will be full compensation for performing PDA
30 testing the first time a pile is tested, performing CAPWAP analysis on data collected during
31 initial drive, restrikes and redrives, providing PDA reports, performing GRLWEAP analysis
32 and developing and providing pile driving criteria. Subsequent PDA testing of the same piles
33 will be incidental to the contract unit price for *Pile Redrives*. The contract unit price for *PDA*
34 *Testing* will also be full compensation for the Contractor's assistance to perform PDA testing
35 during initial drive, restrikes and redrives.

36 Payment will be made under:

SECTION 452
SHEET PILE RETAINING WALLS

452-1 DESCRIPTION

Construct sheet pile retaining walls consisting of steel sheet piles for permanent applications. Provide CIP reinforced concrete coping as required. Construct sheet pile retaining walls based on actual elevations and wall dimensions and with the required embedment below bottom of wall elevations in accordance with the contract and accepted submittals. Define “sheet pile wall” as a sheet pile retaining wall.

452-2 MATERIALS

Refer to Division 10.

Item	Section
Joint Materials	1028
Portland Cement Concrete, Class A	1000
Reinforcing Steel	1070
Steel Sheet Piles	1084-2

452-3 SHEET PILE WALL SURVEYS

The plans typically show a plan view, typical sections, details, notes and an elevation or profile view (wall envelope) for each sheet pile wall. Before beginning sheet pile wall construction, survey existing ground elevations along wall face locations and other elevations in the vicinity of sheet pile wall locations as needed. For proposed slopes above or below sheet pile walls, survey existing ground elevations to at least 10 feet beyond slope stake points. Based on these elevations, finished grades and actual sheet pile wall dimensions and details, submit wall envelopes for acceptance. Use accepted wall envelopes for construction.

452-4 CONSTRUCTION METHODS**(A) Sheet Pile Installation**

Install sheet piles with tolerances that meet Subarticles 450-3(B)(1) and 450-3(B)(2). Install sheet piles with the minimum required pile tip elevations in accordance with Subarticle 450-3(D).

(B) Concrete Coping

Construct CIP concrete coping in accordance with Section 420. Do not remove falsework until concrete attains a compressive strength of at least 2,400 psi. Provide a Class 2 surface finish for coping that meets Subarticle 420-17(F).

Construct coping joints at a maximum spacing of 10 feet. Make 1/2 inch thick expansion joints that meet Article 420-10 for every third joint and 1/2 inch deep grooved contraction joints that meet Subarticle 825-10(B) for the remaining joints. Stop coping reinforcement 2 inches on either side of expansion joints.

(C) Backfilling and Sealing Joints

When concrete coping is required, do not backfill behind sheet pile walls until concrete attains a compressive strength of at least 3,000 psi. Backfill for sheet pile walls in accordance with Article 410-8.

Seal joints above and behind sheet pile walls between coping and concrete slope protection with silicone sealant.

Section 453

1 452-5 MEASUREMENT AND PAYMENT

2 *Sheet Pile Retaining Walls* will be measured and paid in square feet. Sheet pile walls will be
3 measured as the square feet of wall face area with the pay height equal to the difference between
4 top and bottom of wall elevations. Define “top of wall” as top of coping or top of piles for sheet
5 pile walls without coping. Define “bottom of wall” as where finished grade intersects the front
6 of sheet piles and no measurement will be made for portions of sheet pile walls below bottom
7 of wall elevations.

8 The contract unit price for *Sheet Pile Retaining Walls* will be full compensation for providing
9 submittals, labor, tools, equipment and sheet pile wall materials, installing sheet piles,
10 excavating, backfilling, hauling and removing excavated materials and supplying sheet piles,
11 backfill, coping and any incidentals necessary to construct sheet pile walls.

12 The contract unit price for *Sheet Pile Retaining Walls* does not include the cost for ditches,
13 fences, handrails, guardrail or barriers associated with sheet pile walls as these items will be
14 paid for elsewhere in the contract.

15 Where it is necessary to provide backfill material from sources other than excavated areas or
16 borrow sources used in connection with other work in the contract, payment for furnishing and
17 hauling such backfill material will be paid as extra work in accordance with
18 Article 104-7. Placing and compacting such backfill material is not considered extra work but
19 is incidental to the work being performed.

20 Payment will be made under:

Pay Item	Pay Unit
Sheet Pile Retaining Walls	Square Foot

21 SECTION 453

22 CIP GRAVITY RETAINING WALLS

23 453-1 DESCRIPTION

24 Construct CIP gravity retaining walls consisting of CIP concrete supported by and connected
25 to concrete footings. Construct CIP gravity retaining walls based on actual elevations and wall
26 dimensions in accordance with the contract, accepted submittals and if included in the plans,
27 standard CIP gravity wall detail. Define “CIP gravity wall” as a CIP gravity retaining wall.

28 453-2 MATERIALS

29 Refer to Division 10.

Item	Section
Geotextiles, Type 1	1056
Joint Materials	1028
Masonry	1040
Portland Cement Concrete, Class A	1000
Reinforcing Steel	1070
Subdrain Coarse Aggregate	1044-2
Subdrain Fine Aggregate	1044-1

30 Use geotextiles and subdrain aggregate for subsurface drainage at weep holes and reinforcing
31 steel for dowels.

32 453-3 GRAVITY WALL SURVEYS

33 The plans typically show a plan view, typical sections, details, notes and an elevation or profile
34 view (wall envelope) for each CIP gravity wall. Before beginning CIP gravity wall
35 construction, survey existing ground elevations along wall face locations and other elevations
36 in the vicinity of CIP gravity wall locations as needed. For proposed slopes above or below

1 CIP gravity walls, survey existing ground elevations to at least 10 feet beyond slope stake
2 points. Based on these elevations, finished grades and actual CIP gravity wall dimensions and
3 details, submit wall envelopes for acceptance. Use accepted wall envelopes for construction.

4 **453-4 CONSTRUCTION METHODS**

5 Control drainage during construction in the vicinity of CIP gravity walls. Direct run off away
6 from CIP gravity walls and backfill. Contain and maintain backfill and protect material from
7 erosion.

8 Excavate as necessary for CIP gravity walls in accordance with the plans. Embed bottom of
9 footings at least 2 feet below bottom of walls shown in the plans. If applicable and at the
10 Contractor's option, use temporary shoring for wall construction instead of temporary slopes to
11 construct CIP gravity walls. Define "temporary shoring for wall construction" as temporary
12 shoring not shown in the plans or required by the Engineer including shoring for OSHA reasons
13 or the Contractor's convenience.

14 Notify the Engineer when foundation excavation is complete. Do not place concrete for
15 footings until excavation depth and foundation material are approved.

16 Construct CIP gravity walls at elevations and with dimensions shown in the plans and in
17 accordance with Section 420. Use dowels for construction joints at top of footings as shown in
18 the plans. Extend top of walls at least 6 inches above where finished grade intersects back of
19 CIP gravity walls.

20 Provide a Class 2 surface finish for exposed surfaces of CIP gravity walls that meets Subarticle
21 420-17(F). Construct wall joints at a maximum spacing of 10 feet. Make 1/2 inch thick
22 expansion joints that meet Article 420-10 for every third joint and 1/2 inch deep grooved
23 contraction or sawed joints that meet Subarticle 825-10(B) or 825-10(E) respectively for the
24 remaining joints.

25 Construct 3 inch diameter weep holes on 10 foot centers along CIP gravity walls. Provide
26 subsurface drainage at weep holes in accordance with Article 414-8. Exit weep holes just above
27 finished grade and slope holes at 1 in/ft through CIP gravity walls so water drains out of front
28 of walls. When single faced precast concrete barrier is required in front of and against CIP
29 gravity walls, extend weep holes through barrier at the same slope.

30 Do not remove forms or backfill behind CIP gravity walls until concrete attains a compressive
31 strength of at least 2,400 psi. Backfill for CIP gravity walls in accordance with Article 410-8.

32 If a brick veneer is required, construct brick masonry in accordance with Section 830. Anchor
33 brick veneers to CIP gravity walls with approved brick to concrete type anchors in accordance
34 with the manufacturer's instructions. Space anchors no more than 16 inches apart in the vertical
35 direction and no more than 32 inches apart in the horizontal direction with each row of anchors
36 staggered 16 inches from the row above and below.

37 **453-5 MEASUREMENT AND PAYMENT**

38 *CIP Gravity Retaining Walls* will be measured and paid in square feet. CIP gravity walls will
39 be measured as the square feet of wall face area with the pay height equal to the difference
40 between top of wall and top of footing elevations. Define "top of wall" as top of CIP concrete.

41 The contract unit price for *CIP Gravity Retaining Walls* will be full compensation for providing
42 submittals, labor, tools, equipment and CIP gravity wall materials, excavating, backfilling,
43 hauling and removing excavated materials and supplying concrete, dowels, subsurface
44 drainage, weep holes and any incidentals necessary to construct CIP gravity walls. The contract
45 unit price for *CIP Gravity Retaining Walls* will also be full compensation for brick veneers, if
46 required.

47 No separate payment will be made for temporary shoring for wall construction. Temporary
48 shoring for wall construction will be incidental to the contract unit price for *CIP Gravity*
49 *Retaining Walls*.

Section 454

1 The contract unit price for *CIP Gravity Retaining Walls* does not include the cost for ditches,
2 fences, handrails, guardrail or barriers associated with CIP gravity walls as these items will be
3 paid for elsewhere in the contract.

4 Where it is necessary to provide backfill material from sources other than excavated areas or
5 borrow sources used in connection with other work in the contract, payment for furnishing and
6 hauling such backfill material will be paid as extra work in accordance with Article 104-7.
7 Placing and compacting such backfill material is not considered extra work but is incidental to
8 the work being performed.

9 Payment will be made under:

Pay Item	Pay Unit
CIP Gravity Retaining Walls	Square Foot

SECTION 454

SEGMENTAL GRAVITY RETAINING WALLS

454-1 DESCRIPTION

13 Construct segmental gravity retaining walls consisting of segmental retaining wall (SRW) units
14 supported by aggregate footings. Provide CIP concrete slope protection as required. Design,
15 if required, and construct segmental gravity retaining walls based on actual elevations, wall
16 dimensions and batter in accordance with the contract, accepted submittals and if included in
17 the plans, standard segmental gravity wall detail.

18 Define "block wall" as a segmental gravity retaining wall and "standard block wall" as a block
19 wall that meets the standard segmental gravity retaining wall details. Define "blocks" as SRW
20 units, "cap blocks" as SRW cap units and "Block Vendor" as the vendor licensing the block
21 producer. Define "slope protection" as CIP concrete slope protection.

454-2 MATERIALS

23 Refer to Division 10.

Item	Section
Geotextiles, Type 2	1056
Joint Materials	1028
Portland Cement Concrete, Class B	1000
Segmental Retaining Wall Units	1040-4
Select Material	1016
Subsurface Drainage Materials	815-2

24 Provide Type 2 geotextile for separation geotextiles. Use Class VI select material for No. 57
25 stone and Class B concrete for slope protection. Provide PVC pipes, fittings, outlet pipes and
26 concrete pads for subsurface drainage materials. For PVC pipes behind block walls, use pipes
27 with perforations that meet AASHTO M 278.

28 Provide cap blocks that meet the material requirements for blocks. Use blocks from producers
29 approved by the Department and licensed by the Block Vendor. Notify the Engineer of the
30 name and NCDOT ID number of the SRW unit production facility before beginning block
31 production. Provide blocks with a depth (front to back) of at least 12 inches and cap blocks
32 with a depth of at least 8 inches.

33 Use approved SRW units for standard block walls. Blocks for standard block walls are
34 approved for either 2 foot or 4 foot maximum design heights with the design height as shown
35 in the standard segmental gravity wall details. The list of approved SRW units with maximum
36 design heights is available from the Geotechnical web site.

37 Do not mix blocks from different Block Vendors on the same block wall. Damaged blocks
38 with excessive discoloration, chips or cracks as determined by the Engineer will be rejected.

1 Provide adhesives recommended by the Block Vendor. Store adhesives in accordance with the
2 manufacturer's instructions. Load, transport, unload and store block wall materials so materials
3 are kept clean and free of damage.

4 **454-3 PRECONSTRUCTION REQUIREMENTS**

5 **(A) Block Wall Surveys**

6 The plans typically show a plan view, typical sections, details, notes and an elevation or profile
7 view (wall envelope) for each block wall. Before beginning block wall design or construction,
8 survey existing ground elevations along wall face locations and other elevations in the vicinity
9 of block wall locations as needed. For proposed slopes above or below block walls, survey
10 existing ground elevations to at least 10 feet beyond slope stake points. Based on these
11 elevations, finished grades and actual block wall dimensions, details and batter, submit wall
12 envelopes for acceptance. Use accepted wall envelopes for design, if required, and
13 construction.

14 **(B) Block Wall Designs**

15 If the plans do not include standard segmental gravity wall details, submit design calculations
16 and working drawings for block wall designs at least 30 days before starting block wall
17 construction. Do not begin block wall construction until a design submittal is accepted.

18 Design block walls in accordance with the plans and Article 11.11 of the AASHTO LRFD
19 Bridge Design Specifications unless otherwise required. Neglect material above top of footing
20 for stability computations. Design block walls for the wall batter required by the Block Vendor
21 and clearances shown in the plans. Do not locate blocks or footings outside right-of-way or
22 easement limits.

23 Use No. 57 stone for aggregate footings beneath blocks. Use 10 inch thick footings that are
24 continuous at steps and extend at least 6 inches in front of and at least 9 inches behind bottom
25 row of blocks. Embed bottom of footings at least 18 inches below bottom of walls shown in
26 the plans. When noted in the plans, locate a 4 inch diameter continuous perforated PVC drain
27 pipe in the No. 57 stone in back of footings.

28 Fill block core spaces with No. 57 stone and between and behind blocks with No. 57 stone for
29 a horizontal distance of at least 12 inches so stone is continuous in all directions. Assume a
30 unit weight of 100 lb/cf for No. 57 stone. Separation geotextiles are required between No. 57
31 stone and backfill or natural ground, and between stone and overlying fill or pavement section
32 except when concrete pavement, full depth asphalt or cement treated base is placed directly on
33 stone.

34 Use cap blocks at top of walls. Step top of walls as shown in the plans and double stack cap
35 blocks at steps so cap blocks are continuous at steps. Extend top of walls 4 inches to 12 inches
36 above where finished grade intersects back of blocks or cap blocks. When single faced precast
37 concrete barrier is required in front of and against block walls, fill voids between barrier and
38 wall faces with Class V select material.

39 Submit working drawings and design calculations for acceptance in accordance with Article
40 105-2. Submit working drawings showing plan views, wall profiles with required resistances,
41 typical sections, No. 57 stone and geotextile locations and details of footings, blocks, cap
42 blocks, etc. If necessary, include details on working drawings for slope protection and
43 obstructions extending through walls or interfering with footings. Submit design calculations
44 for each wall section with different geometry or material parameters. When designing block
45 walls with computer software, a hand calculation is required for the tallest wall section. Provide
46 block wall designs sealed by an engineer licensed in the state of North Carolina.

Section 454

1 **454-4 CONSTRUCTION METHODS**

2 Control drainage during construction in the vicinity of block walls. Direct run off away from
3 block walls, No. 57 stone and backfill. Contain and maintain stone and backfill and protect
4 material from erosion.

5 Excavate as necessary for block walls in accordance with the plans and accepted submittals.
6 Notify the Engineer when foundation excavation is complete. Do not place No. 57 stone for
7 footings until excavation dimensions and foundation material are approved.

8 Construct aggregate footings at elevations and with dimensions shown in the plans and accepted
9 submittals. If a drain is required, install wall drainage systems consisting of drains and outlet
10 components as shown in the plans and accepted submittals and in accordance with Section 815.
11 Compact No. 57 stone for footings with a vibratory compactor to the satisfaction of the
12 Engineer.

13 Stack blocks with no negative wall batter (wall face leaning forward) so the final wall position
14 is as shown in the plans and accepted submittals. Place blocks with a maximum vertical joint
15 width of 3/8 inch. Stagger blocks to create a running bond by centering blocks over joints in
16 the row below as shown in the plans and accepted submittals. Construct block walls with the
17 following tolerances:

18 A. Blocks are level from front to back and between units when checked with a 4 foot long
19 level,

20 B. Final wall face is within 2 inches of horizontal and vertical alignment shown in the plans
21 and accepted submittals, and

22 C. Wall batter is within 2 degrees of batter required by the Block Vendor.

23 Overlap adjacent separation geotextiles at least 18 inches at seams and hold geotextiles in place
24 with wire staples or anchor pins as needed. Place No. 57 stone between and behind blocks in
25 8 inch to 10 inch thick lifts. Compact stone with hand operated compaction equipment to the
26 satisfaction of the Engineer. Backfill for block walls behind No. 57 stone in accordance with
27 Article 410-8.

28 Set cap blocks with a 1/2 inch to 1-1/2 inch overhang as shown in the plans and accepted
29 submittals. Place cap blocks using adhesive in accordance with the manufacturer's instructions.
30 Do not place cap blocks if surfaces caps will be attached to are wet or frozen or the air
31 temperature measured at the wall location in the shade away from artificial heat is below 40°F.
32 Before applying adhesive, clean surfaces cap blocks will adhere to and ensure surfaces are dry
33 and free of oil, grease, dust and debris.

34 Pave slopes above and behind block walls with slope protection as shown in the plans and
35 accepted submittals and in accordance with Article 462-3. Construct slope protection joints at
36 a maximum spacing of 10 feet. Make 1/2 inch thick expansion joints that meet Article 420-10
37 for every third joint and 1/2 inch deep grooved contraction joints that meet Subarticle 825-
38 10(B) for the remaining joints.

39 **454-5 MEASUREMENT AND PAYMENT**

40 *Segmental Gravity Retaining Walls* will be measured and paid in square feet. Block walls will
41 be measured as the square feet of wall face area with the pay height equal to the difference
42 between top of wall and top of footing elevations. Define "top of wall" as top of cap blocks.

43 The contract unit price for *Segmental Gravity Retaining Walls* will be full compensation for
44 providing designs, if required, submittals, labor, tools, equipment and block wall materials,
45 excavating, backfilling, hauling and removing excavated materials and supplying footings,
46 blocks, select material, wall drainage systems, geotextiles, cap blocks, slope protection and any
47 incidentals necessary to construct block walls.

1 The contract unit price for *Segmental Gravity Retaining Walls* does not include the cost for
 2 ditches, fences, handrails, guardrail or barriers associated with block walls as these items will
 3 be paid for elsewhere in the contract.

4 Where it is necessary to provide backfill material behind No. 57 stone from sources other than
 5 excavated areas or borrow sources used in connection with other work in the contract, payment
 6 for furnishing and hauling such backfill material will be paid as extra work in accordance with
 7 Article 104-7. Placing and compacting such backfill material is not considered extra work but
 8 is incidental to the work being performed.

9 Payment will be made under:

Pay Item	Pay Unit
Segmental Gravity Retaining Walls	Square Foot

10 **SECTION 455**
 11 **PRECAST GRAVITY RETAINING WALLS**

12 **455-1 DESCRIPTION**

13 Construct precast gravity retaining walls consisting of precast retaining wall (PRW) units
 14 supported by concrete footings. Provide CIP concrete slope protection as required. Design and
 15 construct precast gravity retaining walls based on actual elevations, wall dimensions and batter
 16 in accordance with the contract and accepted submittals. Define “precast gravity wall” as a
 17 precast gravity retaining wall and “PRW Unit Vendor” as the vendor licensing the precaster.
 18 Define “slope protection” as CIP concrete slope protection.

19 **455-2 MATERIALS**

20 Refer to Division 10.

Item	Section
Geotextiles, Type 2	1056
Joint Materials	1028-1

Select Material, Class VI	1016
Precast Retaining Wall Units	1077
Subsurface Drainage Materials	815

21 Provide Type 2 geotextile for separation geotextiles. Use Class A concrete for footings, Class
 22 B concrete for slope protection and Class VI select material for No. 57 stone. Provide PVC
 23 pipes, fittings, outlet pipes and concrete pads for subsurface drainage materials. For PVC pipes
 24 behind precast gravity walls, use pipes with perforations that meet AASHTO M 278.

25 Provide PRW cap and top units that meet the material requirements for PRW units. Use PRW
 26 units from producers approved by the Department and licensed by the PRW Unit Vendor.
 27 Produce PRW units with a final finish that meets Article 1077-11 except for unit faces. Provide
 28 PRW units with a vertical rock like face and a concrete gray color with no tints, dyes or
 29 pigments. Do not begin unit production until sample PRW units of the type, face and color
 30 proposed for the project are approved.

31 Do not mix PRW units from different PRW Unit Vendors on the same precast gravity wall.
 32 Damaged PRW units with excessive discoloration, chips or cracks as determined by the
 33 Engineer will be rejected. Load, transport, unload and store precast gravity wall materials so
 34 materials are kept clean and free of damage.

Section 455

1 **455-3 PRECONSTRUCTION REQUIREMENTS**

2 **(A) Precast Gravity Wall Surveys**

3 The Retaining Wall Plans show a plan view, typical sections, details, notes and an elevation or
4 profile view (wall envelope) for each precast gravity wall. Before beginning precast gravity
5 wall design, survey existing ground elevations shown in the plans and other elevations in the
6 vicinity of precast gravity wall locations as needed. For proposed slopes above or below precast
7 gravity walls, survey existing ground elevations to at least 10 feet beyond slope stake points.
8 Based on these elevations, finished grades and actual precast gravity wall dimensions, details
9 and batter, submit revised wall envelopes for acceptance. Use accepted wall envelopes for
10 design.

11 **(B) Precast Gravity Wall Designs**

12 For precast gravity wall designs, submit design calculations and working drawings at least 30
13 days before the preconstruction meeting. Note name and NCDOT ID number of the PRW unit
14 production facility on the working drawings. Do not begin precast gravity wall construction
15 until a design submittal is accepted.

16 Design precast gravity walls in accordance with the plans and Article 11.11 of the AASHTO
17 LRFD Bridge Design Specifications unless otherwise required. Neglect material above top of
18 footing for stability computations. Design precast gravity walls for seismic if walls are located
19 in seismic zone 2 based on Figure 2-1 of the Structure Design Manual. Design precast gravity
20 walls for the wall batter required by the PRW Unit Vendor and clearances shown in the plans.
21 Do not locate PRW units or footings outside right-of-way or easement limits.

22 When noted in the plans, design precast gravity walls for a live load (traffic) surcharge of 250
23 lb/sf in accordance with Figure C11.5.6-3(a) of the AASHTO LRFD specifications. For steel
24 beam guardrail with 8 foot posts above precast gravity walls, analyze walls for a horizontal load
25 (PH1) of 300 lb/ft of wall in accordance with Figure 3.11.6.3-2(a) of the AASHTO LRFD
26 specifications. For concrete barrier rail above precast gravity walls, analyze walls for a PH1 of
27 500 lb/ft of wall in accordance with Figure 3.11.6.3-2(a).

28 Use 12 inch thick CIP unreinforced concrete footings beneath PRW units that are continuous
29 at steps and extend at least 6 inches in front of and behind bottom row of PRW units. Embed
30 bottom of footings at least 2 feet below bottom of walls shown in the plans.

31 Fill PRW unit core spaces with No. 57 stone and between and behind units with No. 57 stone
32 for a horizontal distance of at least 18 inches so stone is continuous in all directions. For
33 adjacent PRW units with different depths (front to back), it may be necessary to fill behind units
34 with more than 18 inches of No. 57 stone to make stone continuous. Assume a unit weight of
35 100 lb/cf for No. 57 stone.

36 When noted in the plans, locate a 4 inch diameter continuous perforated PVC drain pipe in the
37 No. 57 stone behind bottom row of PRW units. Separation geotextiles are required between
38 No. 57 stone and backfill or natural ground and between stone and overlying fill or pavement
39 section except when concrete pavement, full depth asphalt or cement treated base is placed
40 directly on stone.

41 At the Contractor's option, use PRW cap or top units at top of walls unless there is a back slope
42 or concrete barrier rail above precast gravity walls. For precast gravity walls with back slopes,
43 use top PRW units only and extend top of walls at least 4 inches above where finished grade
44 intersects PRW top units. When concrete barrier rail is required above precast gravity walls,
45 use concrete barrier rail with moment slab as shown in the plans and do not use PRW cap units.
46 When single faced precast concrete barrier is required in front of and against precast gravity
47 walls, fill voids between barrier and wall faces with Class V select material.

48 Submit working drawings and design calculations for acceptance in accordance with Article
49 105-2. Submit working drawings showing plan views, wall profiles with required resistances,
50 typical sections, No. 57 stone and geotextile locations and details of footings, PRW units, etc.

1 If necessary, include details on working drawings for slope protection, concrete barrier rail with
2 moment slab and obstructions extending through walls or interfering with footings, barriers or
3 moment slabs. Submit design calculations for each wall section with different surcharge loads,
4 geometry or material parameters. When designing precast gravity walls with computer
5 software, a hand calculation is required for the tallest wall section. Provide precast gravity wall
6 designs sealed by an engineer licensed in the state of North Carolina.

7 (C) Preconstruction Meeting

8 Before starting precast gravity wall construction, hold a preconstruction meeting to discuss the
9 construction and inspection of the precast gravity walls. If this meeting occurs before all precast
10 gravity wall submittals have been accepted, additional preconstruction meetings may be
11 required before beginning construction of precast gravity walls without accepted submittals.
12 The Resident or Bridge Maintenance Engineer, Bridge Construction Engineer, Geotechnical
13 Operations Engineer, Contractor and Precast Gravity Wall Installer Superintendent will attend
14 preconstruction meetings.

15 455-4 CONSTRUCTION METHODS

16 Control drainage during construction in the vicinity of precast gravity walls. Direct run off
17 away from precast gravity walls, No. 57 stone and backfill. Contain and maintain stone and
18 backfill and protect material from erosion.

19 Excavate as necessary for precast gravity walls in accordance with the accepted submittals. If
20 applicable and at the Contractor's option, use temporary shoring for wall construction instead
21 of temporary slopes to construct precast gravity walls. Define "temporary shoring for wall
22 construction" as temporary shoring not shown in the plans or required by the Engineer including
23 shoring for OSHA reasons or the Contractor's convenience.

24 Notify the Engineer when foundation excavation is complete. Do not place concrete for
25 footings until excavation depth and foundation material are approved.

26 Construct CIP concrete footings at elevations and with dimensions shown in the accepted
27 submittals and in accordance with Section 420. Cure footings at least 24 hours before placing
28 PRW units.

29 Stack PRW units with no negative wall batter (wall face leaning forward) so the final wall
30 position is as shown in the accepted submittals. Place PRW units with a maximum vertical
31 joint width of 1/2 inch. Stagger PRW units to create a running bond by centering units over
32 joints in the row below as shown in the accepted submittals. Construct precast gravity walls
33 with the following tolerances:

- 34 A. PRW units are level from front to back and between units when checked with a 4 foot long
35 level,
- 36 B. Wall face is within 2 inches of horizontal and vertical alignment shown in the accepted
37 submittals when measured along a 10 foot straightedge unless otherwise approved, and
- 38 C. Wall batter is within 2 degrees of batter required by the PRW Unit Vendor.

39 Overlap adjacent separation geotextiles at least 18 inches at seams and hold geotextiles in place
40 with wire staples or anchor pins as needed. If a drain is required, install wall drainage systems
41 consisting of drains and outlet components as shown in the accepted submittals and in
42 accordance with Section 815.

43 Place No. 57 stone between and behind PRW units in 8 inch to 10 inch thick lifts. Compact
44 stone with hand operated compaction equipment to the satisfaction of the Engineer. Backfill
45 for precast gravity walls behind No. 57 stone in accordance with Article 410-8. Set PRW cap
46 units with a 1/2 inch to 1-1/2 inch overhang as shown in the plans.

47 Pave slopes above and behind precast gravity walls with slope protection as shown in the plans
48 and accepted submittals and in accordance with Article 462-3. Construct slope protection joints

Section 458

1 at a maximum spacing of 10 feet. Make 1/2 inch thick expansion joints that meet Article 420-
2 10 for every third joint and 1/2 inch deep grooved contraction joints that meet Subarticle 825-
3 10(B) for the remaining joints.

4 455-5 MEASUREMENT AND PAYMENT

5 *Precast Gravity Retaining Walls* will be measured and paid in square feet. Precast gravity walls
6 will be measured as the square feet of wall face area with the pay height equal to the difference
7 between top of wall and top of footing elevations. Define "top of wall" as top of PRW cap or
8 top units.

9 The contract unit price for *Precast Gravity Retaining Walls* will be full compensation for
10 providing design, submittals, labor, tools, equipment and precast gravity wall materials,
11 excavating, backfilling, hauling and removing excavated materials and supplying footings,
12 PRW units, select material, wall drainage systems, geotextiles, PRW cap and top units, slope
13 protection and any incidentals necessary to construct precast gravity walls.

14 No separate payment will be made for temporary shoring for wall construction. Temporary
15 shoring for wall construction will be incidental to the contract unit price for *Precast Gravity*
16 *Retaining Walls*.

17 The contract unit price for *Precast Gravity Retaining Walls* does not include the cost for ditches,
18 fences, handrails, guardrail or barriers associated with precast gravity walls as these items will
19 be paid for elsewhere in the contract.

20 Where it is necessary to provide backfill material behind No. 57 stone from sources other than
21 excavated areas or borrow sources used in connection with other work in the contract, payment
22 for furnishing and hauling such backfill material will be paid as extra work in accordance with
23 Article 104-7. Placing and compacting such backfill material is not considered extra work but
24 is incidental to the work being performed.

25 Payment will be made under:

Pay Item	Pay Unit
Precast Gravity Retaining Walls	Square Foot

26 SECTION 458 27 WATERPROOFING AND DAMPPROOFING

28 458-1 DESCRIPTION

29 Waterproof or dampproof concrete surfaces in accordance with these specifications for the
30 particular method of waterproofing or dampproofing called for in the plans. Furnish and apply
31 all asphalt, tar, fabric, asphalt plank and any other materials.

32 458-2 MATERIALS

33 Refer to Division 10.

Item	Section
Asphalt Binder	1020-7(B)
Asphalt Primer	1020-7(A)
Tar	1020-7(C)
Woven Cotton Fabric	1020-7(D)

34 458-3 METHOD A WATERPROOFING

35 (A) General

36 Method A waterproofing consists of one coat of asphalt primer, and 3 mop coats of hot
37 asphalt cement with 2 layers of cotton fabric alternating between the mop coats.

1 (B) Preparation of Surface

2 Ensure that concrete surfaces are dry, reasonably smooth and free from projections or holes
3 which are capable of puncturing the membrane. Immediately before applying the
4 waterproofing, thoroughly clean the surface of dust and loose materials.

5 Make sure that the concrete is at least 14 days old for Class A concrete, at least 10 days old
6 for Class AA concrete, or at least 7 days old for high early strength concrete, before
7 beginning waterproofing. Do not waterproof in wet weather nor when the temperature is
8 below 35°F, without permission.

9 (C) Application

10 Give waterproofed surfaces a thorough coat of asphalt primer, and allow it to set thoroughly
11 before applying the first mop coat. Heat the asphalt cement for the mop coat to a
12 temperature of at least 300°F and frequently stir to avoid local overheating. Equip the
13 heating kettles with thermometers.

14 Begin the waterproofing at the low point of the surface.

15 Use a half width first strip of fabric; and a full width second strip. Lap the full width of
16 the first strip. Make the third and each succeeding strip full width and lap so there are
17 2 layers of fabric at all points with laps at least 2 inches wide. Make sure that the end laps
18 are at least 12 inches.

19 Beginning at the low point of the surface, mop a section about 20 inches wide and the full
20 length of the surface with hot asphalt cement. Immediately roll the first strip of fabric into
21 the asphalt cement and press into place to eliminate all air bubbles and to provide a firm
22 bond to the surface. Mop this strip and an adjacent section of the surface of a width equal
23 to slightly more than half the width of the fabric with hot asphalt binder and roll a full
24 width of the fabric into this cement, completely covering the first strip, and press into place.
25 Mop this second strip and an adjacent section of the concrete surface with hot asphalt
26 cement and place the third strip of fabric to lap the first strip at least 2 inches. Continue
27 this process until the entire surface is covered, each strip of fabric lapping at least 2 inches
28 over the second preceding strip. Give the entire surface a final mopping of hot asphalt
29 cement.

30 Mop on concrete to completely cover the surface sufficiently heavy on cloth to completely
31 conceal the weave. Use at least 12 gallons of asphalt on horizontal surfaces for each
32 100 square feet of finished work and at least 15 gallons on vertical surfaces. Perform the
33 work so, at the close of a day's work, all laid cloth receives the final mopping of asphalt.
34 Thoroughly seal down all laps.

35 (D) Special Requirements

36 At the edges of the membrane and at any points punctured by such appurtenances as drains
37 or pipes, make suitable provisions to prevent water from getting between the waterproofing
38 and the waterproofed surface.

39 Place all membrane flashing at curbs and against girders, spandrel walls, etc., with separate
40 sheets of membrane lapping the main membrane at least 12 inches. Closely seal flashing
41 with either a metal counter-flashing or by embedding the upper edges of the flashing in a
42 groove poured full of joint filler.

43 Provide expansion joints, both horizontal and vertical, with water stops and premolded
44 joint filler as called for in the plans. Seal expansion joints in the face adjacent to the
45 membrane bituminous material. Carry the membrane continuously across all expansion
46 joints.

47 At the ends of the structure carry the membrane well down on the abutments and make
48 suitable provisions for all movement.

Section 460

1 **(E) Repairs**

2 Repair any damage that occurs as directed. Repair by patching when permitted. Extend
3 the first ply of the patch at least 12 inches beyond the outermost damaged portion of the
4 membrane and extend the second ply at least 3 inches beyond the first.

5 **(F) Backfilling**

6 Do not backfill without permission and until the final mop coat thoroughly hardens. Place
7 backfill so the waterproofing is not damaged.

8 **458-4 METHOD B DAMP PROOFING**

9 **(A) General**

10 Method B dampproofing consists of 2 coats of tar, Grade RT 6.

11 **(B) Preparation of Surface**

12 Make sure the surfaces are dry. Immediately before applying the first dampproofing coat,
13 thoroughly clean the surfaces of dust and loose materials. Permit the concrete to cure for
14 at least 14 days for Class A concrete, at least 10 days for Class AA concrete or 7 days for
15 high early strength concrete before dampproofing.

16 **(C) Application**

17 Give the concrete surfaces 2 applications of tar, Grade RT 6. Apply the tar with suitable
18 brushes to secure uniform and thorough applications. Do not apply the second coat of tar
19 until the first coat thoroughly sets. Do not apply dampproofing during any time that the
20 surface is exposed to any moisture. Make sure that the temperature of the tar is such that
21 uniform and thorough application is obtained. Do not backfill until the second coat
22 thoroughly sets.

23 **458-5 MEASUREMENT AND PAYMENT**

24 *Method A Waterproofing* will be measured and paid as the actual number of square yards of
25 surface that is waterproofed. In measuring this quantity, measurement is made along the actual
26 surface that is to be waterproofed before the waterproofing is applied.

27 *Method B Dampproofing* will be measured and paid as the actual number of square yards of
28 surface that is dampproofed. In measuring this quantity, measurement is made along the actual
29 surface that is to be dampproofed before the dampproofing is applied.

30 These prices and payments will be full compensation for all items required to waterproof and
31 dampproof including, but not limited to, those items contained in Article 454-1.

32 Payment will be made under:

Pay Item	Pay Unit
Method A Waterproofing	Square Yard
Method B Dampproofing	Square Yard

33 **SECTION 460**
34 **CONCRETE AND METAL RAILS**

35 **460-1 DESCRIPTION**

36 Furnish and place metal, pipe or concrete barrier bridge rails, concrete curbs and concrete end
37 posts in accordance with these specifications and as shown in the plans. Provide concrete barrier
38 rails with moment slabs above retaining walls in accordance with the contract and accepted
39 submittals. Furnish posts, rail bars, pipe fittings, hardware, paint, barrier delineators, concrete,
40 reinforcing steel, admixtures, forms, falsework and all other materials; galvanize; paint;
41 fabricate and erect rail; and place, finish and cure concrete.

1 **460-2 MATERIALS**

2 Refer to Division 10.

Item	Section
Aluminum Rail	1074-5
Barrier Delineators	1088-2
Epoxy Coated Reinforcing Steel	1070-7
Galvanized Steel Rail	1074-5
Paint	1080
Pipe Rail	1074-6
Portland Cement Concrete	1000
Reinforcing Steel	1070
Steel Bar Reinforcement	1070

3 Use Class AA concrete for concrete barrier rails, concrete curbs and end posts, and Class A
4 concrete for moment slabs in accordance with Article 1000-4. Use epoxy coated reinforcing
5 steel for concrete barrier rails in accordance with Article 1070-7.

6 **460-3 CONSTRUCTION METHODS**

7 Adhere to the construction load limitations of Article 420-20 while placing concrete for all
8 bridge rails.

9 **(A) Metal Rail**

10 Use either aluminum or galvanized steel rail, but use the same material on all structures on
11 the project on which metal rail is required.

12 Use shims if necessary to obtain correct post alignment.

13 Drive aluminum rivets cold. Thoroughly coat the base of aluminum rail post, closure
14 plates, shims or any other aluminum surface in contact with concrete with an approved
15 aluminum impregnated caulking compound.

16 **(B) Pipe Rail**

17 Give galvanized pipe rail one field coat of organic zinc repair paint, of minimum wet
18 thickness of 1.5 mils, after erection in accordance with Section 442 unless otherwise
19 required in the contract.

20 **(C) Concrete Barrier**

21 This subarticle applies to the construction of concrete barrier rail, vertical concrete barrier
22 rail, concrete curbs, median barrier rail and concrete parapet, referred to collectively as
23 concrete barrier rail.

24 Plans for the concrete barrier rail are detailed for slip-formed CIP concrete. Unless
25 otherwise noted, construct concrete barrier rail detailed in the plans using conventional
26 forms or by slip-forming using an approved self-propelled extrusion machine. Except as
27 noted herein, construct in accordance with Section 420.

28 Construct joints in the barrier rails at the locations and of the type shown in the plans.

29 Construct concrete barrier rail to the shape, line, grade and dimensions shown in the plans
30 except that when slip-forming rails, either radius or chamfer the corners. Check slip-
31 formed rail concrete directly behind the extrusion machine using successive overlapping
32 applications of the 10 foot straightedge. Correct high and low areas while the concrete is
33 still workable. Limit horizontal and vertical deviation from plan line and grade to no more
34 than 1/4 inches in 10 feet.

35 Provide sufficient internal vibrators to consolidate the concrete along the faces of forms
36 and adjacent to joints. Consolidate the concrete by internal vibration in one pass of the

Section 460

1 extrusion machine. Produce a dense and homogeneous barrier free of voids and honeycomb
2 with minimum hand finishing. Coordinate concrete delivery and placement to provide
3 uniform progress while minimizing stopping and starting of the extrusion machine.

4 When plans require horizontal deck drains through the barrier rails, use drain couplings
5 with slip-formed rails.

6 Correct all exposed surfaces that are not satisfactory to the Engineer as to uniformity of
7 color and texture or because of excessive patching as required. Give the roadway face of
8 barrier rails constructed using conventional forms a Class 2 surface finish in accordance
9 with Subarticle 420-17(F). Use a broom finish on the roadway face of slip-formed barrier
10 rails.

11 Provide barrier rail delineators in accordance with Section 854.

12 (D) Concrete Barrier Rail with Moment Slab

13 Construct concrete barrier rails with moment slabs in accordance with the plans and
14 accepted submittals. Construct concrete barrier in accordance with Subarticle 460-3(C)
15 and moment slab in accordance with Section 420. Do not remove moment slab false work
16 until concrete achieves a minimum compressive strength of 2,400 psi.

17 460-4 MEASUREMENT AND PAYMENT

18 ____ *Bar Metal Rail* will be measured and paid as the actual number of linear feet of metal rail,
19 measured along the top bar of the rail that is completed and accepted.

20 *32" Alaska Rail* and *42" Oregon Metal Rail* will be measured and paid as the actual number of
21 linear feet of bridge railing and concrete curb. The price and payment will be full compensation
22 for all materials, labor, equipment, tools, and incidentals necessary to construct the bridge
23 railing, the concrete curb and concrete end posts. Concrete end post payment shall be included
24 in the cost to provide the concrete curb.

25 ____" *Galvanized Steel Pipe Rail* will be measured and paid as the actual number of linear feet of
26 pipe rail, measured along the top pipe of the installed pipe rail, that is completed and accepted.

27 *Concrete Barrier Rail* will be measured and paid as the number of linear feet of concrete barrier
28 rail provided in the plans.

29 *Concrete Barrier Rail with Moment Slab* will be measured and paid for in linear feet. Concrete
30 barrier rails with moment slabs will be measured as the length of concrete barrier rail above
31 retaining walls. The contract unit price for *Concrete Barrier Rail with Moment Slab* will be
32 full compensation for earthwork, materials, hauling and any incidental labor for providing
33 concrete barrier rails with moment slabs in accordance with the contract.

34 *Vertical Concrete Barrier Rail* will be measured and paid as the number of linear feet of vertical
35 concrete barrier rail provided in the plans.

36 *Concrete Median Barrier* will be measured and paid as the number of linear feet provided in
37 the plans.

38 ____ x ____ *Concrete Parapet* will be measured and paid as the number of linear feet of
39 concrete parapet provided in the plans.

40 There will be no direct payment for bridge rail delineators as they are incidental to the work
41 being performed.

42 These prices and payments will be full compensation for all items required to provide bridge
43 railing including, but not limited to, those items contained in Article 460-1.

1 Payment will be made under:

Pay Item	Pay Unit
___ Bar Metal Rail	Linear Foot
32" Alaska Rail	Linear Foot
42" Oregon Rail	Linear Foot
___" Galvanized Steel Pipe Rail	Linear Foot
Concrete Barrier Rail	Linear Foot
Concrete Barrier Rail with Moment Slab	Linear Foot
Vertical Concrete Barrier Rail	Linear Foot
Concrete Median Barrier	Linear Foot
___ x ___ Concrete Parapet	Linear Foot

2

**SECTION 462
SLOPE PROTECTION**

3

4 **462-1 DESCRIPTION**

5 Construct slope protection under the ends of bridges or at other locations in accordance with
6 details shown in the contract. Excavate and backfill, furnish and place concrete, reinforcement
7 and other materials. Unless otherwise noted in the plans, use CIP reinforced concrete.

8 **462-2 MATERIALS**

9 Refer to Division 10.

Item	Section
Curing Agents	1026
Joint Fillers	1028-1
Portland Cement Concrete, Class B	1000
Wire Reinforcement	1070-3

10 **462-3 CONSTRUCTION METHODS**

11 Immediately before placing the paving, properly shape and firmly compact the slope so it
12 conforms to the required lines and grades.

13 Construct CIP concrete slope protection in accordance with Section 420, except as otherwise
14 provided herein. Furnish and place reinforcement as shown in the plans and in accordance with
15 Section 425. After placing the concrete for one section, strike it off to plan grade and finish to
16 a dense and uniform surface.

17 Provide a reasonably smooth and uniform surface for the finished slope protection that does not
18 vary more than 1/2 inch in a distance of 10 feet.

19 Do not place backfill adjacent to CIP slope protection at any one end bent until each individual
20 section of paving at the end bent cures for 3 or more curing days in accordance with Subarticle
21 420-15(A). Place backfill no later than 5 calendar days after the last section of concrete paving
22 placed at the end bent cures for 3 curing days. Compact all backfill to a degree comparable to
23 the adjacent undisturbed material.

24 **462-4 MEASUREMENT AND PAYMENT**

25 ___" *Slope Protection* will be measured and paid as the actual number of square yards of slope
26 protection, measured along the top surface of the paving, which is completed and accepted.

27 The price and payment will be full compensation for all items required to provide slope
28 protection including, but not limited to, those items contained in Article 462-1.

29 Payment will be made under:

Pay Item	Pay Unit
___" Slope Protection	Square Yard

DIVISION 5 SUBGRADE, BASES AND SHOULDERS

SECTION 500

FINE GRADING SUBGRADE, SHOULDERS AND DITCHES

500-1 DESCRIPTION

Perform the work covered by this section on all portions of the project which will be paved under the contract including, but not limited to, preparing, grading, shaping, manipulating moisture content and compacting either an unstabilized or stabilized roadbed to a condition suitable for placement of base course, pavement and shoulders. Clean, shape and maintain roadway ditches; strip existing vegetation; and place and compact in accordance with Sections 235 and 560 all materials resulting from the shaping operation. Stockpile surplus material for the construction of shoulders and dispose of any necessary surplus stockpile material as waste.

On those portions of the project where there is no pavement to be placed under the contract, perform the work of Sections 225 or 230, depending upon the source of the material. This section will not be applicable to such work.

500-2 CONSTRUCTION METHODS

(A) General

Shape the roadway to conform to the lines, grades and typical sections shown on the plans. Strip all existing vegetation from the ground surface wherever shaping of the roadway is to be done. Use all suitable surplus material in the construction of the roadway or stockpile for use in shoulder construction. Dispose of surplus material in excess of that needed for roadway or shoulder construction as waste. Obtain additional material, if needed, from roadway excavation or borrow sources.

Remove all unsuitable material, boulders and all vegetative matter and replace with suitable material. Obtain suitable material, when not available from the shaping or fine grading operation, from roadway excavation or borrow sources.

Clean, reshape and maintain roadway ditches in a satisfactory condition until final acceptance of the project. Conduct operations so as to avoid damage to any previously constructed structures and facilities.

(B) Preparation of Subgrade

Shape the subgrade to the lines, grades and typical sections shown on the plans. Where the Engineer directs that areas of the subgrade are to be stabilized with aggregate, the subgrade surface in such areas may, subject to the approval of the Engineer, be left uniformly below grade to provide for the addition of the stabilizer material.

Store or stockpile material excavated in preparing the subgrade so as to not interfere with proper drainage or later operations of stabilization, placing base or placing pavement.

(C) Compaction of Subgrade

Compact all material to a depth of 8 inches below the finished surface of the subgrade to a density equal to at least 100% of that obtained by compacting a sample of the material in accordance with AASHTO T 99 as modified by the Department. Copies of these modified testing procedures as described in the *Conventional Density Operator's Manual* are available from the Materials and Tests Unit.

Section 500

1 Compact the subgrade at a moisture content which is approximately that required to
2 produce the maximum density indicated by the above test method. Dry or add moisture
3 to the subgrade when required to provide a uniformly compacted and acceptable
4 subgrade.

5 Where the subgrade is to be stabilized with lime, aggregate or cement, the above density
6 requirements will not apply before the incorporation of the stabilizing material; however,
7 perform compaction in accordance with Articles 501-10, 510-3 or 542-9, as appropriate.

8 **500-3 TOLERANCES**

9 A tolerance of ± 1/2 inch from the established grade will be permitted after the subgrade has
10 been graded to a uniform surface. Subgrade tolerance of ± 1/4 inch from the established
11 grade is required for subgrade under concrete pavement mainline lanes.

12 Perform the grading operation such that the maximum difference between the established
13 grade and the graded subgrade within any 100 foot section is 1/2 inch for normal subgrade
14 and 1/4 inch for subgrade for concrete pavement.

15 **500-4 MAINTENANCE OF SUBGRADE**

16 Provide and maintain ditches and drains to drain the subgrade satisfactorily. Where previously
17 approved subgrade is damaged by natural causes, hauling equipment or other traffic, restore
18 the subgrade to the required lines, grades, typical sections and density.

19 **500-5 MEASUREMENT AND PAYMENT**

20 *Fine Grading* will be paid at the contract lump sum price. Such lump sum price will be full
21 payment for all material excavated to a depth of 0.4 feet below the existing graded surface.

22 Any material which has been excavated from the subgrade at the depth greater than 0.4 feet
23 below the existing graded surface will be *Unclassified Excavation* and will be paid in
24 accordance with Article 225-7.

25 As an exception to the above, on those areas in which the Contractor is responsible for
26 constructing the embankment on which the subgrade is located, no payment will be made for
27 that excavation that may be necessary to bring the grade to the established subgrade elevation
28 and typical section. Incorporate such surplus material into the project at no additional cost to
29 the Department.

30 When sufficient material is not available from the fine grading operation to complete the work
31 of fine grading, additional material will be paid in accordance with Article 225-7 for
32 *Unclassified Excavation* or Article 230-5 for *Borrow Excavation*, depending on the source of
33 material.

34 Surplus material stockpiled for shoulder construction and incorporated into the work will be
35 paid in accordance with Article 560-4 for *Shoulder Borrow*. No payment will be made for the
36 removal and disposal of any surplus material remaining in the stockpile after the shoulders
37 have been completed.

38 Maintenance, repair and restoration of the subgrade to the required lines, grades, typical
39 sections and density as it applies to fine grading is incidental to the work of this section.

40 Payment will be made under:

Pay Item	Pay Unit
Fine Grading	Lump Sum

SECTION 501
LIME-TREATED SOIL

501-1 DESCRIPTION

Perform the work covered by this section including, but not limited to, treating the subgrade, embankment, natural ground or existing pavement structure by adding water and lime in the form specified herein, mixing, shaping, compacting and finishing the mixture to the required density. Prepare the soil layer to be stabilized; haul, proportion, spread and mix the materials within the depth range as shown on plans; manipulate, compact and finish the lime-treated soil; correct, repair and maintain the lime-treated soil; and apply a sand seal in accordance with the requirements of Article 501-3. Construct the work in accordance with the typical sections, lines and grades shown on the plan.

501-2 MATERIALS

Refer to Division 10.

Item	Section
Lime	1052-3
Water	1024-4

Use soil material which consists of material upon which the pavement is to be placed, existing material upon which the embankment is to be placed, approved borrow material or a combination of these materials proportioned as directed. Remove all vegetation, roots or other objectionable matter from the soil, as well as all aggregate or stone larger than 2 inches for the full depth to be treated.

501-3 LIMITATIONS

Do not perform lime stabilization when the air temperature is below 45°F. Do not mix the lime with frozen soils or when the soils contain frost. Apply lime to such areas as can be initially mixed and sealed during the day of application. Do not apply lime when wind conditions are such that blowing lime becomes hazardous to traffic, workers or adjacent property owners or when excessive loss of lime may occur.

Do not construct lime-treated soil that will not be covered with a layer of pavement or base by December 1 of that same calendar year. The Engineer may suspend the lime stabilization operations in writing when he determines that the Contractor will not cover the completed stabilization by December 1 as specified above.

Failure of the Contractor to cover the lime-treated soil as required will result in the Engineer notifying the Contractor in writing to cover the lime-treated soil with a sand seal. Apply the sand seal in accordance with Section 660, except Articles 660-3 and 660-12 will not apply. If the Contractor fails to apply the sand seal within 72 hours after receipt of such notice, the Engineer may proceed to have such work performed by other forces and equipment. The application of the sand seal by the Contractor or other forces will in no way relieve the Contractor of the responsibility to maintain or repair the damaged stabilization, no matter what the cause of damage, at no cost to the Department.

501-4 EQUIPMENT

(A) General

Use any combination of machines and equipment to produce the required results that meet the approval of the Engineer. Correct any leakage of fluids or materials promptly or the Engineer may order such equipment removed and replaced with satisfactory equipment. Use equipment and methods for applying lime, water, curing seal and blotting sand that will not damage the base and in accordance with Article 107-21.

Section 501

1 (B) Lime Spreaders

2 Spread lime at the required rate by methods and equipment which have been approved.

3 (C) Water Distribution Equipment

4 Add water to the soil with a pressure distributor or other suitable equipment capable of
5 uniformly distributing the required amount.

6 (D) Mixers

7 Perform mixing with a self-propelled rotary mixer, except that disc harrows, motor
8 graders and other equipment may be used only to supplement the mixing done by the
9 rotary mixer.

10 Use mixing equipment capable of mixing to a compacted depth of at least 10 inches.

11 (E) Compaction Equipment

12 Use compaction equipment that is self-propelled. Perform finish rolling with a pneumatic
13 tired roller, or as permitted, a smooth, steel-wheel roller or a combination of both types.

14 (F) Scarifying Equipment

15 Use a grader-scarifier for the initial scarification of the soil. Use equipment capable of
16 scarifying to the full depth of the stabilized treatment. When required, use a weeder,
17 spiketooth harrow or nail drag, followed by a broom drag to scarify during finishing
18 operations.

19 501-5 PROTECTION AND SAFETY

20 Take necessary precautions to protect personnel from dust created by the lime application and
21 mixing operation to include eye protection, dust masks and appropriate training.

22 501-6 PREPARATION OF ROADBED

23 Before the addition of any lime to the soil, grade and shape the area to be stabilized in
24 accordance with the typical sections, lines and grades shown on the plans. Remove all
25 materials such as aggregate larger than 2 inches, roots and turf.

26 501-7 SCARIFYING

27 When required by the method of application, scarify the soil to the required depth and width
28 and then partially pulverize by making one pass through the area with a pulverizing rotary
29 mixer. Delete the pulverizing portion of the scarifying operation in areas where the soil types
30 or conditions make pulverizing with a rotary mixer impractical.

31 501-8 APPLICATION OF LIME

32 (A) General

33 When the Contractor has brought the soil layer to the elevation required by the plans, the
34 Engineer will sample the soil and determine the quantity of lime to be incorporated.
35 Allow 24 calendar days for the Engineer to perform the required sampling, testing and
36 final design of the lime stabilization. The optimum moisture will be determined by the
37 Engineer.

38 Spread lime or lime slurry only on an area of such size that all primary mixing operations
39 can be completed in the same day during daylight hours, except where the work is to be
40 done at night as required by the contract.

41 Incorporate the lime or lime slurry into the soil mixture at the rates determined by the
42 Engineer. Distribute the lime at the uniform rate and minimize the scattering by the
43 wind. Mix the lime into the soil within 2 hours after application.

1 No equipment, except that used in spreading, slaking and mixing, will be allowed to pass
2 over the freshly spread lime until it is mixed with the soil.

3 **(B) Slurry Method**

4 Do not add lime slurry to the soil when the moisture content exceeds 2% above optimum
5 moisture. Aerate soil or allow to dry naturally until the soil contains no more than
6 2% above optimum moisture.

7 Mix hydrated lime applied by this method with water in approved agitating equipment
8 and apply to the soil to be treated as a thin water suspension or slurry. When quicklime is
9 used to produce the slurry, use equipment specifically manufactured for the slaking of
10 quicklime. Use distributing equipment that provides continuous agitation of the slurry
11 from the slurry production site until the slurry is applied to the soil. Proportion the lime
12 so that the dry solids content is at least 30% by weight.

13 Split the lime application into approximately 2 equal applications with the first being
14 partially mixed into the soil to a minimum depth of 3 inches before applying the second
15 application.

16 **(C) Quicklime**

17 Do not add dry quicklime to the soil when the moisture content exceeds 4% above
18 optimum moisture. Aerate soil or allow to dry naturally until it contains no more than
19 4% above optimum moisture.

20 Where the "Bottom-Dump" method of application is used, omit the preliminary
21 scarification of the soil surface. Apply the quicklime by slowly driving the tanker truck
22 over the coverage area with the bottom discharge valves open creating a windrow of
23 quicklime.

24 Repeat the process until the tanker is empty in order to provide at least 3, for a 24 foot
25 roadway, reasonably uniform and equally spaced windrows over the area being
26 stabilized. The number of windrows required will depend on the width of the section
27 being stabilized and will be stipulated by the Engineer.

28 Carefully spread the windrows of quicklime with a motor grader into an equal depth layer
29 over the entire area to be stabilized.

30 After the lime has been spread, follow with a sprinkling of water to slake the lime. After
31 a complete slaking of the lime, thoroughly mix the lime with the soil. The Engineer may
32 direct that the lime first be mixed into the soil followed by sprinkling and additional
33 mixing to ensure complete slaking of the lime throughout the layer to be stabilized.

34 **(D) Hydrated Lime**

35 Use hydrated lime only with written permission and do not add to the soil when the
36 moisture content exceeds 6% above optimum moisture.

37 **501-9 MIXING**

38 **(A) Primary Mixing**

39 Immediately after the lime has been spread and slaked, if required, mix the lime into the
40 soil for the full depth of treatment. Mix the lime into the soil to provide a compacted
41 depth of at least 8 inches. A minimum number of mixing passes will be required to
42 ensure uniform incorporation of the lime. Add water as necessary and thoroughly mix
43 with the soil lime mixture so that the mixture contains no less than optimum moisture.
44 A tolerance of 3% above optimum will be allowed. Incorporate all of the lime
45 thoroughly and uniformly into the soil layer to the full depth of treatment so that the
46 result is a homogeneous, friable mixture of soil and lime, free of clods or lumps
47 exceeding 2 inches in size.

Section 501

1 After primary mixing operations and before curing, shape and lightly compact the lime-
2 treated area to the approximate section to allow for proper drainage and to minimize
3 evaporation loss.

4 (B) Preliminary Curing

5 Following primary mixing operations, cure the stabilized layer for 1 to 4 days. The
6 actual duration of this curing period will be determined by the Engineer. During the
7 curing period, keep the surface of the material moist to prevent drying and cracking and
8 maintain in a properly sealed and crowned condition. Mix, compact, shape and finish the
9 stabilized layer no later than 4 days after primary mixing.

10 (C) Final Mixing and Pulverizing

11 Immediately after the completion of the preliminary curing period, mix and pulverize
12 completely the stabilized layer to the full depth of the stabilization. Continue the final
13 mixing until all of the clods are broken down to pass a 1/2 inch sieve and at least 80%
14 pass a No. 4 sieve, exclusive of rock. Add water, as required, during the final mixing to
15 raise the moisture content before compaction.

16 501-10 COMPACTING, SHAPING AND FINISHING

17 Begin compaction of the mixture immediately after completion of the final mixing operations.
18 Aerate or moisten the mixture as necessary during compaction operations to maintain the
19 moisture between optimum and optimum plus 2%. Compact the full depth of the mixture to
20 a density equal to at least 97% of that obtained by compacting a sample of the soil lime
21 mixture in accordance with AASHTO T 99 as modified by the Department. Copies of these
22 modified procedures are available upon request from Materials and Tests Unit. Accompany
23 the compaction with sufficient blading to eliminate irregularities.

24 Perform the final rolling of the completed surface with a pneumatic-tired roller or if permitted
25 a smooth, steel-wheel roller.

26 Complete shaping, final mixing, compacting and finishing on the same day upon completion
27 of the preliminary curing. This work is to be completed no later than 4 days after primary
28 mixing and done during daylight hours, unless otherwise provided in the contract. If the
29 above work is not completed as specified, rip up the entire section and add additional lime, as
30 directed, at no additional cost to the Department.

31 501-11 THICKNESS

32 The compacted thickness of the completed treated soil layer will be determined by
33 measurements made in test holes located at random intervals not to exceed 500 feet. Do not
34 deviate the measured thickness from that shown on the plans by more than plus 1 inch or
35 minus 1/2 inch.

36 Where the lime-treated soil layer is deficient in thickness by more than 1/2 inch, remove and
37 replace the area of deficient thickness with lime-treated soil having the required thickness at
38 no cost to the Department.

39 As an exception to the above, if the deficiency is not considered sufficient to seriously impair
40 the required strength of the lime-treated soil layer, the deficient area may, at the discretion of
41 the Engineer, be left in place.

42 501-12 FINAL CURING

43 After the lime-treated soil has been finished in accordance with Article 501-10, protect it
44 against drying for a 7 day curing period in accordance with Section 543.

1 **501-13 TRAFFIC**

2 Completed sections of the lime-treated soil may be opened when necessary to lightweight
 3 local traffic, provided it has hardened sufficiently to prevent marring or distorting of the
 4 surface and provided the curing is not impaired. Do not use construction equipment on the
 5 lime-treated soil, except as necessary to discharge material into the spreader during paving
 6 operations or except as may be otherwise permitted for embankment construction.

7 **501-14 MAINTENANCE**

8 Maintain the lime-treated soil in an acceptable condition until final acceptance of the project.
 9 Include immediate repair of any defects or damage in maintenance operations. Repeat as
 10 necessary to keep the lime-treated soil in an acceptable condition. Perform repairs to
 11 lime-treated soil by replacing the lime-treated soil for its full depth rather than by adding
 12 a thin layer of lime stabilized material to the existing layer. An alternate repair method may
 13 be used if approved in writing.

14 **501-15 MEASUREMENT AND PAYMENT**

15 *Lime-Treated Soil* will be measured and paid as the number of square yards of each layer of
 16 lime-treated soil that has been completed and accepted. In determining this quantity, the
 17 width of the lime-treated soil will be measured across the top surface of the treated layer. The
 18 length will be the actual length constructed, measured along the centerline of the surface of
 19 the treated layer.

20 *Lime for Lime-Treated Soil* where hydrated lime or quick lime is spread directly on the soil in
 21 solid form or when hydrated lime is used to produce a slurry, the quantity of lime to be paid
 22 will be the number of tons of lime that has been incorporated into the soil at the required rates.
 23 No measurement will be made of any lime added or replaced for corrective measures during
 24 construction or for repairing damaged areas. Measurement is to be made in bulk in the truck
 25 on certified platform scales or other certified weighting devices.

26 Where quicklime is slaked on the project and applied in slurry form, measurement will be
 27 calculated as indicated below for each truckload using the certified lime purity for that load.

$$\mathbf{A+B} = \text{Total hydrated lime produced (pay quantity)}$$

Where:

$$\mathbf{A} = \text{Certified weight of quicklime delivered} \times \% \text{ purity} \times 1.32$$

$$\mathbf{B} = \text{Certified weight of quicklime delivered} \times \% \text{ inert material}$$

28 *Asphalt Curing Seal* will be paid in accordance with Article 543-5.

29 *Blotting Sand* will be paid in accordance with Article 818-4.

30 If a layer of lime-treated soil is deficient in thickness but has been permitted to be left in place
 31 in accordance with Article 501-11, payment for that lime-treated soil and lime will be made at
 32 50% of the contract unit prices for *Lime-Treated Soil* and *Lime for Lime-Treated Soil*.

33 Sand seal applied due to the failure of the Contractor to cover the lime-treated soil as required
 34 will be incidental to the work of this section. If the Contractor fails to provide sand seal as
 35 required and the Engineer has the work performed by other forces, the cost of such work will
 36 be deducted from monies due or to become due to the Contractor.

37 Maintenance, repair and restoration of the lime stabilization is incidental to the work of this
 38 section.

39 Payment will be made under:

Pay Item	Pay Unit
Lime-Treated Soil	Square Yard
Lime for Lime-Treated Soil	Ton

Section 505

**SECTION 505
AGGREGATE SUBGRADE**

505-1 DESCRIPTION

Construct aggregate subgrades in accordance with the contract or as directed. Undercut as needed in cut areas. Install geotextile for soil stabilization and place Class IV subgrade stabilization at locations shown on the plans.

505-2 MATERIALS

Refer to Division 10.

Item	Section
Geotextile for Soil Stabilization, Type 4	1056
Select Material, Class IV	1016

Use Class IV select material for Class IV subgrade stabilization.

505-3 CONSTRUCTION METHODS

When shallow undercut is required to construct aggregate subgrades, undercut 6 inches to 24 inches as shown on the plans or as directed. Perform undercut excavation in accordance with Section 225. Install geotextile for soil stabilization in accordance with Article 270-3. Place Class IV subgrade stabilization (standard size no. ABC) by end dumping ABC on geotextiles. Do not operate heavy equipment on geotextiles until geotextiles are covered with Class IV subgrade stabilization. Compact ABC to 92% of AASHTO T 180 as modified by the Department or to the highest density that can be reasonably obtained.

Maintain Class IV subgrade stabilization in an acceptable condition and minimize the use of heavy equipment on ABC in order to avoid damaging aggregate subgrades. Provide and maintain drainage ditches and drains as required to prevent entrapping water in aggregate subgrades.

505-4 MEASUREMENT AND PAYMENT

Shallow Undercut will be measured and paid in cubic yards. Shallow undercut will be measured in accordance with Article 225-7. The contract unit price for *Shallow Undercut* will be full compensation for excavating, hauling and disposing of materials to construct aggregate subgrades.

Class IV Subgrade Stabilization will be measured and paid in tons. Class IV subgrade stabilization will be measured by weighing material in trucks in accordance with Article 106-7. The contract unit price for *Class IV Subgrade Stabilization* will be full compensation for furnishing, hauling, handling, placing, compacting and maintaining ABC.

Geotextile for Soil Stabilization will be measured and paid in accordance with Article 270-4.

Payment will be made under:

Pay Item	Pay Unit
Shallow Undercut	Cubic Yard
Class IV Subgrade Stabilization	Ton

SECTION 510
AGGREGATE STABILIZATION

510-1 DESCRIPTION

Perform the work covered by this section including, but not limited to, furnishing all aggregate and water; hauling, spreading and mixing the required amount of aggregate with the subgrade materials; shaping and compacting the stabilized subgrade to the required grade and typical section; and maintaining the aggregate.

510-2 MATERIALS

Refer to Division 10.

Item	Section
Stabilizer Aggregate	1008-1

510-3 CONSTRUCTION METHODS

(A) Mixing

Remove sufficient subgrade material, if necessary, to compensate for the addition of the stabilizer aggregate. Spread the quantity of aggregate required by the contract uniformly over the subgrade by means of a mechanical spreader. Spread the aggregate on the subgrade in advance of the mixing operations only to the extent that processing can be completed within one week. Mix the aggregate with the top 3 inches of the subgrade soil. Continue mixing until the aggregate is uniformly mixed with the soil to the width and depth to be treated.

The aggregate shall be sampled, tested and approved before placing layers of base material or pavement thereon.

(B) Shaping and Compaction

Shape the stabilized subgrade to the lines, grades and typical sections shown on the plans.

Compact the entire depth and width of the stabilized subgrade to a density equal to at least 100% of that obtained by compacting a sample of the material in accordance with AASHTO T 99 as modified by the Department. Copies of these modified testing procedures are available upon request from the Materials and Tests Unit. Compact the stabilized subgrade at a moisture content which is approximately that required to produce the maximum density indicated by the above test method. Dry or add moisture to the material as required to provide a uniformly compacted and acceptable subgrade.

510-4 TOLERANCE

A tolerance of $\pm 1/2$ inch from the established grade will be permitted after the stabilized subgrade has been graded to a uniform surface.

Perform grading of the subgrade such that the maximum differential between the established grade and the stabilized subgrade within any 100 foot distance is $1/2$ inch.

510-5 PROTECTION

Protect the aggregate stabilized subgrade in accordance with Article 500-4.

510-6 MEASUREMENT AND PAYMENT

Stabilizer aggregate will be measured and paid as the actual number of tons of aggregate, exclusive of any corrective material, which has been mixed with the completed and accepted subgrade. This quantity will be measured as provided for in Article 520-11.

Section 520

1 Payment will be made under:

Pay Item

Stabilizer Aggregate

Pay Unit

Ton

SECTION 520

AGGREGATE BASE COURSE

520-1 DESCRIPTION

5 Perform the work covered by this section including, but not limited to, constructing a base
6 composed of an approved aggregate material hauled to the road, placed on the road, mixed,
7 compacted and shaped in accordance with the lines, grades, depths and typical sections shown
8 in the plans; applying a sand seal in accordance with Article 520-5; and maintaining the base.

520-2 MATERIALS

10 Refer to Division 10.

Item

Aggregate Base Course

Section

1006 and 1010

520-3 METHODS OF PRODUCTION

12 Furnish aggregate upon which no restrictions are placed on the production or stockpiling,
13 except as provided in Sections 1005, 1006 and 1010. Place aggregates on the roadway which
14 have been sampled, tested and approved in accordance with Article 520-6.

520-4 SUBGRADE PREPARATION

15 Prepare the subgrade in accordance with Section 500 before placement of the base material.

520-5 HAULING AND PLACING AGGREGATE BASE MATERIAL

18 Place the aggregate material on the subgrade with a mechanical spreader box capable of
19 placing the material to a uniform loose depth and without segregation; except, for areas
20 inaccessible to a mechanical spreader box, the aggregate material may be placed by other
21 methods approved by the Engineer. In addition, as approved by the Engineer, place by end
22 dumping aggregate on approved sandy subgrade soils to provide a working platform and
23 reduce wheel rutting of the subgrade. When allowed, end dumping will be limited to a
24 uniformly spread thickness of 2 to 3 inches prior to placing the remaining aggregate thickness
25 with a mechanical spreader box.

26 Where the Contractor elects to use more than one source of aggregate as described in
27 Section 1005, place the various types of aggregate used in an approved manner which will
28 permit the sampling and testing required by Section 1006 and 1010.

29 Where the required compacted thickness of base is 10 inches or less, the base material may be
30 spread and compacted in one layer. Where the required compacted thickness is more than
31 10 inches spread the base material and compact in 2 or more approximately equal layers.
32 Compact the base material to a minimum thickness of approximately 4 inches for any one
33 layer.

34 Have each layer of material sampled, tested, compacted and approved before placing
35 succeeding layers of base material or pavement.

36 Do not place base material on frozen subgrade or base.

37 Base course that is in place on November 15 shall immediately be covered with a subsequent
38 layer of pavement structure or with a sand seal. Base course that has been placed between
39 November 16 and March 15 inclusive shall be covered within 7 calendar days with
40 a subsequent layer of pavement structure or with a sand seal. Apply sand seal in accordance
41 with Section 660, except Articles 660-3 and 660-12 will not apply.

1 Failure by the Contractor to cover the base course as required above will result in the
2 Engineer notifying the Contractor in writing to cover the base course with a sand seal and to
3 suspend the operations of placing aggregate base course until such cover has been placed. If
4 the Contractor fails to apply the sand seal within 72 hours after receipt of such notice, the
5 Engineer may proceed to have such work performed with other forces and equipment.
6 The application of the sand seal by the Contractor or by others will in no way relieve the
7 Contractor of the responsibility to maintain or repair the damaged base or subgrade, no matter
8 what the cause of damage.

9 Do not allow traffic on the completed base course other than necessary local traffic and that
10 developing from the operation of essential construction equipment as may be authorized by
11 the Engineer. Repair any defects that develop in the completed base or any damage caused by
12 local or construction traffic acceptably. Hauling equipment may be operated with the
13 approval of the Engineer, over a lower layer of base, however, acceptably repair any rutting,
14 weaving or soft areas that develop.

15 Do not exceed 35 mph with hauling equipment traveling over any part of the base.

16 Use methods of handling, hauling and placing which will minimize segregation and
17 contamination. If segregation occurs, the Engineer may require that changes to the
18 Contractor's methods and may require mixing on the road to correct segregation. Remove and
19 replace all aggregate which is contaminated with foreign materials to the extent that the base
20 course will not adequately serve its intended use. The above requirements will be applicable
21 regardless of the type of aggregate placed and regardless of prior acceptance.

22 **520-6 SAMPLING, TESTING AND ACCEPTANCE**

23 Perform sampling for the determination of gradation, LL and PI for the various types of
24 aggregate, as defined in Articles 1010-1 and 1010-2.

25 Where visual observation indicates the need to do so, the Engineer may require the Contractor
26 to road mix areas of nonuniform gradation. The Engineer reserves the right to take samples in
27 addition to the lot acceptance samples from within the lot in areas exhibiting nonuniform
28 gradation. When the test results from such an additional sample is outside the gradation limits
29 in Section 1010 and the nonuniformity cannot be corrected by road mixing, the aggregate base
30 course represented by the sample will be rejected and replaced by the Contractor.

31 **520-7 SHAPING AND COMPACTION**

32 Machine and compact the layer of base within 48 hours after beginning the placing of a layer
33 of the base. Maintain each layer to the required cross section during compaction and compact
34 each layer to the required density before placing the next layer.

35 Compact the base material at a moisture content which is approximately that required to
36 produce a maximum density. Dry or add moisture to the material when required to provide a
37 uniformly compacted and acceptable base. If it is necessary to add water after the material is
38 placed, scarify the material and add water uniformly throughout the full depth of the layer of
39 the base course material. Density determination will be based on Article 520-9.

40 Shape the final layer of base material in accordance with the lines, grades and typical section
41 as shown on the plans. Construct the base course so that it is smooth, hard, dense, unyielding
42 and well bonded upon completion. A broom drag may be used in connection with the final
43 finishing and conditioning of the surface of the base course.

44 **520-8 TOLERANCES**

45 After final shaping and compacting of the base, the Engineer will check the surface of the
46 base for conformance to the grade and typical section and determine the base thickness.

Section 520

1 Construct the base so that the thickness of the base is within a tolerance of $\pm 1/2$ inch of the
2 base thickness required by the plans. When the base course will be used under concrete
3 pavement, the tolerance will be $\pm 1/4$ inch.

4 Construct the base so that the maximum differential between the established grade and the
5 base within any 100 feet section is $1/2$ inch or $1/4$ inch when used as a base course under
6 concrete pavement.

7 **520-9 DENSITY DETERMINATION**

8 The Engineer may use nuclear or conventional means as described below to determine the
9 density of selected base course materials required by Sections 520 and 540. The target
10 density will be from the material's most recent AASHTO T 180 test results, which may be
11 obtained from the Materials and Tests Unit.

12 A new target density is to be obtained when there is a change in the source of material, when
13 a significant change occurs in the composition of the materials from the same source or when
14 determined necessary.

15 **(A) Conventional Method**

16 When electing to use conventional density test number 3 (ring test) to determine density,
17 compact each layer of the base to a density equal to at least 100% of that obtained by
18 compacting a sample of the material in accordance with AASHTO T 180 as modified by
19 the Department. Information on these modified testing procedures are available in the
20 *NCDOT Conventional Density Operator's Manual* on line in the Materials and Tests
21 Unit's web site.

22 **(B) Nuclear Method**

23 When electing to use a nuclear density gauge to determine density, compact each layer of
24 the base to a density meeting requirements in the *NCDOT Nuclear Density Testing
25 Manual – Base Course, FDR and Select Materials*. Copies of this manual are available
26 upon request from the Materials and Tests Unit.

27 **520-10 MAINTENANCE**

28 Where the base material is placed in a trench section, provide adequate drainage through the
29 shoulders to protect the subgrade and base until such time as the shoulders are completed.

30 Maintain the surface of the base by watering, machining, rolling or dragging when necessary
31 to prevent damage to the base by weather or traffic.

32 Where the base or subgrade is damaged, repair the damaged area; reshape the base to required
33 lines, grades and typical sections; and recompact the base to the required density at no cost to
34 the Department.

35 **520-11 MEASUREMENT AND PAYMENT**

36 *Aggregate Base Course* will be measured and paid at the contract unit price per ton for the
37 actual number of tons of aggregate which has been incorporated into the completed and
38 accepted work. Sampling and acceptance will be determined in accordance with
39 Section 1010.

40 The aggregate will be measured by being weighed in trucks on certified platform scales or
41 other certified weighing devices. If permitted by the contract, the weight of base course
42 material shipped by barge may be determined from water displacement measurements.

43 No deductions will be made for any moisture contained in the aggregate at the time of
44 weighing.

45 Sand seal applied due to the failure of the Contractor to cover the base course as required will
46 be incidental to the work of this section. If the Contractor fails to provide sand seal as

- 1 required and the Engineer has the work performed by other forces, the cost of such work will
- 2 be deducted from monies due or to become due to the Contractor.
- 3 Maintenance, repair and restoration of the base course and subgrade is incidental to the work
- 4 of this section. If segregation during handling, hauling or placing occurs and the Engineer
- 5 requires a change in methods or mixing on the road to correct this segregation, this work will
- 6 be incidental to the work of this section. Removal and replacement of aggregate which is
- 7 contaminated with foreign materials or outside the gradation limits will be incidental to the
- 8 work of this section.
- 9 Payment will be made under:

Pay Item	Pay Unit
Aggregate Base Course	Ton

**SECTION 535
CONDITIONING EXISTING BASE**

535-1 DESCRIPTION

Perform the work covered by this section including, but not limited to, scarifying, shaping, furnishing water, compacting and maintaining the base. Included in the work is:

(A) Conditioning of an existing base to prepare it for the placement of a pavement directly upon the base. Included in the conditioning is scarifying, shaping and compacting the base to conform to the required lines, grades, depths and typical sections established by the plans.

(B) Conditioning of an existing base in preparation for the placement of additional layers of base material. Included in the conditioning is scarifying, shaping and compacting the base to conform to the approximate lines, grades, depths and typical sections established by the plans.

535-2 CONSTRUCTION METHODS

Compact the base to a degree satisfactory to the Engineer. Dry or add moisture to the material when required to provide a uniformly compacted and acceptable base.

Do not condition the existing base when it contains excess moisture or is frozen.

Maintain the base in accordance with Article 520-10.

535-3 MEASUREMENT AND PAYMENT

Conditioning Existing Base will be measured and paid at the contract unit price per 1,000 sy for the actual number of units of 1,000 sy of base over which the work of conditioning existing base has been acceptably performed. The length will be measured along the centerline of the surface of the base. The width will be the width required by the plans or established by the Engineer measured across the top surface of the base.

Payment will be made under:

Pay Item	Pay Unit
Conditioning Existing Base	1,000 Square Yards

Section 540

**SECTION 540
CEMENT-TREATED BASE COURSE**

540-1 DESCRIPTION

Perform the work covered by this section including, but not limited to, construction and curing a cement-treated base composed of aggregate, furnishing of water and aggregate; the mixing, proportioning, hauling and spreading of the materials; furnishing Portland cement at the point where it is incorporated into the mix; manipulating, compacting and finishing the base; maintaining the base; making repairs or corrections to the base; and applying sand seal in accordance with Article 540-3. Compact, shape and cure the base to conform to the lines, grades, depths and typical sections shown on the plans.

When cement-treated base course is called for on the plans, the Contractor has the option of providing a plant mixed cement-treated base course or a road mixed cement-treated base course as specified below.

540-2 MATERIALS

Refer to Division 10.

Item	Section
Aggregate	1010-1, 1010-2
Portland Cement, Type I	1024-1
Water	1024-4

540-3 LIMITATIONS

Do not construct cement-treated base when the air temperature is less than 40°F nor when conditions indicate that the temperature may fall below 40°F within 24 hours. Do not incorporate frozen materials into the mixture nor place material on frozen subgrade. Protect the base from freezing for 7 days after completion.

Do not place cement-treated base that will not be covered with pavement by December 1 of the same year. Failure of the Contractor to cover the cement-treated base as required above will result in the Engineer notifying the Contractor in writing to cover the cement-treated base with a sand seal. Apply the sand seal in accordance with Section 660, except Articles 660-3 and 660-12 will not apply. If the Contractor fails to apply the sand seal within 72 hours after receipt of such notice, the Engineer may proceed to have the work performed with other forces and equipment. The application of the sand seal by the Contractor or other forces will in no way relieve the Contractor of the responsibility to maintain or repair the damaged base, no matter what the cause of damage.

540-4 PREPARATION OF SUBGRADE

Prepare the subgrade in accordance with Section 500. Prepare the subgrade so that it is firm and able to support without displacement the construction equipment and the compaction operations hereinafter specified. Soft or yielding subgrade shall be corrected and made stable before construction proceeds. Moisten the subgrade as needed before spreading the base material.

540-5 CONSTRUCTION METHODS

(A) Composition of Mixture

When the Contractor proposes to use a source of aggregate that is not documented by a currently approved job mix formula, submit to the Department's Materials and Tests Unit, samples of all aggregates proposed for use at least 3 weeks before beginning production. Take the aggregate samples in the presence of the Engineer. Submit in writing the proposed gradation for the cement-treated base material. The Department will then prepare a mix design based upon the samples submitted and the Contractor's stated proposed gradation.

1 A job mix formula will be established for the cement-treated base material within the
 2 design limits in Section 1010. Use the job mix formula unless modified in writing by the
 3 Engineer.

4 Prepare all cement-treated base material mixtures so that they conform to the job mix
 5 formula within the tolerance ranges specified in Table 540-1. If the Contractor is unable
 6 to maintain the production within the tolerance ranges specified in Table 540-1 for two
 7 consecutive lots, production will stop until such time as a new mix design and job mix
 8 formula has been established and approved by the Engineer.

TABLE 540-1 TOLERANCES FOR JOB MIX FORMULA PORTLAND CEMENT-TREATED BASE	
Sieve Size	Tolerance for Percent Passing
1 1/2"	0
1"	± 5
1/2"	± 8
No. 4	± 7
No. 10	± 7
No. 40	± 4
No. 200	± 2
Material Passing No. 10 Sieve (Soil Mortar)	
No. 40	± 8
No. 200	± 5

9 **(B) Plant Mixed Cement-Treated Base Course**

10 (1) Mixing

11 (a) General

12 Add to the aggregate the quantity of cement specified by the Engineer.

13 Thoroughly mix the cement, aggregates and water in an approved central mixing
 14 plant. Use a batch or continuous-flow type stationary mixer and equip it with
 15 feeding and metering devices that will add aggregate, cement and water into the
 16 mixer in the specified quantity. Use batch weights or rates of feed of cement
 17 that are within 0.3% of the quantity designated by the Engineer. Use batch
 18 weights or rates of flow of water that are within a range of optimum to optimum
 19 plus 1.5% moisture. Use batch weights or rates of feed of aggregate that are
 20 within 5% of the amounts designated by the Engineer.

21 Mix materials at least 20 seconds to assure a proper blend of materials.

22 (b) Batch Type Plant

23 Equip the mixer with a sufficient number of paddles of a type and arrangement
 24 to produce a uniformly mixed batch.

25 Add water during the mixing operation as required to provide the quantity of
 26 moisture specified; however, do not add water to the mixture before the
 27 aggregate and cement have been mixed sufficiently to prevent the formation of
 28 cement balls.

29 Equip the mixer with a timing device which will indicate by a definite audible or
 30 visual signal the expiration of the mixing period.

Section 540

1 (c) Continuous Flow Type Plant

2 Calibrate and mark cement storage silos so that the amount of cement in the silo
3 can be readily determined at any time. Design feeders and/or meters for
4 introducing the cement into the mixer such that the amount of cement can be
5 accurately determined before it is introduced into the mixer. Use a variable
6 speed motor on the cement feeder which is regulated by a control mechanism
7 indicating the speed of the motor in r.p.m. or equivalent measure. Design the
8 indicator so that it can be read in daylight from a point 4 feet from the indicator.
9 Equip the cement holding tank which is used in feeding cement with an air
10 pressure gauge and air pressure regulating control such that air pressure can be
11 regulated to a uniform flow.

12 Measure the water by a meter which determines flow in gallons per minute and
13 control it with 2 valves. Use a variable flow valve for controlling the rate of
14 flow of the water only on one valve and use an on-off valve connected to the
15 plant controls such that the water is turned on and/or off when the plant is
16 started and stopped for the other valve.

17 After the material has been processed by the pug mill, store it in a holding bin
18 with the minimum capacity of 3 tons before discharging into trucks. Hold the
19 material in the holding bin for loading purposes only and do not store for
20 loading subsequent trucks. Loading trucks directly from a belt or auger box will
21 not be permitted.

22 Have available a satisfactory platform for obtaining samples from trucks. Make
23 provisions for calibrating the plant daily and at other times as deemed necessary
24 by the Engineer. On plants that are electronically controlled, manual calibration
25 will be required to verify the electronic calibration and shall be performed at the
26 beginning of a project. If the plant operation is interrupted by more than
27 4 calendar days during an active project, perform the manual calibration process
28 again. Perform random manual calibrations at the direction of the Engineer.

29 (2) Hauling and Placing

30 Haul the mixed base material to the roadway in trucks with protective covers to
31 avoid moisture loss. Do not exceed one hour between the loading of the haul trucks
32 and the beginning of compaction.

33 Place stringlines for alignment control for placing a layer of base.

34 Place the base in a uniform layer on the moistened, prepared subgrade to produce the
35 depth required by the plans. To insure homogenous distribution of the base material
36 in each layer, place the material using approved spreaders. Perform the spreading
37 operations to eliminate pockets of material of non-uniform gradation resulting from
38 segregation in the hauling or discharging operations. Spread each layer so that
39 compaction can be started without further shaping.

40 A single spreader may be used provided it is capable of placing a uniform, full-depth
41 layer of material across the full width of the base in one pass. Otherwise, 2 or more
42 spreaders will be required and operate the spreaders so that the spreading progresses
43 along the full width of the base in a uniform manner.

44 Base placed on areas inaccessible to mechanical spreading equipment may be spread
45 in one layer by approved methods. After spreading, compact the material thoroughly
46 to the required lines, grades and typical sections by means of pneumatic tampers or
47 with other compaction equipment which will constantly obtain the degree of
48 compaction required.

1 **(C) Road Mixed Cement-Treated Base Course**

2 (1) Equipment

3 Use any combination of machines or equipment that will produce the required results
 4 meeting the approval of the Engineer. Use a cement spreader which has
 5 an adjustable rate of flow and the capability of spreading the required amount of
 6 cement in one pass. Mix cement, aggregate and water with a self-propelled rotary
 7 mixer capable of mixing to a depth of 10 inches. Correct any leakage of fluids
 8 and/or materials promptly or the Engineer may order such equipment removed and
 9 replaced with satisfactory equipment. Use equipment and methods for applying
 10 cement, water, curing seal and blotting sand that does not damage the base and in
 11 accordance with Article 107-21.

12 (2) Spreading and Mixing

13 Place the required quantity of aggregate on the prepared subgrade in a uniform layer.
 14 Spread aggregate on the subgrade in advance of the mixing operations only to the
 15 extent that processing can be completed within one week. Apply the required
 16 quantity of cement in a uniform spread on the aggregate in place and immediately
 17 blend the aggregate until the cement is uniformly distributed throughout the
 18 aggregate. Maintain the moisture content at or below the optimum moisture at the
 19 time of application of the cement. Do not apply cement on excessively windy days
 20 and apply only to such an area that all operations shall be completed on the same day
 21 during daylight hours.

22 The Engineer will establish the actual cement content during construction.

23 Immediately after the aggregate and cement have been thoroughly blended, apply
 24 water as needed and incorporate into the mixture. Control the application of the
 25 water so that there is no excessive concentration on or near the surface of the
 26 mixture. After the necessary water has been applied, continue mixing until
 27 a thorough and uniform mixture is obtained.

28 Maintain the moisture content at the time of final mixing and during compaction
 29 within a range of optimum to optimum plus 1.5% as determined. Make sure that the
 30 moisture content in the mix does not exceed the quantity that will cause the base
 31 course to become unstable during compaction or finishing operations.

32 **540-6 COMPACTION**

33 Begin compaction immediately after the plant mixed base has been placed on the prepared
 34 subgrade or immediately after cement and water has been incorporated into the previously
 35 placed aggregate. Compact any one layer of base so the thickness is between 4 inches and
 36 8 inches.

37 After spreading, maintain the moisture content of the material within a range of optimum to
 38 optimum plus 1.5% moisture during compaction.

39 Accomplish compaction by the use of approved self-propelled rollers, except do not use
 40 a sheep-foot roller for more than 2 passes. Compact the base by the use of approved
 41 self-propelled rollers to a density equal to at least 97% of the maximum density obtained by
 42 compacting a sample of the material in accordance with AASHTO T 180 as modified by the
 43 Department. Copies of these modified testing procedures are available upon request from the
 44 Materials and Tests Unit. The Engineer may, at his option, utilize nuclear methods as
 45 described in the *NCDOT Nuclear Density Testing Manual – Base Course, FDR and Select*
 46 *Materials* to determine the density of the base instead of the methods required above. Copies
 47 of this manual are available upon request from the Materials and Tests Unit.

48 Complete final compaction, including that necessary due to correction of high or low areas,
 49 within 3 hours after water has been added to the mixture. Do not leave any cement-aggregate

Section 540

1 mixture undisturbed for more than 30 minutes if it has not been compacted and finished.
2 When rain causes excessive moisture, reconstruct the entire section. When such
3 reconstruction is necessary, perform the work of reconstruction and provide the cement
4 required at no cost to the Department.

540-7 CONSTRUCTION JOINTS

6 Build the base for large, wide areas in a series of parallel lines of convenient length and width
7 meeting the approval of the Engineer. Form straight longitudinal joints at the edge of each
8 day's construction by cutting back into the completed work to form a vertical face free of
9 loose or shattered materials. Where traffic considerations require that a longitudinal joint be
10 exposed for an excessive length of time, the Engineer may require that it be covered with
11 a curing seal in accordance with Section 543.

540-8 TOLERANCES

13 After final shaping and compacting of the base, the Engineer will check the surface of the
14 base for conformance to the grade and typical section and determine the base thickness.

15 Construct the thickness of the base so that it is within a tolerance of $\pm 1/2$ inch of the base
16 thickness required by the plans. When the base course will be used under concrete pavement
17 the tolerance will be $\pm 1/4$ inch.

18 Construct the base so that the maximum differential between the established grade and the
19 base within any 100 foot section is $1/2$ inch or $1/4$ inch when used as a base course under
20 concrete pavement.

540-9 CURING

22 After the cement-treated base has been finished as specified herein, cure it in accordance with
23 Section 543.

540-10 AGGREGATE FOR CEMENT-TREATED BASE

25 Use aggregate for cement-treated base course from an approved source participating in the
26 Department's Aggregate Quality Control/Quality Assurance Program (Aggregate QC/QA
27 Program) which has been sampled, tested and approved in accordance with Section 1006.

540-11 TRAFFIC

29 Completed sections of the base may be opened when necessary to lightweight local traffic,
30 provided the base has hardened sufficiently to prevent marring or distorting of the surface and
31 provided the curing is not impaired. Do not operate construction equipment on the base,
32 except as necessary to discharge into the spreader during paving operations.

540-12 MAINTENANCE

34 Maintain the base in an acceptable condition until final acceptance of the project. Include
35 immediate repair of any defects or damage that may occur in any maintenance operation.
36 Perform this maintenance at no cost to the Department and repeat as often as may be
37 necessary to keep the base in an acceptable condition. Perform repairs to the base by
38 replacing the base for its full depth rather than by adding a thin layer of cement-stabilized
39 material to the existing layer of base.

540-13 MEASUREMENT AND PAYMENT

41 *Aggregate for Cement-Treated Base Course* will be measured and paid at the contract unit
42 price per ton that has been incorporated into the completed and accepted work. The quantity
43 will be measured by weighing in trucks on certified platform scales or other certified
44 weighing devices. No deduction will be made for any moisture contained in the aggregate at
45 the time of weighing. Measurement will not be made of any base mixture added or replaced
46 for corrective measures during construction or for repairing damaged areas.

1 *Portland Cement for Cement-Treated Base Course* will be measured and paid at the contract
 2 unit price per ton that has been incorporated into the mix. When bulk cement is used, the
 3 quantity will be measured by weighing in trucks on certified platform scales or other certified
 4 weighing devices. When cement-treated base is produced at a commercial source for more
 5 than one project, the Engineer may elect to measure the cement based upon the cement
 6 content shown in the approved job mix formula. Measurement will not be made of any
 7 cement added or replaced for corrective measures during construction or for repairing
 8 damaged areas.

9 *Asphalt Curing Seal* will be paid in accordance with Article 543-5.

10 *Blotting Sand* will be paid in accordance with Article 818-4.

11 The above prices and payments will be full compensation for all work covered by this section
 12 including, but not limited to, the furnishing of water and aggregate; the mixing, proportioning,
 13 hauling and spreading of the materials; furnishing Portland cement at the point where it is
 14 incorporated into the mix; manipulating, compacting and finishing the base; maintaining the
 15 base; making repairs or corrections to the base; and applying sand seal in accordance with
 16 Article 542-3.

17 If the Contractor fails to provide sand seal as required and the Engineer has the work
 18 performed by other forces, the cost of such work will be deducted from monies due or to
 19 become due to the Contractor.

20 Payment will be made under

Pay Item	Pay Unit
Aggregate for Cement-Treated Base Course	Ton
Portland Cement for Cement-Treated Base Course	Ton

21 **SECTION 542**
 22 **SOIL-CEMENT BASE**

23 **542-1 DESCRIPTION**

24 The work covered by this section consists of constructing and curing a soil-cement base by
 25 treating the subgrade, existing subbase or existing base, or any combination of these
 26 materials, by pulverizing, adding Portland cement, adding aggregate when required, mixing,
 27 wetting and compacting the mixture to the required density. Proportion, spread and mix the
 28 materials on the roadway; manipulate, compact and finish in accordance with the *Standard*
 29 *Specifications* and the lines, grades, depths and typical sections shown on the plans or
 30 established by the Engineer.

31 **542-2 MATERIALS**

32 Refer to Division 10.

Item	Section
Aggregate, ABC	Table 1005-1
Portland Cement, Type I	1024-1
Water	1024-4

33 Use soil material that consists of material existing in the area to be paved, approved borrow
 34 material or a combination of these materials proportioned as directed by the Engineer that is
 35 free from vegetation, roots or other objectionable matter; and does not contain aggregate or
 36 stone larger than 2 inches.

37 **542-3 LIMITATIONS**

38 Do not construct the soil-cement base when the air temperature is below 40°F nor when
 39 conditions indicate that the temperature may fall below 40°F within 24 hours. Do not place or
 40 mix materials with frozen subgrade. Protect the base from freezing for 7 days after

Section 542

1 completion. Perform the work only during daylight hours except as otherwise provided in the
2 contract.

3 Do not construct soil-cement base that will not be covered with a layer of base or pavement
4 by December 1st of the same year. Failure of the Contractor to cover the soil-cement base as
5 required above will result in the Engineer notifying the Contractor in writing to cover the
6 soil-cement base with a sand seal. Apply the sand seal in accordance with Section 660 except
7 Articles 660-3 and 660-12 will not apply. If the Contractor fails to apply the sand seal within
8 72 hours after a receipt of such notice, the Engineer may proceed to have the work performed
9 with other forces and equipment. The application of the sand seal by the Contractor or other
10 forces will in no way relieve the Contractor of the responsibility to maintain or repair the
11 damaged base, no matter what the cause of damage.

12 542-4 EQUIPMENT

13 (A) General

14 Use any combination of machines or equipment that will produce the required results
15 meeting the approval of the Engineer. Correct any leakage of fluids and/or materials
16 promptly or the Engineer may order such equipment removed and replaced with
17 satisfactory equipment. Use equipment and methods for applying cement, water, curing
18 seal and blotting sand that will not damage the base and in accordance with Article 107-
19 21.

20 (B) Cement Spreaders

21 Use mechanical spreaders that have an adjustable rate of flow and the capability of
22 spreading the required amount of cement in one pass.

23 (C) Water Distribution Equipment

24 Add water to the soil with a pressure distributor or other suitable equipment capable of
25 uniformly distributing the required amount.

26 (D) Mixers

27 Perform all mixing with a self-propelled rotary mixer. Disc harrows, motor graders and
28 other equipment may be used only to supplement the mixing done by the rotary mixer.

29 Use mixing equipment that is capable of mixing to a compacted depth of at least
30 10 inches.

31 (E) Compaction Equipment

32 Use self-propelled compaction equipment. Accomplish finish rolling with a pneumatic-
33 tire roller or if permitted by the Engineer, a smooth steel-wheel roller.

34 (F) Scarifying Equipment

35 Use a grader-scarifier for the initial scarification of the soil. Use equipment capable of
36 scarifying the soil to the full depth of the stabilized treatment. When required by the
37 Engineer, use a weeder, spiketooth harrow or nail drag, followed by a broom drag when
38 scarifying during finishing operations.

39 542-5 PREPARATION OF ROADBED

40 Before the addition of any cement to the soil, grade and shape the area to be stabilized in
41 accordance with the typical sections, lines and grades shown on the plans. Perform drying or
42 addition of moisture where necessary before the application of cement. Create the subgrade
43 so it is firm and able to support the construction equipment and compaction operations
44 specified. Correct and make stable, soft or yielding subgrade before construction proceeds.

1 542-6 SCARIFYING

2 Scarify the soil in the area to be stabilized to the required depth and width before application
3 of cement. Pulverizing with a rotary mixer will follow scarifying, except it may be deleted in
4 areas where, if determined, the soil types or conditions make pulverizing with a rotary mixer
5 impractical.

6 542-7 APPLICATION OF CEMENT

7 When the Contractor has brought the subgrade to the elevation required by the plans, the
8 Engineer will sample the soil to be stabilized in order to determine the quantity of cement to
9 be incorporated. Incorporate 24 calendar days into the schedule to allow the Engineer
10 sufficient time to perform the required sampling, testing and final design of the cement
11 stabilization.

12 Before spreading cement, aggregate shall be spread at the rate shown in the plans.

13 Incorporate cement into the mix at the rate directed by the Engineer. Uniformly spread the
14 quantity of cement required for the full depth of treatment over the surface in one pass. Do
15 not apply cement on excessively wet grade or on windy days.

16 Apply cement to the soil when the percentage of moisture in the soil material is the correct
17 amount that assures a uniform mixture of soil material and cement during the mixing
18 operation. Do not exceed the optimum moisture content established by the Engineer for the
19 soil cement moisture except by permission.

20 The optimum moisture content and density will be determined in the field by a moisture-
21 density test on representative samples of soil-cement mixture; however, preliminary moisture-
22 density values may be determined by laboratory tests using soils from the project. Moisture
23 content will be determined by the Engineer in accordance with standard test procedures used
24 by the Department.

25 Apply cement only to such an area that all operations shall be completed in the same day
26 during daylight hours. Complete finishing the soil-cement mix within 4 hours of adding water
27 to the soil-cement mixture. No equipment, except that used in spreading and mixing, will be
28 allowed to pass over the freshly spread cement until it is mixed with the soil. Replace all
29 spread cement that has been displaced before mixing is started.

30 542-8 MIXING

31 Immediately after the cement has been spread, mix it with the loosened soil material for the
32 full depth of the treatment until a homogenous and uniform mixture is produced. Mixing will
33 be sufficient when 100% of the mixture passes a 1/2 inch sieve and at least 80% passes
34 a No. 4 sieve, exclusive of any aggregate.

35 Immediately after mixing the soil and cement, add any additional water that is necessary to
36 bring the moisture content between optimum and optimum plus 2% as determined by the
37 Engineer. If moisture content exceeds the specified range, the soil-cement mixture may, if
38 approved by the Engineer, be manipulated by remixing or blading to reduce the moisture
39 content to within the specified range. Avoid excessive concentrations of water as well as wet
40 spots or streaks on or near the surface. After all mixing water has been applied, continue
41 mixing until a uniform mixture is obtained at the required moisture content. Perform the
42 operations of cement spreading, water application and mixing so that they result in a uniform
43 soil, cement and water mixture for the full depth and width of the area being treated. Remix
44 any soil and cement mixture that has not been compacted and finished within 30 minutes.

45 542-9 COMPACTION

46 Begin compaction of the mixture immediately after the mixing operation is completed. At the
47 start of compaction, make sure that the moisture in the mixture is no more than 2% above or
48 below the optimum moisture content and is less than the quantity which will cause the soil-
49 cement mixture to become unstable during compaction and finishing. Compact the mixture to

Section 542

1 at least 97% of that obtained by a moisture-density test using AASHTO T 134 as modified by
2 the Department. Copies of these modified testing procedures are available upon request from
3 the Materials and Tests Unit.

4 Before compaction, prepare the mixture in a loose condition for its full depth. Compact the
5 loose mixture uniformly to the specified density. During the compaction operations, initial
6 shaping may be required to obtain uniform compaction and required grade and cross section.

7 **542-10 FINISHING**

8 When initial compaction is nearing completion, shape the surface of the soil-cement to the
9 required lines, grades and cross section. Maintain the moisture content of the surface material
10 at optimum or higher during finishing operations.

11 If necessary, lightly scarify the surface to remove any tire imprints or smooth surfaces left by
12 equipment. Continue compaction until a uniform and adequate density is obtained.

13 Perform the compaction and finishing to produce a dense surface free of compaction planes,
14 cracks, ridges or loose material.

15 When rain causes excessive moisture, reconstruct the entire section. Where such
16 reconstruction is necessary, furnish all work and cement required.

17 **542-11 THICKNESS**

18 The compacted thickness of the completed soil-cement base will be determined by
19 measurements made in test holes located at random intervals not to exceed 500 feet.
20 Construct the soil-cement base so that the measured thickness does not deviate from that
21 shown on the plans by more than + 1 inch or - 1/2 inch.

22 Where the base is deficient in thickness by more than 1/2 inch, remove and replace the area of
23 deficient base with base of the required thickness.

24 As an exception to the above, if the deficiency is not considered sufficient to seriously impair
25 the required strength of the soil-cement base, the deficient area may, at the discretion of the
26 Engineer, be left in place.

27 **542-12 CURING**

28 After the cement-treated base has been finished as specified herein, cure it in accordance with
29 Section 543.

30 **542-13 CONSTRUCTION JOINTS**

31 Build soil-cement for large wide areas in a series of parallel lanes of convenient length and
32 width meeting the approval of the Engineer. Form straight longitudinal joints at the edge of
33 each day's construction by cutting back into completed work to form a true vertical face free
34 of loose or shattered material.

35 Construct joints to provide a vertical joint having adequately mixed properly compacted
36 material immediately adjacent to the joint. A longitudinal joint adjacent to partially hardened
37 soil-cement built the preceding day may be formed by cutting back into the previously
38 constructed area during mixing operations. Set guide stakes for cement spreading and mixing
39 if deemed necessary.

40 **542-14 TRAFFIC**

41 Completed sections of the base may be opened when necessary to light-weight local traffic,
42 provided the base has hardened sufficiently to prevent marring or distorting of the surface and
43 provided the curing is not impaired. Do not use construction equipment on the base for
44 hauling except as necessary to discharge into the spreader during paving operations.

1 **542-15 MAINTENANCE**

2 Maintain the soil-cement base in an acceptable condition until final acceptance of the project.
 3 Include, in maintenance operations, immediate repair of any defects or damage that may
 4 occur. Repeat as often as may be necessary to keep the base in an acceptable condition.
 5 Perform repairs to the base by replacing the base for its full depth rather than by adding a thin
 6 layer of soil-cement mixture to the existing layer of base.

7 **542-16 MEASUREMENT AND PAYMENT**

8 *Soil Cement Base* will be measured and paid at the contract unit price per square yard that has
 9 been completed and accepted. In measuring this quantity, the width of the base will be
 10 measured across the top surface of the base. The length will be the actual length constructed,
 11 measured along the centerline of the surface of the base. Measurement will not be made
 12 of any base added or replaced for corrective measures during construction or for repairing
 13 damaged areas.

14 *Aggregate for Soil Cement Base* will be measured and paid in tons at the contract unit price
 15 per ton. The aggregate will be measured by weighing in trucks or certified platform scales or
 16 other certified weighing devices. No deductions will be made for any moisture contained in
 17 the aggregate at the time of weighing.

18 *Portland Cement for Soil Cement Base* will be paid at the contract unit price per ton that has
 19 been incorporated into the mix. When bulk cement is used, the quantity will be measured by
 20 weighing in trucks on certified platform scales or other certified weighing devices.
 21 Measurement will not be made of any cement added or replaced for corrective measures
 22 during construction or for repairing damaged areas.

23 *Asphalt curing seal* will be paid as provided in Article 543-5.

24 *Blotting Sand* will be paid as provided in Article 818-4.

25 If a layer of soil-cement base is deficient in thickness but has been permitted to be left in
 26 place in accordance with Article 542-11, payment for that soil-cement base will be made at
 27 50% of the contract unit prices for *Soil Cement Base*.

28 Sand seal applied due to the failure of the Contractor to cover the soil-cement base as required
 29 will be incidental to the work of this section. If the Contractor fails to provide sand seal as
 30 required and the Engineer has the work performed by other forces, the cost of such work will
 31 be deducted from monies due or to become due to the Contractor.

32 Payment will be made under:

Pay Item	Pay Unit
Soil Cement Base	Square Yard
Portland Cement for Soil Cement Base	Ton
Aggregate for Soil Cement Base	Ton

33

SECTION 543

34

ASPHALT CURING SEAL35 **543-1 DESCRIPTION**

36 Perform the work covered by this section including, but not limited to, keeping the stabilized
 37 layer moist; furnishing and applying the asphalt curing seal; correcting, maintaining and
 38 repairing the asphalt curing seal; and blotting sand where directed, to either a chemically
 39 stabilized soil layer or to a cement-stabilized base course.

Section 543

1 **543-2 MATERIALS**

2 Refer to Division 10.

Item	Section
Asphalt, Grade CRS-1	1020-3
Asphalt, Grade CRS-1H	1020-3
Asphalt, Grade CRS-2	1020-3
Asphalt, Grade RS-1	1020-3
Asphalt, Grade RS-1H	1020-3

3 **543-3 EQUIPMENT**

4 Use equipment to apply the asphalt material in accordance with Article 600-5.

5 Use equipment to apply water, curing seal and blotting sand that is of such type and weight
6 that it will not damage the completed stabilized layer.

7 **543-4 CONSTRUCTION METHODS**

8 Continuously moisten the finished stabilized layer or base course until the asphalt curing seal
9 is placed. Place the curing seal as soon as possible, but no later than 24 hours after
10 completing finishing operations except where delayed by wet weather. If wet weather delays
11 application of the curing seal, apply the curing seal as soon as the surface becomes
12 sufficiently dry.

13 At the time the asphalt curing seal is applied, prepare the surface of the stabilized layer or
14 base so that it is free of all loose or extraneous material and contains sufficient moisture to
15 prevent excessive penetration of the asphalt material. If deemed necessary, sweep the base
16 surface clean of loose material before applying the curing seal. Apply the curing seal in
17 accordance with Section 600.

18 Apply the asphalt material to the surface of the completed stabilized layer or base at a target
19 rate of 0.14 +/- 0.04 gal/sy with approved equipment. Apply the asphalt material at the exact
20 rate and temperature of application as established by the Engineer.

21 Cure the underlying materials for 7 curing days. Curing time will be counted in at least
22 1/2 day units and only when the air temperature measured at the location of the operation is at
23 least 50°F. Complete the curing before placement of subsequent layers of pavement.

24 Maintain the curing material during the curing period so that all of the stabilized layer or base
25 will be covered effectively during the period. Provide sufficient protection from freezing to
26 the stabilized layer or base during the entire curing period and until it has hardened. Replace
27 excessive loss of curing seal caused by heavy rains within 8 hours of placement.

28 If the Engineer determines that it is necessary to allow local traffic to use parts of the
29 stabilized layer or base before the asphalt material has cured sufficiently, protect those areas
30 by applying blotting sand in accordance with Section 818.

31 **543-5 MEASUREMENT AND PAYMENT**

32 *Asphalt Curing Seal* will be measured and paid at the contract unit price per gallon that has
33 been placed on the stabilized layer or base. Seal material placed on the stabilized layer or
34 base in excess of the authorized rate plus 0.02 gal/sy will not be measured for payment.
35 Measurement will not be made of any curing seal used to replace curing seal lost by heavy
36 rains which occur after placing the curing seal.

37 *Blotting Sand* will be paid as provided for in Article 818-4.

38 Payment will be made under:

Pay Item	Pay Unit
Asphalt Curing Seal	Gallon

**SECTION 545
INCIDENTAL STONE BASE**

545-1 DESCRIPTION

Perform the work covered by this section including, but not limited to, furnishing, hauling, placing and shaping a graded stone material for use in driveways, temporary maintenance of traffic, adjacent to mailboxes, beneath traffic island, median covers and at any other locations, other than use as a part of any base course on which pavement is to be placed; shaping; tamping when required; maintaining the base; and disposing of any surplus stockpiled material.

545-2 MATERIALS

Use stone, gravel or recycled concrete for the graded stone material which is well graded from the 1-1/2 inches through the No. 200 sieve sizes in accordance with Article 1006. The liquid limit of the recycled concrete is raised 5 points to no more than 35.

545-3 GRADATION SAMPLING, TESTING AND ACCEPTANCE

Acceptance of the graded stone material will be made by visual inspection and approval by the Engineer as being satisfactory for the purpose intended before its use. No sampling or testing of the graded stone material will be performed.

545-4 PLACING AND SHAPING STONE

Spread the stone material uniformly over the area required and then shape and dress to the satisfaction of the Engineer.

Uniformly spread, grade to the required depth and firmly tamp the stone material beneath traffic island and median covers. If the Contractor desires, the surface of the stone material may be covered with a sufficient amount of fine material to facilitate grading and shaping.

545-5 MAINTENANCE

Maintain the stone material until final acceptance of the project by reshaping and by the addition of incidental stone base material when directed by the Engineer.

Maintain all stone material beneath traffic islands and median covers in satisfactory condition until the covers are placed.

545-6 MEASUREMENT AND PAYMENT

Incidental Stone Base will be measured and paid at the contract unit price per ton that has been stockpiled or incorporated into the completed and accepted work. This quantity will be measured as provided for in Article 520-11. Incidental stone base which has been stockpiled will not be measured more than one time.

Payment will be made under:

Pay Item	Pay Unit
Incidental Stone Base	Ton

Section 560

**SECTION 560
SHOULDER CONSTRUCTION**

560-1 DESCRIPTION

Perform the work covered by this section including, but not limited to, furnishing the source of the borrow; building; maintaining and obliterating haul roads; clearing and grubbing the borrow source; removal, hauling and disposition of overburden and other unsuitable material; excavation; hauling; formation of roadway shoulders include the reshaping and finishing of slopes adjacent to the shoulders and roadway ditches; restoration of the source and haul roads to an acceptable condition; disposal of surplus stockpiled material; and seeding and mulching.

560-2 MATERIALS

Refer to Division 10.

Item	Section
Shoulder Borrow	1019-2
Aggregate Shoulder Borrow	1019-3

560-3 CONSTRUCTION METHODS

Construct the top 6 inches of shoulders with soils capable of supporting vegetation.

Construct the shoulders in proper sequence with the type of base and pavement being constructed. Perform the work so as to provide proper drainage at all times. Shape and roll the shoulder material during placement to provide for bonding of layers and compaction to the satisfaction of the Engineer.

Before placing any earth material on existing graded shoulders, remove all existing vegetation and scarify the existing shoulders to ensure a proper bond.

Perform the final shaping of the shoulders, adjacent slopes and ditches in accordance with the typical section shown on the plans.

Provide adequate equipment to perform the work. Do not damage base, surface, pavement or drainage features during the construction of the shoulders. Should damage occur because of the Contractor's operations, repair the damaged portions or remove and replace them as directed at no cost to the Department.

560-4 MEASUREMENT AND PAYMENT

(A) General

Shoulder borrow will be measured in its original position or in the haul truck, as directed by the Engineer.

No measurement will be made of material transported directly from unclassified excavation or fine grading and deposited directly in place on the shoulder.

The quantity of shoulder borrow will be paid at the contract unit price per cubic yard for *Shoulder Borrow*, except as otherwise provided below.

(B) Measured in Original Position

The quantity of shoulder borrow to be paid will be the actual number of cubic yards of approved material, measured in its original position in the borrow source or stockpile by cross sectioning and computed by the average end area method, which has been incorporated into the completed and accepted work. No measurement will be made of any overburden or unsuitable material removed from the borrow source, nor of any material excavated before cross sections being taken.

1 **(C) Truck Measurement**

2 The quantity of shoulder borrow to be paid will be the actual number of cubic yards of
 3 approved material, measured in trucks, which has been incorporated into the completed
 4 and accepted work. Each truck will be measured by the Engineer and shall bear a legible
 5 identification mark indicating its capacity. Load each truck to its measured capacity at
 6 the time it arrives at the point of delivery. The recorded capacity will be adjusted by
 7 making a 25% deduction to allow for shrinkage, and the adjusted capacity will be the
 8 quantity to be paid.

9 When shoulder material is obtained as a result of fine grading operations, trenching out
 10 existing subgrade or shaping slopes and ditches, no direct payment will be made for the
 11 work of shoulder construction as such work will be incidental to the work of constructing
 12 the base or pavement.

13 No payment will be made for the removal and disposal of any surplus material remaining
 14 in the stockpile after the shoulders have been completed.

15 Where the borrow source has been furnished by the Department, payment for clearing
 16 and grubbing the source will be made as provided in Article 200-8 and payment for
 17 draining the source will be made as provided in Article 240-4. Where the source has
 18 been furnished by the Contractor, no separate payment will be made for clearing and
 19 grubbing or draining the source as such work will be incidental to the work covered by
 20 this section.

21 If aggregate shoulder borrow (ASB) is used for borrow, a unit weight of 140 lb/cf will be
 22 used to convert the weight of ASB to cubic yards.

23 Payment for seeding and mulching all borrow sources will be made at the contract unit prices
 24 for the items established in the contract as payment for the work of seeding and mulching.

25 Payment will be made under:

Pay Item	Pay Unit
Shoulder Borrow	Cubic Yard

DIVISION 6 ASPHALT PAVEMENTS

SECTION 600 PRIME COAT

600-1 DESCRIPTION

Perform the work covered by this section including, but not limited to, treating an existing non-asphalt base course with asphalt material by furnishing and applying the prime, furnishing and placing granular material to protect the prime and maintaining the prime coat in accordance with these Specifications.

Treat all non-asphalt bases beneath an asphalt surface treatment with a prime coat.

600-2 MATERIALS

Refer to Division 10.

Item	Section
Prime Coat Materials	1020-5

Use materials for prime coat application that are on the APL for prime coats available on the Department's website.

Where the grade of prime coat material is not established by the contract, the Contractor may select the grade to be used from the APL. All prime coat materials shall be delivered to the project ready for use.

600-3 WEATHER LIMITATIONS

Apply prime coat only when the surface to be treated is free of standing water, at proper moisture content and the atmospheric temperature measured at the location of the operation away from artificial heat is 40°F or above for plant mix and 50°F or above for asphalt surface treatment.

Do not apply prime coat on a frozen surface or when the weather is foggy or rainy.

600-4 BASE PREPARATION

Clean the base of objectionable debris, excessive dust and any other deleterious matter before placing the prime coat.

When directed, dampen the surface of the base before application of the prime coat.

600-5 APPLICATION EQUIPMENT

Provide, maintain and operate a pressure distributor that is designed and equipped such that the asphalt material remains at a constant temperature and is applied uniformly on variable widths of surface at predetermined and controlled rates. Use a distributor equipped with a tachometer or synchronizer, pressure gauges, accurate volume measuring devices or a calibrated tank and a mounted thermometer for measuring temperature.

Use a distributor equipped with a power driven pump of sufficient capacity to distribute the required quantity of asphalt material at constant flow and uniform pressure. Provide a full circulation spray bar adjustable laterally and vertically and adjustable in length to conform to the required width of application without overlapping. Provide and maintain nozzles designed to provide equal and uniform application at all times. Provide a hand spray hose and nozzle to cover areas inaccessible to the spray bars. Equip the distributor with a positive shut-off control for the spray bar and hand hose.

Section 605

1 **600-6 APPLICATION RATES AND TEMPERATURES**

2 Apply the prime coat at a rate from 0.20 to 0.50 gal/sy. The exact rate for each application
3 will be established by the Engineer before application.

4 The required rate of application of asphalt materials will be based on the volume of material
5 measured at the application temperature. Apply the prime coat material at a temperature that
6 is in accordance with the manufacturer's recommendations or as approved.

7 **600-7 APPLICATION OF PRIME COAT**

8 Apply the prime coat only when the base to be treated has been approved.

9 Cover bridge floors, curbs and handrails of structures and all other appurtenances to protect
10 them from tracking or splattering of prime coat.

11 After the prime coat has penetrated sufficiently and when directed, roll the primed surface
12 until all loose base material is thoroughly bonded.

13 **600-8 MAINTENANCE AND PROTECTION**

14 When directed, apply blotting sand in accordance with Section 818.

15 Maintain the prime coat in an acceptable condition until such time as the pavement is placed.
16 Replace any damaged prime coat.

17 **600-9 MEASUREMENT AND PAYMENT**

18 Ensure the volume of the distributor tank is calibrated by a commercial laboratory or the
19 manufacturer before use. Provide a calibration chart with an accurately calibrated measuring
20 stick graduated in increments of not more than 25 gal on the distributor at all times for use by
21 the Engineer.

22 *Prime Coat* will be paid at the contract unit price per gallon of prime coat material
23 satisfactorily placed on the roadway. Each distributor load of prime coat material delivered
24 and used on the project will be measured. Repair damaged prime coat at no cost to the
25 Department.

26 *Blotting Sand* will be paid in accordance with Article 818-4.

27 Payment will be made under:

Pay Item	Pay Unit
Prime Coat	Gallon

28 **SECTION 605**
29 **ASPHALT TACK COAT**

30 **605-1 DESCRIPTION**

31 Apply tack coat material to existing asphalt or concrete surfaces in accordance with these
32 Specifications.

33 Apply tack coat beneath each layer of asphalt plant mix to be placed. Where a prime coat or a
34 newly placed asphalt surface treatment mat coat has been applied, apply tack coat as directed.

35 **605-2 MATERIALS**

36 Refer to Division 10.

Item	Section
Asphalt Binder, Grade PG 58-28	1020-2
Asphalt Binder, Grade PG 64-22	1020-2
Emulsified Asphalt, Grade CRS-1	1020-3
Emulsified Asphalt, Grade CRS-1H	1020-3

Emulsified Asphalt, Grade CRS-2	1020-3
Emulsified Asphalt, Grade HFMS-1	1020-3
Emulsified Asphalt, Grade RS-1H	1020-3

1 Do not dilute or mix the tack coat material with water, solvents or other materials before
2 application.

3 Unless otherwise specified in the contract, use any of the grades of tack coat material
4 specified in this article.

5 For tack coat beneath an open-graded asphalt friction course, the asphalt grade and rate of
6 application to be used on the project will be specified in accordance with Section 650-5.

7 **605-3 WEATHER LIMITATIONS**

8 Apply tack coat only when the surface to be treated is dry and when the atmospheric
9 temperature measured at the location of the paving operation away from artificial heat is 35°F
10 or above.

11 Do not apply tack coat when the weather is foggy or rainy.

12 **605-4 SURFACE PREPARATION**

13 Ensure that the existing asphalt or concrete surface is free of all dust and foreign material
14 before applying the tack coat.

15 Remove grass, dirt and other materials from the edge of the existing pavement before the
16 placement of tack coat.

17 **605-5 ACCEPTANCE OF ASPHALT MATERIALS**

18 The acceptance of asphalt materials will be in accordance with Article 1020-1.

19 **605-6 APPLICATION EQUIPMENT**

20 Provide equipment for heating and uniformly applying the asphalt material in accordance with
21 Article 600-5.

22 **605-7 APPLICATION RATES AND TEMPERATURES**

23 Apply tack coat uniformly across the existing surface at target application rates shown in
24 Table 605-1.

TABLE 605-1 APPLICATION RATES FOR TACK COAT	
Existing Surface	Target Rate (gal/sy)
	Emulsified Asphalt
New Asphalt	0.04 ± 0.01
Oxidized or Milled Asphalt	0.06 ± 0.01
Concrete	0.08 ± 0.01

25 Apply tack coat at a temperature within the ranges shown in Table 605-2. Tack coat shall not
26 be overheated during storage, transport or at application.

Section 607

Asphalt Material	Temperature Range
Asphalt Binder, Grade PG 58-28 or PG 64-22	350 - 400°F
Emulsified Asphalt, Grade RS-1H	130 - 160°F
Emulsified Asphalt, Grade CRS-1	130 - 160°F
Emulsified Asphalt, Grade CRS-1H	130 - 160°F
Emulsified Asphalt, Grade HFMS-1	130 - 160°F
Emulsified Asphalt, Grade CRS-2	130 - 160°F

1 **605-8 APPLICATION OF TACK COAT**

2 Apply only as much tack coat material as can be covered with base, intermediate or surface
3 course material during the next day's operation except where public traffic is being
4 maintained.

5 If public traffic is being maintained, cover the tack coat in the same day's operation. Provide
6 safe traffic conditions. If needed, apply suitable granular material so it bonds to the tack coat.
7 In addition, the Engineer may limit the application of tack coat in advance of the paving
8 operation depending on traffic conditions, project location, proximity to business or
9 residential areas or other reasons.

10 Take necessary precautions to limit the tracking or accumulation of tack coat on either
11 existing or newly constructed pavements. Excessive accumulation of tack coat requires
12 corrective measures.

13 Apply tack coat with a distributor spray bar that can be adjusted to uniformly coat the entire
14 surface at the directed rate. Use a hand hose attachment only on irregular areas and areas
15 inaccessible to the spray bar. Cover these areas uniformly and completely.

16 Apply tack coat as directed by and in the presence of the Engineer. Do not place any asphalt
17 mixture until the tack coat has sufficiently cured.

18 Apply tack coat to all exposed transverse and longitudinal edges of each course before
19 mixture is placed adjacent to such surfaces. Apply tack coat to contact surfaces of headers,
20 curbs, gutters, manholes and vertical faces of old pavements.

21 Cover bridge floors, curbs and handrails of structures and all other appurtenances to protect
22 them from tracking or splattering tack coat material.

23 **605-9 PROTECTION OF TACK COAT**

24 After the tack coat has been applied, protect it until it has cured for a sufficient length of time
25 to prevent it from being picked up by traffic.

26 **605-10 MEASUREMENT AND PAYMENT**

27 There will be no direct payment for the work covered by this section.

28 Payment at the contract unit prices for the various mix items covered by Sections 610, 650
29 and 654 will be full compensation for all work covered by this section.

30 **SECTION 607**
31 **MILLING ASPHALT PAVEMENT**

32 **607-1 DESCRIPTION**

33 Perform the work covered by this section including, but not limited to, milling and re-milling
34 the pavement at locations, depths, widths and typical sections indicated in the contract;
35 cleaning the milled surface; loading, hauling and stockpiling the milled material for use in
36 recycled asphalt mixtures; and disposal of any excess milled material.

1 Except where the milled material is used in the work or where otherwise directed, provide
2 areas outside the right of way to dispose of milled material, which shall be property of the
3 Contractor.

4 **607-2 EQUIPMENT**

5 Use a self-propelled unit capable of removing the existing asphalt pavement to the depths,
6 widths and typical sections shown in the contract. Use milling machines designed and built
7 exclusively for pavement milling operations and with sufficient power, traction and stability
8 to accurately maintain depth of cut and slope. Use milling machines equipped with
9 an electronic control system that will automatically control the longitudinal profile and cross
10 slope of the milled pavement surface. Accomplish this through the use of a mobile grade
11 reference, an erected string line, joint matching shoe, slope control systems or a combination
12 of approved methods. Use an erected fixed stringline when required by the contract.
13 Otherwise, use a mobile grade reference system capable of averaging the existing grade or
14 pavement profile over at least 30 feet. Use either a non-contacting laser or sonar type ski
15 systems with at least 4 referencing stations mounted on the milling machine at a length of at
16 least 24 feet. Coordinate the position of the grade control system such that the grade sensor is
17 at the approximate midpoint of the mobile reference system. Use a machine capable of
18 leaving a uniform surface suitable for handling traffic without damage to the underlying
19 pavement structure. Use a milling machine and other loading equipment capable of loading
20 milled material to be used in other parts of the work without segregation.

21 Provide additional equipment necessary to satisfactorily remove the pavement in the area of
22 manholes, water valves, curb, gutter and other obstructions.

23 Equip the milling equipment with a means of effectively limiting the amount of dust escaping
24 from the removal operation in accordance with Federal, State and local air pollution control
25 laws and regulations.

26 **607-3 CONSTRUCTION METHODS**

27 Mill the existing pavement to restore the pavement surface to a uniform longitudinal profile
28 and cross section in accordance with typical sections shown in the plans. Where indicated in
29 the contract, remove pavement to a specified depth and produce a specified cross slope. Mill
30 intersections and other irregular areas unless otherwise directed by the Engineer.

31 The Contractor may elect to make multiple cuts to achieve the required depth of cut or cross
32 slope required by the plans.

33 Establish the longitudinal profile of the milled surface by a mobile string line on the side of
34 the cut nearest the centerline of the road. Establish the cross slope of the milled surface by
35 an automatic cross slope control mechanism or by a second skid sensing device located on the
36 opposite edge of the cut. The Engineer may waive the requirement for automatic grade and
37 cross slope controls where conditions warrant.

38 Operate the milling equipment so as to prevent damage to the underlying pavement structure,
39 utilities, drainage facilities, curb and gutter, paved surfaces outside the milled area and any
40 other appurtenances. Produce milled pavement surfaces that are reasonably smooth and free
41 of excessive scarification marks, gouges, ridges, continuous grooves or other damage. Repair
42 any leveling or patching required as a result of negligence by the Contractor with hot asphalt
43 plant mix in a manner acceptable to the Engineer. Coordinate the adjustment of manholes,
44 meter boxes and valve boxes with the milling operation in accordance with Article 858-3
45 including a temporary asphalt ramp.

Section 607

1 When necessary, the contractor may remove the top section of a utility and use a bridge steel
2 plate placed to cover the entire width of the structure, ensuring no debris is dropped inside the
3 structure. Backfill with compacted material and hot mix asphalt as a temporary riding surface
4 as well as any further necessary requirements of the utility owner. This steel plate must be
5 capable of carrying any traffic load carried by the facility. Where necessary, double-reference
6 the location of each structure that has been removed and maintain a map of their location.
7 Construct a temporary ramp of asphalt plant mix to extend a minimum of 3 feet around raised
8 structures before opening to traffic.

9 The Engineer may require re-milling of any area exhibiting laminations or other defects.
10 Thoroughly clean the milled pavement surface of all loose aggregate particles, dust and other
11 objectionable material. Disposing or wasting of oversize pieces of pavement or loose
12 aggregate material will not be permitted within the right of way.

13 Conduct pavement removal operations so as to effectively minimize the amount of dust being
14 emitted. Plan and conduct the operation so it is safe for persons and property adjacent to the
15 work including the traveling public.

16 **607-4 TOLERANCE**

17 Remove the existing pavement to the depth required by the contract. The Engineer may vary
18 the depth of milling.

19 **607-5 MEASUREMENT AND PAYMENT**

20 **(A) Milled Asphalt Pavement**

21 *Milled Asphalt Pavement, ___" Depth and Milling Asphalt Pavement, ___" to ___"* to be paid
22 will be the actual number of square yards of pavement surface milled in accordance with
23 this Specification. In measuring this quantity, the length will be the actual length milled,
24 measured along the pavement surface. The width will be the width required by the plans
25 or directed, measured along the pavement surface. Areas to be paid under these items
26 include mainline, turn lanes, shoulders, and any additional equipment necessary to
27 remove pavement in the area of manholes, water valves, curb, gutter and other
28 obstructions.

29 **(B) Milled Asphalt Pavement Depth Varies from Required Depth**

30 Where the depth of milling varies from the required depth, no adjustment in the contract
31 unit price for *Milling Asphalt Pavement, ___" Depth and Milling Asphalt*
32 *Pavement, ___" to ___"* will be made, except if the Engineer directs the depth of milling per
33 cut to be altered by more than 1 inch. In this case, either the Department or the
34 Contractor may request an adjustment in unit price in accordance with Article 104-3. In
35 administering Article 104-3, the Department will give no consideration to value given to
36 RAP due to the deletion or reduction in quantity of milling. Article 104-3 will not apply
37 to the item of *Incidental Milling*.

38 For each square yard that the Engineer directs to be milled, including, but not limited to,
39 the mainline, turn lanes, bus loading and unloading areas, widening for bus or truck
40 U-turns, shoulders, intersections and crossovers requiring any additional equipment
41 necessary to remove pavement in the area of manholes, water valves, curb, gutter and
42 other obstructions, compensation will be made at the contract unit price per square yard
43 for *Milling Asphalt Pavement, ___" Depth or Milling Asphalt Pavement, ___" to ___"*.

44 **(C) Incidental Milling**

45 *Incidental Milling* to be paid will be the actual number of square yards of surface milled
46 where the Contractor is required to mill butt joints, irregular areas and intersections
47 milled as a separate operation from mainline milling and re-mill areas that are not due to
48 the Contractor's negligence whose length is less than 100 feet. Measurement will be
49 made as provided in Subarticle 607-5(A) for each cut the Contractor is directed to

perform. Where the Contractor elects to make multiple cuts to achieve the final depth, no additional measurement will be made. Compensation will be made at the contract unit price per square yard for *Incidental Milling*.

(D) Milling of Defects

If defects are determined to be the result of the Contractor's negligence, then measurement for the re-milling or repairs will not be made. If the Engineer directs re-milling of an area that is equal to or greater than 100 feet and is not due to the Contractor's negligence, the re-milled area will be measured as provided in Subarticle 607-5(A) and paid at the contract unit price per square yard for *Milled Asphalt Pavement, ___" Depth* or *Milling Asphalt Pavement, ___" to ___"*.

Payment will be made under:

Pay Item	Pay Unit
Milling Asphalt Pavement, ___" to ___"	Square Yard
Milling Asphalt Pavement, ___" Depth	Square Yard
Incidental Milling	Square Yard

SECTION 609

QUALITY MANAGEMENT SYSTEM FOR ASPHALT PAVEMENTS

609-1 DESCRIPTION

Produce and construct asphalt mixtures and pavements in accordance with a quality management system as described herein. Apply these *Standard Specifications* to all materials and work performed in accordance with Division 6. Perform all quality control (QC) activities in accordance with the Department's *Asphalt Mixture Quality Management System (QMS) Manual* in effect on the date of contract advertisement.

(A) Quality Control (QC)

Define a "quality control (QC) program" as all activities, including mix design, process control, plant and equipment calibration, sampling and testing and necessary adjustments in the process that are related to production of a pavement that meet the *Standard Specifications*. Provide and conduct a QC program in accordance with this section.

(B) Quality Assurance (QA)

Define a "quality assurance (QA) program" as all activities, including inspection, sampling and testing related to determining that the quality of the completed pavement conforms to specification requirements. The Department will conduct a QA program in accordance with Article 609-10.

609-2 MIX DESIGN/JOB MIX FORMULA REQUIREMENTS

Apply all requirements of Article 610-3.

609-3 FIELD VERIFICATION OF MIXTURE AND JOB MIX FORMULA ADJUSTMENTS

Conduct field verification of the mix at each plant within 45 calendar days before initial production of each mix design, when required by the *Allowable Mix Adjustment Policy* and when directed as deemed necessary.

Field verification testing consists of performing a minimum of one full test series on mix sampled and tested in accordance with Subarticle 609-6(B). Mix obtained from Department or non-Department work may be used for this purpose provided it is sampled, tested and the test data handled in accordance with the *Asphalt QMS Manual* and this article.

Section 609

1 Obtain the mix verification sample and split in accordance with procedures in the *Asphalt*
2 *QMS Manual*. Do not begin normal plant production until all field verification test results
3 have been completed and the mix has been satisfactorily verified by the Contractor's
4 Level II technician.

5 In addition to the required sampling and testing for field verification, perform all preliminary
6 inspections and plant calibrations as outlined in the *Asphalt QMS Manual*. Retain records of
7 these calibrations and mix verification tests at the QC laboratory. Furnish copies to the
8 Engineer for review and approval within one working day after beginning production of the
9 mix.

10 Failure by the Contractor to fully comply with the above mix verification requirements will
11 result in immediate production stoppage by the Engineer. Do not resume normal production
12 until all mix verification sampling, testing, calibrations and plant inspections have been
13 performed and approved.

14 **609-4 CONTRACTOR'S QUALITY CONTROL PERSONNEL REQUIREMENTS**

15 Obtain all certifications in accordance with the Department's QMS Asphalt Technician
16 Certification Program as outlined in the *Asphalt QMS Manual*. Perform all sampling, testing,
17 data analysis and data posting by or under the direct supervision of a certified QMS asphalt
18 plant technician.

19 Provide a certified asphalt plant technician Level I to perform QC operations and activities at
20 each plant site at all times during production of material for the project. A plant operator who
21 is a certified asphalt plant technician Level I may be used to meet this requirement when daily
22 production for each mix design is less than 100 tons provided the randomly scheduled
23 increment sample as defined in Section 7.3 of the *Asphalt QMS Manual* is not within that
24 tonnage. When performing in this capacity, the plant operator will be responsible for all QC
25 activities that are necessary and required. Absences of the Level I technician, other than those
26 for normal breaks and emergencies shall be pre-approved by the appropriate Engineer or his
27 designated representative. Any extended absence of the technician that has not been approved
28 will result in immediate suspension of production by the Engineer. All mix produced during
29 this absence will be accepted in accordance with Article 105-3.

30 Provide and have readily available a certified asphalt plant technician Level II to supervise,
31 coordinate and make any necessary adjustments in the mix QC process in a timely manner.
32 The Level II technician may serve in a dual capacity and fulfill the Level I technician
33 requirements specified above.

34 Provide a certified QMS roadway technician with each paving operation at all times during
35 placement of asphalt. This person is responsible for monitoring all roadway paving operations
36 and all QC processes and activities, to include stopping production or implementing
37 corrective measures when warranted. Provide a certified density gauge operator when density
38 control is being used.

39 Post in the QC laboratory an organizational chart, including names, telephone numbers and
40 current certification numbers of all personnel responsible for the QC program while asphalt
41 paving work is in progress.

42 **609-5 CONTRACTOR'S QUALITY CONTROL FIELD LABORATORY REQUIREMENTS**

43 For a contract with 5,000 or more total tons of asphalt mix, furnish and maintain
44 a Department certified laboratory at the plant site meeting the minimum requirements outlined
45 in Section 7.2 of the *Asphalt QMS Manual*.

46 For a contract with less than 5,000 total tons of asphalt mix, the QC testing may be conducted
47 in a Department certified off-site laboratory meeting the requirements.

48 Provide testing equipment as required in Section 7.2 of the *Asphalt QMS Manual*. Provide
49 equipment that is properly calibrated and maintained. Allow all measuring and testing

1 devices to be inspected to confirm both calibration and condition. If at any time the Engineer
 2 determines that the equipment is not operating properly or is not within the limits of
 3 dimensions or calibration described in the applicable test method, the Engineer may stop
 4 production until corrective action is taken. Maintain and have available a record of all
 5 calibration results at the laboratory.

6 **609-6 PLANT MIX QUALITY CONTROL**

7 **(A) General**

8 Include in the QC process the preliminary inspections, plant calibrations and field
 9 verification of the mix and JMF in accordance with the *Asphalt QMS Manual*. Obtain all
 10 scheduled samples at randomly selected locations in accordance with the *Asphalt QMS*
 11 *Manual*. Log all samples taken on forms provided by the Department. Split and retain
 12 all samples taken in accordance with the *Asphalt QMS Manual*. Provide documentation
 13 as required in Subarticle 609-8. Identify any additional QC samples taken and tested on
 14 the appropriate forms. Process control test results shall not be plotted on control charts
 15 nor reported to the QA Laboratory.

16 Retain and store all samples in accordance with the requirements of Section 7.5 of the
 17 *Asphalt QMS Manual*.

18 **(B) Required Sampling and Testing Frequencies**

19 Maintain minimum test frequencies as established in the schedule below. Complete all
 20 tests within 24 hours of the time the sample is taken, unless specified otherwise within
 21 these provisions. If the specified tests will not be completed within the required time
 22 frame, cease production at that point until such time the tests are completed.

23 If the Contractor's testing frequency fails to meet the minimum frequency requirements
 24 as specified, all mix without the specified test representation will be unsatisfactory. The
 25 Engineer will evaluate if the mix may remain in place in accordance with Article 105-3.

26 Sample and test the completed mixture from each JMF at the following minimum
 27 frequency during mix production:

<u>Accumulative Production Increment</u>	<u>Number of Samples per Increment</u>
750 tons	1

28 If production is discontinued or interrupted before the accumulative production increment
 29 tonnage is completed, continue the increment on the next production day(s) until the
 30 increment tonnage is completed. Obtain a random sample within the specified increment
 31 at the location determined in accordance with the *Asphalt QMS Manual*. Conduct
 32 QC testing on each random sample in accordance with Section 7.3 of the *Asphalt QMS*
 33 *Manual*. When daily production of each mix design exceeds 100 tons and a regularly
 34 scheduled full test series on a sample from a random sample location for that JMF does
 35 not occur during that day's production, perform at least one partial test series in
 36 accordance with Section 7.3 of the *Asphalt QMS Manual*. These partial test series and
 37 associated tests do not substitute for the regularly scheduled random sample for that
 38 increment.

39 **(C) Control Charts**

40 Maintain standardized control charts furnished by the Department at the field laboratory.
 41 For mix incorporated into the project, record full test series data from all regularly
 42 scheduled random samples or directed samples that replace regularly scheduled random
 43 samples, on control charts the same day the test results are obtained.

44 Record QC sample data on the standardized control charts in accordance with Section 7.4
 45 of the *Asphalt QMS Manual*.

46 Maintain a continuous moving average with the following exceptions.

Section 609

1 Re-establish a new moving average only when:

- 2 (1) A change in the binder percentage, aggregate blend or G_{mm} is made on the JMF, or
- 3 (2) When the Contractor elects to stop or is required to stop production after one or two
4 moving average values, respectively, fall outside the moving average limits as
5 outlined in Table 609-1, or
- 6 (3) Failure to stop production after 2 consecutive moving averages exceed the moving
7 average limits occurs, but production does stop at a subsequent time, re-establish
8 a new moving average beginning at the actual production stop point.

9 In these cases, re-establish the moving averages for all mix properties. Moving averages
10 will not be re-established when production stoppage occurs due to an individual test
11 result exceeding the individual test limits or the *Standard Specifications*.

12 All individual test results for regularly scheduled random samples or directed samples
13 that replace regularly scheduled samples are part of the plant QC record and shall be
14 included in moving average calculations with the following exception. When the
15 Contractor's testing data has been proven incorrect, use the correct data as determined by
16 the Engineer instead of the Contractor's data to determine the appropriate pay factor in
17 accordance with Section 7021 of the *Asphalt QMS Manual*. In this case, replace the data
18 in question and any related data proven incorrect.

19 (D) Control Limits

20 Establish control limits for mix production in accordance with Table 609-1. Control
21 limits for the moving average limits are based on a moving average of the last 4 data
22 points. Apply all control limits to the applicable target source.

TABLE 609-1 CONTROL LIMITS			
Mix Control Criteria	Target Source	Moving Average Limit	Individual Limit
2.36 mm Sieve	JMF	$\pm 4.0\%$	$\pm 8.0\%$
1.18mm Sieve (S4.75A only)	JMF	$\pm 4.0\%$	$\pm 8.0\%$
0.075 mm Sieve	JMF	$\pm 1.5\%$	$\pm 2.5\%$
Binder Content	JMF	$\pm 0.3\%$	$\pm 0.7\%$
VTM @ N_{des}	JMF	$\pm 1.0\%$	$\pm 2.0\%$
VMA @ N_{des}	Min. Spec. Limit	Min. Spec. Limit	- 1.0%
$P_{0.075}/P_{be}$ Ratio	1.0	$\pm 0.4\%$	$\pm 0.8\%$
% G_{mm} @ N_{ini}	Max. Spec. Limit	-	+ 2.0%
TSR	Min. Spec. Limit	-	- 15%

23 (E) Corrective Actions

24 All required corrective actions are based upon initial test results and shall be taken
25 immediately upon obtaining those results. If more than one corrective action or
26 adjustment applies, give precedence to the more severe of these actions. Stopping
27 production when required takes precedence over all other corrective actions. Document
28 all corrective actions.

29 If the process adjustment improves the property in question such that the moving average
30 after 4 additional tests is on or within the moving average limits, the Contractor may
31 continue production.

1 When any of the following occur, production of a mix shall cease immediately:

- 2 (1) An individual test result for a mix control criteria (including results for required
3 partial test series on mix) exceeds both the individual test control limits and the
4 applicable specification design criteria, or
- 5 (2) Two consecutive field TSR values fail to meet the minimum specification
6 requirement, or
- 7 (3) Two consecutive binder content test results exceed the individual limits, or
- 8 (4) Two consecutive moving average values for any one of the mix control criteria fall
9 outside the moving average limits.

10 Do not resume normal plant production until one of the following has occurred.

11 Option 1: Approval has been granted by the appropriate QA supervisor.

12 Option 2: The mix in question has been satisfactorily verified in accordance with
13 Section 7.4 of the *Asphalt QMS Manual*. Normal production may resume
14 based on the approval of the contractor's Level II technician, provided
15 notification and the verification test results have been furnished to the QA
16 Laboratory.

17 Failure to fully comply with any of the above corrective actions will result in immediate
18 production stoppage by the Engineer. Normal production shall not resume until
19 a complete verification process has been performed and approved by the Engineer.

20 Failure to stop production when required will make all mix unacceptable from the stop
21 point tonnage to the point when Option 1 or Option 2 occurs or to the tonnage point when
22 production is actually stopped, whichever occurs first.

23 In any case, remove and replace this mix with materials that comply with the *Standard*
24 *Specifications*, unless otherwise approved. The Engineer will evaluate acceptance of the
25 mix in question based on Articles 105-3 and 609-11.

26 Immediately notify the Engineer when any moving average value exceeds the moving
27 average limit. If two consecutive moving average values for any one of the mix control
28 criteria fall outside the moving average limits, immediately cease production of that mix
29 and make adjustments. The Contractor may elect to stop production after only one
30 moving average value falls outside the moving average limits. In either case, do not
31 determine a new moving average until the fourth test after the elective or mandatory stop
32 in production.

33 **(F) Allowable Resampling and Retesting for Mix Deficiencies**

34 The Contractor shall resample and retest for plant mix deficiencies when warranted as
35 outlined in Section 7.19 of the *Asphalt QMS Manual*. Perform the retesting within
36 10 days after initial test results are determined. Retests for any mix deficiency other than
37 as listed below will not be allowed, unless otherwise permitted.

38 The Department reserves the right to require the Contractor to resample and retest at any
39 time or location as directed.

Section 609

**TABLE 609-2
RETEST LIMITS FOR MIX DEFICIENCIES**

Property	Limit
VTM	by more than $\pm 2.5\%$
VMA	by more than $\pm 2.0\%$
% Binder Content	by more than $\pm 1.0\%$
0.075 mm sieve	by more than $\pm 3.0\%$
2.36 mm sieve	exceeds both the Specification mix design limits and one or more of the above tolerances
TSR	by more than - 15% from Specification limit

1 **609-7 FIELD COMPACTION QUALITY CONTROL**

2 **(A) General**

3 Perform QC of the compaction process in accordance with these provisions and
4 applicable requirements of Article 610-10. The Contractor may elect to use either
5 pavement core samples or density gauge readings as the method of density control.
6 Provide to the Department at the pre-construction conference the method of density QC
7 that will be used on the project.

8 Establish acceptable control strips when required at locations approved by the Engineer
9 and in accordance with the *Asphalt QMS Manual*. In addition, place control strips
10 anytime deemed necessary by the Engineer.

11 Perform density sampling and testing on all pavements as outlined in Sections 10.4 and
12 10.6 of the *Asphalt QMS Manual* unless otherwise approved.

13 Perform the sampling and testing at the minimum test frequencies as specified. If the
14 density testing frequency fails to meet the minimum frequency as specified, all mix
15 without the required density test representation will be unsatisfactory. The Engineer will
16 evaluate if the mix may remain in place in accordance with Article 105-3.

17 **(B) Limited Production Procedures**

18 Define “resurfacing” as the first new uniform layer placed on an existing pavement.
19 Proceed on limited production when, for the same mix type and on the same contract, one
20 of the following conditions occur (except as noted below).

21 (1) Two consecutive failing lots, except on resurfacing,

22 (2) Three consecutive failing lots on resurfacing, or

23 (3) Two consecutive failing density gauge control strips.

24 As exceptions to the above, pavement within each construction category (New and
25 Other), as defined in Section 10.3.3 of the *Asphalt QMS Manual*, and pavement placed
26 simultaneously by multiple paving crews will be evaluated independently for limited
27 production purposes.

28 Limited production is defined as the production, placement and compaction of a
29 sufficient quantity of mix to construct a 300 feet control strip plus 100 feet of pavement
30 adjacent to each end of the control strip.

31 Remain on limited production until such time as satisfactory density results are attained
32 or until two control strips have been attempted without achieving acceptable density test
33 results. If the Contractor fails to achieve satisfactory density after two control strips have
34 been attempted, cease production of that mix type until such time as the cause of the
35 failing density test results can be determined. As an exception, the Engineer may grant
36 approval to produce a different mix design of the same mix type if Quality Control and
37 Quality Assurance plant mix test indicate the failing densities are attributed to the mix
38 problem(s) rather than compaction related problems and limited production startup would

1 not be required. The determination of whether a mix problem exists at this time will be
2 made by QA personnel.

3 If the Contractor does not operate by the limited production procedures when conditions
4 as specified in Section 10.9 of the *Asphalt QMS Manual*, all mix produced thereafter will
5 be unacceptable. Remove this material and replace with material that complies with the
6 *Standard Specifications*, at no additional cost to the Department.

7 **609-8 CONTRACTOR QUALITY CONTROL DOCUMENTATION (RECORDS)**

8 Document all QC activities, records of inspection, samples taken, adjustments to the mix and
9 test results on a daily basis. Note the results of observations and records of inspection as they
10 occur in a permanent field record. Record adjustment to mix production and test results on
11 forms provided. Process control sample test results are for the Contractor's informational
12 purposes only.

13 Make all such records available to the Engineer, upon request, at any time during project
14 construction. Complete and maintain all QC records and forms and distribute in accordance
15 with the *Asphalt QMS Manual*. Submit data electronically using the Department's software.
16 Failure to maintain QC records and forms as required, or to provide these records and forms
17 to the Engineer upon request, may result in production stoppage, placement stoppage, removal
18 from the NCDOT Certified Asphalt Laboratory List and removal from the NCDOT Certified
19 Asphalt Plant List until the problem is resolved.

20 Falsification of test results, documentation of observations, records of inspection, adjustments
21 to the process, discarding of samples and/or test results or any other deliberate
22 misrepresentation of the facts will result in the revocation of the applicable person's
23 QMS certification. The Engineer will determine acceptability of the mix and/or pavement
24 represented by the falsified results or documentation. If the mix and/or pavement in question
25 is determined to be acceptable, the Engineer may allow the mix to remain in place at no pay
26 for the mix, asphalt binder and other mix components. If the mix or pavement represented by
27 the falsified results is determined not to be acceptable, remove and replace with mix that
28 complies with the *Standard Specifications*.

29 **609-9 QUALITY ASSURANCE**

30 The Department's QA program will be conducted by a certified QMS technician(s) and will
31 be accomplished based on the requirements of Section 7.60 for mix and Sections 10.5 and
32 10.7 for density in the *Asphalt QMS Manual*.

33 Differences between the Contractor's and the Department's split sample test results will be
34 acceptable if within the limits of precision in Table 609-3.

Section 609

**TABLE 609-3
LIMITS OF PRECISION FOR TEST RESULTS**

Mix Property	Limits of Precision
25.0 mm sieve (Base Mix)	± 10.0%
19.0 mm sieve (Base Mix)	± 10.0%
12.5 mm sieve (Intermediate Mix)	± 6.0%
9.5 mm sieve (Surface Mix)	± 5.0%
4.75 mm sieve (Surface Mix)	± 5.0%
2.36 mm sieve (All Mixes)	± 5.0%
0.075 mm sieve (All Mixes)	± 2.0%
Asphalt Binder Content	± 0.5%
Maximum Specific Gravity (G_{mm})	± 0.020
Bulk Specific Gravity (G_{mb})	± 0.030
TSR	± 15.0%
QA retest of prepared QC Gyratory Compacted Volumetric Specimens	± 0.015
Retest of QC Core Sample	± 1.2% (% Compaction)
QA Verification Core Sample	± 2.0% (% Compaction)
Comparison of Density Gauge QC Test	± 2.0% (% Compaction)
QA Density Gauge Verification Test	± 2.0% (% Compaction)

1 The Engineer will immediately investigate the reason for differences if any of the
 2 following occur: QA test results of QC split sample does not meet above limits of
 3 precision, QA test results of QC split sample does not meet the individual test control
 4 limits or the specification requirements or QA verification sample test results exceed the
 5 allowable retesting tolerances.

6 If the potential for a pavement failure exist, the Engineer may suspend production,
 7 wholly or in part, in accordance with Article 108-7 while the investigation is in progress.
 8 The Engineer's investigation may include, but not be limited to: review and observation
 9 of the QC technician's sampling and testing procedures, evaluation and calibration of QC
 10 and QA testing equipment, comparison testing of other retained quality control samples,
 11 and/or comparison testing of additional density core samples.

12 The Engineer will periodically witness the sampling and testing being performed by the
 13 Contractor. If the Engineer observes that the sampling and QC tests are not being
 14 performed in accordance with the applicable test procedures, the Engineer may stop
 15 production until corrective action is taken. The Engineer will promptly notify the
 16 Contractor of observed deficiencies, both verbally and in writing. The Engineer will
 17 document all witnessed samples and tests.

18 609-10 ACCEPTANCE

19 Final acceptance of the asphalt pavement will be made by the Department in accordance with
 20 the following:

21 (A) Mix Acceptance

22 The Engineer will base final acceptance of the mix on the results of random testing made
 23 on split samples during the assurance process, verification samples, retests (if applicable)
 24 and validation of the Contractor's quality control process conducted in accordance with
 25 Specifications.

26 (B) Density Acceptance

27 The Department will evaluate the asphalt pavement for density compliance after the
 28 asphalt mix has been placed and compacted using the Contractor's quality control test
 29 results, the Department's quality assurance test results (including verification samples)

1 and by observation of the Contractor's total density quality control process conducted in
2 accordance with Specifications.

3 **609-11 MEASUREMENT AND PAYMENT**

4 Any mix produced that is not verified may be assessed a price reduction at the Engineer's
5 discretion in addition to any reduction in pay due to mix or density deficiencies.

6 Produce and construct all asphalt mixtures and pavements in accordance with these *Standard*
7 *Specifications*. There will be no direct payment for work covered by this Specification.
8 Payment at the contract unit prices for the various asphalt items will be full compensation for
9 all work covered by these specifications.

10 If the mix or pavement represented by the falsified results is removed and replaced, payment
11 will be made for the actual quantities of materials required to replace the falsified quantities,
12 not to exceed the original amounts.

13 **SECTION 610**

14 **ASPHALT CONCRETE PLANT MIX PAVEMENTS**

15 **610-1 DESCRIPTION**

16 Perform the work covered by this section including, but not limited to, the construction of one
17 or more courses of asphalt mixture placed on a prepared surface in accordance with these
18 Specifications and in reasonably close conformity with the lines, grades, thickness and typical
19 sections shown on the plans. This work includes producing, weighing, transporting, placing
20 and compacting the plant mix; furnishing aggregate, asphalt binder, anti-strip additive and all
21 other materials for the plant mix; furnishing and applying tack coat as specified; furnishing
22 scales; maintaining the course until final acceptance of the project; making any repairs or
23 corrections to the course that may become necessary; providing and conducting QC as
24 specified in Section 609; and surface testing of the completed pavement. The design
25 requirements for the various mix types are given in Section 610 for dense-graded mix types,
26 Section 650 for OGFC, Section 652 for PADC and Section 661 for UTBWC.

27 Perform all activities in accordance with the Department's *Asphalt Quality Management*
28 *System (QMS) Manual* in effect on the date of contract advertisement

29 Provide and conduct the QC and required testing for acceptance of the asphalt mixture in
30 accordance with Section 609.

31 Define "warm mix asphalt (WMA)" as additives or processes that allow a reduction in the
32 temperature at which asphalt mixtures are produced and placed. Use only WMA additives or
33 processes listed on the NCDOT APL maintained by the Materials and Tests Unit.

34 **610-2 MATERIALS**

35 Refer to Division 10.

Item	Section
Anti-Strip Additives	1020-8
Asphalt Binder, Performance Grade	1020-2
Coarse Aggregate	1012-1(B)
Fine Aggregate	1012-1(C)
Mineral Filler	1012-1(D)
Reclaimed Asphalt Pavement (RAP)	1012-1(F)
Reclaimed Asphalt Shingles (RAS)	1012-1(E)
Silicone	1020-9

Section 610

1 610-3 COMPOSITION OF MIXTURES (MIX DESIGN AND JOB MIX FORMULA)

2 (A) Mix Design-General

3 Prepare the asphalt mix design using a mixture of coarse and fine aggregate, asphalt
4 binder, mineral filler and other additives when required. Size, uniformly grade and
5 combine the several aggregate fractions in such proportions that the resulting mixture
6 meets the grading and physical requirements of the Specifications for the specified mix
7 type. Materials that will not produce a mixture within the design criteria required by the
8 Specifications will be rejected, unless otherwise approved.

9 At least 10 days before start of asphalt mix production, submit the mix design and
10 proposed JMF targets for each required mix type and combination of aggregates to the
11 Engineer for review and approval. Prepare the mix design using a Department certified
12 mix design technician in an approved mix design laboratory and in accordance with the
13 procedures outlined in Section 4.5 of the *Asphalt QMS Manual*.

14 For the final surface layer of the specified mix type, use a mix design with an aggregate
15 blend gradation above the maximum density line on the 2.36 mm and larger sieves.

16 The Contractor has the option to use a recycled plant mix in lieu of virgin plant mix.
17 However, all provisions of the Specifications for virgin mixes apply to recycled mixes.
18 This means that the same design criteria tests, test frequencies, and quality control
19 requirements will apply.

20 Reclaimed Asphalt Pavement (RAP) or Reclaimed Asphalt Shingles (RAS) may be
21 incorporated into asphalt plant mixes in accordance with Article 1012-1 and the
22 following applicable requirements. However, use of RAP materials is not allowed in
23 Open Graded Friction Course (OGFC) mixes or Ultra-Thin Bonded Wearing Course
24 (UBWC) mixes. Use of RAS materials is not allowed in Ultra-Thin Bonded Wearing
25 Course (UBWC) mixes.

26 RAS material may constitute up to 6% by weight of total mixture, except for Open
27 Graded Friction Course (OGFC) mixes, which are limited to 5% RAS by weight of total
28 mixture. Also, when the percentage of RAP is greater than 30% by weight of total
29 mixture, use Fractionated RAP (FRAP) meeting the requirements of Subarticle 1012-
30 1(F)(c).

31 When RAP, RAS, or a combination of both is used in asphalt mixtures, the recycled
32 binder replacement percentage (RBR%) shall not exceed the amounts specified in Table
33 610-4 for the mix type. For recycled mixtures, the virgin binder Performance Grade (PG)
34 grade to be used is specified in Table 610-5 for the mix type based on the recycled binder
35 replacement percentage (RBR%).

36 If the Contractor wishes to submit mix designs containing recycled material amounts
37 exceeding the specified maximums, additional testing will be required to verify the
38 Performance Grade (PG) of the reclaimed binder. Also, the Contractor has the option to
39 have additional testing performed to determine if the mix can be approved using a virgin
40 binder grade different than specified in Table 610-5. The Engineer will determine if the
41 binder grade is acceptable for use based on the test data submitted with the mix design. If
42 the mix design is acceptable, the Engineer will establish and approve the grade and
43 percentage of virgin asphalt binder to be used.

44 If a change in the source of RAP or RAS be made, a new mix design and JMF may be
45 required in accordance with Article 1012-1. Samples of the completed recycled mixture
46 may be taken by the Department on a random basis to determine the PG grading on the
47 recovered asphalt binder in accordance with AASHTO M 320. If the grading is
48 determined to be a value other than required for the specified mix type, the Engineer may
49 require the Contractor to adjust any combination of the grade, the percentage of

1 additional asphalt binder or the blend of reclaimed material to bring the grade to the
2 specified value.

3 (B) Mix Design Criteria

4 Design and produce asphalt concrete mixtures that conform to the gradation requirements
5 and design criteria in Table 610-2 and Table 610-3 for the mix type specified. The mix
6 type designates the nominal maximum aggregate size and the design traffic level.

7 Surface mix designs will be tested by the Department for rutting susceptibility. Rut depth
8 requirements for each surface mix type and traffic level are specified in Table 610-3.
9 Mix designs that fail to meet these requirements will be unacceptable and shall be
10 redesigned by the Contractor such that rut depths are acceptable.

11 Table 610-2 provides gradation control points to be adhered to in the development of the
12 design aggregate structure for each mix type. Aggregate gradations shall be equal to or
13 pass between the control points. Table 610-3 provides the mix design criteria for the
14 various mix types.

15 Use an anti-strip additive in all asphalt mixes. It may be hydrated lime or a chemical
16 additive or a combination of both as needed to meet the retained strength requirements as
17 specified in Table 610-3. When a chemical additive is used, add at a rate of not less than
18 0.25% by weight of binder in the mix, or as approved by the Engineer. When hydrated
19 lime is used, add at a rate of not less than 1.0% by weight of the total dry aggregate.

20 (C) Job Mix Formula (JMF)

21 Establish the JMF gradation target values within the design criteria specified for the
22 particular type of asphalt mixture to be produced. Establish the JMF asphalt binder
23 content at the percentage that will produce voids in total mix (VTM) at the midpoint of
24 the specification design range for VTM, unless otherwise approved. The formula for
25 each mixture will establish the following: blend percentage of each aggregate fraction,
26 the percentage of reclaimed aggregate, if applicable, a single percentage of combined
27 aggregate passing each required sieve size, the total percentage and grade of asphalt
28 binder required for the mixture (by weight of total mixture), the percentage and grade of
29 asphalt binder to be added to the mixture (for recycled mixtures), the percentage of
30 chemical anti-strip additive to be added to the asphalt binder or percentage of hydrated
31 lime to be added to the aggregate, the temperature at that the mixture is to be discharged
32 from the plant, the required field density and other volumetric properties.

33 When WMA is used, document the additive or process used and recommended rate on
34 the JMF submittal. Verify the JMF based on plant produced mixture from the trial batch.

35 The mixing temperature at the asphalt plant will be established on the JMF. The JMF
36 mix temperature shall be within the ranges shown in Table 610-1 unless otherwise
37 approved.

Binder Grade	JMF Temperature
PG 58-28; PG 64-22	250 - 290°F
PG 70-22	275 - 305°F
PG 76-22	300 - 325°F

38 When using RAP or RAS with a different binder than specified, use mixing temperatures
39 in Table 610-1 based on the original binder grade for that mix type shown in Table 610-3.

40 When RAS is used, the JMF mix temperature shall be established at 275°F or higher.

41 Have on hand at the asphalt plant the approved mix design and JMF issued by the
42 Department, before beginning the work.

Section 610

1 The JMF for each mixture will remain in effect until modified in writing, provided the
 2 results of QMS tests performed in accordance with Section 609 on material currently
 3 being produced conform with specification requirements. When a change in sources of
 4 aggregate materials is to be made, a new mix design and JMF will be required before the
 5 new mixture is produced. When a change in sources of RAP or RAS material is to be
 6 made, a new JMF is required and a new mix design may be required. When
 7 unsatisfactory results or other conditions make it necessary, the Engineer may revoke the
 8 existing JMF or establish a new JMF.

Standard Sieves (mm)	Mix Type (Nominal Max. Aggregate Size)							
	4.75 mm		9.5 mm ^A		19.0 mm		25.0 mm	
	Min	Max	Min	Max	Min	Max	Min	Max
50.0	-	-	-	-	-	-	-	-
37.5	-	-	-	-	-	-	100	-
25.0	-	-	-	-	100	-	90.0	100
19.0	-	-	-	-	90.0	100	-	90.0
12.5	100	-	100	-	-	90.0	-	-
9.50	95.0	100	90.0	100	-	-	-	-

2.36	-	-	32.0 ^B	67.0 ^B	23.0	49.0	19.0	45.0
1.18	30.0	60.0	-	-	-	-	-	-
0.075	6.0	12.0	4.0	8.0	3.0	8.0	3.0	7.0

- 9 **A.** For the final surface layer of the specified mix type, use a mix design with
 10 an aggregate blend gradation above the maximum density line on the 2.36 mm and
 11 larger sieves.
 12 **B.** For Type SF9.5A, the percent passing the 2.36 mm sieve shall be a minimum of 60%
 13 and a maximum of 70%.

Mix Type	Design ESALs ^A millions	Binder PG Grade ^B	Compaction Levels		Max. Rut Depth (mm)	Volumetric Properties

S9.5D, OGFC	PG 76-22 ^B	n/a	n/a

1 **A.** If the mix contains any amount of RAS, the virgin binder shall be PG 58-28.

2 **B.** Maximum Recycled Binder Replacement (%RBR) is 18% for mixes using PG 76-22
3 binder.

4 **610-4 WEATHER, TEMPERATURE AND SEASONAL LIMITATIONS FOR**
5 **PRODUCING AND PLACING ASPHALT MIXTURES**

6 Do not produce or place asphalt mixtures during rainy weather, when the subgrade or base
7 course is frozen or when the moisture on the surface to be paved would prevent proper bond.
8 Do not place asphalt material when the air or surface temperatures, measured at the location
9 of the paving operation away from artificial heat, do not meet Table 610-6.

10 Do not place surface course material that is to be the final layer of pavement between
11 December 15 and March 16 of the next year if it is 1 inch or greater in thickness, or between
12 November 15 and April 1 of the next year if it is less than 1 inch in thickness, unless
13 otherwise approved.

14 As an exception to the above, when in any day's operations the placement of a layer of asphalt
15 base course material or intermediate material 2 inches or greater in thickness has started, it
16 may continue until the temperature drops to 32°F.

17 Do not place plant mix base course that will not be covered with surface or intermediate
18 course during the same calendar year or within 15 days of placement if the plant mix is placed
19 in January or February. Failure by the Contractor to cover the plant mix as required above
20 will result in the Engineer notifying the Contractor in writing to cover the plant mix with a
21 sand seal. Apply the sand seal in accordance with Section 660, except that Articles 660-3 and
22 660-12 will not apply. In the event the Contractor fails to apply the sand seal within 72 hours
23 of receipt of such notice, the Engineer may proceed to have such work performed with
24 Department forces and equipment.

Section 610

Asphalt Concrete Mix Type	Minimum Surface and Air Temperature
B25.0B, C	35°F
I19.0B, C, D	35°F
SF9.5A, S9.5B	40°F ^A
S9.5C	45°F ^A
S9.5D	50°F

- 1 **A.** For the final layer of surface mixes containing RAS, the minimum surface and air
2 temperature shall be 50°F.

3 **610-5 ASPHALT MIXTURE PRODUCTION**

4 Use plants that are either of the batch mixing, continuous mixing or drum mixing type,
5 and so designed, equipped and operated that the weighing, proportioning and mixing of
6 the materials will result in a uniform and satisfactory asphalt mixture meeting these
7 Specifications. All plants shall conform to requirements of Sections 5 and 6 of the
8 *Asphalt QMS Manual*.

9 Before production of the mix, stockpile aggregates for a sufficient period of time to
10 facilitate the drainage of free moisture. Keep the different aggregate sizes separated until
11 they have been delivered to the cold feeders. Keep the separate stockpiles readily
12 accessible for sampling. When mineral filler is required in the mix, feed or weigh-in
13 separately from the other aggregates.

14 Introduce the asphalt binder and other additives, when required, into the mixture at the
15 amounts and percentages specified by the JMF. No working tolerance will be allowed.
16 Introduce the hot and dry aggregates, mineral filler, and recycled materials, in amounts
17 and at temperatures such that the mixture produced is within the production control limits
18 of Subarticle 609-6(D). Provide a positive means of controlling mixing time to obtain
19 complete and uniform coating of the aggregate particles and thorough distribution of the
20 asphalt binder throughout the aggregate. Produce the mixture at the asphalt plant within
21 ±25 °F of the JMF mix temperature. The temperature of the mixture, when discharged
22 from the mixer, shall not exceed 350°F.

23 All asphalt plants shall be certified by the Department. Certification is effective from the
24 date of issuance and is non-expiring subject to continued compliance. The Department
25 will check the plant on an annual basis or as deemed necessary by the Engineer. Any
26 plant that is relocated, modified or changes ownership shall be recertified before use.

27 Any completely automatically controlled asphalt plant that, due to the basic design of the
28 plant, does not meet all these Specifications for conventional batch mixing, continuous
29 mixing or drum mixing may be used on a project by project basis provided a uniformly
30 consistent mix meeting all mix requirements can be produced and the plant has been
31 approved in writing.

32 Any asphalt plant that cannot consistently produce a high quality mix meeting these
33 Specifications will be in non-compliance with these Specifications and may have its
34 certification revoked.

35 Upon a malfunction of required automatic equipment on a batch mixing plant, the plant
36 may continue to operate manually for the following 2 consecutive working days,
37 provided acceptable mixture is being produced.

38 When a malfunction of required automatic equipment on a drum mixer or continuous
39 plant occurs, manual operation of the plant will not be allowed except that if, in the
40 opinion of the Engineer, an emergency traffic condition exists, the plant may be allowed
41 to operate manually until the unsafe traffic condition is corrected. All mix produced by
42 manual operation will be subject to Section 609.

610-6 HOT MIX STORAGE SYSTEMS

When a storage system is used, provide a system capable of conveying the mix from the plant to the storage bin and storing the mix without a loss in temperature, segregation or oxidation of the mix. Limit storage time to the ability of the storage system to maintain the mix within the Specification requirements. Material may be stored in storage bins without an approved heating system for no more than 24 hours.

Provide a continuous type or skip bucket type conveyor system. Enclose continuous type conveyors so that the mix temperature is maintained within specification requirements.

Provide a system designed in such manner as to prevent segregation of the mix during discharge from the conveyor into the bins and equipped with discharge gates that will not cause segregation of the mix while loading the mix into trucks.

610-7 HAULING OF ASPHALT MIXTURE

Transport the mixture from the mixing plant to the point of use in vehicles that have tight, clean, smooth beds approved by the Department, that have been sprayed with an approved release agent material to prevent the mixture from adhering to the beds. Remove excess release agent before loading. Cover each load of mixture with a solid, waterproof tarp constructed of canvas, vinyl, or other suitable material. Provide a 3/8 inch to 5/8 inch diameter hole on each side of the vehicle body near the center of the body and above the bed of the vehicle for the purpose of inserting a thermometer.

Assure temperature of the mixture immediately before discharge from the hauling vehicle is within a tolerance of $\pm 25^{\circ}\text{F}$ of the specified JMF mix temperature.

610-8 SPREADING AND FINISHING

Apply tack coat in accordance with Section 605.

Mixtures produced simultaneously from different plant sources cannot be intermingled by hauling to the same paver on the roadway unless the mixtures are being produced from the same material sources and same JMF.

As referenced in Section 9.6.3 of the *Asphalt QMS Manual*, use the automatic screed controls on the paver to control the longitudinal profile. Where approved by the Engineer, the Contractor has the option to use either a fixed or mobile string line.

Perform this work in accordance with and using equipment meeting Section 9 of the *Asphalt QMS Manual*.

Use a material transfer vehicle (MTV) when placing all asphalt concrete plant mix pavements which require the use of asphalt binder grade PG 76-22 and for all types of OGFC, unless otherwise approved. Use a MTV for all surface mix regardless of binder grade placed on Interstate and US routes that have 4 or more lanes and median divided. Where required above, use the MTV when placing all full width travel lanes and collector lanes. Use MTV for all ramps, loops, Y-line travel lanes, full width acceleration lanes, full width deceleration lanes and full width turn lanes that are greater than 1,000 feet in length. Use a MTV meeting Section 9.5(E) of the *Asphalt QMS Manual*.

Place asphalt concrete base course material in trench sections with asphalt pavement spreaders made for the purpose or with other equipment approved by the Engineer.

Request the Engineer to waive the requirement for use of pavers for spreading and finishing where irregularities or obstacles make their use impractical. Spread, rake and lute the mixture by hand methods or other approved methods in these areas.

Operate the paver as continuously as possible. Pave intersections, auxiliary lanes and other irregular areas after the main line roadway has been paved, unless otherwise approved. Place a wedge course at locations ahead of the paving operation as required by the Engineer.

Section 610

1 Repair any damage caused by hauling equipment across structures at no additional cost to the
2 Department.

3 **610-9 COMPACTION**

4 Immediately after the asphalt mixture has been spread, struck off and surface and edge
5 irregularities adjusted, thoroughly and uniformly compact the pavement. Compact the mix to
6 the required degree of compaction for the type of mixture being placed.

7 Provide sufficient number and weight of rollers, except as noted, to compact the mixture to
8 the required density while it is still in a workable condition. Obtain approval of equipment
9 used in compaction from the Engineer before use. Where uniform density is not being
10 obtained throughout the depth of the layer of material being tested, change the type and/or
11 weight of the compaction equipment as necessary to achieve uniform density even though
12 such equipment has been previously approved.

13 Compact all final wearing surfaces, except OGFC, using a minimum of two steel-wheel
14 tandem rollers, unless otherwise approved. Pneumatic-tire rollers with two tandem axles and
15 smooth tread tires may be used for intermediate rolling.

16 Limit rolling for OGFC to one coverage with a tandem steel-wheel roller weighing a
17 maximum of 10 tons, with additional rolling limited to one coverage with the roller where
18 necessary to improve the riding surface.

19 Steel-wheel tandem vibratory rollers specifically designed for the compaction of asphalt
20 pavements may be used on all layers 1 inch or greater in thickness during the breakdown and
21 intermediate rolling phase. Do not operate vibratory rollers in the vibratory mode during the
22 finish rolling phase on any mix type or pavement course, OGFC or on PADC.

23 When vibratory rollers are used, use rollers that have variable amplitude and frequency
24 capabilities and that are designed specifically for asphalt pavement compaction. Provide
25 rollers equipped with controls that automatically disengage the vibration mechanism before
26 the roller stops when being used in the vibratory mode.

27 The Engineer may prohibit or restrict the use of vibratory rollers where damage to the
28 pavement being placed, the underlying pavement structure, drainage structures, utilities or
29 other facilities is likely to occur or is evident.

30 Do not use rolling equipment that results in excessive crushing of the aggregate or excessive
31 displacement of the mixture.

32 In areas inaccessible to standard rolling equipment, thoroughly compact the mixture by the
33 use of hand tampers, hand operated mechanical tampers, small rollers or other approved
34 methods.

35 Use rollers that are in good condition and capable of being reversed without backlash to
36 compact the mixture. Operate rollers with the drive wheels nearest the paver and at uniform
37 speeds slow enough to avoid displacement of the mixture. Equip steel-wheel rollers with
38 wetting devices that will prevent the mixture from sticking to the roller wheels.

39 Begin compaction of the material immediately after the material is spread and shaped to the
40 required width and depth. Carry out compaction in such a manner as to obtain uniform
41 density over the entire section. Perform compaction rolling at the maximum temperature at
42 which the mix will support the rollers without moving horizontally. Complete the compaction
43 (including both intermediate rolling) before the mixture cooling below a workable
44 temperature. Perform finish rolling to remove roller marks resulting from the compaction
45 rolling operations.

1 **610-10 DENSITY REQUIREMENTS**

TABLE 610-7 DENSITY REQUIREMENTS	
Mix Type	Minimum % G_{mm} (Maximum Specific Gravity)
S4.75A	85.0 ^A
SF9.5A	90.0
S9.5X, I19.0X, B25.0X	92.0

2 A. Compaction to the above specified density will be required when the S4.75A
3 mix is applied at a rate of 100 lbs/sy or higher.

4 Compact the asphalt plant mix to at least the minimum percentage of the maximum specific
5 gravity listed in Table 610-7, except as noted in Section 10.3.4 of the *Asphalt QMS Manual*.

6 Compaction with equipment other than conventional steel drum rollers may be necessary to
7 achieve adequate compaction. Occasional density sampling and testing to evaluate the
8 compaction process may be required. The Contractor shall maintain minimum test frequencies
9 as established. Should the Contractor's density testing frequency fail to meet the minimum
10 frequency as, all mix without required density test representation shall be considered
11 unsatisfactory and if allowed to remain in place, will be evaluated for acceptance in
12 accordance with Article 105-3.

13 **610-11 JOINTS**14 **(A) Transverse Joints**

15 When the placing of the mixture is to be suspended long enough to permit the mixture to
16 become chilled, construct a transverse joint.

17 If traffic will not pass over the end of the paving, a butt joint will be permitted, provided
18 proper compaction is achieved. If traffic will pass over the joint, construct a sloped
19 wedge ahead of the end of the full depth pavement to provide for proper compaction and
20 protection of the full depth pavement. Construct the joint square to the lane alignment
21 and discard all excess material. Place a paper parting strip beneath this wedge to
22 facilitate joint construction unless waived by the Engineer.

23 Before paving operations are resumed, remove the sloped wedge and cut back into the
24 previously constructed pavement to the point of full pavement depth. Coat the exposed
25 edge of the previously constructed pavement with tack coat.

26 When laying of the mixture is resumed at the joint, complete and then test the
27 construction of the joint in accordance with Article 610-12 while the mixture is still in
28 a workable condition.

29 **(B) Longitudinal Joints**

30 Tack the exposed edge of all longitudinal joints before placing the adjoining pavement.

31 Form longitudinal joints by allowing the paver to deposit the mixture adjacent to the joint
32 to such depth that maximum compaction can be obtained along the joint. Pinch the joint
33 by rolling immediately behind the paver.

34 When multi-lane multi-layer construction is required, offset the longitudinal joints in
35 each layer from that in the layer immediately below by approximately 6 inches.
36 Construct the joints in the final layer, where possible, between designated travel lanes of
37 the final traffic pattern.

Section 610

1 **610-12 SURFACE REQUIREMENTS AND ACCEPTANCE**

2 Construct pavements using quality-paving practices as detailed herein. Construct the
3 pavement surface smooth and true to the plan grade and cross slope. Immediately correct any
4 defective areas with satisfactory material compacted to conform with the surrounding area.

5 Pavement imperfections resulting from unsatisfactory workmanship such as segregation,
6 improper longitudinal joint placement or alignment, non-uniform edge alignment or excessive
7 pavement repairs will be unsatisfactory. Pavement imperfections will be evaluated for
8 acceptance in accordance with Article 105-3.

9 When directed due to unsatisfactory laydown or workmanship, operate under the limited
10 production procedures. Limited production for unsatisfactory laydown is defined as being
11 restricted to the production, placement, compaction and final surface testing (if applicable) of
12 a sufficient quantity of mix necessary to construct only 2,500 feet of pavement at the laydown
13 width.

14 Remain on limited production until such time as satisfactory laydown results are obtained or
15 until three consecutive 2,500 feet sections have been attempted without achieving satisfactory
16 laydown results. If the Contractor fails to achieve satisfactory laydown results after
17 three consecutive 2,500 feet sections have been attempted, cease production of that mix type
18 until such time as the cause of the unsatisfactory laydown results can be determined.
19 As an exception, the Engineer may grant approval to produce a different mix design of the
20 same mix type if the cause is related to mix problems rather than laydown procedures.

21 Mix placed under the limited production procedures for unsatisfactory laydown or
22 workmanship will be evaluated for acceptance in accordance with Article 105-3.

23 Each pavement layer will be tested by the Contractor and the Engineer using a 10 foot
24 stationary straightedge furnished by the Contractor. Any location on the pavement selected
25 by the Department shall be tested as well as all transverse joints. Apply the straightedge
26 parallel to the centerline of the surface. Do not exceed 1/8 inch variation of the surface being
27 tested from the edge of the straightedge between any two contact points. Correct areas found
28 to exceed this tolerance by removal of the defective work and replacement with new material,
29 unless other corrective measures are permitted. Provide the work and materials required in
30 the correction of defective work.

31 **610-13 FINAL SURFACE TESTING AND ACCEPTANCE**

32 On portions of this project where the typical section requires two or more layers of new
33 pavement, perform smoothness acceptance testing of the longitudinal profile of the finished
34 pavement surface using either an Inertial Profiler or a North Carolina Hearne Straightedge
35 (Model No. 1). Smoothness acceptance testing using the inertial profiler is not required on
36 ramps, loops and turn lanes.

37 Use an Inertial Profiler (Option 1) to perform smoothness acceptance testing of the
38 longitudinal profile of the finished pavement surface. Furnish an inertial profiler(s) necessary
39 to perform this work. Maintain responsibility for all costs related to the procurement,
40 handling, and maintenance of these devices.

41 Furnish and operate the Hearne straightedge (Option 2) to determine and record the
42 longitudinal profile of the pavement on a continuous graph.

43 Before beginning any paving operations, the Contractor shall select one of the above options
44 and submit documentation to the Engineer on the selected option for smoothness acceptance.

45 **(A) Option 1 - Inertial Profiler**

46 Use an Inertial Profiler to measure the longitudinal pavement profile for construction
47 quality control and smoothness acceptance. Use a profiler with line laser technology as
48 single-point laser technology will not be allowed. Produce International Roughness
49 Index (IRI) and Mean Roughness Index (MRI) values for measuring smoothness.

- 1 Use testing and recording software to produce electronic inertial road profiles in a format
2 compatible with the latest version of FHWA's ProVAL (Profile Viewing and Analysis)
3 software.
- 4 The Inertial Profiler shall be calibrated and verified in accordance with the most current
5 version of AASHTO M 328. Provide certification documentation that the profiler meets
6 AASHTO M 328 to the Engineer before the first day the Inertial Profiler is used on the
7 project.
- 8 Configure the profiler to record the actual elevation of the pavement surface. Do not use
9 the profiler's internal IRI calculation mode. The profile data shall be filtered with
10 a cutoff wavelength of 300 feet. The interval at which relative profile elevations are
11 reported shall be 2 inches.
- 12 Provide IRI data in accordance with most current version of ASTM E1926. Use
13 personnel trained to record and evaluate IRI data.
- 14 Provide a competent operator, trained in the operation of the Inertial Profiler Operation of
15 the Inertial Profiling system shall conform to AASHTO R 57.
- 16 Provide the user selected Inertial Profiler settings to the Engineer for the project records.
17 Certification of the Inertial Profiling system shall conform to AASHTO R 56.
- 18 Remove all objects and foreign material on the pavement surface prior to longitudinal
19 pavement profile testing.
- 20 Operate the profiler at any speed as per the manufacturer's recommendations to collect
21 valid data. Operate the Inertial Profiler in the direction of the final traffic pattern.
22 Collect IRI data from both wheel paths during the same run. Define a "wheel path" as
23 the 3 feet from the edge of the travel lane. MRI values are the average of the IRI values
24 from both wheel paths. When using an inertial profiler that collects a single trace per
25 pass, take care to ensure that the measurements from each trace in a travel lane start and
26 stop at the same longitudinal locations. Unless otherwise specified, multiple runs are not
27 necessary for data collection.
- 28 Operate the automatic triggering method at all times unless impractical. A tape stripe or
29 traffic cone wrapped with reflective material may be used to alert the profiler's automatic
30 triggering sensor to begin data collection. The profiler shall reach the intended operating
31 speed before entering the test section. The runup and runout distances should be
32 sufficient to obtain the intended operating speed and to slow down after testing is
33 completed.
- 34 Divide the pavement surface for the project into sections which represent a continuous
35 placement (i.e. the start of the project to bridge, intersection to intersection). Terminate
36 a section 50 feet before a bridge approach, railroad track, or similar interruption.
37 (Separate into 0.10-mile sections).
- 38 The evaluation of the profiles will be performed on a section basis. A section is
39 0.10 mile of a single pavement lane. For any section, which is less than 0.10 mile in
40 length, the applicable pay adjustment incentive will be prorated on the basis of the actual
41 length.
- 42 Mark the limits of structures and other special areas to be excluded from testing using the
43 profiler's event identifier such that the exact locations can be extracted from the profile
44 data file during processing.
- 45 Unless otherwise authorized by the Engineer, perform all smoothness testing in the
46 presence of the Engineer. Perform smoothness tests on the finished surface of the
47 completed project or at the completion of a major stage of construction as approved by
48 the Engineer. Coordinate with and receive authorization from the Engineer before starting
49 smoothness testing. Perform smoothness tests within 7 days after receiving authorization.

Section 610

1 Any testing performed without the Engineer’s presence, unless otherwise authorized, may
2 be ordered retested at the Contractor’s expense.

3 After testing, transfer the profile data from the profiler portable computer’s hard drive to
4 a write once storage media (Flash drive, USB, DVD-R or CD-R) or electronic media
5 approved by the Engineer. Label the disk or electronic media with the Project number,
6 Route, file number, date, and termini of the profile data. Submit the electronic data on
7 the approved media to the Engineer immediately after testing and this media will not be
8 returned to the Contractor.

9 Submit a report with the documentation and electronic data of the evaluation for each
10 section to the Engineer within 10 days after completion of the smoothness testing. The
11 report shall be in the tabular format for each 0.10 segment or apportion thereof with a
12 summary of the MRI values and the localized roughness areas including corresponding
13 project station numbers or acceptable reference points. Calculate the pay adjustments for
14 all segments in accordance with the formulas in Sections (1) and (2) shown below. The
15 Engineer shall review and approve all pay adjustments unless corrective action is
16 required. Submit the electronic files compatible with ProVAL and the evaluation in
17 tabular form with each 0.10 mile segment occupying a row. Include each row with the
18 beginning and ending station for the section, the length of the section, the original IRI
19 values from each wheel path, and the MRI value for the section. Each continuous run for
20 a section will occupy a separate table and each table will have a header that includes the
21 following: the project contract number, county, the roadway number or designation, a
22 lane designation, the JMF used for the final lift, the dates of the smoothness runs, and the
23 beginning and ending station of the continuous run. Summarize each table at the bottom.

24 Traffic control and all associated activities included in the pavement smoothness testing
25 of the pavement surface will be the responsibility of the Contractor.

26 (1) Acceptance for New Construction

27 IRI and MRI numbers recorded in inches per mile will be established for each
28 0.10 mile section for each travel lane of the surface course designated by the
29 contract. Areas excluded from testing by the profiler will be tested using
30 a 10 foot straightedge in accordance with Article 610-12.

31 Table 610-7 provides the acceptance quality rating scale of pavement based on the
32 final rideability determination.

TABLE 610-8	
MRI PRICE ADJUSTMENT PER 0.10-MILE SECTION	
MRI after Completion (Inches Per Mile)	Price Adjustment Per Lane (0.10-Mile Section)
45.0 and Under	\$200.00
45.1-55.0	PA = 600 – (10 * MRI)
55.1-70.0	Acceptable (No Pay Adjustment)
70.1-90.0	PA = 650 – (10 * MRI)
Over 90.1	Corrective Action Required

33 This price adjustment will apply to each 0.10-mile section or prorated for a portion
34 thereof, based on the Mean Roughness Index (MRI), the average IRI values from
35 both wheel paths.

36 When corrections to the pavement surface are required, the Engineer shall approve
37 the Contractor’s method of correction. Methods of correction shall be milling and
38 inlay, remove and replace or other methods approved by the Engineer. To produce
39 a uniform cross section, the Engineer may require correction to the adjoining traffic
40 lanes or shoulders. Corrections to the pavement surface, the adjoining traffic lanes
41 and shoulders will be at no cost to the Department.

1 Where corrections are made after the initial smoothness testing, the pavement will be
 2 retested by the Contractor to verify that corrections have produced the acceptable
 3 ride surface. No incentives will be provided for sections on which corrective actions
 4 have been required. The Contractor will have one opportunity to perform corrective
 5 action(s).

6 (2) Localized Roughness

7 Areas of localized roughness shall be identified through the “Smoothness Assurance
 8 Module (SAM)” provided in the ProVAL software. Use the SAM report to optimize
 9 repair strategies by analyzing the measurements from profiles collected using inertial
 10 profilers. The ride quality threshold for localized roughness shall be 165 inches per
 11 mile for any sections that are 15 feet to 100 feet in length at the continuous short
 12 interval of 25 feet. Submit a continuous roughness report to identify each section
 13 with project station numbers or reference points outside the threshold and identify all
 14 localized roughness, with the signature of the Operator included with the submitted
 15 IRI trace and electronic files.

16 The Department will require that corrective action be taken regardless of final IRI.
 17 Re-profile the corrected area to ensure that the corrective action was successful.
 18 If the corrective action is not successful, the Department will assess a penalty or
 19 require additional corrective action.

$$\text{PA} = (165 - \text{LR\#}) 5$$

Where:

$$\begin{aligned} \text{PA} &= \text{Pay Adjustment (dollars)} \\ \text{LR\#} &= \text{The Localized Roughness number determined from SAM report for the ride quality threshold} \end{aligned}$$

20 Corrective work for localized roughness shall be approved by the Engineer before
 21 performing the work and shall consist of either replacing the area by milling and
 22 inlaying or other methods approved by the Engineer. Any corrective action
 23 performed shall not reduce the integrity or durability of the pavement that is to
 24 remain in place. Milling and inlay or any corrective actions shall meet the
 25 specifications requirements for ride quality over the entire length of the correction.
 26 Notify the Engineer five days before commencement of the corrective action.

27 Localized roughness correction work shall be for the entire traffic lane width.
 28 Pavement cross slope shall be maintained through corrective areas.

29 **(B) Option 2 - North Carolina Hearne Straightedge**

30 Push the straightedge manually over the pavement at a speed not exceeding 2 miles per
 31 hour. For all lanes, take profiles in the right wheel path approximately 3 feet from the
 32 right edge of pavement in the same direction as the paving operation, unless otherwise
 33 approved due to traffic control or safety considerations. As an exception, lanes adjacent
 34 to curb and gutter, expressway gutter, or shoulder berm gutter may be tested in the left
 35 wheel path. Make one pass of the straightedge in each full width travel lane. The full
 36 lane width should be comparable in ride quality to the area evaluated with the Hearne
 37 Straightedge. If deviations exist at other locations across the lane width, use a 10 foot
 38 non-mobile straightedge or the Hearne Straightedge to evaluate which areas may require
 39 corrective action. Take profiles as soon as practical after the pavement has been rolled
 40 and compacted, but no later than 24 hours following placement of the pavement, unless
 41 otherwise authorized by the Engineer. Take profiles over the entire length of final
 42 surface travel lane pavement exclusive of Y-line travel lanes less than or equal to
 43 1,000 feet in length, ramps less than or equal to 1,000 feet in length, turn lanes less than
 44 or equal to 1,000 feet in length, structures, approach slabs, paved shoulders, loops and
 45 tapers or other irregular shaped areas of pavement, unless otherwise approved by the
 46 Engineer. Test in accordance with this provision all mainline travel lanes, full width

Section 610

1 acceleration or deceleration lanes, Y-line travel lanes greater than 1,000 feet in length,
2 ramps, full width turn lanes greater than 1,000 feet in length and collector lanes.

3 At the beginning and end of each day's testing operations, and at such other times as
4 determined by the Engineer, operate the straightedge over a calibration strip so that the
5 Engineer can verify correct operation of the straightedge. The calibration strip shall be
6 a 100 foot section of pavement that is reasonably level and smooth. Submit each day's
7 calibration graphs with that day's test section graphs to the Engineer. Calibrate the
8 straightedge in accordance with the current NCDOT procedure titled *North Carolina*
9 *Hearne Straightedge - Calibration and Determination of Cumulative Straightedge Index*.
10 Copies of this procedure may be obtained from the Department's Pavement Section in the
11 Construction Unit.

12 Plot the straightedge graph at a horizontal scale of approximately 25 feet per inch with
13 the vertical scale plotted at a true scale. Record station numbers and references (bridges,
14 approach slabs, culverts, etc.) on the graphs. Distances between references/stations shall
15 not exceed 100 feet. Have the operator record the Date, Project No., Lane Location,
16 Wheel Path Location, Type Mix and Operator's Name on the graph.

17 Upon completion of each day's testing, evaluate the graph, calculate the Cumulative
18 Straightedge Index (CSI) and determine which lots, if any, require corrective action.
19 Document the evaluation of each lot on a QA/QC-7 form. Submit the graphs along with
20 the completed QA/QC-7 forms to the Engineer, within 24 hours after profiles are
21 completed, for verification of the results. The Engineer will furnish results of their
22 acceptance evaluation to the Contractor within 48 hours of receiving the graphs. In the
23 event of discrepancies, the Engineer's evaluation of the graphs will prevail for acceptance
24 purposes. The Engineer will retain all graphs and forms.

25 Use blanking bands of 0.2 inch, 0.3 inch and 0.4 inch to evaluate the graph for
26 acceptance. The 0.2 inch and 0.3 inch blanking bands are used to determine the
27 Straightedge Index (SEI), which is a number that indicates the deviations that exceed
28 each of the 0.2 inch and 0.3 inch bands within a 100 foot test section. The Cumulative
29 Straightedge Index (CSI) is a number representing the total of the SEIs for one lot, which
30 consist of not more than 25 consecutive test sections. In addition, the 0.4 inch blanking
31 band is used to further evaluate deviations on an individual basis. The CSI will be
32 determined by the Engineer in accordance with the current procedure titled *North*
33 *Carolina Hearne Straightedge - Calibration and Determination of Cumulative*
34 *Straightedge Index*.

35 The pavement will be accepted for surface smoothness on a lot by lot basis. A test
36 section represents pavement one travel lane wide not more than 100 feet in length. A lot
37 will consist of 25 consecutive test sections, except that separate lots will be established
38 for each travel lane, unless otherwise approved by the Engineer. In addition, full width
39 acceleration or deceleration lanes, ramps, turn lanes and collector lanes will be evaluated
40 as separate lots. For any lot that is less than 2,500 feet in length, the applicable pay
41 adjustment incentive will be prorated on the basis of the actual lot length. For any lot
42 which is less than 2,500 feet in length, the applicable pay adjustment disincentive will be
43 the full amount for a lot, regardless of the lot length.

44 If during the evaluation of the graphs, five lots require corrective action, then proceed on
45 limited production for unsatisfactory laydown in accordance with Article 610-12.
46 Proceeding on limited production is based upon the Contractor's initial evaluation of the
47 straightedge test results and shall begin immediately upon obtaining those results.
48 Additionally, the Engineer may direct the Contractor to proceed on limited production in
49 accordance with Article 610-12 due to unsatisfactory laydown or workmanship.

1 Limited production for unsatisfactory laydown is defined as being restricted to the
2 production, placement, compaction and final surface testing of a sufficient quantity of
3 mix necessary to construct only 2,500 feet of pavement at the laydown width. Once this
4 lot is complete, the final surface testing graphs will be evaluated jointly by the Contractor
5 and the Engineer. Remain on limited production until such time as acceptable laydown
6 results are obtained or until three consecutive 2,500 foot sections have been attempted
7 without achieving acceptable laydown results. The Engineer will determine if normal
8 production may resume based upon the CSI for the limited production lot and any
9 adjustments to the equipment, placement methods, and/or personnel performing the work.
10 Once on limited production, the Engineer may require the Contractor to evaluate the
11 smoothness of the previous asphalt layer and take appropriate action to reduce and/or
12 eliminate corrective measures on the final surface course. Additionally, the Contractor
13 may be required to demonstrate acceptable laydown techniques off the project limits
14 before proceeding on the project.

15 If the Contractor fails to achieve satisfactory laydown results after three consecutive
16 2,500 foot sections have been attempted, cease production of that mix type until such
17 time as the cause of the unsatisfactory laydown results can be determined.

18 As an exception, the Engineer may grant approval to produce a different mix design of
19 the same mix type if the cause is related to mix problem(s) rather than laydown
20 procedures. If production of a new mix design is allowed, proceed under the limited
21 production procedures detailed above.

22 After initially proceeding under limited production, the Contractor shall immediately
23 notify the Engineer if any additional lot on the project requires corrective action. The
24 Engineer will determine if limited production procedures are warranted for continued
25 production.

26 If the Contractor does not operate by the limited production procedures as specified
27 above, the 5 lots, which require corrective action, will be considered unacceptable and
28 may be subject to removal and replacement. Mix placed under the limited production
29 procedures for unsatisfactory laydown will be evaluated for acceptance in accordance
30 with Article 105-3.

31 The pay adjustment schedule for the Cumulative Straightedge Index (CSI) test results per
32 lot is in Table 610-8.

Section 610

TABLE 610-9				
PAY ADJUSTMENT SCHEDULE FOR CUMULATIVE STRAIGHTEDGE INDEX				
(Obtained by adding SE Index of up to 25 consecutive 100 ft test sections)				
CSI^A	Acceptance Category	Corrective Action	Pay Adjustment Before Corrective	Pay Adjustment After Corrective Action
0-0	Acceptable	None	\$300 Incentive	None
1-0 or 2-0	Acceptable	None	\$100 Incentive	None
3-0 or 4-0	Acceptable	None	No Adjustment	No Adjustment
1-1, 2-1, 5-0 or 6-0	Acceptable	Allowed	\$300 Disincentive	\$300 Disincentive
3-1, 4-1, 5-1 or 6-1	Acceptable	Allowed	\$600 Disincentive	\$600 Disincentive
Any other Number	Unacceptable	Required	Per CSI after Correction(s) (not to exceed 100% Pay)	

- 1 **A.** Either Before or After Corrective Actions
- 2 Correct any deviation that exceeds a 0.4 inch blanking band such that the deviation is
- 3 reduced to 0.3 inch or less.
- 4 Corrective actions shall be performed at the Contractor's expense and shall be presented
- 5 for evaluation and approval by the Engineer prior to proceeding. Any corrective action
- 6 performed shall not reduce the integrity or durability of the pavement that is to remain in
- 7 place. Corrective action for deviation repair may consist of overlaying, removing and
- 8 replacing, indirect heating and rerolling. Scraping of the pavement with any blade type
- 9 device will not be allowed as a corrective action. Provide overlays of the same type mix,
- 10 full roadway width, and to the length and depth established by the Engineer. Tapering of
- 11 the longitudinal edges of the overlay will not be allowed.
- 12 Corrective actions will not be allowed for lots having a CSI of 4-0 or better. If the CSI
- 13 indicates Allowed corrective action, the Contractor may elect to take necessary measures
- 14 to reduce the CSI instead of accepting the disincentive. Take corrective actions as
- 15 specified if the CSI indicates required corrective action. The CSI after corrective action
- 16 shall meet or exceed Acceptable requirements.
- 17 Where corrective action is allowed or required, the test section(s) requiring corrective
- 18 action will be retested, unless the Engineer directs the retesting of the of the entire lot.
- 19 No disincentive will apply after corrective action if the CSI is 4-0 or better. If the
- 20 retested lot after corrective action has a CSI indicating a disincentive, the appropriate
- 21 disincentive will be applied.
- 22 Test sections and/or lots that are initially tested by the Contractor that indicate excessive
- 23 deviations such that either a disincentive or corrective action is necessary, may be
- 24 re-rolled with asphalt rollers while the mix is still warm and in a workable condition, to
- 25 possibly correct the problem. In this instance, reevaluation of the test section(s) shall be
- 26 completed within 24 hours of pavement placement and these test results will serve as the
- 27 initial test results.
- 28 Incentive pay adjustments will be based only on the initially measured CSI, as
- 29 determined by the Engineer, before any corrective work. Where corrective actions have
- 30 been taken, payment will be based on the CSI determined after correction, not to exceed
- 31 100% payment.

1 Areas excluded from testing by the N.C. Hearne Straightedge will be tested by using
 2 a non-mobile 10-foot straightedge. Assure that the variation of the surface from the
 3 testing edge of the straightedge between any 2 contact points with the surface is not more
 4 than 1/8 inch. Correct deviations exceeding the allowable tolerance in accordance with
 5 the corrective actions specified above, unless the Engineer permits other corrective
 6 actions.

7 Furnish the North Carolina Hearne Straightedge(s) necessary to perform this work.
 8 Maintain responsibility for all costs relating to the procurement, handling, and
 9 maintenance of these devices. The Department has entered into a license agreement with
 10 a manufacturer to fabricate, sell and distribute the N.C. Hearne Straightedge. The
 11 Department's Pavement Construction Section may be contacted for the name of the
 12 current manufacturer and the approximate price of the straightedge.

13 **610-14 DENSITY ACCEPTANCE**

14 The Department will evaluate the asphalt pavement for density acceptance after the asphalt
 15 mix has been placed and compacted using the Contractor's QC test results, the Department's
 16 QA test results (including verification samples) and by observation of the Contractor's density
 17 QC process conducted in accordance with Section 610 of the *Asphalt QMS Manual*.
 18 Minimum density requirements for all mixes will be as specified in Table 610-7. Density
 19 acceptance will be as provided in Section 10 of the *Asphalt QMS Manual*.

20 A failing lot for density acceptance purposes is defined as a lot for which the average of all
 21 test sections, and portions thereof, fails to meet the minimum specification requirement. If
 22 additional density sampling and testing, beyond the minimum requirement, is performed and
 23 additional test sections are thereby created, then all test results shall be included in the lot
 24 average. In addition, any lot or portion of a lot that is obviously unacceptable will be rejected
 25 for use in the work.

26 If the Engineer determines that a given lot of mix that falls in the New category does not meet
 27 the minimum specification requirements but the work is reasonably acceptable, the lot will be
 28 accepted at a reduced pay factor in accordance with the following formula. The reduced pay
 29 factor will apply only to the mix unit price.

$$\text{Reduced Pay Factor} = 100 + \left[\left(\frac{\text{Actual Density} - \text{Specified Density}}{2} \right) \times 30 \right]$$

Where:

Actual Density = the lot average density, not to exceed 2.0% of the specified density

Specified Density = the density in Table 610-6 or as specified in the contract

30 All failing lots in the Other category will be evaluated for acceptance in accordance with
 31 Article 105-3.

32 Any density lot not meeting minimum density requirements detailed in Table 610-6 will be
 33 evaluated for acceptance in accordance with Article 105-3. If the lot is determined not to be
 34 acceptable, the mix will be removed and replaced with mix meeting and compacted to the
 35 requirement of these *Standard Specifications*.

36 **610-15 MAINTENANCE**

37 Maintain the plant mix pavement in an acceptable condition until final acceptance of the
 38 project. Immediately repair any defects or damage that may occur. Perform maintenance to
 39 damaged or defective pavement and repeat as often as may be necessary to keep the base or
 40 pavement in an acceptable condition.

Section 620

1 **610-16 MEASUREMENT AND PAYMENT**

2 *Hot Mix Asphalt Pavement* will be paid at the contract unit price per ton that will be the actual
3 number of tons of each type of hot mix asphalt pavement incorporated into the completed and
4 accepted work in accordance with Article 106-7.

5 No direct payment will be made for providing and using the materials transfer vehicle or any
6 associated equipment, as the cost of providing same will be included in the contract unit bid
7 price per ton for the mix type to be placed.

8 Any reduction in pay due to failing density will be in addition to any reduction in pay due to
9 failing mix property test results on the same mix.

10 A high frequency of asphalt plant mix or density deficiencies may result in future deficient
11 asphalt being excluded from acceptance at an adjusted contract unit price in accordance with
12 Article 105-3. This acceptance process will apply to all asphalt produced or placed and will
13 continue until the Engineer determines a history of quality asphalt production and placement
14 is reestablished.

15 Furnishing asphalt binder will be paid as provided in Article 620-4 for *Asphalt Binder for*
16 *Plant Mix* for each grade required.

17 Provide the work and materials required in the correction of defective work or sand seal base
18 course as required at no cost to the Department. If the Engineer has such work performed
19 with Department forces and equipment, the cost of such work performed by Department
20 forces will be deducted from monies due or to become due to the Contractor.

21 No direct payment will be made for final surface testing covered by this section. Payment at
22 the contract unit prices for the various items covered by those sections of the *Standard*
23 *Specifications* directly applicable to the work constructed will be full compensation for all
24 work covered by Article 610-13 including, but not limited to, performing testing in
25 accordance with this Specification, any corrective work required as a result of this testing and
26 any additional traffic control as may be necessary.

27 Payment will be made under:

Pay Item	Pay Unit
Asphalt Concrete Base Course, Type B25.0B	Ton
Asphalt Concrete Base Course, Type B25.0C	Ton
Asphalt Concrete Intermediate Course, Type I19.0B	Ton
Asphalt Concrete Intermediate Course, Type I19.0C	Ton
Asphalt Concrete Intermediate Course, Type I19.0D	Ton
Asphalt Concrete Surface Course, Type S4.75A	Ton
Asphalt Concrete Surface Course, Type SF9.5A	Ton
Asphalt Concrete Surface Course, Type S9.5B	Ton
Asphalt Concrete Surface Course, Type S9.5C	Ton
Asphalt Concrete Surface Course, Type S9.5D	Ton

28 **SECTION 620**
29 **ASPHALT BINDER FOR PLANT MIX**

30 **620-1 DESCRIPTION**

31 Perform the work covered by this section including, but not limited to, furnishing of asphalt
32 binder, with anti-strip additive when required, at an asphalt plant and incorporating the asphalt
33 binder and anti-strip additive into the asphalt plant mix.

1 **620-2 MATERIALS**

2 Refer to Division 10.

Item	Section
Anti-strip Additives	1020-8
Asphalt Binder, All Grades	1020-2
Silicone	1020-9

3 The asphalt binder for the mixture will be accepted at the source subject to Article 1020-1.

4 Use additives from the NCDOT APL. Submit a sample and manufacturer's data to the
5 Engineer for approval before use, if proposing to use a brand not on the NCDOT APL.6 **620-3 GENERAL REQUIREMENTS**7 The requirements of Section 610 that pertain to handling of asphalt binder will be applicable
8 to the work covered by this section.9 Add silicone to all asphalt binder used in surface courses and open-graded asphalt friction
10 course, unless otherwise directed. The amount of silicone added will range from one ounce
11 per 2,000 gal of asphalt binder to one ounce per 2,500 gal. Add silicone to the asphalt binder
12 at the plant site unless added at the source and it is so noted on the delivery ticket.13 Do not heat the asphalt binder to a temperature in excess of the supplier's recommendation
14 while stored or when being used in production of mix at the asphalt plant.15 Introduce the actual quantity of asphalt binder at the established percentage shown on the
16 applicable JMF into the mix by the plant weighing or metering system. No working tolerance
17 for asphalt binder percentage will be allowed during production.18 When required, incorporate an anti-strip additive. It may be either chemical additive mixed
19 with the asphalt binder or hydrated lime added to the aggregate or a combination of both.
20 Furnish the brand name of the type (lime or chemical), supplier and shipping point of
21 anti-strip additive. Note on the asphalt binder delivery ticket the rate (or quantity), brand of
22 chemical additive when added at the supplier's terminal. Introduce and mix chemical anti-
23 strip additive into the asphalt binder at either the supplier's terminal or at the asphalt plant site
24 at the dosage required by the JMF. Use in-line blending equipment at either location. When
25 added at the asphalt plant, use equipment that meets Sections 5 and 6 of the *Asphalt QMS*
26 *Manual*. When added at the supplier's terminal, use equipment that in-line blends with a
27 constant flow of the additive for a minimum of 80% of the asphalt binder loading time. When
28 hydrated lime is used, use equipment to introduce the lime that meets Sections 5 and 6 of the
29 *Asphalt QMS Manual*. Thoroughly mix chemical anti-strip additive and asphalt binder
30 together before incorporating into the asphalt plant mix.31 **620-4 MEASUREMENT AND PAYMENT**32 *Asphalt Binder for Plant Mix* and *Polymer Modified Asphalt Binder for Plant Mix* will be
33 measured and paid as the theoretical number of tons required by the applicable JMF based on
34 the actual number of tons of plant mix completed and accepted on the job.

35 Such price and payment will be full compensation for all work covered by this section.

36 There will be no direct payment for anti-strip additive. Payment at the contract unit prices for
37 the various asphalt plant mix items will be full compensation for the work.38 Adjustments will be made to the payments due the Contractor for each grade of asphalt binder
39 when it has been determined that the monthly average terminal F.O.B. Selling Price of asphalt
40 binder, Grade PG 64-22, has fluctuated from the Base Price Index for Asphalt Binder
41 included in the contract. The methods for calculating a base price index, for calculating the
42 monthly average terminal F.O.B. selling price and for determining the terminals used are in
43 accordance with procedures on file with the Construction Unit.

Section 650

1 When it is determined that the monthly selling price of asphalt binder on the first business day
2 of the calendar month during which the last day of the partial payment period occurs varies
3 either upward or downward from the base price index, the contract unit price for asphalt
4 binder for plant mix will be adjusted. The adjusted contract unit price will be determined by
5 adding the difference between the selling price and the base price index to the contract unit
6 bid price for asphalt binder.

7 The adjusted contract unit price will then be applied to the theoretical quantity of asphalt
8 binder authorized for use in the plant mix placed during the partial payment period involved,
9 except that where recycled plant mix is used, the adjusted unit price will be applied only to
10 the theoretical number of tons of additional asphalt binder materials required by the JMF.

11 Adjusted contract unit prices for all grades of asphalt binder, including additional asphalt
12 binder materials in recycled mixtures, will be based on the average selling price and base
13 price index for asphalt binder, Grade PG 64-22, regardless of the actual grade required by
14 the JMF.

15 In determining the adjusted contract unit price for any material specified in this section the
16 following formula will be used:

$$A = B + (D - C)$$

Where:

A = Adjusted Contract Unit Price

B = Contract Unit Price

C = Base Price Index

D = Monthly Average Terminal F.O.B. Selling Price

17 In the event the Department is unable to secure an F.O.B. selling price from at least
18 4 terminals in a given month, payment will be at the contract unit price for each ton of asphalt
19 binder used in the work during that month.

20 Payment will be made under:

Pay Item	Pay Unit
Asphalt Binder for Plant Mix	Ton
Polymer Modified Asphalt Binder for Plant Mix	Ton

SECTION 650

OPEN-GRADED ASPHALT FRICTION COURSE

650-1 DESCRIPTION

24 Perform the work covered by this section including, but not limited to, construction of a plant
25 mixed open-graded asphalt friction course (OGFC) properly laid upon a prepared surface in
26 accordance with these Specifications and in conformity with the lines, grades, thickness and
27 typical sections shown on the plans; producing, weighing, transporting, placing and rolling the
28 plant mix as specified in Section 610; furnishing the asphalt binder, anti-strip additive, fiber
29 stabilizing additive and all other materials for the plant mix; furnishing and applying tack coat
30 as specified; providing QC as specified in Section 609 as modified for OGFC; surface testing
31 of the completed pavement; furnishing scales; making any repairs or corrections to the friction
32 course that may become necessary and maintaining the friction course until final acceptance
33 of the project.

1 **650-2 MATERIALS**

2 Refer to Division 10.

Item	Section
Anti-strip Additives	1020-8
Asphalt Binder, Performance Grade	1020-2
Coarse Aggregate	1012-1(B)
Fiber Stabilizing Additives	1020-10
Fine Aggregate	1012-1(C)
Mineral Filler	1012-1(D)
Reclaimed Asphalt Shingles (RAS)	1012-1(E)

3 **650-3 COMPOSITION OF MIXTURE (MIX DESIGN AND JOB MIX FORMULA)**4 **(A) General**

5 Design the open-graded asphalt friction course using a mixture of coarse and fine
6 aggregate, asphalt binder, mineral filler, fiber stabilizing additive and other additives as
7 required to produce a mix meeting Table 650-1.

8 At least 20 days before start of asphalt mix production, submit the mix design and
9 proposed JMF targets for each required mix type and combination of aggregates to the
10 Engineer for review and approval. The mix design shall be prepared by a mix design
11 technician approved by the Department in an approved mix design laboratory. Prepare
12 the mix design in accordance with Article 610-3 and the Department's mix design
13 procedures. Copies of these procedures can be obtained through the Materials and Tests
14 Unit.

15 The mix design and JMF target values will be established within the mix design criteria
16 specified in Table 650-1 for the particular type of mixture to be produced.

17 **(B) Mix Design Criteria**

18 Design open-graded asphalt friction course (OGFC) mixtures conforming to the gradation
19 requirements and other mix design criteria in Table 650-1 for the mix type specified.

20 Use the asphalt binder grade shown in Table 650-1 for the mix type specified. RAS may
21 be used in accordance with Subarticle 610-3(A).

22 Use an anti-strip additive in all OGFC mixes. It may be hydrated lime or a chemical
23 additive or both. Add chemical anti-strip additive at a rate of 0.5% by weight of asphalt
24 binder. Add hydrated lime at a rate of 1.0% by weight of dry aggregate. Use
25 an approved source and grade. Add the anti-strip additive to the asphalt binder in
26 accordance with Article 620-3.

27 If needed to prevent asphalt draindown, incorporate a fiber stabilizing additive into all
28 OGFC types. Add the fiber at a dosage rate by weight of the total mix as approved.

29 In addition to the required mix design submittal, the Contractor shall prepare and deliver
30 gyratory compactor specimens to the Department's Central Asphalt Laboratory for
31 Cantabro durability testing. The Contractor shall prepare these specimens using lab
32 produced mix in accordance with NCDOT procedures. Provide the samples at least
33 20 days before the anticipated beginning placement of OGFC mixture.

Section 650

**TABLE 650-1
OGFC DESIGN CRITERIA**

Grading Requirements	Total Percent Passing
<i>Sieve Size (mm)</i>	<i>Type FC-1 Modified</i>
19.0	-
12.5	100
9.50	75 - 100
4.75	25 - 45
2.36	5 - 15
0.075	1.0 - 3.0
Asphalt Binder Grade	PG 76-22
Binder Content, %	5.5 - 8.0
Mixing Temperature at the Asphalt Plant ^A	300 – 325°F
Air Voids, % minimum	18.0
Cantabro Loss, % maximum	20.0
Draindown, % maximum	0.3

- 1 **A.** The JMF mix temperature shall be within the ranges shown unless otherwise
2 approved.

3 **650-4 PLANT EQUIPMENT**

4 Use plant equipment in accordance with Article 610-5 and the requirements herein.

5 When fiber stabilizing additives are used as an ingredient of the mixture, use a separate feed
6 system capable of accurately proportioning the required quantity into the mixture and in such
7 a manner that uniform distribution will be obtained. Interlock the proportioning device with
8 the aggregate feed or weigh system so as to maintain the correct proportions for all rates of
9 production and batch sizes. Accurately control the proportion of fibers to within $\pm 10\%$ of the
10 amount required. Provide flow indicators or sensing devices for the fiber system that are
11 interlocked with plant controls such that mixture production will be interrupted if introduction
12 of the fiber fails.

13 When a batch type plant is used, add the fiber to the aggregate in the weigh hopper or as
14 approved. Increase the batch dry mixing time by 8 to 12 seconds, or as directed, to assure the
15 fibers are uniformly distributed before the injection of asphalt binder into the mixer.

16 When a continuous mix or dryer-drum type plant is used, add the fiber to the aggregate and
17 uniformly disperse at the point of injection of asphalt binder. Add the fiber in such a manner
18 that it will not become entrained in the exhaust system of the drier or plant.

19 **650-5 CONSTRUCTION METHODS**

20 Produce, transport to the site and place the OGFC in accordance with Section 610, except as
21 otherwise provided below.

22 Do not place OGFC between October 31 and April 1 of the next year, unless otherwise
23 approved. The minimum air and road surface temperature for placing Type FC-1 Modified
24 mix will be 60°F.

25 Before starting production of the mix, stockpile all aggregates for a sufficient period of time
26 to facilitate the drainage of free moisture.

27 Clean the existing surface in an acceptable manner before placement of any asphalt material.

28 Remove all existing raised pavement markers as directed and repair any damaged areas
29 caused by the removal. Use an approved dense graded mixture of similar type material for the
30 repair.

- 1 Apply tack coat in accordance with Section 605 and the following:
- 2 (A) Use Asphalt Binder, Grade PG 64-22 tack coat material or as approved.
- 3 (B) Uniformly apply the tack coat material at a rate of application 0.06 to 0.08 gal/sy, as
4 directed.
- 5 Spread and finish the friction course as specified in Article 610-8. Roll the friction course
6 as specified in Article 610-9.
- 7 Perform this work in accordance with and using equipment meeting Section 9.5 of the *Asphalt*
8 *QMS Manual*.
- 9 Use a Material Transfer Vehicle (MTV) when placing all types of OGFC. Use a MTV
10 meeting Section 9.5(E) of the *Asphalt QMS Manual*.
- 11 Remove and replace any part of the finished friction course that shows non-uniform
12 distribution of asphalt binder, aggregate or fiber at no additional cost to the Department.
- 13 Coordinate plant production, transportation and paving operations such that uniform
14 continuity of operation is maintained. If spreading operations are interrupted, the Engineer
15 may require that a transverse joint be constructed any time the mixture immediately behind
16 the paver screed cools to less than 250 °F.
- 17 For end of project joints, provide a transition area consisting of one load of mixture per lane,
18 or as directed. Taper the mixture in thickness from 3/8 inch at the end of the project to the
19 typical thickness (approximately 3/4 inch) within the maximum distance of spread for one
20 load of mixture. For ramps and gore areas, taper the mixture in thickness from that at the
21 edge of the mainline, approximately 3/4 inch to 3/8 inch at the point of the ramp transverse
22 joint. Construct the ramp transverse joint at a point specified by the plans or as directed.

23 **650-6 QUALITY MANAGEMENT SYSTEM**

- 24 Produce the OGFC in accordance with Section 609, with the following exceptions.
- 25 Sample and test the completed mixture from each mix design per plant per year at the
26 following minimum frequency during mix production:

<u>Accumulative Production Increment</u>	<u>Number of Samples per Increment</u>
500 tons	1

- 27 Record the following data on the standardized control charts and in accordance with the
28 requirements of Section 7.4 of the *Asphalt QMS Manual*:
- 29 (a) Aggregate Gradation Test Results:
- 30 1. 2.36 mm
- 31 2. 0.075 mm Sieves
- 32 (b) Binder Content, %, P_b

33 **650-7 MEASUREMENT AND PAYMENT**

- 34 *Open-Graded Asphalt Friction Course, Type FC-1 Modified* will be measured and paid as the
35 actual number of tons of friction course incorporated into the completed and accepted work.
36 The friction course will be measured by being weighed in trucks on certified platform scales
37 or other certified weighing devices.
- 38 Furnishing asphalt binder for the mix will be paid as provided in Article 620-4 for *Asphalt*
39 *Binder for Plant Mix*. Adjustments in contract unit price due to asphalt binder price
40 fluctuation will be made in accordance with Section 620.
- 41 No direct payment will be made for providing and using the materials transfer vehicle or any
42 associated equipment, as the cost of providing same shall be included in the contract unit bid
43 price per ton for the mix type to be placed.

- 1 The mixing temperature at the asphalt plant will be established on the JMF. The JMF
 2 mix temperature shall be within the ranges shown in Table 652-1 unless otherwise
 3 approved.

TABLE 652-1		
PERMEABLE ASPHALT DRAINAGE COURSE		
GRADATION AND MIX DESIGN CRITERIA		
Sieve Size (mm)	Total Percent Passing	
	Type P-78M	Type P-57
37.5	-	100
25.0	-	95 - 100
19.0	100	-
12.5	95 - 100	25 - 60
9.50	75 - 100	-
4.75	20 - 45	10 - 20
2.36	3 - 15	5 - 10
0.075	1.0 - 3.0	1.0 - 3.0
Asphalt Binder Content, %	2.5 - 3.5	2.0 - 3.0
Mixing Temperature at Plant	240 - 270°F	260 - 290°F

4 **652-4 CONSTRUCTION METHODS**

- 5 Produce, transport to the site and place the asphalt plant mix in accordance with Section 610,
 6 except as otherwise provided herein.
- 7 Incorporate the asphalt binder into the asphalt plant mix in accordance with Section 620. Add
 8 the anti-strip additive to the asphalt binder in accordance with Article 620-3.
- 9 A prime coat or tack coat will not be required.
- 10 When the PADC is placed in trench sections, the rolling equipment and rolling sequences
 11 required by Article 610-9 will not apply.
- 12 Following placement of the PADC mixture to the appropriate line, grade and thickness, begin
 13 rolling when the mat has cooled sufficiently to support the weight of an 8 to 12 ton steel-
 14 wheel tandem roller. Mat temperature at the time of initial rolling shall be approximately
 15 175°F to 225°F. The maximum number of roller passes shall be three. Consolidate the
 16 drainage layer sufficiently with rolling so as to support the weight of equipment that will
 17 place the next layer of pavement. Do not compact the drainage layer to the extent that it is not
 18 free draining or that the aggregate is crushed. Density acceptance testing is not required for
 19 this layer.
- 20 No construction traffic will be allowed to travel on any PADC layer. Only equipment
 21 necessary to place the next layer of pavement will be allowed on the drainage layer.
- 22 Do not place PADC that will not be covered with the next layer of pavement during the same
 23 calendar year or within 15 days of placement if the PADC is placed in January or February.

Section 654

1 **652-5 QUALITY MANAGEMENT SYSTEM FOR ASPHALT PAVEMENTS**

2 Produce the PADC in accordance with the Section 609, with the following exceptions.

3 Sample and test the completed mixture from each mix design per plant per year at the
4 following minimum frequency during mix production:

<u>Accumulative Production Increment</u>	<u>Number of Samples per Increment</u>
500 tons	1

5 Record the following data on the standardized control charts and in accordance with the
6 requirements of Section 7.4 of the *Asphalt QMS Manual*:

- 7 (a) Aggregate Gradation Test Results:
 - 8 1. 12.5 mm (Type P-57 Only)
 - 9 2. 9.5 mm (Excluding Type P-57)
 - 10 3. 4.75 mm
 - 11 4. 2.36 mm
 - 12 5. 0.075 mm Sieves

- 13 (b) Binder Content, %, P_b

14 **652-6 MEASUREMENT AND PAYMENT**

15 *Permeable Asphalt Drainage Course, Type _____* will be paid as the actual number of tons of
16 drainage course incorporated into the completed and accepted work. The drainage course will
17 be measured by being weighed in trucks on certified platform scales or other certified
18 weighing devices.

19 *Asphalt Binder for Plant Mix* will paid in accordance with Article 620-4.

20 Payment will be made under:

Pay Item	Pay Unit
Permeable Asphalt Drainage Course, Type P-78M	Ton
Permeable Asphalt Drainage Course, Type P-57	Ton

21 **SECTION 654**

22 **ASPHALT PLANT MIX, PAVEMENT REPAIR**

23 **654-1 DESCRIPTION**

24 Perform the work covered by this section including, but not limited to, repairing of existing
25 pavement with asphalt plant mix in order to provide a safe, passable and convenient condition
26 for traffic, or to replace pavement removed in order to remove or to place pipe lines.

27 Perform the work by cutting the existing pavement to a neat vertical joint and uniform line;
28 removing and disposing of pavement, base and subgrade material as approved or directed;
29 coating the area to be repaired with a tack coat; furnishing, placing and compacting asphalt
30 plant mix; and replacing of the removed material with asphalt plant mix.

31 Make the repairs in accordance with the plans, or as approved or directed.

32 **654-2 MATERIALS**

33 Where a pavement repair detail is not shown in the plans, use an approved asphalt plant mix.

34 Where a pavement repair detail is shown in the plans, the type of plant mix shall be in
35 accordance with the pavement repair detail except where the Specifications permit the
36 substitution of another type of plant mix or where approved.

1 In areas where the existing pavement is not to be resurfaced, the Contractor will not be
 2 allowed to substitute a different type of surface course from that shown on the pavement
 3 repair detail.

4 **654-3 CONSTRUCTION METHODS**

5 **(A) General**

6 Perform repair of existing pavement as approved or directed. Coordinate the work with
 7 all other work and operations necessary to maintain traffic.

8 **(B) Pipe Removal or Installation**

9 Where traffic is to be maintained, perform the removal or installation of pipe in sections
 10 so that half the width of the roadway will be available to traffic. Immediately upon
 11 completion of the entire pipeline removal or installation, repair the pavement.

12 **654-4 MEASUREMENT AND PAYMENT**

13 *Asphalt Plant Mix, Pavement Repair* will be paid as the actual number of tons of asphalt plant
 14 mix, complete in place, used to make completed and accepted repairs, except for those repairs
 15 made necessary by the contractor's negligence. The asphalt plant mixed material will be
 16 measured by being weighed in trucks on certified platform scales or other certified weighing
 17 devices.

18 Any requirements included in the contract that provide for adjustments in compensation due
 19 to variations in the price of asphalt cement will not be applicable to payment for the work
 20 covered by this section.

21 Payment will be made under:

Pay Item	Pay Unit
Asphalt Plant Mix, Pavement Repair	Ton

22 **SECTION 657** 23 **SEALING EXISTING PAVEMENT CRACKS AND JOINTS**

24 **657-1 DESCRIPTION**

25 The work consists of sealing existing longitudinal and transverse pavement cracks and joints
 26 with hot applied joint sealer at locations as directed by the Engineer. The Contractor will not
 27 be required to seal the existing edge joints.

28

29 **657-2 MATERIALS**

30 Refer to Division 10.

Item	Section
Hot Applied Joint Sealer	1028-2

31 **657-3 CONSTRUCTION METHODS**

32 Install the sealant so that it forms a complete watertight bond with a high degree of elasticity,
 33 with maximum flexibility and longevity under extreme temperature ranges.

34 Clean cracks and joints using a hot compressed air lance to blast out any vegetation, dirt,
 35 dampness and loose materials from the cracks and joints. Equip the air compressor with
 36 suitable traps and filters to remove moisture and oil from the compressed air. Use the hot air
 37 lance to dry and warm the adjacent pavement immediately before sealing. Direct flame dryers
 38 are not allowed.

Section 660

1 Heat and apply the sealant material according to the manufacturer’s recommendations. Use
2 a portable melting kettle for heating the material that is equipped with indirect heating
3 (air-jacketed flow) and is capable of constantly agitating the joint sealer to maintain a uniform
4 temperature. Equip the kettle with either mechanically operated paddles and/or a continuous
5 circulating pump to maintain agitation. Use heating equipment capable of controlling the
6 sealant material temperature within the manufacturer’s recommended temperature range and
7 that is thermostatically-control calibrated between 200°F to 600°F. Locate a thermometer on
8 the kettle so the Engineer can safely check the temperature of the sealant material.
9 Overheating of the sealant material will not be permitted.

10 Apply sealant in the prepared cracks and joints within the manufacturer’s recommended
11 temperature range, using a pressure screed shoe to completely fill the crack or joint, leaving
12 a sealed 2 inch overband. Excessive overbanding or waste of sealant materials will not be
13 tolerated. Immediately squeegee the crack seal material to minimize the height of the
14 overband. All sealed cracks and joints shall have a minimum of 1/8 inch depth of sealant
15 installed.

16 Do not apply the hot applied joint sealer when the surface temperature of the pavement is
17 below 32°F. Follow manufacturer’s recommendations.

18 After the crack or joint has been sealed, promptly remove any surplus sealer on the pavement.
19 Do not permit traffic over the sealed cracks and joints without approval by the Engineer.
20 When approved by the Engineer, place sand or other approved material over the crack or joint
21 to prevent tracking.

22 **657-4 MEASUREMENT AND PAYMENT**

23 Sealing existing pavement cracks and joints will be measured and paid as the actual number
24 of pounds of material that has satisfactorily been used to seal pavement cracks and joints in
25 the designated highway. Any material spilled, used in excessive overbanding, wasted,
26 misapplied or unsatisfactorily used in any way will be deducted in determining quantities for
27 payment. The Engineer will determine the quantity, if any, to be deducted. The Engineer's
28 decision on the quantity to be deducted will be final and binding.

29 Payment will be made under:

Pay Item	Pay Unit
Sealing Existing Pavement Cracks and Joints	Pound

30 **SECTION 660**
31 **ASPHALT SURFACE TREATMENT**

32 **660-1 DESCRIPTION**

33 Perform the work covered by this section including, but not limited to, furnishing, hauling,
34 spreading and rolling the emulsion and aggregate consisting of one or more applications of
35 liquid asphalt material and one or more applications of aggregate cover coat material on a
36 prepared surface; and maintaining and repairing the asphalt surface treatment (AST).

37 **660-2 MATERIALS**

38 Refer to Division 10.

Item	Section
Aggregates for Asphalt Surface Treatment	1012-2
Emulsified Asphalt, Grade CRS-2L	1020-3
Emulsified Asphalt, Grade CRS-2P	1020-3
Fine Aggregate	1014-1
Mineral Filler	1012-1(D)
Water	1024-4

1 Before any asphalt surface treatment is placed, obtain from the asphalt supplier and furnish to
2 the Engineer a Certification of Compatibility of the emulsion with the aggregate proposed for
3 use.

4 **660-3 WEATHER AND SEASONAL LIMITATIONS**

5 Do not place any asphalt surface treatment between October 15 and April 1, except for asphalt
6 surface treatment that is to be overlaid immediately with asphalt plant mix.

7 Apply AST only when the surface to be treated is dry and when the air or surface
8 temperatures, measured at the location of the AST operation away from artificial heat, is 50°F
9 and rising. Do not place AST when air temperature is 98°F and rising.

10 When placing AST that is to be immediately overlaid with asphalt plant mix, the seasonal and
11 temperature limitations of Article 610-4 shall apply.

12 Do not apply asphalt material when the weather is foggy or rainy.

13 **660-4 SURFACE PREPARATION**

14 Clean the surface to be treated of dust, dirt, clay, grass, and any other deleterious matter
15 before application of the AST.

16 **660-5 ACCEPTANCE OF ASPHALT MATERIALS**

17 The acceptance of asphalt materials will be in accordance with Article 1020-1.

18 **660-6 APPLICATION EQUIPMENT**

19 Use asphalt application equipment that meets Article 600-5.

20 Apply aggregate by the use of a self-propelled, pneumatic-tire aggregate spreader capable of
21 maintaining a specified rate with a uniform application for the width of asphalt material being
22 covered. Tailgate spreaders will not be permitted. Areas that are inaccessible to the aggregate
23 spreader shall be covered by hand spreading or other acceptable methods.

24 **660-7 AGGREGATE TYPE AND APPLICATION RATES**

25 Contractor shall provide aggregate types and rates as specified in the contract.

26 **660-8 CONSTRUCTION METHODS**

27 For any type of AST work, demonstrate that all equipment has been calibrated in the presence
28 of the Engineer with a minimum 100 foot test section. If approved by the Engineer, test
29 section may be incorporated into the production section. If the test section is not feasible,
30 submit a calibration plan to the Engineer with detailed information on equipment and a
31 designated area for calibration.

32 **(A) Asphalt Seal Coat**

33 Use the type of seal coat as required by the contract. Seal coat aggregates shall be
34 drained of free moisture and have an amount passing the #200 sieve no greater than 1.5%
35 in accordance with Table 1005-1 before use. Place the seal coat in full-lane widths.

36 Adjust the aggregate rates to provide a sufficient quantity of cover material to be spread
37 over the surface of the seal coat preventing traffic damage, where it is necessary to permit
38 traffic on sections of a completed seal coat.

39 Perform rolling of each layer immediately after the aggregate has been uniformly spread.
40 Rolling will consist of at least three complete coverages with one pneumatic-tire roller
41 followed by at least one complete coverage with a 5 to 8 ton steel-wheel roller. All roller
42 coverages shall be completed within 5 minutes of the asphalt emulsion being placed. Do
43 not allow crushing of the aggregate or picking up of the material by the rollers.

Section 660

1 The use of a combination steel-wheel and pneumatic-tire roller will be permitted instead
2 of the 5 to 8 ton steel-wheel roller.

3 After the aggregate is thoroughly seated, broom all excess aggregate off of the surface of
4 the seal coat after 3 calendar days but no more than 7 calendar days. If necessary, use a
5 vacuum truck as directed by the Engineer. Traffic may be permitted on the seal coat
6 immediately after the rolling is complete.

7 Clean driveways, ditches, turn lanes, and areas adjacent to the AST construction of
8 excess aggregate, excess emulsion run off, over spray or debris from construction.

9 Blotting sand may be required as directed by the Engineer and shall be applied in
10 accordance with Section 818.

11 The construction of the various types of seal coats will be in accordance with the
12 following additional requirements:

13 (1) Single Seal

14 Apply emulsion to the existing surface followed immediately by an application of
15 aggregate as specified in the contract. Uniformly spread the full required amount of
16 aggregate in one application and correct all non-uniform areas before rolling.

17 Immediately after the aggregate has been uniformly spread, perform rolling as
18 previously described.

19 (2) Double Seal

20 Apply emulsion to the existing surface followed immediately by an application of
21 aggregate as specified in the contract ensuring each is uniformly placed over the
22 existing surface and rolled as previously described.

23 Immediately after the first application of seal aggregate has been made uniform and
24 rolled, apply the second application of the required amount of emulsion and seal coat
25 aggregate and roll as previously described.

26 (3) Triple Seal

27 Follow the procedure outlined in Subarticle 660-8(A)(2) and apply emulsion and
28 aggregate as a third layer and roll as previously described.

29 (4) Sand Seal

30 Place the fully required amount of asphalt material in one application and
31 immediately cover with the seal coat aggregate. Uniformly spread the fully required
32 amount of aggregate in one application and correct all non-uniform areas before
33 rolling.

34 Immediately after the aggregate has been uniformly spread, perform rolling.

35 Broom excess aggregate material from the surface of the seal coat.

36 When the sand seal is to be constructed for temporary sealing purposes only and will
37 not be used by traffic, use other grades of asphalt material meeting the requirements
38 of Articles 1020-5 and 1020-6.

39 (B) Asphalt Mat and Seal

40 Construct the mat coat in accordance with Subarticle 660-8(A) using the size aggregate
41 required by the contract.

42 Construct the seal coat in accordance with Subarticle 660-8(C) using the type seal
43 required by the contract.

(C) Asphalt Mat Coat for Soil Subgrade

The surface on which the mat coat is to be applied shall be approved by the Engineer before the mat coat emulsion is applied.

Place a string line guide for application equipment. Place the mat coat in full-lane widths.

Existing surface shall be damp prior to placement of the mat coat.

Immediately follow the application of emulsion with the spreading of the aggregate. No more than 5 minutes can elapse from the time the emulsion is applied and the rolling is completed when using CRS-2L or CRS-2P.

Mat coat aggregate shall be drained of free moisture and have an amount passing the #200 sieve no greater than 1.5% in accordance with Table 1005-1 before use. Spread the aggregate uniformly at the required rate and correct all non-uniform areas before rolling.

Roll immediately after the aggregate is uniformly spread. Rolling consists of at least three complete coverages with two 5 to 10 ton steel-wheel rollers. Continue rolling until the aggregate is thoroughly keyed into the emulsion. Do not allow crushing of the aggregate or picking up of the material by the rollers. A combination steel-wheel and pneumatic-tire roller will not be permitted. Use two individual steel-wheel rollers. The three coverages shall be completed within 5 minutes of the spraying of the emulsion.

At the discretion of the Engineer, at the beginning of each emulsion application, spread a paper over the end of the previously completed mat coat and begin the asphalt application on the paper. After application, remove and dispose of the paper.

After the aggregate is thoroughly seated, traffic may be permitted on the mat coat after the rolling is complete. No brooming shall be performed on the mat coat.

Correct defects or damage to the mat coat before the application of seal coat or plant mix overlay. The seal coat or plant mix may be applied the same day the mat coat is placed provided the mat coat has been satisfactorily applied and rolled.

(D) Asphalt Mat Coat for Pavement Surfaces

For mat coats with an asphalt overlay, construct the mat coat in accordance with Subarticle 660-8(C). The same grade of emulsion used for the mat coat may be used for the tack coat of the asphalt overlay.

For mat coats constructed on existing pavement surfaces, construct the mat coat in accordance with Subarticle 660-8(C) using the size aggregate required by the contract and the application rates specified in the contract.

660-9 TEMPORARY TRAFFIC CONTROL (TTC)

All AST operations shall be conducted in daylight hours.

Provide temporary traffic control for the asphalt surface treatment operations in accordance with the contract and in accordance with the provision RWZ-1 TEMPORARY TRAFFIC CONTROL (TTC) found elsewhere in the proposal except the following sections do not apply:

TRAFFIC OPERATIONS, Drop-Off Requirements and Time Limitations

TRAFFIC OPERATIONS, Project Requirements

Install advance/general warning work zone signs according to the Detail Drawing titled *Signing for Asphalt Surface Treatment* provided in the plans.

660-10 WARRANTY

The AST shall be warranted by the project payment and performance bonds for a period of 12 months.

Section 660

1 **(A) Warranty Period**

2 The Department will conduct an inspection of the work and provide written
3 acceptance in accordance with Article 105-17. Written acceptance of the work will
4 constitute the start date for the 12 month AST warranty period.

5 **(B) Situations Affecting the Warranty**

6 During the warranty period, the Contractor will not be held responsible for distresses
7 that are caused by factors not related to materials and workmanship. These include,
8 but are not limited to, chemical and fuel spills, vehicle fires, base failures, and snow
9 plows. Other factors considered to be beyond the control of the Contractor, which
10 may contribute to pavement distress, will be considered by the Engineer on a case by
11 case basis upon receipt of a written request from the Contractor. Maintaining traffic
12 on the pavement surface prior to the Engineer's acceptance will not be a condition
13 for voiding the warranty.

14 **(C) Emergency Repairs**

15 If, in the opinion of the Department, a pavement condition covered by the warranty
16 requires immediate attention for the safety of the traveling public, the Contractor will
17 be notified immediately. If the Contractor cannot perform the work in a timely
18 manner, the Department may directly perform or have the corrective work performed
19 by another entity at the Contractor's expense. Any emergency work performed will
20 not alter the requirements, responsibilities, or obligations of the warranty.

21 **(D) Warranty Performance Criteria**

TABLE 660-1 PERFORMANCE CRITERIA		
Surface Defects	Severity	Extent (Per Lot)
Surface Patterns	Alternate lean and heavy lines streaking over the entire pavement surface.	Greater than 20% of a lot affected; distress spotted evenly over the lot or over localized areas within the lot.
Bleeding/ Flushing	Distinctive appearance (with excess asphalt binder already free).	Greater than 20% of the wheel tracks within a lot affected.
Loss of Cover Aggregate	Large patches of cover aggregate lost from the pavement surface.	Greater than 20% of a lot affected; distress spotted evenly over the lot or over localized areas within the lot.

22 *Lot* – A 1,000 foot section of pavement or portion thereof, a lane width wide, on
23 which AST is constructed on a single map.

24 The beginning point of the first lot will be the beginning point of each day's
25 operation or the beginning of a map, whichever is applicable.

26 The Department will review the AST and advise the Contractor of any required
27 corrective work in writing prior to expiration of the warranty period.

28 The Department will approve all materials and methods used in warranty work.

29 The Department will determine if warranty work performed by the Contractor meets
30 the contract and provide written acceptance of the warranty work when complete.

1 The Chief Engineer will review any disputes for corrective work covered under the
2 warranty.

3 **660-11 MAINTENANCE**

4 Maintain the asphalt surface treatment in an acceptable condition until final acceptance of the
5 project.

6 **660-12 MEASUREMENT AND PAYMENT**

7 *Asphalt Surface Treatment: Single Seal, Double Seal, Triple Seal, Mat and Single Seal, Mat*
8 *and Double Seal, Sand Seal, and Mat Coat, No. ___Stone.* All AST will be measured and
9 paid at the contract unit price per square yard. Payment at the above prices will be made for
10 replacing any satisfactorily completed AST when such replacement has been made necessary
11 by defects in subgrade or base constructed by others.

12 *Emulsion for Asphalt Surface Treatment* will be measured by the actual surface area of
13 application and the specified application rate (gallon/sy) and paid at the contract unit price per
14 gallon, which price will be full compensation for all materials including modifiers and
15 additives, tack coat, labor, tools, equipment, and all other incidentals necessary to complete
16 the work.

17 *Vacuum truck* will be measured and paid on a weekly basis for each week or any portion
18 thereof that the Engineer directs the use of a vacuum truck.

19 Price adjustments herein shall apply concurrently; however, price adjustment will not apply in
20 the event the material is rejected.

21 Furnishing and applying prime will be paid as provided in Article 600-9 for *Prime Coat*.

22 If included in the contract, furnishing and applying blotting sand will be paid as provided in
23 Article 818-4 for *Blotting Sand*.

24 **Adjustment for *Emulsion for AST* will be paid per the following formula:**

25
$$A = B + ((D - C) / 235) 0.65$$

26 Where:

27 A = Adjusted Contract Unit Price of *Emulsion for AST* per gallon

28 B = Contract Unit Price of *Emulsion for AST* per gallon

29 C = Base Price Index of PG 64-22 per ton

30 D = Monthly Average Terminal F.O.B. Selling Price for PG 64-22 per ton

31 See Price Adjustment – Asphalt Binder Special Provision found elsewhere in this proposal for
32 the base price index of PG 64-22 per ton.

33 Payment will be made under:

Section 661

**SECTION 661
ULTRA-THIN BONDED WEARING COURSE**

661-1 DESCRIPTION

Produce and place an Ultra-thin Bonded Wearing Course (UBWC), including an application of a warm Polymer-Modified Emulsion Membrane (PMEM) followed immediately with an UBWC hot mix asphalt overlay. Spray PMEM immediately before applying hot mix asphalt.

The Contractor may elect to use an alternate method for the placement of the UBWC. As an alternate to spraying PMEM prior to placement of the asphalt mix with a spray paver, the Contractor may use a non-tracking hot-applied polymer asphalt tack coat material prior to placement of the asphalt mix. If the alternate method is selected, submit documentation and proposed plan to the Engineer prior to beginning any work.

Provide and conduct the QC and required testing for acceptance of the UBWC in accordance with the contract.

661-2 MATERIALS

Refer to Division 10.

Item	Section
Anti-strip Additives	1020-8
Coarse Aggregate	1012-1(B)
Fine Aggregate	1012-1(C)
Mineral Filler	1012-1(D)
Polymer Modified Asphalt Binder	1020-2
Polymer-Modified Emulsion Membrane (PMEM)	1020-4

Use either PG 70-28 or PG 76-22 binder conforming to Section 620 in the asphalt mix design. Ensure that the asphalt binder is compatible with the PMEM (or alternate) and the existing pavement.

Use an approved non-tracking hot applied polymer asphalt tack coat found on NCDOT's APL for *Non-Tracking Asphalt Tack Coat*.

661-3 COMPOSITION OF MIX

Do not use crystalline limestone, crystalline-dolomitic limestone or marble for aggregates and do not use reclaimed asphalt pavement (RAP). Use a mixture of coarse and fine aggregate, asphalt binder, mineral filler and other additives when required. Size, uniformly grade and combine in such proportions such that the resulting mixture meets the gradation and physical requirements of Tables 661-1 and 661-2.

At least 20 days before start of asphalt mix production, submit the mix design and proposed JMF targets for each required mix type and combination of aggregates to the Engineer for review and approval. Establish the JMF target values within the mix design criteria specified in Table 661-2 for the particular type mixture.

Determine and certify compatibility of all asphalt emulsion, asphalt binder and aggregate components.

**TABLE 661-1
UBWC GRADATION CRITERIA**

Sieves (mm)	% Passing by Weight
12.5	100
9.50	85 - 100
4.75	28 - 44
2.36	17 - 34
1.18	13 - 23
0.600	8 - 18
0.300	6 - 13
0.150	4 - 10
0.075	3.0 - 7.0

**TABLE 661-2
UBWC MIX DESIGN CRITERIA**

Property	Requirement
Asphalt Content, %	5.0 (minimum)
Draindown Test, AASHTO T 305	0.1% max
Moisture Sensitivity, AASHTO T 283 ^A	85% min
Application Rate, lb/sy	70 lb/sy
Approximate Application Depth, in.	5/8"
Asphalt PG Grade, AASHTO M 320	PG 70-28 or PG 76-22

- 1 **A.** Specimens for AASHTO T 283 testing are to be compacted using the gyratory
2 compactor. The mixtures shall be compacted using 100 gyrations to achieve
3 specimens approximately 95 mm in height. Use mixture and compaction
4 temperatures recommended by the binder supplier.

5 **661-4 CONSTRUCTION METHODS**

6 **(A) Equipment**

7 Use asphalt mixing plants in accordance with Article 610-5. Furnish paving machine
8 with the following capabilities:

- 9 (1) Self-priming paving machine capable of spraying the PMEM, applying the hot
10 asphalt concrete overlay and screeding the surface of the mat to the required profile
11 and cross section in one pass at any rate between 30 and 92 feet per minute.
- 12 (2) Receiving hopper, feed conveyor, storage tank for PMEM material, PMEM emulsion
13 single variable-width spray bar and a variable width, heated, vibratory-tamping bar
14 screed.
- 15 (3) Screed with the ability to be crowned at the center both positively and negatively and
16 have vertically and horizontally adjustable extensions to accommodate the desired
17 pavement profile and widths.
- 18 (4) Sprayer system capable of accurately and continuously monitoring the rate of spray
19 and providing a uniform application across the entire width to be overlaid.
- 20 (5) Use pavers equipped with an electronic screed control that will automatically control
21 the longitudinal profile and cross slope of the pavement. Control the longitudinal
22 profile through the use of either a mobile grade reference(s), including mechanical,
23 sonic and laser grade sensing and averaging devices, an erected string line(s) when
24 specified, joint matching shoe(s), slope control devices or the approved methods or
25 combination of methods. Unless otherwise specified, use a mobile grade reference
26 system capable of averaging the existing grade or pavement profile over
27 at least a 30 feet distance or by non-contacting laser or sonar type ski with
28 at least four referencing stations mounted on the paver at a minimum length of 24

Section 661

1 feet. Establish the position of the reference system such that the average profile
2 grade is established at the approximate midpoint of the system. The transverse cross
3 slope shall be controlled as directed by the Engineer.

4 Use an erected fixed stringline for both and longitudinal profile and cross slope control
5 when required by the contract. When an erected fixed string line is required, furnish and
6 erect the necessary guide line for the equipment. Support the stringline with grade stakes
7 placed at maximum intervals of 25 feet for the finished pavement grade.

8 Use the 30 feet minimum length mobile grade reference system or the non-contacting
9 laser or sonar type ski with at least four referencing stations mounted on the paver at a
10 minimum length of 24 feet to control the longitudinal profile when placing the initial
11 lanes and all adjacent lanes of all layers, including resurfacing and asphalt in-lays, unless
12 other specified or approved. A joint matching device (short 6 inch shoes) may be used
13 only when approved.

14 Use the automatic slope control system unless otherwise approved. The Engineer may
15 waive the use of automatic slope controls in areas where the existing surface (subgrade,
16 base, asphalt layer, etc.) exhibits the desired cross slope of the final surface. The
17 Engineer may also waive the use of automatic slope controls in areas where the use of
18 such equipment is impractical due to irregular shape or cross section (such as
19 resurfacing). When the use of the automatic slope controls is waived, the Engineer may
20 require the use of mobile grade references on either or both sides of the paver. Manual
21 screed operation will be permitted in the construction of irregularly shaped and minor
22 areas, subject to approval. Waiver of the use of automatic screed controls does not
23 relieve the Contractor of achieving plan profile grades and cross slopes.

24 In the case of malfunction of the automatic screed control equipment, the paver may be
25 manually operated for the remainder of the workday provided this method of operation
26 produces acceptable results. Do not resume work thereafter until the automatic system is
27 functional.

28 The Engineer will waive the requirement for use of pavers for spreading and finishing
29 where irregularities or obstacles make their use impractical. Spread, rake and lute the
30 mixture by hand methods or other approved methods in these areas.

31 Operate the paver as continuously as possible. Pave intersections, auxiliary lanes and
32 other irregular areas after the main line roadway has been paved, unless otherwise
33 approved.

34 Compact the wearing course with a steel double drum asphalt roller(s) with a minimum
35 weight of 10 tons. Maintain rollers in reliable operating condition and equip with
36 functioning water system and scrapers to prevent adhesion of the fresh mix onto the roller
37 drums. Supply adequate roller units and compact promptly following the placement of
38 the material.

39 Request approval of equipment before the start of any work. Maintain all equipment and
40 tools in satisfactory working condition at all times.

41 **(B) Surface Preparation**

42 Perform the following items before the commencement of paving operations.

43 (1) Protect and cover manhole covers, drains, grates catch basins and other such utility
44 structures with plastic or building felt before paving and reference for location and
45 adjustment after paving.

46 (2) Remove thermoplastic traffic markings symbols, characters or other markings
47 greater than 1/4 inch in thickness on the existing pavement.

- 1 (3) Clean and completely fill pavement cracks and joints greater than 1/4 inch wide. Do
2 not overband the existing cracks and joints. Apply sealant per manufacturer's
3 recommendation.
- 4 (4) Fill surface irregularities greater than 1 inch deep with a material approved by the
5 Engineer.
- 6 (5) Thoroughly clean the entire pavement surface, giving specific attention to
7 accumulated mud and debris. Pressurized water and/or vacuum systems may be
8 required to ensure a clean surface.

9 **(C) Application of Ultra-thin Bonded Wearing Course**

10 Produce, transport to the site and place the UBWC in accordance with Section 610,
11 except as otherwise provided below.

12 Use only one asphalt binder PG grade for the entire project, unless the Engineer gives
13 written approval.

14 Do not place UBWC between October 31 and April 1 and when the air and surface
15 temperature is less than 60°F.

16 Apply the UBWC mixture at the rate per square yard as shown in Table 661-2 for the mix
17 type shown in the plans.

18 Spray the PMEM at a temperature of 140°F to 180°F. Provide a uniform application
19 across the entire width. Use a target application rate of 0.20 gal/sy and adjust according
20 to the mix design, existing pavement type and condition for the specified project, and the
21 manufacturer's recommendations. Ensure the rate of application is approved by the
22 Engineer before beginning work.

23 Do not allow wheels or other parts of the paving machine to touch the PMEM before the
24 hot mix asphalt concrete wearing course is applied.

25 Place the hot asphalt concrete wearing course over the full width of the PMEM. Apply
26 the hot mix asphalt concrete at a temperature of 300°F to 330°F and within a maximum
27 of 3 seconds immediately after the application of the membrane.

28 Before opening to traffic, allow the pavement to sufficiently cool after the rolling
29 operation to resist damage to the pavement.

30 For the alternate method, use distributor equipment to uniformly place the non-tracking
31 hot applied polymer asphalt tack coat in accordance with Section 605 and shall be applied
32 at a temperature in accordance with the manufacturer's recommendations and at a target
33 residual application rate of 0.12 ± 0.02 gal/sy. For placing the asphalt mix, use of a spray
34 paver is not required.

35 **(D) Compaction**

36 Compact the wearing course with at least two passes of a steel double drum asphalt roller
37 before the material temperature has fallen below 185°F. Do not allow the rollers to
38 remain stationary on the freshly placed asphalt concrete. Compact immediately following
39 the placement of UBWC. A release agent (added to the water system) may be required to
40 prevent adhesion of the fresh mix to the roller drum and wheels. Compact in the static
41 mode.

Section 661

1 **661-5 QUALITY MANAGEMENT SYSTEM FOR ASPHALT PAVEMENTS**

2 Produce the ultra-thin hot mix asphalt in accordance with Section 609 with the following
3 exceptions.

4 Sample and test the completed mixture from each mix design per plant per year at the
5 following minimum frequency during mix production:

<u>Accumulative Production Increment</u>	<u>Number of Samples per Increment</u>
500 tons	1

6 Record the following data on the standardized control charts and in accordance with the
7 requirements of Section 7.4 of the *Asphalt QMS Manual*:

8 (a) Aggregate Gradation Test Results:

- 9 1. 2.36 mm
- 10 2. 0.075 mm Sieves

11 (b) Binder Content, %, P_b

12 **661-6 MEASUREMENT AND PAYMENT**

13 *Ultra-thin Bonded Wearing Course* will be measured and paid by the actual number of tons of
14 mixture incorporated into the completed and accepted work. The hot mix asphalt pavement
15 will be measured by being weighed in trucks on certified platform scales or other certified
16 weighing devices. Application of Ultra-thin Hot Mix Asphalt shall be included in the per ton
17 pay item for *Ultra-thin Bonded Wearing Course*.

18 *Polymer Modified Asphalt Binder for Plant Mix* will be paid in accordance with Article 620-4.
19 Asphalt binder price adjustments when applicable will be based on Grade PG 64-22,
20 regardless of the grade used.

21 Where PG 76-22 is being used in the production of ultra-thin, the grade of asphalt binder to be
22 paid will be PG 70-28, unless otherwise approved.

23 For the alternate method, *Ultra-thin Bonded Wearing Course* will be measured and paid by
24 the actual number of tons of mixture incorporated into the completed and accepted work. The
25 hot mix asphalt pavement will be measured by being weighed in trucks on certified platform
26 scales or other certified weighing devices. Non-tracking hot applied polymer asphalt tack
27 coat shall be included in the per ton pay item for *Ultra-thin Bonded Wearing Course*. No
28 other pay item shall be associated with this alternate method.

29 The above prices and payments will be full compensation for all work covered by this section
30 including, but not limited to, furnishing all materials, producing, weighing, transporting,
31 placing and compacting the polymer modified asphalt emulsion; maintaining the ultra-thin
32 bonded wearing course until final acceptance of the project; performing QC as specified in the
33 contract; and making any repairs or corrections to the surface of the pavement or adjacent
34 landscape that may become necessary.

35 Payment will be made under:

Pay Item	Pay Unit
Ultra-thin Bonded Wearing Course	Ton

SECTION 665
MILLED RUMBLE STRIPS ON ASPHALT CONCRETE
SHOULDERS

665-1 DESCRIPTION

Construct rumble strips on asphalt concrete shoulders in accordance with the plans and as directed by the Engineer. Work includes, but is not limited to, furnishing all labor, equipment and all incidentals necessary to complete the work satisfactorily and disposing of milled material.

665-2 EQUIPMENT

Provide equipment consisting of a rotary-type cutting head with an outside diameter of no more than 24 inches and at least 16 inches long. Provide a cutting head that has the cutting tips arranged to provide a relatively smooth cut. Provide a cutting head on its own independent suspension from that of the power unit to allow the tool to self align with the slope of the shoulder or any irregularities in the shoulder surface.

Provide a cutting tool equipped with guides to provide consistent alignment of each cut in relation to the roadway and to provide uniformity and consistency throughout the project.

665-3 CONSTRUCTION METHODS

Demonstrate the ability to achieve desired surface inside each depression without tearing or snagging the asphalt before beginning the work.

Provide rumble strips that have finished dimensions of 7 inches \pm 1/2 inch wide in the direction of travel and are at least 16 inches long measured perpendicular to the direction of travel. Provide rumble strips having depressions with a concave circular shape with a minimum 1/2 inch depth at center (no more than an allowable depth 5/8 inch). Place rumble strips in relation to the roadway according to the patterns shown in the plans.

Material resulting from the operation becomes the property of the Contractor. Remove and dispose of this material in accordance with Section 802.

At the end of each working day remove all equipment to a location where it does not present a traffic hazard, clean pavement and reopen work area to traffic.

665-4 MEASUREMENT AND PAYMENT

Milled Rumble Strips (Asphalt Concrete) will be measured and paid at the contract unit price per linear foot for the actual number of linear feet of shoulder, measured longitudinally along the surface of each shoulder, where rumble strips have been constructed.

Payment will be made under:

Pay Item	Pay Unit
Milled Rumble Strips (Asphalt Concrete)	Linear Foot

DIVISION 7 CONCRETE PAVEMENTS AND SHOULDERS

SECTION 700 GENERAL REQUIREMENTS FOR PORTLAND CEMENT CONCRETE PAVEMENT

700-1 DESCRIPTION

Perform the work covered by this section, which includes, but is not limited to, the construction of a single course non-reinforced Portland cement concrete pavement on a prepared base, in accordance with these *Standard Specifications* and with the lines, grades, thicknesses and typical sections shown on the plans or as directed.

The Department accepts concrete pavement with respect to strength, thickness and ride quality on a lot by lot basis subject to adjusted unit prices as provided in Sections 710 and 720.

Use any combination of equipment that shall effectively perform the necessary construction operations. Ensure the equipment is at the job site sufficiently ahead of the start of construction operations for the Engineer to examine thoroughly and approve.

Maintain all equipment in a satisfactory operating condition while in use on the work.

Submit for approval a Process Control Plan addressing all operations necessary in the production and placement of concrete pavement a minimum of 30 calendar days prior to placing concrete pavement.

700-2 CONCRETE PRODUCTION EQUIPMENT

Use batch plants, central mix plants and truck mixers that meet Section 1000.

700-3 CONCRETE HAULING EQUIPMENT

Transport concrete to the point of placement either in a truck agitator, a truck mixer operating at agitating speed or in non-agitating equipment meeting the provisions below. Bottom or belly dump equipment is prohibited. Provide and secure material covers on the equipment bodies for protection against detrimental environmental conditions.

Prevent the accumulation of hardened concrete in the delivery vehicles. Discharge all flushing water before charging with the next concrete load.

When using non-agitating hauling equipment, provide bodies which are smooth, watertight, metal containers with rounded internal corners equipped with vibrators and gates to discharge the concrete without segregation or damage.

For concrete hauled in a transit mix (ready mix) truck, use Table 1000-2 to determine the maximum elapsed time. For concrete hauled in other equipment, the elapsed time shall be 60 minutes or less, unless otherwise approved. Define the "elapsed time" as the period from first contact between mixing water and cement until the completion of the entire operation including placing, finishing, micro-surfacing and any necessary corrective work.

Deliver the concrete to the work site in a thoroughly mixed and uniform mass.

If at discharge, the concrete is not thoroughly mixed and homogeneous, the hauling distance, charging sequence, size of load, mixing time or any combination thereof shall be altered to meet these requirements; otherwise, use other equipment capable of delivering a thoroughly mixed and uniform concrete mass.

Section 700

1 **700-4 PREPARATION OF SUBGRADE AND BASE**

2 Prepare the subgrade and base beneath Portland cement concrete pavement in accordance
3 with the applicable sections of these Specifications and with a grading tolerance of $\pm 1/4$ inch
4 from the established grade on mainline lanes and a grading tolerance of $\pm 1/2$ inch in all other
5 areas. Use approved automatically controlled grading and paving equipment to produce final
6 subgrade and base surfaces meeting the lines, grades and cross sections required by the plans
7 or as directed. When in the judgment of the Engineer the use of such equipment is
8 impractical, this requirement will be waived.

9 Dampen the surface of the base at the time the concrete is placed. Sprinkle the base when
10 necessary to provide a damp surface. Ensure that no free water or ponding is present at the
11 time of concrete placement. Correct all damaged areas in the subgrade or base before placing
12 concrete.

13 Do not allow traffic on the underlying asphalt courses other than necessary local traffic and
14 essential construction equipment as authorized by the Engineer.

15 Unless otherwise approved, use and maintain a braided metal cable stringline reference to
16 control the profile and alignment of the concrete pavement. Monitor the stringline for
17 accuracy and tautness. Set pins at a distance no farther than 50 feet apart. When located on
18 a vertical curve, set pins no farther than 25 feet apart.

19 **700-5 PLACING CONCRETE**

20 **(A) General**

21 Use a slip form paver to place concrete except where impractical due to irregular areas or
22 areas of existing pavement adjacent to the proposed pavement.

23 Place concrete only in the presence of the Engineer or his authorized representative.

24 Handle concrete so as to prevent segregation and keep free from mud, soil or any other
25 foreign matter.

26 Where finishing operations must be completed after dark, provide acceptable artificial
27 light in accordance with Section 1413.

28 Do not pave when any of the following conditions exist:

29 (1) A descending air temperature at the location of the concrete paving operation and
30 away from artificial heat reaches 35°F. Paving may resume when the weather
31 forecast is projected to reach a high of 40°F on that day's operation and the morning
32 ambient temperature is above 32°F.

33 (2) The subgrade or base course is frozen.

34 (3) Aggregates to be used in the mix contain frozen particles.

35 (4) Air temperature in the shade is 90°F and rising or the concrete temperature is greater
36 than 95°F.

37 Where additional pavement, aggregate or soil must be placed adjacent to new pavement
38 by machine methods, do not place it until the concrete has attained a compressive
39 strength of at least 3,000 psi.

40 Construction equipment or hauling equipment will not be allowed over the pavement
41 until the concrete has attained a compressive strength of 3,000 psi.

42 Spread the concrete uniformly over the entire area without segregation. Perform the
43 spreading with a mechanical spreader independent of the paver except where hand
44 methods are necessary due to pavement design, equipment breakdown or other
45 emergencies.

(B) Slip Form Paver Method

Use a slip form paver that is an approved self-propelled machine designed to spread, consolidate, screed and float finish the concrete in one complete pass of the machine to provide a smooth, dense and homogeneous pavement with minimal hand finishing. Use a slip form paver equipped with forms of sufficient length and rigidity to support the edges of the slab to minimize hand finishing. Use a slip form paver equipped with both horizontal and vertical automatic controls. Operate the paver with continuous forward movement and coordinate all operations of mixing, delivering and spreading the concrete to provide uniform progress and minimize stopping and starting of the paver.

Provide concrete that has sufficient cohesion to prevent appreciable slumping at the edges of each slab. Longitudinal straight edge tolerance of 1/4 inch in 10 feet shall apply to the area within 6 inches of the edge. Edge slump shall be limited to no more than 1/4 inch.

(C) Fixed Form Method

Apply this section to all paving operations where a slip form paver is not being used.

Use forms made of metal and of such section and design that they will adequately support the concrete and the construction equipment.

Use forms that have a depth not less than the edge thickness of the pavement to be constructed and not more than 1 inch greater than the edge thickness of the pavement to be constructed. Use a form which has the base width at least equal to the height of the form.

Use a form in which the top face does not vary from a true plane more than 1/8 inch in 10 feet and the upstanding leg does not vary more than 1/4 inch.

Use straight forms that have at least 3 pin pockets per 10 feet in length and at least 2 pin pockets per 5 feet in length.

Use form pins that are metal and capable of holding the forms rigidly in place during construction operations. The Engineer may require pinholes in the base to be sealed before placing subsequent pavement.

Connect the form sections by a locking joint that will keep the forms free from vertical and horizontal movement.

Use straight forms 10 feet in length on tangents and on curves having a radius of 200 feet or more. For curves having a radius of between 50 feet and 200 feet use either straight forms 5 feet in length or flexible forms. Use flexible forms for curves having a radius of less than 50 feet.

Clean all forms before they are set. Oil all forms before placing concrete. Check the bearing of the forms and correct all areas of inadequate bearing.

Remove all rejected forms immediately from the project.

Set forms a sufficient distance in advance of the point where the concrete is being placed to provide for a continuous operation in placing the concrete and for proper inspection of line and grade.

All forms used for construction joints shall meet this section except provisions shall be made for inserting dowel bars where required.

700-6 VIBRATING CONCRETE

Uniformly vibrate the concrete after it has been spread. Consolidate the full width and depth of the concrete in a single pass.

Section 700

1 Vibrators for full width vibration of concrete may be either the surface pan type or the internal
2 type with either immersed tube or multiple spuds. Attach the vibrators to the spreader or the
3 finishing machine, or mount the vibrators on a separate carriage.

4 Furnish an electronic vibrator monitoring device, displaying the operating frequency of each
5 individual vibrator on the paving equipment. Operate the electronic vibrator monitoring
6 device in areas where the mainline, ramp or loop pavement exceeds 600 feet in length.
7 Record the time, station location, paver track speed and operating frequency of each
8 individual vibrator after every 25 feet of paving or after each 5 minute time interval has
9 elapsed. Provide a report of the vibrator data to the Engineer daily for the first 3 days of
10 paving and weekly thereafter. The Engineer may determine that more frequent submissions
11 are necessary, particularly if equipment is malfunctioning.

12 Set the internal vibrators to approximately mid slab depth and provide a locking device to
13 avoid contact with any joint, load transfer device, tie bar, subgrade or side form. Provide an
14 operating position locking device so that no part of the vibrating unit can be lowered to the
15 extent that it will come in contact with dowel bars, dowel bar assemblies or tie bars while
16 paving.

17 Set the horizontal spacing of vibrators to the manufacturer's recommendations, but in no case
18 exceed 16 inches from center to center.

19 Operate internal and spud vibrators within a frequency range of 3,500 to 8,000 vpm and
20 surface vibrators within a frequency range of 3,500 to 6,500 vpm. Operate vibrators to avoid
21 separation of the mix ingredients. A reduction in vibrator frequency may be required when
22 the forward motion of the paver is reduced to avoid separation of the mix. Either discontinue
23 the use or remove from contact with the concrete, the machine mounted vibrators, whenever
24 the forward motion of the machinery is stopped.

25 Should the electronic monitoring device fail to operate properly, immediately check the
26 vibrators manually in the presence of the Engineer. If the vibrators are functioning properly,
27 paving may continue. Repair the monitoring device within 3 production days or suspend
28 paving.

29 **700-7 FINISHING**

30 Finish concrete pavement or concrete shoulders in accordance with Article 710-6 or 720-7,
31 respectively. Do not use excessive water for finishing.

32 **700-8 PROTECTION OF PORTLAND CEMENT CONCRETE PAVEMENT**

33 **(A) General**

34 Protect the concrete pavement from environmental conditions. Remove and replace
35 concrete pavement damaged as a result of environmental conditions.

36 Use protective covering that will protect the surface of the freshly placed pavement from
37 rain or cold weather readily available each day at the location of each proposed day's
38 operation before beginning work. Store an adequate quantity of these materials at the
39 paving train.

40 **(B) Cold Weather**

41 When the temperature is projected to drop below 35°F for more than four hours, insulate
42 the concrete pavement to prohibit the concrete surface temperature from dropping below
43 35°F during the curing period.

44 **(C) Hot Weather**

45 When the anticipated daily high temperature is above 90°F, place the concrete at the
46 coolest temperature practical. Control concrete temperatures to assure proper placing,
47 consolidation, finishing, curing and to prevent plastic shrinkage cracking.

1 (D) Rain

2 When rain appears imminent, stop all paving operations, and ensure all available
3 personnel protect the surface of the unhardened concrete. Failure to properly protect the
4 concrete pavement may constitute cause for removal and replacement of the damaged
5 pavement.

6 700-9 CURING**7 (A) General**

8 Immediately after finishing operations have been completed and surface water has
9 disappeared, cover all exposed surfaces of the pavement by one of the curing methods
10 herein or as approved by the Engineer.

11 Apply the selected curing method to the edges of the pavement immediately after the
12 forms are removed.

13 Curing is required until the concrete compressive strength has exceeded 3,000 psi using
14 the maturity method in accordance with Article 700-13.

15 (B) Membrane Curing Compound

16 After final finish and immediately after the free surface moisture has disappeared, use
17 a minimum application rate of 0.0067 gal/sf when the application equipment is
18 mechanically operated. Provide an inline flow-metering device to ensure the proper rate
19 is applied. Apply the curing compound such that puddling or ponding does not occur on
20 the fresh concrete surface.

21 Use mechanically operated application equipment designed to apply a uniformly agitated
22 continuous flow of the curing compound at the prescribed rate to all concrete surfaces.

23 Hand spraying shall only be permitted for irregular widths or shapes and surfaces
24 exposed by removal of forms. The rate of application for these areas shall be 0.01 gal/sf.

25 Do not expose newly placed concrete for more than 30 minutes before being covered
26 with curing compound. Failure to cover the surfaces of the concrete shall be cause for
27 immediate suspension of the paving operation.

28 Protect the membrane curing compound film at all times during the curing period and
29 repair any damage immediately. Ensure a sufficient amount of polyethylene film, burlap
30 or other approved material is available to provide for protection of the concrete during
31 rain or when the application equipment fails to apply the curing compound uniformly to
32 all surfaces.

33 Reapply curing compound to any concrete surfaces that received heavy rainfall within
34 3 hours after initial application.

35 (C) Polyethylene Film

36 Spread the sections of the film in a manner that will not damage the finished pavement
37 surface. Securely tape or provide lap joints for the sections that are at least 12 inches
38 wide, and take suitable precautions to prevent the circulation of air beneath the film.
39 Cover all exposed surfaces and beyond the edge of the pavement surface.

40 Use black or dark plastic sheets when the daily high ambient temperature is between
41 40°F and 60°F. Use white opaque reflective plastic sheet when the daily ambient
42 temperature is above 60°F. Plastic sheets will meet ASTM C171.

43 Check the film for damage when it is spread and during the curing period. Repair or
44 replace any damaged sections immediately.

Section 700

1 (D) Burlap

2 Spread the sections of burlap in a manner that will not damage the finished pavement
3 surface. Provide lap joints that are at least 6 inches wide.

4 Use an amount of burlap that is not less than 12 ounces per running yard based on a
5 40 inch width. Use either one layer of Class 4 burlap or 2 layers of Class 1, 2 or 3 burlap.

6 Saturate the burlap thoroughly before placing on the concrete and keep thoroughly wet
7 throughout the curing period.

8 700-10 REMOVING FORMS

9 Do not remove forms from freshly placed concrete for at least 12 hours after placement and
10 until the concrete has hardened sufficiently to resist spalling, cracking or any other damage.
11 Repair any honeycombed areas along the sides or edges of the slab by filling with mortar
12 immediately after the forms have been removed. Use mortar consisting of one part cement to
13 2 parts fine aggregate.

14 700-11 JOINT CONSTRUCTION

15 (A) General

16 Construct all joints in accordance with these *Standard Specifications* and the details
17 shown on the plans. Saw all transverse joints and seal them with joint sealer in
18 accordance with the dimensions and details shown in the contract. Seal joints in
19 accordance with Article 700-12.

20 Saw the concrete pavement as soon as it can support the weight of the equipment and
21 operator without disturbing the final finish. Saw joints in a neat, vertical straight line
22 without chipping, spalling, tearing or disturbing the final finish.

23 Ensure an adequate amount of sawing equipment is available to match the production and
24 concrete paving operations. At least one standby sawing unit is recommended.
25 Construct the joint groove using a 1/8 inch saw blade to a minimum depth of 4 inches or
26 the design thickness divided by 3 whichever is less. Perform sawing as soon as the
27 concrete has hardened sufficiently without undercutting, spalling and raveling to control
28 random cracking. To estimate the time of sawing, it is recommended to use the latest
29 version of FHWA's High Performance Paving software entitled HIPERPAV.

30 Immediately after sawing the joint to the dimensions shown on the plans, completely
31 remove the resulting slurry from the joint without damaging the adjacent concrete.
32 Immediately reapply curing membrane to areas damaged by the sawing operation.

33 Deviations from the method of joint construction specified in the contract requires prior
34 approval in writing. Such approval is conditional and is subject to obtaining satisfactory
35 results.

36 The Engineer may order any concrete pavement or shoulder where uncontrolled cracking
37 has occurred before final acceptance to be removed and replaced at no cost to the
38 Department. Where permitted, the Contractor may be allowed to repair the cracking in
39 a manner acceptable to the Engineer.

40 Before placing either concrete pavement or concrete shoulders adjacent to a previously
41 placed pavement, cover the transverse joint opening on the edge of the existing slab to
42 prevent intrusion of grout into the opening.

43 (B) Transverse Contraction Joints

44 Construct transverse contraction joints in accordance with the details, dimensions and
45 intervals as shown on the plans.

1 (C) Longitudinal Contraction Joints

2 Construct longitudinal contraction joints in all pavements wider than 16 feet in
3 accordance with the details and dimensions shown on the plans.

4 (D) Transverse Construction Joints**5 (1) General**

6 Construct transverse construction joints by use of an approved form at the end of
7 each day's operations (planned joint) or whenever the placing of concrete is
8 suspended for more than 30 minutes (emergency joint).

9 (2) Planned Transverse Construction Joints

10 Locate this type of joint at the same spacing required for contraction joints. Use
11 dowel bars of the size and spacing shown on the plans.

12 (3) Emergency Transverse Construction Joints

13 Use this type of joint when the placing of concrete is suspended for more than
14 30 minutes. Use tie bars of the size and spacing shown on the plans.

15 Do not change the spacing of contraction joints due to emergency construction joints.
16 Locate the emergency construction joints at least 6 feet from any contraction joint or
17 planned construction joint.

18 (E) Longitudinal Construction Joints

19 Construct longitudinal construction joints using tie bars in accordance with the details
20 shown on the plans.

21 (F) Transverse Expansion Joints

22 Construct transverse expansion joints in accordance with the details shown on the plans
23 utilizing an approved joint assembly.

24 (G) Verification of Dowel Bar Alignment

25 Use either properly secured dowel baskets or a dowel bar inserter, provided the ability to
26 correctly locate and align the dowels at the joints is demonstrated as described below.

27 Provide a calibrated magnetic imaging device that will document dowel bar location and
28 alignment. Calibrate the magnetic imaging device to the type and size dowel bar used in
29 the work. Use this device as a process control and make necessary adjustment to ensure
30 the dowels are placed in the correct location.

31 Scan at least 25% of the joints in the initial placement or 1.0 mile of pavement,
32 whichever is greater, at random intervals, as selected by the Engineer, throughout the
33 pavement each time the paving train is mobilized. Mark scanned joints on the pavement.

34 Scan all joints in this initial placement if the dowel bars exhibit longitudinal translation
35 (side shift), horizontal translation, vertical translation (depth), horizontal skew or vertical
36 tilt, above the allowable tolerances defined below. In addition, continue scanning no less
37 than 25% of the joints until it is established that the dowel bar inserter or secured dowel
38 basket assemblies are consistently placing the dowel bars at the correct location and
39 meeting the tolerances defined in Table 700-1. Once the engineer determines that
40 consistency is established, the contractor may reduce the percentage of scanned joints to
41 no less than 10%. Any time inconsistency in the placement of the dowel bars becomes
42 evident, additional scanning may be required up to 100% of the joints. Materials and
43 Tests Unit will provide Quality Assurance and random verification scans during the
44 initial concrete placement to verify the Contractor's scan results. The QA frequency will
45 be at least 10% of the Contractor's scan.

Section 700

1 If consistency of the proper dowel bar alignment cannot be established within
2 a reasonable time frame, the Engineer will have the option of suspending the paving
3 operation.

4 Provide a report of the scanned joints within 48 hours of completing the day's
5 production. The report should include the station and lane of the joint scanned, as well as
6 the horizontal location, depth, longitudinal translation (side shift), horizontal skew and
7 vertical tilt, and total misalignment, of each dowel bar in the joint. If a dowel bar inserter
8 is used, the joint score described below should also be provided in the report.

9 Longitudinal translation (side shift) is defined as the position of the center of the dowel
10 bar in relation to the sawed joint. The maximum allowable longitudinal translation (side
11 shift) is 2 inches.

12 Horizontal translation is defined as difference in the actual dowel bar location from its
13 theoretical position as detailed in the standard details. The maximum allowable
14 horizontal translation is 2 inches.

15 Vertical translation (depth) is the difference in the actual dowel bar location from the
16 theoretical midpoint of the slab. The maximum allowable vertical translation is 1/2 inch
17 higher than the theoretical midpoint and 1 inch lower than the theoretical midpoint.

18 Dowel bar misalignment, either vertical tilt or horizontal skew is defined as the difference
19 in position of the dowel bar ends with respect to each other. Vertical tilt is measured in
20 the vertical axis whereas horizontal skew is measured in the horizontal axis.

21 If a dowel bar inserter is used, determine a joint score for each joint scanned. The joint
22 score is a measure of the combined effects from the dowel's horizontal skew or vertical
23 tilt. The joint score is determined by summing the product of the weight shown in the
24 Table 700-1 and the number of bars in each misalignment category and adding one. The
25 vertical tilt and horizontal skew should be evaluated and the total misalignment shall be
26 used in determining the joint score.

Misalignment Category, inches (mm)	Weight
$0 \leq d \leq 0.6$ (15)	0
0.6 (15) $< d \leq 0.8$ (20)	2
0.8 (20) $< d \leq 1.00$ (25)	4
1.00 (25) $< d \leq 1.50$ (38)	5
1.50 (38) $\leq d$	10

27 **A.** Where **d** is the individual dowel bar misalignment.

28 A joint that has a joint score of 12 or greater will be considered locked.

29 When a locked joint as defined above is discovered, scan the 2 joints immediately
30 adjacent to the locked joint. If either of the adjacent joints are deemed to be locked,
31 provide a written proposal to address the dowel misalignment for each locked joint.
32 No corrective action should be performed without written approval.

33 **700-12 SEALING JOINTS**

34 **(A) General**

35 Seal all joints with an approved low modulus silicone sealant in the presence of the
36 Engineer.

37 Install backer rod and sealant in accordance with the details shown in the plans and the
38 manufacturer's recommendations.

1 Any failure of the joint material will be cause for rejection. Repair the failed joint
2 material as approved by the Engineer.

3 When requested, have a representative of the silicone sealant manufacturer present on the
4 project during the sealing operation.

5 **(B) Age of Pavement**

6 Do not seal the joints until the concrete is at least 7 calendar days old and concrete is dry
7 based on sealant manufacturer's recommendations.

8 Do not perform final sawing and sealing of concrete pavement joints until after surface
9 testing, correction of surface deficiencies and all adjacent earth and paved shoulder
10 construction has been completed.

11 **(C) Temperature**

12 Do not place joint sealant when the air temperature near the joint is less than 45°F or
13 is 45°F and falling.

14 **(D) Sealing the Joint**

15 Immediately after sawing the joint to the dimensions as shown on the plans, completely
16 remove the resulting slurry from the joint by flushing with a jet of water under pressure.
17 Use sand blasting to clean joint faces before applying sealant. Make as many passes with
18 a sand blaster as are necessary to provide a clean joint wall.

19 Blow all joints clear of deleterious materials with air using a nozzle pressure of at least
20 90 psi before installing the backer rod. Use rotary screw compressors for this purpose
21 that are equipped with traps capable of removing water and oil from the air. Maintain the
22 traps in accordance with manufacturer's instructions.

23 Apply sealer only on thoroughly clean and dry joints. Place the sealer to closely conform
24 to dimensions shown on the plans. Any unreasonable deviation will be cause for
25 rejection.

26 **(E) Cleaning Pavement**

27 After a joint has been sealed, remove surplus joint sealer on the pavement as soon as
28 possible.

29 **700-13 USE OF NEW PAVEMENT OR SHOULDER**

30 Traffic or other heavy equipment will not be allowed on the concrete pavement or shoulder
31 until the estimated compressive strength of the concrete using the maturity method has
32 exceeded 3,000 psi. Estimate the compressive strength of concrete pavement in accordance
33 with ASTM C1074 unless otherwise specified.

34 Furnish thermocouples or thermistors and digital data logging maturity meters that
35 automatically compute and display the maturity index in terms of a temperature-time
36 factor (TTF). The maturity meters must be capable of storing at least 28 days worth of data
37 and exporting data into an Excel® spreadsheet. Install loggers in slabs after every 2 lots
38 approximately 4 inches from the concrete surface. Submit the proposed equipment to the
39 Engineer for approval.

40 When establishing a strength-maturity relationship, perform compressive tests at ages 1, 3, 7,
41 14 and 28 days in accordance with AASHTO T 22.

42 Use the TTF maturity function to compute the maturity index from the measured temperature
43 history of the concrete. Set the datum temperature at -10°C to calculate the TTF in
44 Equation 1 of ASTM C1074.

Section 700

1 Establish and submit a strength-maturity relationship in conjunction with each concrete
2 pavement mix design. Determine the TTF corresponding to the strength-maturity relationship
3 at 3,500 psi, TTF. Any changes to plant operations, material sources or mix proportions will
4 affect the strength-maturity relationship. If any changes occur during production, develop
5 a new strength-maturity relationship unless otherwise directed.

6 Validate the strength-maturity relationship and the correlation between cylinders and beams
7 during the first day's production by casting cylinders and beams and performing strength
8 tests. Use the TTF developed during the mix design process to verify the strength-maturity
9 relationship.

10 Validate the strength-maturity relationship and the correlation between cylinders and beams
11 by casting cylinders and beams and performing strength tests at least every 30 calendar days,
12 or when the TTF varies by more than 10% from the latest approved maturity curve or there is
13 a material change from the approved concrete mix design. If the verification sample's
14 compressive strength when tested at TTF is less than 3,000 psi, immediately suspend early
15 opening of traffic on pavement that has not obtained TTF until a new strength-maturity
16 relationship is developed.

17 No permanent traffic will be allowed on the pavement until construction of the joints,
18 including all sawing, sealing and curing that is required, has been completed.

19 Take particular care to protect the exposed pavement edges and ends.

20 **700-14 CONTRACTOR'S RESPONSIBILITY FOR PROCESS CONTROL**

21 Perform process control sampling and testing of concrete materials and operations in
22 accordance with Article 1000-3. The Contractor's roadway foreman and all personnel
23 involved in the batching, sampling, testing and acceptance of Portland cement concrete
24 pavement shall be Department certified Portland cement concrete pavement technicians.

25 **700-15 ACCEPTANCE TESTS FOR CONCRETE**

26 **(A) Responsibility**

27 The Engineer will conduct acceptance sampling and testing of concrete. Provide access
28 to all materials to be sampled and tested. The following tests will be performed on both
29 concrete pavement and concrete shoulders to determine acceptance.

30 **(B) Lot Definition**

31 A lot for acceptance purposes is defined and described in Article 710-4.

32 **(C) Air Content**

33 The air content of the concrete will be determined on the roadway at a frequency
34 established by the Engineer and in accordance with Subarticle 1000-3(B). The sample
35 taken for determination of air content will be obtained immediately after the concrete has
36 been discharged on the road.

37 Concrete failing to meet specification requirements for air content will be subject to
38 rejection.

39 **(D) Slump**

40 The slump of the concrete will be determined in accordance with AASHTO T 119 at
41 a frequency established by the Engineer. The sample taken for determination of slump
42 will be obtained immediately after the concrete has been discharged on the road.

43 When the slump of the concrete is questionable by visual observation, do not place the
44 concrete on the road until tested for slump by the Engineer.

45 Concrete failing to meet specification requirements for slump will be subject to rejection.

1 **(E) Compressive Strength**

2 Determine the compressive strength of concrete using one set of two 6 inch x 12 inch
 3 cylinders at 28 calendar days. Test samples will be made by the Engineer from the
 4 concrete as it comes from the mixer. The samples will be made and cured in accordance
 5 with AASHTO T 23. Test specimens will be tested by the Engineer in accordance with
 6 AASHTO T 22. Furnish curing facilities for the test samples in accordance with
 7 Section 725.

8 **(F) Thickness**

9 The thickness of the pavement will be determined by measurement of cores in
 10 accordance with AASHTO T 148.

11 Take 4 inch diameter cores in the presence of the Engineer. The Engineer will take
 12 immediate possession of the cores. Take the cores when the concrete has attained
 13 a compressive strength of at least 3,500 psi and at least 72 hours have elapsed since
 14 placement of the pavement. If the concrete has not attained a compressive strength of at
 15 least 3,500 psi, the gross vehicle weight rating of vehicles supporting the coring operation
 16 may not exceed 7,000 lbs. Take cores no later than 30 days after the pavement has been
 17 placed. The core locations for each lot will be selected at random by the Engineer.

18 Patch all core holes within 72 hours of taking the core, using an approved nonshrink
 19 grout compatible with the pavement or shoulder concrete.

20 **(G) Surface Smoothness**

21 Perform acceptance testing for surface smoothness on concrete pavements in accordance
 22 with Article 710-7. The Engineer will have a representative present during all testing and
 23 will take possession of the results at the completion of each day's testing.

24 **700-16 MEASUREMENT AND PAYMENT**

25 Remove and repair defects and damage to underlying asphalt course, Portland cement
 26 concrete and joints at no cost to the Department.

27 **SECTION 710**
 28 **CONCRETE PAVEMENT**

29 **710-1 DESCRIPTION**

30 Perform the work covered by this section, including, but not limited to, designing the concrete
 31 mix; furnishing and placing concrete; furnishing of all admixtures and additives; constructing
 32 all joints and furnishing joint materials; marking the pavement; curing the pavement and
 33 furnishing all curing materials; furnishing concrete necessary for making test beams and
 34 cylinders; performing maturity testing; coring and patching the pavement; calibrating and
 35 checking the operation of batching equipment; taking actions necessary to prevent or to repair
 36 cracking; sawing and sealing joints; verifying dowel bar alignment; removing and replacing
 37 of defective pavement; and constructing Portland cement concrete pavement in accordance
 38 with these *Standard Specifications* and with the lines, grades and dimensions shown on the
 39 plans.

Section 710

1 **710-2 MATERIALS**

2 Refer to Division 10.

Item	Section
Curing Agents	1026
Dowels and Tie Bars	1070-6
Joint Filler	1028-1
Low Modulus Silicone Sealant	1028-3
Portland Cement Concrete	1000
Water	1024-4

3 **710-3 COMPOSITION OF CONCRETE**

4 Design the concrete mix in accordance with Section 1000.

5 Before placement, produce a trial batch through the plant. The Engineer will make
6 compressive and flexural samples from the trial batch for testing at 1, 3, 7, 14 and 28 days of
7 age. Until the trial batch meets 650 psi flexural strength and 4,500 psi compressive strength,
8 the Engineer will make acceptance samples for flexural and compressive tests for mix placed.
9 If the trial batch test results meet strength requirements, flexural samples representing placed
10 concrete will be discarded, and compressive samples will be used for acceptance. If the trial
11 batch does not meet strength requirements, flexural samples will be used for acceptance until
12 plant produced mix meets strength requirements.

13 If any major change as defined in Section 1000-3 is made to the mix design, this process shall
14 be initiated again.

15 **710-4 ACCEPTANCE OF CONCRETE**

16 The Department will test the concrete pavement for acceptance with respect to compressive
17 strength and thickness on a lot by lot basis in accordance with Article 700-15 and the
18 requirements herein.

19 For all concrete pavement, including mainline, shoulders, ramps, tapers, intersections,
20 entrances, crossovers and irregular areas not otherwise defined, produce a lot consisting of
21 1,333.3 sy or fraction thereof placed within 28 calendar days. From each lot, the Engineer
22 will make at least one set of two 6 inch x 12 inch cylinders from a randomly selected batch of
23 concrete. The average compression strength of the 2 cylinders is considered one test. If
24 Department personnel make and test additional sets of cylinders for a lot, all sets will be
25 averaged with the original set to determine the strength. In the case of low strength, the
26 Engineer will perform an investigation.

27 **710-5 CONSTRUCTION METHODS**

28 Construct concrete pavement in accordance with Section 700.

29 Place concrete in 2 lane minimum widths in a single operation except as follows:

30 (A) Where the total number of lanes is an odd number, in which case one of the lanes may be
31 placed in a separate operation.

32 (B) Areas such as ramps or auxiliary lanes where the total width is less than 2 lanes.

33 **710-6 FINISHING**

34 Screed and float finish the concrete to the required cross section that minimizes or eliminates
35 hand finishing. Additional water for finishing will not be allowed. Hand finishing will not be
36 permitted except under the following conditions:

37 (A) Narrow widths or irregular areas, where operation of mechanical equipment is
38 impractical.

- 1 (B) If a breakdown of mechanical equipment occurs, hand methods may be used to finish
2 only that concrete deposited on the base before the breakdown.
- 3 (C) Abnormal circumstances of short duration subject to approval.
- 4 Produce a final finish on the pavement surface true to grade and uniform in appearance and
5 free of irregular, rough or porous areas.
- 6 Following the finishing of the pavement by screeding, floating and checking with
7 straightedges, further finish the surface of the pavement by burlap dragging or other
8 acceptable method to produce a uniform surface texture. Pull the burlap drag in a longitudinal
9 direction.
- 10 Produce the final surface finish on all mainline pavement, auxiliary lanes, and ramps by
11 mechanical equipment for longitudinally tined grooves while the concrete is plastic. The
12 tining shall be done with a mechanical device such as a wire comb. The comb shall have a
13 single row of tines. Each shall have a nominal width of 5/56 inch to 1/8 inch. The nominal
14 spacing of the tines shall be $3/4 \pm 1/8$ inch center-to-center. The nominal depth of tined
15 groove in the plastic concrete shall be $1/8 \pm 1/32$ inch.
- 16 Longitudinal tining shall be accomplished by equipment with automated horizontal and
17 vertical controls to ensure straight, uniform depth tined grooves. The texture geometry shall
18 be the same as imparted throughout the length of the tining comb. A 2 inch to 3 inch wide
19 strip of pavement surface shall be protected from tining for the length of and centered about
20 longitudinal joints.
- 21 The tining operation shall be done so that the desired surface texture will be achieved while
22 minimizing displacement of the larger aggregate particles and before the surface permanently
23 sets. Where abutting pavement is to be placed, the tining shall extend as close to the edge as
24 possible without damaging the edge. If abutting pavement is not to be placed, the 6 inch area
25 nearest the edge or 1 foot from the face of the curb shall not be tined. Hand-operated tining
26 equipment that produces an equivalent texture may be used only on small or irregularly
27 shaped areas. Tines shall be thoroughly cleaned at the end of each day's use and damaged or
28 worn tines replaced.
- 29 When surface corrections for pavement smoothness are made in the hardened concrete, no
30 additional texturing is required.
- 31 After final finishing, hand finishing may be required on the edges of pavement and joints
32 whenever irregularities in surface texture or alignment occur. Care should be taken in hand
33 finishing pavement edges to avoid ridges or high places that will prevent water from draining
34 out of the transverse grooves.
- 35 The use of excessive water during the finishing operations will not be permitted.
- 36 Provide a textured surface with an average texture depth of 0.8 mm as tested in accordance
37 with ASTM E965 with no single test having a texture depth of 0.5 mm or less. Perform 4
38 randomly located tests in accordance with ASTM E965 within the initial pavement lot of each
39 mobilization in the presence of the Engineer. A "lot" is defined in Article 710-4. If the
40 average of the 4 tests does not meet the above criteria, make appropriate changes to the
41 surface texture operations and test the next lot as detailed above. Once the surface texture
42 process is established to meet minimum texture requirements, maintain consistency within the
43 operation to provide the above minimum texture depth. Perform additional sand patch tests in
44 accordance with ASTM E965 when directed.
- 45 If the surface texture becomes damaged or reduced by rain or any other action, reestablish or
46 restore surface texture by an approved method.
- 47 **710-7 FINAL SURFACE TESTING**
- 48 Use an Inertial Profiler to measure the longitudinal pavement profile for construction quality
49 control and smoothness acceptance. Use a profiler with line laser technology as single-point

Section 710

- 1 laser technology will not be allowed. Produce International Roughness Index (IRI) and Mean
2 Roughness Index (MRI) values for measuring smoothness.
- 3 Use testing and recording software to produce electronic inertial road profiles in a format
4 compatible with the latest version of FHWA's ProVAL (Profile Viewing and Analysis)
5 software.
- 6 The Inertial Profiler shall be calibrated and verified in accordance with the most current
7 version of AASHTO M 328. Provide certification documentation that the profiler meets
8 AASHTO M 328 to the Engineer before the first day the Inertial Profiler is used on the
9 project.
- 10 Configure the profiler to record the actual elevation of the pavement surface. Do not use the
11 profiler's internal IRI calculation mode. The profile data shall be filtered with a cutoff
12 wavelength of 250 feet. The interval at which relative profile elevations are reported shall be
13 a maximum of 1 inch.
- 14 Provide IRI data in accordance with most current version of ASTM E1926. Use personnel
15 trained to record and evaluate IRI data.
- 16 Provide a competent operator, trained in the operation of the Inertial Profiler. Operation of
17 the Inertial Profiling system shall conform to AASHTO R 57.
- 18 Provide the user selected Inertial Profiler settings to the Engineer for the project records.
19 Certification of the Inertial Profiling system shall conform to AASHTO R 56.
- 20 Remove all objects and foreign material on the pavement surface prior to longitudinal
21 pavement profile testing.
- 22 Operate the profiler at any speed as per the manufacturer's recommendations, however, the
23 speed must be constant to within ± 3 mph of the intended speed and any required acceleration
24 should be as gradual as possible. For example, if the intended speed were 30 mph, the
25 acceptable range of speed for testing would be 27 to 33 mph.
- 26 Operate the Inertial Profiler in the direction of the final traffic pattern. Collect IRI data from
27 both wheel paths during the same run. It is permissible to collect data one wheel path at a
28 time if each wheel path is tested and evaluated separately. Define a "wheel path" as the 3 feet
29 from the edge of the travel lane. MRI values are the average of the IRI values from both
30 wheel paths. When using an inertial profiler that collects a single trace per pass, take care to
31 ensure that the measurements from each trace in a travel lane start and stop at the same
32 longitudinal locations. Unless otherwise specified, multiple runs are not necessary for data
33 collection.
- 34 Operate the automatic triggering method at all times unless impractical. A tape stripe or
35 traffic cone wrapped with reflective material may be used to alert the profiler's automatic
36 triggering sensor to begin data collection. The profiler shall reach the intended operating
37 speed before entering the test section. The runup and runout distances should be sufficient to
38 obtain the intended operating speed and to slow down after testing is completed.
- 39 Divide the pavement surface for the project into sections which represent a continuous
40 placement (i.e. the start of the project to bridge, intersection to intersection). Terminate
41 a section 50 feet before a bridge approach, railroad track, or similar interruption. (Separate
42 into 0.10-mile sections).
- 43 The evaluation of the profiles will be performed on a section basis. A section is 0.10 mile of
44 a single pavement lane. For any section, which is less than 0.10 mile in length, the applicable
45 pay adjustment incentive will be prorated on the basis of the actual length.
- 46 Mark the limits of structures and other special areas to be excluded from testing using the
47 profiler's event identifier such that the exact locations can be extracted from the profile data
48 file during processing.

1 Unless otherwise authorized by the Engineer, perform all smoothness testing in the presence
 2 of the Engineer. Perform smoothness tests on the finished surface of the completed project or
 3 at the completion of a major stage of construction as approved by the Engineer. Coordinate
 4 with and receive authorization from the Engineer before starting smoothness testing. Perform
 5 smoothness tests within 7 days after receiving authorization. Any testing performed without
 6 the Engineer’s presence, unless otherwise authorized, may be ordered retested at the
 7 Contractor’s expense.

8 After testing, transfer the profile data from the profiler portable computer’s hard drive to a
 9 write once storage media (USB flash drive, external hard drive or DVD-R) or electronic
 10 media approved by the Engineer. Label the disk or electronic media with the Project number,
 11 Route, file number, date, and termini of the profile data. Submit the electronic data on the
 12 approved media to the Engineer immediately after testing and this media will not be returned
 13 to the Contractor.

14 Submit documentation and electronic data of the evaluation for each section to the Engineer
 15 within 10 days after completion of the smoothness testing. Submit the electronic files
 16 compatible with ProVAL and the evaluation in tabular form with each 0.10-mile segment
 17 occupying a row. Include each row with the beginning and ending station for the section, the
 18 length of the section, the original IRI values from each wheel path, and the MRI value for the
 19 section. Each continuous run for a section will occupy a separate table and each table will
 20 have a header that includes the following: the project contract number, county, the roadway
 21 number or designation, a lane designation, the dates of the smoothness runs, and the
 22 beginning and ending station of the continuous run. Summarize each table at the bottom.

23 Traffic control and all associated activities included in the pavement smoothness testing of the
 24 pavement surface will be the responsibility of the Contractor.

25 **(A) Acceptance for New Construction**

26 IRI and MRI numbers recorded in inches per mile will be established for each
 27 0.10-mile section for each travel lane of the finished pavement surface designated by the
 28 Contract.

29 Areas excluded from testing by the profiler will be tested by the Contractor and the
 30 Engineer using a 10-foot stationary straightedge furnished by the Contractor. Any
 31 location on the pavement selected by the Department shall be tested as well as all
 32 transverse joints. Apply the straightedge parallel to the centerline of the surface. Do not
 33 exceed 1/8 inch variation of the surface being tested from the edge of the straightedge
 34 between any 2 contact points. Correct areas found to exceed this tolerance by removal of
 35 the defective work and replacement with new material, unless other corrective measures
 36 are permitted. Provide the work and materials required in the correction of defective
 37 work.

38 Table 710-1 provides the acceptance quality rating scale of pavement based on the final
 39 rideability determination.

TABLE 710-1	
MRI PRICE ADJUSTMENT PER 0.10-MILE SECTION	
MRI after Completion (Inches Per Mile)	Price Adjustment Per Lane (0.10-Mile Section)
45.0 and Under	\$200.00
45.1-55.0	PA = 600 – (10 * MRI)
55.1-70.0	Acceptable (No Pay Adjustment)
70.1-90.0	PA = 650 – (10 * MRI)
Over 90.1	Corrective Action Required

40 This price adjustment will apply to each 0.10-mile section based on the Mean Roughness
 41 Index (MRI), the average IRI values from both wheel paths.

Section 710

1 When corrections to the pavement surface are required, the Engineer shall approve the
2 Contractor's method of correction. Methods of correction shall be diamond grinding,
3 remove and replace, or other methods approved by the Engineer. To produce a uniform
4 cross section, the Engineer may require correction to the adjoining traffic lanes or
5 shoulders. Corrections to the pavement surface, the adjoining traffic lanes and shoulders
6 will be at no cost to the Department.

7 Where corrections are made after the initial smoothness testing, the pavement will be
8 retested by the Contractor to verify that corrections have produced the acceptable ride
9 surface. No incentives will be provided for sections on which corrective actions have
10 been required. The Contractor will have one opportunity to perform corrective action(s).

11 (B) Localized Roughness

12 Areas of localized roughness shall be identified through the "Smoothness Assurance
13 Module" provided in the ProVAL software. Use the "Smoothness Assurance Module" to
14 optimize repair strategies by analyzing the measurements from profiles collected using
15 inertial profilers. The ride quality threshold for localized roughness shall be 150 inches
16 per mile at the continuous short interval of 25 feet. Submit a continuous roughness report
17 to identify sections outside the threshold and identify all localized roughness, with the
18 signature of the Operator included with the submitted IRI trace and electronic files.

19 The Department will require that corrective action be taken regardless of final IRI.
20 Re-profile the corrected area to ensure that the corrective action was successful. If the
21 corrective action is not successful, the Department will assess a penalty or require
22 additional corrective action.

$$\text{PA} = (165 - \text{LR\#}) 5$$

Where:

$$\begin{aligned} \text{PA} &= \text{Pay Adjustment (dollars)} \\ \text{LR\#} &= \text{The Localized Roughness number determined from} \\ &\quad \text{SAM report for the ride quality threshold} \end{aligned}$$

23 Corrective work for localized roughness shall be approved by the Engineer before
24 performing the work and shall consist of either diamond grinding or other methods
25 approved by the Engineer. Any corrective action performed shall not reduce the integrity
26 or durability of the pavement that is to remain in place. Notify the Engineer 5 days prior
27 to commencement of the corrective action.

28 Localized roughness correction work shall be for the entire traffic lane width. Pavement
29 cross slope shall be maintained through corrective areas.

30 710-8 MARKING FOR STATION NUMBERS AND DRAINAGE OUTLETS

31 Mark the pavement at locations as shown on the plans with station numbers. Mark the
32 pavement by pressing beveled-face metal dies between 4 inches and 6 inches high into the
33 plastic concrete.

34 At locations where shoulder drain outlets are placed, mark the edge of pavement nearest the
35 outlet with the letters "OL". Use the same marking procedure as for station numbers.

36 710-9 THICKNESS TOLERANCES

37 A lot for thickness acceptance testing is defined in Article 710-4.

38 To establish an adjusted unit price, if appropriate, for mainline pavement, take one 4
39 inch diameter core from each lot at a random location as directed. Other areas such as
40 intersections, entrances, crossovers and ramps will each be considered as one lot and the
41 thickness of each of these lots will be determined separately. Small irregular areas may be
42 included as part of another lot. Take one core for each 1,333.3 sy of pavement or fraction
43 thereof in the lot.

1 When the measurement of any core, original core or additional cores taken to calculate the
2 average, is less than the plan thickness by more than 1.0 inch, the extent of the removal area
3 due to thickness deficiency will be determined by taking additional exploratory cores at
4 approximately 10 foot intervals parallel to the center line in each direction from the deficient
5 core until an exploratory core is found in each direction which is within 1.0 inch of the plan
6 thickness. The pavement between these exploratory cores will be removed full lane width
7 wide and replaced with concrete of the thickness shown on the plans. Exploratory cores for
8 deficient thickness will not be used in averages for adjusted unit price.

9 When the measurement of the core from a lot is deficient by 0.2 inch or less from the plan
10 thickness, no pay reduction will be made for thickness. When such measurement is deficient
11 by more than 0.2 inch from the plan thickness, take 2 additional cores at random locations
12 within the lot and calculate the average thickness of the lot from the 3 cores.

13 In determining the average thickness of the pavement lot, the Engineer will use all 3 core
14 measurements. Individual core measurements which are greater than the plan thickness + 0.2
15 inch will be considered as the plan thickness + 0.2 inch. Individual cores which are less than
16 the plan thickness - 1.0 inch will be considered as the plan thickness - 1.0 inch. If the average
17 measurement of the 3 cores is within 0.2 inch from the plan thickness, full payment will be
18 made. If the average measurement of the 3 cores is deficient by more than 0.2 inch from the
19 plan thickness, an adjusted unit price in accordance with Subarticle 710-10(B) will be paid for
20 the lot represented.

21 Areas found deficient in thickness by more than 1.0 inch shall be removed and replaced with
22 concrete of the thickness shown on the plans. Any full lane or full shoulder width repairs to
23 the concrete pavement shall be performed in accordance with the *North Carolina Department*
24 *of Transportation Partial and Full Depth Repair Manual* and not be less than 1/2 of the slab
25 length.

26 Patch all core holes within 72 hours of taking the core, using a Department approved
27 nonshrink grout compatible with the pavement concrete.

28 **710-10 MEASUREMENT AND PAYMENT**

29 **(A) General**

30 The quantity of Portland cement concrete pavement to be paid will be the actual number
31 of square yards of concrete pavement completed and accepted. In measuring this
32 quantity, the width of the pavement will be as called for on the plans or as directed. The
33 length will be the actual length constructed, measured along the centerline of the
34 pavement.

35 Separate measurement will be made of pavement that is deficient in thickness by more
36 than 0.2 inch and of pavement that is deficient in compressive strength.

37 The quantities of Portland cement concrete pavement will be paid at the contract unit
38 price per square yard for ___" *Portland Cement Concrete Pavement, Through Lanes, (with*
39 *dowels)*, ___" *Portland Cement Concrete Pavement, Ramps, (with dowels)* or ___" *Portland*
40 *Cement Concrete Pavement, Miscellaneous, (without dowels)*, or if applicable, at such
41 contract unit prices adjusted in accordance with the requirements shown below. No unit
42 price adjustments on lots will be made until a final determination of the lot strength and
43 depth is made. Pavement will be classified as through lane, ramp or miscellaneous
44 pavement in accordance with the classification shown on the plans.

45 Payment for all work of surface testing will be incidental to the contract unit price for
46 *Portland Cement Concrete Pavement, Through Lanes, (with dowels)* for *Surface Testing*
47 *Concrete Pavement*.

Section 710

1 (B) Pavement Deficient In Thickness

2 The quantities of Portland cement concrete pavement which are deficient in thickness by
3 more than 0.2 inch but not deficient by more than 1.0 inch, measured as provided in
4 Article 710-10, will be paid at an adjusted contract unit price per square yard for
5 ___" *Portland Cement Concrete Pavement, Through Lanes, (with dowels)*, ___" *Portland*
6 *Cement Concrete Pavement, Ramps, (with dowels)* or ___" *Portland Cement Concrete*
7 *Pavement, Miscellaneous, (without dowels)* completed in place and accepted.

8 The adjusted contract unit price is determined by the following formula, except no pay
9 over 100% will be allowed:

$$10 \quad \text{Pay Factor (\%)} = 110 - \left[50 \times (\text{Plan Thickness} - \text{Average Core Thickness}) \right]$$

11 Exploratory cores for deficient thickness will not be used in averages for adjusted unit
12 price. Where pavement deficient by more than 1.0 inch is removed and replaced, the
13 replacement pavement will be paid at the contract unit price per square yard for
14 ___" *Portland Cement Concrete Pavement, Through Lanes, (with dowels)*, ___" *Portland*
15 *Cement Concrete Pavement, Ramps, (with dowels)* or ___" *Portland Cement Concrete*
16 *Pavement, Miscellaneous, (without dowels)* which price and payment will be full
17 compensation for all work of placement, removal, restoration of subgrade and base and
18 replacement.

19 (C) Concrete Pavement Varying In Strength

20 One of the following formulas will be used to calculate the concrete pavement pay factor.

21 (1) Compressive Strength

22 The pay factor for pavement achieving a compressive strength in 28 days of
23 4,500 psi or greater is 100%. The pay factor for pavement achieving a compressive
24 strength in 28 days between 3,500 psi and 4,500 psi is determined by the following
25 formula:

$$26 \quad \text{Pay Factor (\%)} = 100.0 - \left[0.05 \times (4,500 - \text{Compressive Strength}) \right]$$

27 (pay factor rounded to nearest 0.1%)

28 (2) Flexural Strength

29 The pay factor for pavement achieving a flexural strength in 28 days of 650 psi or
30 greater is 100%. The pay factor for pavement achieving a flexural strength in
31 28 days between 600 psi and 650 psi is determined by the following formula:

$$32 \quad \text{Pay Factor (\%)} = 100.0 - (650 - \text{Flexural Strength})$$

33 (pay factor rounded to nearest 0.1%)

34 The quantities of Portland cement concrete pavement that meet these criteria, will be paid
35 at an adjusted unit price per square yard for ___" *Portland Cement Concrete Pavement,*
36 *Through Lanes, (with dowels)*, ___" *Portland Cement Concrete Pavement, Ramps, (with*
37 *dowels)* or ___" *Portland Cement Concrete Pavement, Miscellaneous, (without dowels)*
38 completed in place and accepted. The adjusted contract unit price will be determined by
39 multiplying the contract unit price by the pay factor level determined for the average
40 strength of concrete in each lot and will be applicable to the total square yards of concrete
41 in each lot.

42 Any pavement that fails to attain 3,500 psi in compression is subject to removal. If
43 allowed to remain in place, the pavement will be accepted at a reduced unit price based
44 on a pay factor level of 50% as provided in Article 105-3.

45 Where pavement deficient in strength is removed and replaced, the replacement
46 pavement, if acceptable, will be paid at the contract unit price for ___" *Portland Cement*

1 *Concrete Pavement, Through Lanes, (with dowels), ___" Portland Cement Concrete*
 2 *Pavement, Ramps, (with dowels) or ___" Portland Cement Concrete Pavement,*
 3 *Miscellaneous, (without dowels) which price and payment will be full compensation for*
 4 *all work including placement, removal, restoration of subgrade and base and replacement.*

5 **(D) Multiple Adjustments in Price**

6 Pavement found deficient in both thickness and strength will be evaluated by the
 7 Engineer to determine if it may be permitted to remain in place. Pavement permitted to
 8 remain in place will be paid at a reduced price determined by successively multiplying
 9 the contract price by the appropriate factor indicated for each deficiency.

10 **(E) Compensation**

11 Payment at the contract unit prices for ___" *Portland Cement Concrete Pavement,*
 12 *Through Lanes, (with dowels) and ___" Portland Cement Concrete Pavement Ramps,*
 13 *(with dowels) and ___" Portland Cement Concrete Pavement, Miscellaneous, (without*
 14 *dowels) will be full compensation for all work covered by this section.*

15 **(F) Pay Items**

16 Payment will be made under:

Pay Item	Pay Unit
___" Portland Cement Concrete Pavement, Through Lanes (with dowels)	Square Yard
___" Portland Cement Concrete Pavement, Ramps (with dowels)	Square Yard
___" Portland Cement Concrete Pavement, Miscellaneous (without dowels)	Square Yard

17

SECTION 720

18

CONCRETE SHOULDERS

19 **720-1 DESCRIPTION**

20 Perform the work covered by this section including, but not limited to, the construction of
 21 Portland cement concrete shoulders in accordance with this section and with the lines, grades
 22 and dimensions shown on the plans; designing the mix; furnishing and placing the concrete
 23 shoulders; furnishing maturity testing equipment; furnishing all admixtures and additives;
 24 constructing joints; furnishing joint materials; curing the shoulder and furnishing curing
 25 materials; coring and patching core holes; taking actions to prevent or repair cracking; and
 26 removing and replacing unsatisfactory shoulder.

27 **720-2 MATERIALS**

28 Refer to Division 10.

Item	Section
Curing Agents	1026
Dowels and Tie Bars	1070-6
Joint Filler	1028-1
Low Modulus Silicone Sealant	1028-3
Portland Cement Concrete	1000
Water	1024-4

29 **720-3 COMPOSITION OF CONCRETE**

30 Design the concrete mix in accordance with Section 1000.

Section 720

1 720-4 ACCEPTANCE OF CONCRETE

2 The Engineer will test concrete shoulders for acceptance with respect to compressive strength
3 and thickness on a lot by lot basis. A "lot" is defined in Article 710-4.

4 720-5 EQUIPMENT

5 Use equipment in the production and placement of the concrete shoulders in accordance with
6 Section 700 and Section 1000.

7 720-6 CONSTRUCTION METHODS

8 Place the concrete shoulders only in the presence of an authorized representative of the
9 Engineer. Construct concrete shoulders in accordance with Section 700.

10 Place the full width of the shoulder in a single operation.

11 720-7 FINISHING

12 Finish the shoulder surface with approved equipment. Hand finishing will be permitted when
13 the use of mechanical finishing equipment is impractical.

14 Perform the final finishing of the shoulder surface by burlap dragging, brooming or other
15 acceptable methods that will produce a similar surface texture acceptable to the Engineer.

16 720-8 JOINTS

17 Construct and seal all joints in accordance with Articles 700-11 and 700-12 except as
18 provided in this article. Saw all joints in the concrete shoulder and seal with joint sealer as
19 shown in the plans.

20 Dowels will not be required at the transverse joints in the concrete shoulder. Use tie bars
21 between the concrete pavement and the concrete shoulder.

22 Match the transverse joints in the concrete shoulder with the transverse joints in the adjacent
23 concrete pavement.

24 720-9 THICKNESS TOLERANCES

25 The Engineer will determine the thickness of the shoulder by measurement of cores in
26 accordance with AASHTO T 148. A lot for thickness acceptance testing is defined in
27 Article 710-4.

28 Take one 4 inch core from each lot at a random location as directed. Core each location in the
29 presence of the Engineer. The Engineer will take immediate possession of the cores. Take
30 cores with a diameter of 4 inches and deliver them to the Engineer for measurement. When
31 the required thickness for the shoulder varies, each core will be measured and compared to the
32 required thickness for the shoulder at the location of the core. The deviation of the measured
33 core thickness from the required thickness will be recorded as a plus or minus value for each
34 core. Thickness tolerances in Article 710-9 apply for concrete shoulders.

35 720-10 MEASUREMENT AND PAYMENT

36 (A) General

37 *Concrete Shoulders Adjacent to ___" Pavement* will be measured and paid as the actual
38 number of square yards of shoulders completed and accepted. In measuring this quantity,
39 the width of the shoulders will be as called for on the plans or as directed by the
40 Engineer. The length will be the actual length constructed, measured along the surface of
41 the shoulders at the centerline of each shoulder.

42 (B) Shoulder Deficient in Thickness

43 Pay factors are determined in accordance with Subarticle 710-10(B). When the shoulder
44 is deficient in thickness by more than 1 inch, the Engineer will determine if the shoulder

1 can be left in place or be removed and replaced. Where the Engineer determines the
 2 shoulder can be left in place, the shoulder will be accepted at a reduced unit price not to
 3 exceed 50% as provided in Article 105-3.

4 (C) Concrete Shoulder Varying In Strength

5 Concrete shoulders shall meet the strength requirements of Subarticle 710-10(C).

6 The quantities of concrete shoulder that fail to meet 4,500 psi, measured as provided in
 7 Article 710-10, will be paid for at an adjusted unit price per square yard completed in
 8 place and accepted. The adjusted contract unit price will be determined by multiplying
 9 the contract unit price by the pay factor level in Subarticle 710-10(C).

10 Where concrete shoulder deficient in strength is removed and replaced, the replacement
 11 pavement, if acceptable, will be paid at the contract unit price for *Concrete Shoulders*
 12 *Adjacent to ___" Pavement*, which price and payment will be full compensation for all
 13 work of placement, removal and replacement.

14 (D) Multiple Adjustments in Price

15 Concrete shoulder found deficient in both thickness and strength will be evaluated by the
 16 Engineer to determine if it may be permitted to remain in place. Concrete shoulder
 17 permitted to remain in place will be paid at a reduced price determined by successively
 18 multiplying the contract price by the appropriate factor indicated for each deficiency.

19 (E) Pay Items

20 Payment will be made under:

Pay Item	Pay Unit
Concrete Shoulders Adjacent to ___" Pavement	Square Yard

21 SECTION 723 22 CONCRETE REPAIR

23 723-1 DESCRIPTION

24 Perform work covered by this section, including, patching concrete pavement spalls and
 25 repair of jointed concrete pavement slabs using very high early strength concrete.

26 Patch partial and full depth spalls in existing Portland cement concrete pavement by sawing
 27 and removing the broken, damaged or disintegrated concrete pavement from the spalled areas
 28 of the pavement surface and patch the areas with an approved patching material. Alternate
 29 methods and materials for patching concrete spalls may be submitted by the Contractor for
 30 approval by the Engineer.

31 Remove and satisfactory dispose of existing damaged jointed concrete pavement slabs,
 32 furnish and place new jointed concrete pavement slabs as shown in the plans or directed by
 33 the Engineer.

34 723-2 MATERIALS

35 Refer to Divisions 6, 7 and 10.

Item	Section
Portland Cement Concrete	1000
Curing Agents	1026
Water	1024-4
Select Material, Class IV	1016
Dowels and Tie Bars	1070-6
Geotextile for Soil Stabilization	270

Section 723

1 For repair of jointed concrete pavement slabs, use Select Material, Class IV. If Select
2 Material, Class IV does not meet the requirements of Article 1016, the Engineer may consider
3 the material reasonable acceptable in accordance with Article 105-3.

4 Patching material shall be mixed and installed, handled and stored, and cured in accordance
5 with the manufacturer's instructions. The Contractor may, at his option, use any approved
6 material from the NCDOT APL or an approved equal as per the Engineer.

7 **723-3 METHODS OF PRODUCTION**

8 **(A) Repair of Jointed Concrete Pavement Slabs**

9 Repair the slabs in accordance with Section 700.

10 The concrete shall meet the requirements of Article 723-4. Repair of the slabs shall be
11 conducted in one lane at a time and be accomplished with other operations in progress in
12 the same area.

13 For all cases of slab removal, remove the entire 12 feet width and a minimum of 6 feet in
14 the travel direction. Any remaining portion of a slab that is removed shall not be less
15 than 6 feet in the travel direction.

16 As a result of the full depth sawing of the existing pavement to remove the distressed
17 area, saw cuts that extend into the adjacent pavement shall be filled with epoxy prior to
18 placing traffic on the new area. The epoxy shall meet the requirements of Section 1081,
19 Type 3.

20 Take necessary measures to protect the exposed subgrade and base from damage
21 resulting from surface water or rain during the period between the pavement removal and
22 replacement. The Contractor shall submit his plan for removing the pavement areas to
23 the Engineer for approval. The removal method shall minimize damage to the subgrade
24 and to adjacent pavement and shoulders.

25 At locations as directed by the Engineer, the Contractor shall:

26 (1) Remove unsuitable aggregate base material and backfill with Select Material, Class
27 IV as directed by the Engineer; or

28 (2) Remove unsuitable aggregate base material, undercut the subgrade, place Geotextile
29 for Soil Stabilization per Section 270, and backfill with Select Material, Class IV as
30 directed by the Engineer.

31 Thoroughly tamp any loosened subgrade or base material to the satisfaction of the
32 Engineer before the pavement is replaced. New pavement shall be cast to match the
33 thickness of the adjacent slabs.

34 Pneumatic or hydraulic drills and bits that will drill a hole in the existing concrete faces
35 for placement of the dowels at location specified on the Plans shall be used. The
36 equipment shall be operated so as to prevent damage to the pavement being drilled. The
37 drilling procedure shall be approved by the Engineer. The drilled holes shall be
38 thoroughly cleaned of all contaminants and the dowels of specified type and size shall
39 then be set into the hardened concrete face of the existing pavement with an epoxy
40 bonding compound meeting the requirements of a Type 3A epoxy detailed in Section
41 1081. The specified dowels shall be placed at locations noted on Plan details with one-
42 half of dowel protruding beyond the hardened face of existing pavement and placed at
43 correct horizontal and vertical alignment with misalignment not to exceed 0.4 inches in
44 the vertical or oblique plane. The epoxy shall be allowed to harden sufficiently prior to
45 placing concrete to prevent any movement of the dowels during the placement of the
46 concrete. A sufficient amount of epoxy must be placed in the back of the hole so that the
47 entire cavity around the dowel is completely filled upon insertion of the dowel bars. Any
48 excess epoxy shall be removed. The epoxy adhesive must be packaged in a cartridge
49 with a mixing nozzle that thoroughly mixes the two components as they are dispensed

1 (the mixing nozzle must be a minimum of 8 inches long) or may be placed with a
2 machine which mixes the two components thoroughly and to the proper ratio as the
3 material is being placed.

4 Use dowels of the type, size, spacing, and at the location specified in the *Roadway*
5 *Standard Drawing*. At no time shall dowels be driven into a dowel hole with sledge
6 hammers or other devices. In all cases, any dowel which cannot be freely inserted into a
7 dowel hole will be rejected for use.

8 Prior to placing concrete, the vertical exposed faces of the existing slabs shall be
9 thoroughly cleaned of contaminants using wire brushing or other methods approved by
10 the Engineer. Extra care must be taken to remove all existing silicone or other joint
11 sealant from the exposed concrete faces.

12 The concrete shall be deposited within the slab replacement area in such manner as to
13 require as little re-handing as possible, to prevent segregation of the mix. Hand spreading
14 shall be minimized as much as possible, but where necessary, shall be done with shovels,
15 not rakes. Workers will not be allowed to walk in the fresh concrete with shoes coated
16 with earth or other foreign substances. The replaced slab area shall be filled with
17 concrete and thoroughly consolidated by rodding, spading, and sufficient vibration to
18 form a dense homogeneous mass throughout the area. The final surface area shall be
19 uniform in appearance and free of irregularities and porous areas.

20 The finished surface, including joints, shall meet a surface tolerance of 1/8 inch in 10 feet
21 in any direction. Any necessary corrections shall be done by grinding. Any replaced slab
22 which is low in relation to adjacent slabs may be ordered replaced by the Engineer.
23 Replacement of such a slab would generally be required if, in the opinion of the
24 Engineer, excessive grinding of the adjacent pavement is necessary to match the profile
25 of the full depth slab replacement or if a drainage problem would be created by grinding
26 the adjacent pavement.

27 The surface finish of the proposed concrete pavement shall be a burlap drag finish and
28 conform to the cross-section of adjacent pavement. The method of finishing shall be
29 approved by the Engineer. Immediately after finishing operations have been completed
30 and surface water has disappeared, all exposed surfaces of the pavement shall be cured in
31 accordance with the applicable provisions of Section 700-9 and Section 1026.

32 **(B) Patching Concrete Pavement Spalls**

33 When the Contractor is working under a lane closure, concrete patching operations shall
34 be conducted in one lane at a time or as directed by the Engineer. The work shall be
35 accomplished with other operations in progress within the same area.

36 Clean surfaces within the repair area free of oil, dust, dirt, deteriorated concrete and other
37 contaminants immediately before placement of the epoxy and patching material. Apply
38 epoxy to the vertical and flat surface of the cleaned spall areas prior to placing concrete.

39 The pavement shall not be opened to traffic until the concrete is appropriately cured per
40 the manufacturer's recommendations.

41 **723-4 Very High Early Strength Concrete for Concrete Pavement Repair**

42 Submit mix designs for Very High Early Strength Concrete for Concrete Pavement Repair in
43 terms of saturated surface dry weights on M & T Form 312U for acceptance at least 30 days
44 before proposed use.

45 Use a mix sufficient to obtain at least a flexural strength of 400 psi at 4 hours or prior to
46 opening to traffic. Entrain 5% \pm 1.5% air in the freshly mixed concrete. Produce the mix
47 with a maximum slump of 1.5 inches for placement by a fully mechanized paving train and a
48 maximum slump of 3 inches for hand placement.

Section 723

1 Use cement, fine aggregate, coarse aggregate, admixtures and, optionally, pozzolan as shown
2 on NCDOT's APL.

3 Submit 4 hour flexural strength results of at least 6 beams made and tested in accordance with
4 AASHTO T126 and T97 with M & T Form 312U. In addition, submit 4 hour compressive
5 strength results of at least six 4 inch by 8 inch or 6 inch by 12 inch cylinders and maturity test
6 results of the mix. With permission of the Engineer, compressive strength testing and maturity
7 testing may be used in lieu of or concurrent with flexural strength testing to determine the
8 acceptability of the concrete in the field.

9 Design and produce the mix in accordance a concrete system that can produce 400 psi flexural
10 strength in approximately 4 hours or a comparable equal system. The timing of the addition of
11 hydration control admixtures is critical to the performance of this concrete; therefore, an
12 admixture representative shall be present on the job when Very High Early Strength Concrete
13 is batched.

14 **723-5 Measurement and Payment**

15 The quantity of *Repair of Jointed Concrete Pavement Slab* to be paid for at the unit price
16 established herein will be the actual number of square yards of jointed concrete pavement
17 with dowels which has been completed and accepted. In measuring this quantity, the width of
18 the repair will be measured perpendicular to the centerline of the lane. The length will be the
19 actual length constructed, measured along the centerline of the pavement.

20 The unit price for *Repair of Jointed Concrete Pavement Slabs* will be full compensation for
21 all work covered including furnishing all labor, materials, tools, equipment, and incidentals
22 for doing all work involved in placement of the concrete including but not limited to
23 furnishing placing, and curing concrete; dowel bars; sawing and removing concrete; and
24 filling saw cuts around the pavement repair.

25 The quantity of *Select Material, Class IV* to be paid for at the unit price established herein
26 will be the actual number of tons of aggregate which has been incorporated into the completed
27 and accepted work. The aggregate will be measured by being weighed in trucks on certified
28 platform scales or other certified weighing devices. No deductions will be made for any
29 moisture contained in the aggregate at the time of weighing.

30 The unit price for *Select Material, Class IV* will be full compensation for all work including
31 but not limited to, removing of existing aggregate base course and backfilling with *Select*
32 *Material, Class IV*.

33 The quantity of material removed from beneath the base course as *Undercut Excavation* will
34 be measured and paid for in accordance with Section 225.

35 The quantity of *Geotextile for Soil Stabilization* furnished and placed as directed will be
36 measured and paid for in accordance with Section 270.

37 *Patching Concrete Pavement Spalls* to be paid will be the actual number of square feet of
38 existing concrete which has been patched and accepted. The actual length and width of each
39 completed patch will be measured along the surface of the patch. The price and payment will
40 be full compensation for work involved including furnishing labor, materials, tools,
41 equipment and incidentals for sawing concrete pavement, removing deteriorated concrete,
42 cleaning surfaces, epoxying, furnishing, placing, finishing, and curing concrete patch.

1 Payment will be made under:

Pay Item	Pay Unit
Repair of Jointed Concrete Pavement Slabs	Square Yard
Select Material, Class IV	Ton
Patching Concrete Pavement Spalls	Square Foot

2

SECTION 724

3

NONWOVEN GEOTEXTILE INTERLAYER

4

724-1 DESCRIPTION

5 Furnish and install a non-woven geotextile interlayer at locations shown on the plans.
 6 Schedule a Pre-Pave Meeting at least 3 weeks prior to paving to discuss installation and
 7 construction procedures for the nonwoven geotextile interlayer with representatives from the
 8 Contractor including Paving Superintendent, Subcontractor, Geotextile Manufacturer,
 9 Engineer, Roadway Inspector, Area Roadway Construction Engineer, Division Construction
 10 Engineer, and the State Pavement Construction Engineer.

11

724-2 MATERIALS

12 The geotextile interlayer shall be constructed of a non-woven needle-punched geotextile, with
 13 no thermal treatment (calendaring or IR). The material shall be resistant to chemicals,
 14 mildew, and rot and shall not have any tears or holes that will adversely affect the in-situ
 15 performance and physical properties of the installed material.

16 Furnish with each shipment a Type 3 Certification in accordance with Article 106-3 certifying
 17 that the paving mat is a non-woven needle-punched geotextile with no thermal treatment
 18 (calendaring or IR) meeting the requirements in Table 724-1.

Section 724

TABLE 724-1			
PHYSICAL PROPERTIES OF NON-WOVEN GEOTEXTILE INTERLAYER			
Property	Test Method	Units	Value
Minimum Mass per unit area	ASTM D 5261	oz/yd ²	15.0
Minimum thickness under load (a) at 2 kPa (0.29 psi) (b) at 20 kPa (2.9 psi) (c) at 200 kPa (29 psi)	ASTM D 5199	in	(a) 0.12 (b) 0.10 (c) 0.04
Minimum wide-width tensile strength	ASTM D 4595	lb/ft	685
Maximum wide-width elongation	ASTM D 4595	%	130
Minimum water permeability in normal direction under load (pressure) at 20 kPa (2.9 psi)	Mod. ASTM D 5493 or ASTM D 4491	ft/s	3.3x10 ⁻⁴
Minimum in-plane water permeability (transmissivity) under load (pressure) (a) at 20kPa (2.9 psi) (b) at 200kPa (29 psi)	Mod. ASTM D 6574 or ASTM D 4716	ft/s	(a) 1.6x10 ⁻³ (b) 6.6x10 ⁻⁴
Minimum weather resistance retained strength	ASTM D 4355 at 500 hrs. exposure	%	60
Alkali resistance, minimum polypropylene/polyethylene	Manufacturer certification of polymer	%	96

1 Requirements must be met for 95% of the samples.

2 **724-3 GENERAL REQUIREMENTS**

3 A trained and experienced installer, certified by the Geotextile Manufacturer, shall be present
4 on-site during the installation of the geotextile and until the crew has a comfort level working
5 with this material.

6 Ensure that any potential for keying of the two cementitious layers is minimized through
7 proper repair techniques. Clean the underlying surface to remove loose debris before
8 applying the interlayer. Roll the geotextile out on the underlying layer. The geotextile shall
9 be tight and without excess wrinkles and folds. No more than 650 feet of geotextile shall be
10 installed in advance of the paving operation at a given time. The interlayer shall be placed no
11 more than 3 days before concrete placement.

12 Keep driving on the interlay to a minimum. Tight radius turns and excessive acceleration and
13 braking shall be avoided.

14 The geotextile shall be secured to the underlying layer with pins or nails punched through
15 2 to 2.75 inch galvanized washers or disks every 6 feet or less. Additional fasteners shall be
16 used as needed to ensure that the geotextile does not shift or fold before or during concrete
17 placement. Edges of the geotextile shall overlap by 8 inches ± 2 inches. No more than 3

1 layers of geotextile shall overlap at any location. Transverse seams of adjacent rolls shall be
 2 staggered to prevent 4 layers from coinciding at any location. The free edge of the geotextile
 3 shall extend beyond the edge of the new concrete into a location that facilitates drainage.

4 **725-1 MEASUREMENT AND PAYMENT**

5 *Nonwoven Geotextile Interlayer* will be measured and paid at the contract unit price per
 6 square yard. In measuring this quantity, the length will be the actual length installed,
 7 measured along the surface. The width will be the width measured along the underlying layer
 8 that has been acceptably placed. No separate measurement will be made for the overlapping
 9 fabric.

10 The contract prices for this section shall include but not be limited to, furnishing all labor,
 11 materials, tools, equipment and other incidentals necessary to perform the required work.

12 Payment will be made under:

Pay Item	Pay Unit
Nonwoven Geotextile Interlayer	Square Yard

13 **SECTION 725** 14 **FIELD LABORATORY FOR** 15 **PORTLAND CEMENT CONCRETE PAVEMENT**

16 **725-1 DESCRIPTION**

17 Perform the work covered by this section including, but not limited to, providing and
 18 maintaining the building or trailer and the curing shelter for the exclusive use of the Engineer
 19 at concrete plants producing Portland cement concrete for use in pavement to be constructed
 20 on the project; furnishing water, heat, electricity and other utility services; and any other
 21 equipment that may be necessary.

22 **725-2 GENERAL REQUIREMENTS**

23 Furnish and maintain for the exclusive use of the Engineer a field office and laboratory in
 24 which to house and use all testing equipment needed. Only Department representatives will
 25 have unattended access to these facilities.

26 Provide a field office that is dust and water tight, floored, and has an adequate foundation so
 27 as to prevent excessive floor movement. Provide a field office that contains 6 or more 110 V
 28 electrical double outlets properly grounded and spaced; a telephone; at least 2 windows,
 29 satisfactory locks on all doors and windows; adequate lighting, heating and air conditioning;
 30 sink; running water to sink; and satisfactory exhaust fan. Provide a field office that meets the
 31 following approximate minimum requirements: 200 sf of floor space; 9 feet interior width;
 32 6.5 feet interior height; 20 sf of counter space, 2.5 feet to 3 feet high and 2 feet deep with
 33 cabinets or drawers below the counter top; and 6 sf of desk space not enclosed with cabinets.
 34 Locate the office in a position that will permit full view of the plant from the interior of the
 35 office. At or near the office, furnish toilet facilities, with waste disposal, available for use of
 36 the Department personnel. Maintain these toilets in a neat and clean condition.

37 Provide a laboratory trailer adjacent to the field office that is at least 400 sf in area,
 38 approximately 20 feet wide, 20 feet long and 7 feet in height. Provide a laboratory trailer that
 39 contains 6 or more 110 V electrical double outlets properly grounded and spaced; satisfactory
 40 locks on all doors and windows; adequate lighting, heating and air conditioning; sink; running
 41 water to sink; and satisfactory exhaust fans. Provide two workbenches that are approximately
 42 10 feet long, 2 feet wide and 2.5 feet high. One workbench shall be installed inside the trailer
 43 and the other across the end of the trailer. Provide a shelter or roof over the outside
 44 workbench to provide protection from weather. Provide, in the laboratory, an adequate
 45 number of water storage tanks to hold all acceptance beams and cylinders and any additional
 46 beams and cylinders made for the purpose of determining early strengths.

Section 730

1 Construct the water storage tanks of non-corroding materials and have requirements for
2 automatic control of the water temperature. Maintain the water in the tank at a temperature of
3 $73^{\circ}\text{F} \pm 3^{\circ}\text{F}$. Equip each tank with a recording thermometer with its bulb located in the water.
4 Provide sufficient tank volume to maintain all beams and cylinders, stored with the long axis
5 vertical, in a fully submerged condition for the duration of the required curing period. Furnish
6 a wooden mixing board at least 3/4 inch thick and approximately 4 feet wide and 4 feet long
7 that is covered on one side with sheet metal of at least 22 gauge, at the shelter. Provide
8 facilities to maintain the test beams and cylinders at temperature between 60°F and 80°F
9 during initial curing.

10 **725-1 MEASUREMENT AND PAYMENT**

11 *Field Laboratory Rental, Portland Cement Concrete Pavement* will be paid at the contract
12 lump sum price which will be made for furnishing and maintaining all field laboratories
13 available for use by the Engineer at any concrete plant producing Portland cement concrete
14 for use in pavement to be constructed on the project. Partial payments for field laboratory
15 rental will be made with the first and last partial pay estimates which include concrete
16 pavement or concrete shoulders. Payments will be made at the rate of 50% of the lump sum
17 price for *Field Laboratory Rental, Portland Cement Concrete Pavement* on each of these
18 partial pay estimates.

19 Payment will be made under:

Pay Item	Pay Unit
Field Laboratory Rental, Portland Cement Concrete Pavement	Lump Sum

20 **SECTION 730**

21 **MILLED RUMBLE STRIPS ON CONCRETE SHOULDERS**

22 **730-1 DESCRIPTION**

23 Mill rumble strips on Portland cement concrete shoulders in accordance with the *Roadway*
24 *Standard Drawings*, the plans, and as directed by the Engineer.

25 **730-2 EQUIPMENT**

Provide equipment consisting of a rotary type cutting head with an outside diameter of no
more than 24 inches and no less than 16 inches long. Provide a cutting head that has the
cutting tips arranged in such a pattern as to provide a relatively smooth cut as well as a cutting
head that is on its own independent suspension from that of the power unit to allow the tool to
self-align with the slope of the shoulder and/or any irregularities in the shoulder surface.
Provide a cutting tool equipped with guides to establish consistent alignment and uniformity
of each cut in relation to the roadway.

26 **730-3 CONSTRUCTION METHODS**

27 Demonstrate the ability to achieve desired surface inside each depression without tearing or
28 snagging the Portland cement concrete prior to beginning the work.

29 Provide rumble strips that have finished dimensions and pattern in accordance with the
30 *Roadway Standard Drawings*.

31 Material resulting from the operation shall become the property of the Contractor. Remove
32 and dispose of material in accordance with Section 802.

33 Remove all equipment to a location where it does not present a traffic hazard and clean
34 pavement before reopening work area to traffic.

1 **730-4 MEASUREMENT AND PAYMENT**

2 *Milled Rumble Strips (Concrete Shoulder)* will be measured and paid as the actual number of
3 linear feet of shoulder, measured longitudinally along the surface of each shoulder, where
4 rumble strips have been constructed and accepted.

5 Payment will be made under:

Pay Item

Milled Rumble Strips (Concrete Shoulder)

Pay Unit

Linear Foot

DIVISION 8 INCIDENTALS

SECTION 800 MOBILIZATION

800-1 DESCRIPTION

This work consists of preparatory work and operations to mobilize personnel, materials and equipment to the project site.

800-2 MEASUREMENT AND PAYMENT

Mobilization will be paid as contract lump sum price.

Partial payments for *Mobilization* will be made with the first and second partial pay estimates paid on the contract and will be made at the rate of 50% lump sum price on each of these partial pay estimates, provided the amount bid for *Mobilization* does not exceed 5% of the total amount bid for the contract. Where the amount bid for *Mobilization* exceeds 5% of the total amount bid for the contract, 2.5% of the total amount bid will be paid on each of the first two partial pay estimates. That portion exceeding 5% will be paid on the last partial pay estimate.

As an exception to the above, where the work covered by the contract is limited exclusively to the resurfacing of an existing pavement, payment of the entire lump sum price for *Mobilization* will be made with the first partial pay estimate paid on the contract, provided the amount bid does not exceed 5% of the total amount bid for the contract. Where the amount bid for *Mobilization* exceeds 5% of the total amount bid for the contract, 5% of the total amount bid will be paid on the first partial pay estimate. That portion exceeding 5% will be paid on the last partial pay estimate.

Such price and payment includes, but is not limited to, the movement of personnel, equipment, supplies and incidentals to the project site, for the establishment of offices, buildings and other facilities necessary for work on the project; the removal and disbandment of those personnel, equipment, supplies, incidentals or other facilities that were established for the prosecution of work on the project; and for all other work and operations that shall be performed for costs incurred before beginning work on the various items on the project site.

For projects that have a delayed availability date of 90 calendar days or more after contract execution, the first mobilization payment may be for the verified actual cost of paid bond premiums. This payment will only be made upon request by the contractor with supporting documentation including invoice and proof of payment. This payment will be limited to 1% of the amount bid for the contract and the subsequent mobilization payment will be reduced by an equal amount to follow the payment schedule as shown above. In no case will more than 5% of the amount bid for the contract be paid before the last partial pay estimate.

Payment will be made under:

Pay Item	Pay Unit
Mobilization	Lump Sum

Section 801

**SECTION 801
CONSTRUCTION STAKES, LINES AND GRADE**

801-1 DESCRIPTION

When required by the contract, provide all construction layout, surveying, stakeout, supplemental surveying and engineering necessary for the proper control of construction operations in accordance with this section and the *Manual for Construction Layout*. Provide a stakeout of areas where an environmental permit is required before performing any construction in or adjacent to these areas. Stake out limits of the permitted work areas according to the approved permit drawings. Provide clear delineation by use of highly visible flagging. Insure construction limits do not exceed approved permitted work areas. Immediately notify the Engineer of any variations of the stakeout limits when compared to the approved permit drawings.

The *Manual for Construction Layout* and the *Guidelines for Drainage Studies and Hydraulic Design* may be obtained from the Contract Standards and Development Unit.

801-2 CONSTRUCTION METHODS

(A) General

Furnish personnel who are under the direct supervision of the Contractor's project engineer or a land surveyor licensed by the State of North Carolina in conformance with NCGS § 89C.

Furnish personnel who are experienced in highway construction surveying and are capable of accurately establishing all line and grade points necessary to complete the work in accordance with the plan dimensions within the precision established in the *Manual for Construction Layout*. Consult the Engineer for clarifications of the plans.

Perform work in safe manner and conform to Article 107-21. Perform all flagging operations in accordance with Section 1150.

The Contractor may elect to use global positioning system (GPS) surveying, either static or kinematic. Perform GPS surveys with same or higher order of accuracy as conventional surveys detailed in the *Manual for Construction Layout*. Department projects use a localized coordinate system developed by the Location and Surveys Unit specifically for each individual project. Obtain the control information that the Location and Surveys Unit used in establishing the localized coordinate system, specifically the rotation, scaling, translation and coordinates for the azimuth pairs. Newly developed GPS procedures and techniques that do not conform to this section may be used, if approved.

Investigate the plan horizontal alignment, vertical profile and super elevation of existing facilities that tie to proposed roadways. Investigate 100 feet beyond all paving limits and revise grades as needed to establish smooth transitions to the existing facilities.

Tie existing driveways to proposed facilities within the limits detailed in the plans and within the gradients detailed in the *Roadway Standard Drawings*.

The Engineer reserves the right to check, correct where necessary or require any layout work to be revised. The Engineer will perform checks to ensure the roadway, structure and incidental items are surveyed in accordance with the plans and the *Manual for Construction Layout*.

The Department's review of the Contractor's work in no way relieves the Contractor of responsibility for conformance with the contract. Failure by the Engineer or inspector to point out unsatisfactory work, from lack of discovery or for any other reason, in no way prevents later rejection or corrections to the unsatisfactory work, when discovered. No

1 claims will be allowed for losses suffered due to any necessary removals or repairs
2 resulting from the unsatisfactory work.

3 When requested by the Engineer, check the accuracy of the stakeout. Correct all
4 inaccuracies in the construction stakeout before performing the affected work.

5 When the Contractor proposes an alteration to the plans to rectify a construction stakeout
6 error, submit alterations to the Engineer for review and approval. Include design
7 calculations and drawings sealed by an engineer licensed by the State of North Carolina
8 along with a narrative describing justification for the alteration.

9 When surveying is required, which in the Contractor's opinion could not have been
10 reasonably anticipated and is not customary or inherent to the construction industry,
11 notify the Engineer in writing before beginning such surveying. After investigation, the
12 following will occur:

13 (1) When the Engineer determines that the surveying could not have been anticipated or
14 is not customary or inherent to the construction industry, the Contractor will be
15 notified in writing that the work is considered supplemental and measurement and
16 payment will be made in accordance with Article 801-3.

17 (2) When the Engineer determines that the surveying could have been anticipated or is
18 customary or inherent to the construction industry, he will notify the Contractor, in
19 writing, of his determination. If the Contractor intends to file a claim for additional
20 compensation by reason of such surveying, notify the Engineer in writing of such
21 intent before beginning any of the alleged supplemental surveying. Strictly adhere to
22 Subarticle 104-8(B).

23 **(B) Records**

24 Submit proposed method for setting up survey books or electronic data files to the
25 Engineer before beginning work to assure clarity and adequacy.

26 Promptly make available to the Engineer all requested survey records.

27 Provide updates to the Engineer monthly of the electronic and/or manuscript survey
28 records. Submit remaining records upon completion of the work. Attest the work was
29 performed in accordance with the contract by providing all receivable information signed
30 by an engineer or land surveyor licensed by the State of North Carolina and in
31 responsible charge.

32 **(C) Horizontal and Vertical Control**

33 The Department will provide azimuth pairs to be used as primary horizontal and vertical
34 control at approximately 1 mile intervals along the project corridor, and secondary
35 horizontal baseline control on approximate 1,000 foot intervals and secondary vertical
36 control on approximate 2,500 foot intervals within the project limits. Obtain a copy of the
37 electronic survey control files from the Engineer.

38 Clearing limits may be established during original traverse of baseline control provided
39 the accuracy ratio does not exceed 1 foot per 5,000 feet of perimeter and all Department
40 established baseline control is protected and preserved during clearing operations. Before
41 performing any additional construction layout, verify the horizontal baseline control by
42 a closed traverse survey or alternate approved method based on the established azimuth
43 pairs. The horizontal accuracy ratio shall not exceed an error of closure of 1 foot per
44 20,000 feet of perimeter. Verify the vertical control by performing a closed loop survey
45 using differential leveling. For the vertical error of closure, do not exceed 0.05 feet times
46 the square root of the miles:

$$47 \quad \text{Error of Closure} \leq 0.05 \text{ ft} \sqrt{(x) \text{ miles}} .$$

Section 801

1 Notify the Engineer of any discrepancies in either the horizontal or vertical control.
2 Reference, outside of the proposed construction limits and evenly distributed throughout
3 the project limits, a minimum of 50% of the Department's horizontal and vertical control.
4 Provide reference information to the Engineer.

5 If GPS is used, occupy the azimuth pairs with the base station during verification of
6 baseline control, otherwise, occupy baseline. Verify remaining baseline control using a
7 Rover. Submit coordinate data showing differences between supplied baseline
8 coordinates and field obtained GPS coordinates. Include report detailing the use of
9 preliminary input data, specifically rotation, scaling and translation.

10 Using the horizontal and vertical control established by the Department, provide
11 surveying necessary to construct all roadway, structure and miscellaneous items as
12 detailed in the plans. Perform staking in accordance with the *Manual for Construction*
13 *Layout*. Layout the work and provide all measurements that may be required for the
14 execution of the construction in conformity with the contract.

15 **(D) Right of Way, Control of Access and Easements**

16 The Department will establish the location of all proposed right-of-way markers, control-
17 of-access markers and permanent easements. Validate the position of the markers and
18 permanent easement locations with those detailed in the plans. Report any discrepancies
19 to the Engineer.

20 Reference the location of all proposed markers and permanent easements. Restore right-
21 of-way and control-of-access monument positions after completion of construction. Set
22 a right-of-way or control-of-access monument cap on an 18 inch (minimum) long
23 #5 reinforcing bar and a carsonite witness stake unless concrete right-of-way and control-
24 of-access markers are specified in the contract. The Department will provide the
25 monument cap and witness stake. Re-establish location of permanent easements after
26 completion of construction and install a permanent easement cap on 18 inch (minimum)
27 long #5 reinforcing bar for monumentation.

28 Re-establishment and verification of existing monuments or the replacement of existing
29 monuments with other material (concrete R/W markers, new iron pins, etc.), shall be
30 performed under the responsible charge of a North Carolina Professional Land Surveyor
31 (PLS). Verify all right of way, permanent easement, and control-of-access monument
32 positions after completion of construction with signed and sealed attestation by PLS of
33 said verification in accordance with the *Manual for Construction Layout*.

34 **(E) Cross sections for Earthwork Quantities**

35 The Engineer may elect to obtain cross sections either by hand or aerial methods. If the
36 Engineer elects to obtain cross sections by aerial methods, furnish materials and install
37 photogrammetric control panels in accordance with the *Manual for Construction Layout*
38 or as otherwise directed.

39 (1) Borrow Pits

40 Establish a baseline alignment or establish horizontal and vertical control on
41 approximate 1,000 foot intervals within each borrow pit, as necessary, to allow the
42 Engineer to obtain measurement of quantities for payment. Stake these alignments
43 just before field cross sections are taken by the Engineer for original, intermediate
44 and final cross sections.

45 (2) Roadway

46 Unless otherwise directed, stakeout the survey lines for original and final cross
47 sections. The stakeout of the survey lines will consist of surveying and staking all
48 alignments within the plans on 50 foot intervals, including all cardinal points. When
49 the alignments are inaccessible, install offset alignments. Begin the staking of these

1 alignments within 48 hours of the Engineer's notice to proceed. Upon the
2 completion of the entire project, with the exception of the survey line for final cross
3 sections, and upon request by the Contractor, the project may be accepted for
4 maintenance by the Department, excluding the survey line.

5 (F) Drainage and Utility Construction Systems

6 (1) General

7 Where underground conflicts are suspected, contact utility owners and locate all
8 utilities horizontally and vertically. Consider the utilities' locations and elevations in
9 the layout of the drainage systems and utility construction systems. Utilities may
10 exist that are not depicted in the plans.

11 Submit two copies of all layout drawings for drainage systems and utility
12 construction systems to the Engineer for his review and approval. The Engineer will
13 note the review and approval by adding an appropriate note to the drawings along
14 with the date and his signature. The Engineer will retain a copy of the drawings and
15 a copy will be returned to the Contractor.

16 (2) Drainage Systems

17 Provide construction layout of drainage systems, as depicted in the plans and in
18 accordance with the *Guidelines for Drainage Studies and Hydraulic Design*.
19 Consider the locations and elevations of all existing and proposed utilities, proposed
20 utility construction and existing and proposed drainage systems, in the layout of the
21 drainage system. Modifications of the drainage plan may be necessary to properly
22 collect and transport water. Advise the Engineer if modifications are needed to
23 achieve the original design functionality and the intent of the drainage plans, such as
24 adjusting the location of a drainage structure, adding a drainage structure and
25 increasing or decreasing pipe lengths. The Engineer will review any major
26 modifications.

27 Provide layout drawing of the drainage system including calculations of flow line
28 elevations for all drainage structures; pipe invert elevations, both inlet and outlet of
29 the drainage structure; grade of each pipe within the drainage system; elevation of
30 any existing facility connection, such as stream or pipe; headwall location, if
31 depicted in the plans; and locations and elevations of any existing or proposed
32 utilities to the Engineer for review and approval at least 7 days before beginning
33 work on the drainage system. Modification of the submitted drainage layout drawing
34 by the Engineer will not eliminate the Contractor's liability for the accuracy of the
35 information submitted. Any restaking or additional staking required to conform to
36 the approved drainage layout drawing is incidental to the work.

37 (3) Utility Construction

38 Provide utility construction layout as detailed in the contract. Consider the locations
39 and elevations of all existing and proposed utilities, proposed utility construction and
40 existing and proposed drainage systems in the layout of the utility construction.
41 Advise the Engineer if modifications to the utility construction plans are necessary.
42 The Engineer will review any major modifications.

43 Provide layout drawing of the utility construction system including elevations of any
44 existing utilities, drainage systems and/or proposed drainage systems to the Engineer
45 for review and approval at least 7 days before beginning work on the utility
46 construction system. Modification of the submitted utility construction layout
47 drawing by the Engineer will not eliminate the Contractor's liability for the accuracy
48 of the information submitted. Any restaking or additional staking required to
49 conform to the approved utility layout drawing is incidental to the work.

Section 801

1 (G) Structures

2 Provide surveying and calculations necessary to construct structures in accordance with
3 the plans. Provide staking in accordance with the *Manual for Construction Layout*.
4 Establish horizontal alignment of entire structure. Set at least one benchmark adjacent to
5 the structure site that will be retained throughout the structure construction. The
6 Engineer will furnish the finished construction elevations for use in determining the
7 required construction elevations for bridges. Provide method for computing buildups
8 over beams, screed grades and overhang form elevations to the Engineer for review
9 before staking these items to assure clarity and adequacy.

10 Submit two copies of structure layout drawings to the Engineer for his review and
11 approval. The Engineer will independently verify and accept the structure layout before
12 the structure construction may begin. The Engineer will note the review and approval by
13 adding an appropriate note to the drawings along with the date and his signature. The
14 Engineer will retain a copy of the drawings and a copy will be returned to the Contractor.

15 If structure phasing or damaged stakes require significant resurveying during the life of
16 the structure, provide revised layout drawing for the Engineer's verification and
17 acceptance.

18 (H) Signs

19 Stake horizontal locations of all overhead and Type A and B ground-mounted signs for
20 Engineer's verification before obtaining S-dimensions. Measure or calculate overhead
21 and ground-mounted sign S-dimensions in accordance with the plans and the *Manual for*
22 *Construction Layout*. Perform investigation of proposed sign locations and notify the
23 Engineer of any obstructions, either existing or proposed, that may interfere with the
24 proposed sign installation. Provide an 11 inch x 17 inch drawing depicting the theoretical
25 finished section at each proposed overhead sign assembly location. Include within the
26 submittal the roadway, shoulder and slope gradients. Include the proposed finish
27 elevations of the edges of pavement, each lane line and the ground at each proposed sign
28 footing location. Set a slope stake at each proposed overhead sign location to ensure the
29 slopes are constructed as calculated and detailed in the above submittal. Submit sign
30 information to the Engineer. Stake horizontal locations of all ground mounted and barrier
31 mounted signs.

32 801-3 MEASUREMENT AND PAYMENT

33 *Construction Surveying* will be paid at the contract lump sum price for the work detailed in
34 this section.

35 Partial payments will be made on each particular payment estimate based upon the percentage
36 complete of *Construction Surveying* as determined by the Engineer. The Contractor shall
37 submit a certified statement each month indicating the percentage of *Construction Surveying*
38 work completed. The Engineer will determine if the amount indicated is reasonably correct
39 and the Engineer will pay accordingly on the next partial pay estimate.

40 Establishment of baseline alignments within each borrow pit is incidental to *Construction*
41 *Surveying*.

42 *Supplemental Field Surveying* will be measured and paid as the actual number of hours the
43 Contractor's survey crew is actively engaged in performing the following:

44 (A) Investigative surveying, in excess of 100 feet of horizontal alignment, vertical profile and
45 superelevation of existing facilities that tie to proposed roadways.

46 (B) Surveying specifically for the relocation of utility conflicts.

47 (C) Investigation of a previous stakeout when such stakeout is found to be correct.

- 1 **(D)** Surveying that the Engineer has deemed could not have been anticipated or is not
 2 customary or inherent to the construction industry.
- 3 **(E)** The stakeout of the roadway survey alignments for intermediate cross sections when
 4 deemed necessary by the Engineer.
- 5 If the Engineer determines intermediate cross sections are not necessary for computing partial
 6 payments, the intermediate stakeout of the survey line is incidental to the work.
- 7 *Supplemental Surveying Office Calculations* will be measured and paid as the actual number
 8 of hours the Contractor’s survey personnel is actively engaged in performing office
 9 calculations specifically associated with Subarticles 801-3(A) through 801-3(E).
- 10 *Supplemental Surveying Office Calculations* will be paid at the stated price of \$60.00 per
 11 hour. *Supplemental Field Surveying* will be paid at the stated price of \$110.00 per hour. The
 12 payment includes furnishing personnel, all surveying equipment, stakes, layout drawings,
 13 calculations, stakeout records and any materials and equipment necessary to perform the
 14 surveying and engineering work.
- 15 If the Engineer directs that the accuracy of the original stakeout be checked and the stakeout
 16 is found to be in error, perform the work required to check and correct the stakeout at no cost
 17 to the Department.
- 18 *Exploratory Excavation* required to locate a utility will be paid in accordance with
 19 Article 104-7.
- 20 *Work Zone Signs (Portable)* will be paid in accordance with Article 1110-4.
- 21 *Flaggers* will be paid by the day in accordance with Article 1150-4.
- 22 Any payments for *Supplemental Field Surveying* or *Supplemental Surveying Office*
 23 *Calculations* required by this section will be paid on the appropriate partial payment estimate.
- 24 Payment will be made under:

Pay Item	Pay Unit
Construction Surveying	Lump Sum
Supplemental Field Surveying	Hour
Supplemental Surveying Office Calculations	Hour

**SECTION 802
 DISPOSAL OF WASTE AND DEBRIS**

802-1 DESCRIPTION

28 The work consists of the disposal of waste and debris including, but not limited to, furnishing
 29 any waste areas; providing and implementing a Development, Use and Reclamation Plan; any
 30 right of access to waste areas; disposing of waste and debris; dressing and shaping of waste
 31 areas; furnishing and spreading earth material over debris, rock, broken pavement and
 32 masonry; clearing and grubbing of waste areas; hauling waste and debris to waste areas or
 33 permitted landfills; assessment for wetlands and endangered species; obtaining required
 34 permits or certifications; and any tipping fees required for disposal in permitted landfills.

35 Define “waste” as all excavated materials that are not used in the construction of the project,
 36 including overburden from borrow sources and soil-type base course sources.

37 Define “debris” as all undesirable material encountered on the project.

802-2 GENERAL REQUIREMENTS

39 Follow the most recent reclamation procedures found on the Department’s website for all
 40 waste sites. Before the removal of any waste from any project, obtain certification from the
 41 State Historic Preservation Officer of the State Department of Cultural Resources certifying

Section 802

1 that the deposition of the waste material to the proposed waste area will have no effect on any
2 known district, site building, structure or object, architectural or archaeological, that is
3 included, or eligible for inclusion, in the National Register of Historic Places. Furnish a copy
4 of this certification to the Engineer before performing any work in the proposed waste site.

5 Provide an area and dispose of waste and debris outside of the right of way, unless otherwise
6 allowed by written request. Limit the materials placed in non-permitted disposal areas to
7 clean soil, rock, concrete, brick, other inert materials and bituminous asphalt when placed at
8 least 4 feet above the water table. Mixtures of soil and vegetation, that are primarily soil, may
9 be placed in non-permitted disposal areas. Place all other debris in sites permitted by the
10 Solid Waste Management Division of NCDEQ, unless otherwise approved.

11 Maintain the earth surfaces at all waste areas in a manner that will effectively control erosion
12 and siltation until final acceptance of the project.

13 Shape the waste or disposal area to drain such that no water will collect or stand. Provide
14 a functioning drainage system.

15 Shape rock and earth waste to contour and blend with the adjacent topography. Cover all
16 rock, concrete, broken pavement and masonry with a minimum 6 inch thick layer of earth
17 material from the project or borrow. Earth material should be tested to insure it will support
18 long-term growth of the proposed ground cover and should be amended as necessary to
19 support permanent growth. As an exception, side slopes constructed of all rock material will
20 not require earth covering. Construct all slopes, other than rock, 2:1 or flatter. Construct rock
21 slopes on a stable angle of repose.

22 Where the Engineer has granted permission to dispose of waste within the right of way, the
23 Engineer will have the authority to establish whatever additional requirements may be
24 necessary to insure the satisfactory appearance and drainage of the completed project.

25 Where electing to dispose of waste or debris in active public waste or disposal sites, provide
26 evidence satisfactory to the Engineer that the Solid Waste Management Division of NCDEQ
27 has permitted the proposed area or site.

28 Where electing to dispose of waste in a waste or disposal area, other than active public waste
29 or disposal areas permitted by the Solid Waste Management Division of NCDEQ or on the
30 Department's right of way or an existing borrow pit, submit jointly with the property owner
31 a notarized Development, Use and Reclamation Plan for each waste or disposal area proposed
32 for use.

33 As part of the Reclamation Plan, perform the following before wasting:

34 (A) Material Description

35 Detail the type of waste material proposed in the area. Only material originating from the
36 Department's projects and complying with the Solid Waste Disposal Act will be
37 permitted within the proposed waste or disposal area.

38 (B) Topography

39 Detail the existing topography and locations of the proposed access and egress haul
40 roads. Detail the proposed final topography of the waste or disposal area showing any
41 proposed drainage systems. If a pond is to be constructed or remain, the minimum depth
42 shall be at least 4 feet as determined from the water table at the time the reclamation plan
43 is executed. The slope of the soil below the water shall be between 5:1 and 2:1. The
44 slope of the sides above the water line shall be 2:1 or flatter.

45 (C) Slopes

46 Rock and earth waste shall be shaped to contours that are compatible to and blend with
47 the adjacent topography. Cover all rock with a minimum 6 inch layer of earth material
48 either from project waste or from borrow. As an exception, side slopes constructed of all

1 rock material will not require earth covering. Construct all slopes at a 2:1 or flatter
2 except rock slopes that shall be on a stable angle of repose.

3 **(D) Construction Debris**

4 Cover construction debris and all broken pavement and masonry with a minimum
5 6 inch thick layer of earth waste material from the project or borrow. Shape the
6 completed waste area as required above for the disposal of earth or rock waste.

7 **(E) Erosion Control**

8 Detail the temporary and permanent erosion control measures, along with design
9 calculations, that are intended during use of the site and as part of the reclamation.
10 Unless considered impractical due to special circumstances, provide in the plan for the
11 use of staged permanent seeding and mulching and appropriate fertilizer topdressing on
12 a continual basis during site use and the immediate total reclamation of the site when the
13 site is no longer needed. Define the seed mixture proposed for establishing temporary
14 and/or permanent vegetation. Establish permanent stand of vegetation before acceptance
15 of project.

16 **(F) Evaluation for Potential Wetlands and Endangered Species**

17 Hire an experienced environmental consultant on the Department's approved list to
18 perform an assessment of the waste site for potential conflicts with wetlands, areas of
19 environmental concern, federally listed threatened or endangered species, and federal
20 species of concern.

21 Delineate the boundaries of any wetlands or jurisdictional surface waters (streams)
22 encountered. Follow the standard practice for documenting the wetland delineation
23 including completion of the US Army Corps of Engineer's approved Wetland
24 Determination Data Form. Document information including data regarding soil,
25 vegetation and hydrology. Maintain a minimum 25 foot buffer adjacent to all sides of the
26 wetland boundary and a minimum 50 foot buffer adjacent to any stream. Depict the
27 limits of the delineated wetland and surrounding buffer on the Reclamation Plan. Do not
28 dispose of waste and debris in any area under the Corps of Engineers' or any other
29 environmental agencies' regulatory jurisdiction unless and until the NCDOT permit has
30 been modified to permit such disposal activity in the jurisdictional area.

31 Perform a site assessment for federally listed threatened or endangered species to include
32 habitats that may support these species. Provide to the Engineer a detailed report on the
33 assessment findings. If federally listed threatened or endangered species, or habitat that
34 may support such species, exist on the proposed waste site, notify the Engineer before
35 continued pursuit of such site.

36 **(G) Buffer Zones**

37 Allocate sufficient area between the nearest property line and the tie-in of the slope to
38 natural ground to allow for the operation of excavation, hauling, and seeding equipment
39 and for the installation of any and all erosion control devices required. Leave additional
40 undisturbed area between the source and any watercourse or body to prevent siltation of
41 the watercourse or body and the movement of the shore line either into the watercourse or
42 body or into the waste areas. Determine if the adjoining property owners or other
43 government agencies require any additional buffer zones and comply with those
44 requirements. [Suggested minimum distances are 10 feet from property lines and 50 feet
45 from water bodies or watercourses.] Do not place waste material within the 100-year
46 floodplain unless superseded by an environmental permit.

47 **(H) Approval**

48 Obtain written approval from the Engineer before wasting within the proposed waste or
49 disposal area.

Section 806

1 Submit a revised or additional reclamation plan if the non-permitted waste or disposal
2 area is expanded by more than one acre or is significantly changed from the previously
3 approved submittal.

4 **802-3 MEASUREMENT AND PAYMENT**

5 Seeding and mulching, fertilizer topdressing and establishing erosion control measures for
6 waste or disposal areas will be measured and paid at the contract unit prices for the items
7 established in the contract.

8 When permitted to waste within the right of way and when the waste area requires additional
9 covering material before seeding, provide covering material at no cost to the Department.

10 When waste areas are located outside the right of way, no payment will be made for any
11 borrow used to cover rock, broken pavement, masonry or other inert materials.

12 Except as otherwise provided above, no direct payment will be made for the work covered by
13 this section. Payment at the contract prices for the various items in the contract will be full
14 compensation for all work covered by this section.

15 **SECTION 806**

16 **RIGHT-OF-WAY AND CONTROL-OF-ACCESS MARKERS**

17 **806-1 DESCRIPTION**

18 Furnish and install precast concrete or granite markers to mark the boundaries of the right of
19 way or the control of access in accordance with the contract.

20 **806-2 MATERIALS**

21 Refer to Division 10.

Item	Section
Deformed Steel Bar Reinforcement	1070-2
Precast Concrete Units	1077

22 The Contractor may, at his option, use either granite or concrete markers. Make granite
23 markers from granite that is hard and durable, of a light color, free from seams which impair
24 its structural integrity, and of a good, smooth splitting appearance.

25 **806-3 CONSTRUCTION METHODS**

26 Precast the right-of-way and control-of-access markers in watertight forms of a size and shape
27 that will produce a completed marker of the dimensions shown in the *Roadway Standard*
28 *Drawings*. Construct the forms so as to impress the plastic concrete with the lettering and
29 markings shown in the contract.

30 Cure the concrete in accordance with Article 420-15. Give that portion of the marker that will
31 be above the surface of the ground ordinary surface finish in accordance with
32 Subarticle 420-17(B).

33 If using granite markers, quarry and finish the markers to the dimensions indicated in the
34 contract. Drill holes will be permitted in the sides and bottom.

35 Install the markers vertically in the ground to the depth and locations specified in the contract.
36 Thoroughly tamp backfill material.

37 **806-4 MEASUREMENT AND PAYMENT**

38 *Right-of-Way Markers* will be measured and paid in units of each for the actual number of
39 right-of-way markers furnished, installed and accepted.

40 *Control-of-Access Markers* will be measured and paid in units of each for the actual number
41 of control-of-access markers furnished, installed and accepted.

1 Payment will be made under:

Pay Item	Pay Unit
Right-of-Way Markers	Each
Control-of-Access Markers	Each

2 **SECTION 808**
 3 **OBLITERATION OF EXISTING ROAD**

4 **808-1 DESCRIPTION**

5 The work covered by this section consists of the obliteration of an existing road outside of the
 6 construction limits.

7 **808-2 CONSTRUCTION METHODS**

8 Remove any existing pavement as directed. Fill or grade and shape the entire roadway to
 9 a degree that will blend with the adjacent topography and suitable for the application of
 10 vegetative cover.

11 **808-3 MEASUREMENT AND PAYMENT**

12 *Removal of Existing Asphalt Pavement* and *Removal of Existing Concrete Pavement* will be
 13 measured and paid in accordance with Article 250-3. The work includes, but is not limited to,
 14 all breaking up, removing, and disposing of pavement; all plowing of the roadbed; and all
 15 grading and excavation necessary to reshape the roadway.

16 *Removal of Existing Concrete Pavement* will be measured and paid in accordance with the
 17 requirements of Article 250-3. Such price includes, but is not limited to, all breaking up,
 18 removing and disposing of pavement; all plowing of the roadbed; and all grading and
 19 excavation necessary to reshape the roadway.

20 All materials excavated in obliterating the abandoned roadway will be paid at the contract
 21 price for *Unclassified Excavation* in accordance with Article 225-7.

22 Any additional material that is required to complete the reshaping of the roadway will be paid
 23 at the contract unit price for *Unclassified Excavation* in accordance with Article 225-7 or at
 24 the contract unit price for *Borrow Excavation* in accordance with Article 230-5, depending on
 25 the source of the material.

26 All seeding and mulching performed on obliterated areas will be paid at the contract unit
 27 prices for the items established in the contract.

28 **SECTION 815**
 29 **SUBSURFACE DRAINAGE**

30 **815-1 DESCRIPTION**

31 Construct subsurface drains, underdrains, blind drains and other types of drains in accordance
 32 with the contract or as directed. Install markers to locate concrete pads for drains as shown in
 33 the plans. This section does not apply to shoulder drains; see Section 816.

34 **815-2 MATERIALS**

35 Refer to Division 10.

Item	Section
Geotextile for Subsurface Drains, Type 1	1056
Pavement Marker Paint	1087
Portland Cement Concrete, Class B	1000
Select Material, Class V	1016
Steel Marker Paint	1080-12
Steel Markers	1072-2

Section 815

Item

Subsurface Drainage Materials

Section

1044

- 1 Use Class B concrete for concrete pads. Provide Type 1 geotextile for filtration geotextiles.
2 Provide subdrain coarse aggregate (standard size No. 78M) for subsurface drains and subdrain
3 fine aggregate (standard size No. 2S or 2MS) for underdrains and blind drains. For PVC
4 drain pipes, use pipes with perforations that meet AASHTO M 278.

5 **815-3 CONSTRUCTION METHODS**

- 6 Excavate trenches as necessary in accordance with the contract or as directed. Install blind
7 drains at a depth of 4 to 6 feet below subgrade elevation. Install subdrain pipes for subsurface
8 drains and underdrains at a depth of 4 to 6 feet below subgrade elevation unless the subgrade
9 will be proof rolled. For subsurface drains and underdrains in subgrades that will be proof
10 rolled, install subdrain pipes at a depth of 6 feet below subgrade elevation.

- 11 Do not leave filtration geotextiles exposed for more than 7 days before covering with
12 material. For subsurface drains, line trench with filtration geotextiles and overlap adjacent
13 geotextiles at least 18 inches. Overlap geotextile closures on top of subdrain coarse aggregate
14 at least 6 inches and secure with mechanical ties.

- 15 Install continuous perforated PVC drain pipes with perforations point down. Provide subdrain
16 pipes with positive drainage towards outlets. Firmly connect subdrain pipes together as
17 needed. Place perforated subdrain pipes with perforations down except for pipes in dry
18 materials, in which case turn perforations up or use non-perforated pipes. For concrete pipes
19 in dry materials, construct joints that meet Subarticle 300-6(A).

- 20 Place subdrain aggregate beneath, around and over subdrain pipes such that pipes are covered
21 by at least 6 inches of aggregate unless shown otherwise in the plans. Do not displace or
22 damage subdrain pipes while placing and compacting subdrain aggregate. Lightly compact
23 backfill material such that settlement is minimized.

- 24 Use solvent cement for connecting Schedule 40 PVC outlet pipes and fittings such as wyes,
25 tees and elbows. Provide connectors for outlet pipes and fittings that are watertight and
26 suitable for gravity flow conditions. Cover open ends of outlet pipes with rodent screens as
27 shown in the plans.

- 28 Connect drains to concrete pads or existing drainage structures at ends of outlet pipes.
29 Construct concrete pads and provide an ordinary surface finish in accordance with
30 Section 825. Install steel and pavement markers at concrete pads as shown in the plans.

- 31 Allow drains to function for up to 30 days or a sufficient time as determined by the Engineer
32 before undercutting, proof rolling or constructing embankments over drains.

33 **815-4 MEASUREMENT AND PAYMENT**

- 34 *Subdrain Excavation* will be measured and paid in cubic yards. Excavation will be measured
35 based on the trench width shown in the plans or approved by the Engineer and the actual
36 trench depth as determined by the Engineer. The contract unit price for *Subdrain Excavation*
37 will be full compensation for excavating trenches and backfilling above subdrain aggregate.

- 38 *Geotextile for Subsurface Drains* will be measured and paid in square yards. Filtration
39 geotextiles in a trench will be measured in place based on the subdrain aggregate width shown
40 in the plans or approved by the Engineer and the actual aggregate depth as determined by the
41 Engineer. No additional payment will be made for overlapping geotextiles. The contract unit
42 price for *Geotextile for Subsurface Drains* will be full compensation for supplying,
43 transporting and installing filtration geotextiles and mechanical ties.

Section 816

1 *Subdrain Fine Aggregate* and *Subdrain Coarse Aggregate* will be measured and paid in cubic
2 yards. Subdrain aggregate in a trench will be measured in place based on the aggregate width
3 shown in the plans or approved by the Engineer and the actual aggregate depth as determined
4 by the Engineer. When subdrain aggregate is not placed in a trench, aggregate will be
5 measured in place based on the aggregate dimensions shown in the plans or as determined by
6 the Engineer. The contract unit prices for *Subdrain Fine Aggregate* and *Subdrain Coarse*
7 *Aggregate* will be full compensation for furnishing, hauling, handling, placing, compacting
8 and maintaining subdrain aggregate.

9 ___" *Perforated Subdrain Pipe* and ___" *Outlet Pipe* will be measured and paid in linear feet.
10 Pipes will be measured in place as the pipe length, including fittings, to the nearest 0.1 feet
11 with no deduction for fittings. The contract unit prices for ___" *Perforated Subdrain Pipe* and
12 ___" *Outlet Pipe* will be full compensation for supplying, transporting and installing pipes,
13 fittings and rodent screens and making joint connections.

14 *Subdrain Pipe Outlets* will be measured and paid in units of each. Outlets will be measured
15 as the number of concrete pads or connections to existing drainage structures. The contract
16 unit price for *Subdrain Pipe Outlets* will be full compensation for concrete pads including
17 furnishing concrete, constructing pads and providing and placing markers and connecting
18 pipes to existing drainage structures including cutting into structures, removing existing paved
19 ditches and grouting around connections.

20 Payment will be made under:

Pay Item	Pay Unit
Subdrain Excavation	Cubic Yard
Geotextile for Subsurface Drains	Square Yard
Subdrain Fine Aggregate	Cubic Yard
Subdrain Coarse Aggregate	Cubic Yard
___" Perforated Subdrain Pipe	Linear Foot
___" Outlet Pipe	Linear Foot
Subdrain Pipe Outlet	Each

21

SECTION 816 SHOULDER DRAINS

22

23 **816-1 DESCRIPTION**

24 Construct shoulder drains and furnish and install painted pavement markers and vertical
25 markers to locate concrete pads for the drains in accordance with the requirements of the
26 contract.

27 **816-2 MATERIALS**

28 Refer to Division 10.

Item	Section
Corrugated Plastic Pipe and Fittings	1044-7
Corrugated Steel Pipe and Fittings	1044-5
Geotextile for Shoulder Drains, Type 1	1056
Outlet Pipe	1044-8
Pavement Marker Paint	1087
PVC Pipe	1044-6
Portland Cement Concrete, Class B	1000
Shoulder Drain Aggregate, No. 57 Stone	1005
Steel Marker	1072-2
Steel Marker Paint	1080-12

Section 816

1 Use Class B concrete for concrete pads. Provide Type 1 geotextile for filtration geotextiles.
2 Material for shoulder drain pipe and fittings may be concrete, corrugated steel or corrugated
3 plastic.

4 **816-3 CONSTRUCTION METHODS**

5 Excavate the trench to the width, depth, lines and grades shown in the plans unless otherwise
6 directed.

7 Do not leave filtration geotextiles exposed for more than 7 days before covering with
8 material. Overlap adjacent filtration geotextiles at least 18 inches. Overlap geotextile
9 closures at the top of the trench at least 6 inches and secure with mechanical ties. Where
10 outlet pipes pass through geotextiles, wrap a separate piece of geotextile around the outlet
11 pipe, flare against the side of the filled drain and secure with anchor pins.

12 Anchor field splices of geotextile with anchor pins to ensure that required overlap is
13 maintained.

14 Perform aggregate placement operations and the pipe installation to prevent damage to
15 filtration geotextiles. Replace damaged sections of geotextiles.

16 Firmly join together corrugated steel pipe sections with coupling bands, a smooth sleeve type
17 coupler or other approved mechanical methods.

18 Solvent cement the Schedule 40 PVC pipe and fittings together. Connect the HDPE pipe with
19 watertight neoprene connectors that are suitable for gravity flow conditions. Obtain approval
20 for all pipe fittings from the Engineer before delivery. Protect the open end of all outlet pipes
21 with a galvanized rodent screen as shown in plans. When the pipe perforations are not
22 distributed uniformly over the circumference of the pipe, lay perforated pipe with the
23 perforated segments of the pipe down. When plain pipe is called for by the plans, turn the
24 perforations up or use non-perforated pipe.

25 Install outlet fittings and outlet pipes with aggregate shoulder drains. Provide shoulder drain
26 pipes with positive drainage towards outlets. Establish positive drainage within 72 hours of
27 beginning trenching for installation of a given section of aggregate shoulder drain. Failure to
28 comply with this requirement may result in the Engineer restricting installation of additional
29 sections of aggregate shoulder drain until such time as the Contractor completes appropriate
30 outlet installations.

31 Compact the aggregate to a degree acceptable to the Engineer by the use of a vibratory
32 compactor before making the geotextile closure at the top of the trench.

33 Carefully place the backfill material after the pipe has been laid, so that the pipe will not be
34 disturbed by the backfilling operation. Firmly tamp all earth backfill material.

35 Connect the shoulder drains to existing drainage structures or to concrete pads at the outlet
36 end of the shoulder drain. Construct the concrete pad in accordance with Section 825 and
37 give an ordinary surface finish.

38 Furnish and install steel markers in accordance with the plans and use at all concrete pads.

39 **816-4 MEASUREMENT AND PAYMENT**

40 *Shoulder Drain* will be measured and paid as the actual number of linear feet that has been
41 completed and accepted, measured to the nearest foot along the centerline of the completed
42 shoulder drain aggregate. No measurement will be made along the outlet pipe.

43 ___" *Shoulder Drain Pipe* will be measured and paid in linear feet of all pipe that has been
44 incorporated into the completed and accepted work. Measurement will be made along the
45 pipe installation, including fittings, to the nearest 0.1 feet with no deduction made for fittings.

46 ___" *Outlet Pipe for Shoulder Drain* will be measured and paid in linear feet of all pipe that
47 has been incorporated into the completed and accepted work. Measurement will be made

- 1 along the pipe installation, including fittings, to the nearest 0.1 feet with no deduction made
- 2 for fittings.
- 3 *Concrete Pad for Shoulder Drain Pipe Outlet* will be measured and paid in units of each for
- 4 the actual number of pads completed and accepted.
- 5 Such price and payment includes, but is not limited to, furnishing, hauling and placing all
- 6 pipe, fittings, shoulder drain aggregate, filtration geotextiles, concrete and other materials;
- 7 making all joint connections; cutting into and making connections to existing drainage
- 8 structures; grouting around the pipe where it enters existing drainage structures; pavement and
- 9 vertical markers; and all excavation and backfilling.
- 10 Replacement of damaged geotextile is incidental to the work in this section.
- 11 Payment will be made under:

Pay Item	Pay Unit
Shoulder Drain	Linear Foot
___" Shoulder Drain Pipe	Linear Foot
___" Outlet Pipe for Shoulder Drain	Linear Foot
Concrete Pad for Shoulder Drain Pipe Outlet	Each

12 **SECTION 818**

13 **BLOTTING SAND**

14 **818-1 DESCRIPTION**

15 Furnish and uniformly spread the blotting sand, as directed to prime coat, asphalt surface

16 treatment or asphalt curing seal.

17 **818-2 MATERIALS**

18 Refer to Division 10.

Item	Section
Blotting Sand	1012-3

19 **818-3 CONSTRUCTION METHODS**

20 Apply blotting sand upon completion of the asphalt application, when directed. Provide

21 relatively dry blotting sand. Spread uniformly, as directed, on the same day as the application

22 of prime coat, asphalt surface treatment or asphalt curing seal. Apply at the rate of 10 lbs. / sy

23 of surface area, unless otherwise directed.

24 **818-4 MEASUREMENT AND PAYMENT**

25 *Blotting Sand* will be measured and paid in tons that have actually been placed. The quantity

26 will be measured by weighing in trucks on certified platform scales or other certified

27 weighing devices. No deduction will be made of any moisture in the sand at the time of

28 weighing. No measurement of *Blotting Sand* will be made when it is part of a *Drag Seal* or

29 a *Sand Seal*.

30 Payment will be made under:

Pay Item	Pay Unit
Blotting Sand	Ton

Section 820

**SECTION 820
FUNNELS AND FUNNEL DRAINS**

820-1 DESCRIPTION

Furnish and install all funnels, pipe, elbows and other materials in accordance with the contract.

820-2 MATERIALS

Refer to Division 10.

Item	Section
Funnel Drain Pipe	1054-2(B)
Funnel Drain Pipe Elbows	1054-2(B)
Funnels	1054-2(A)
Portland Cement Concrete, Class B	1000

Use connector rings with gaskets in accordance with manufacturer's recommendations that are designed to form a properly sealed joint and provide circumferential and longitudinal strength sufficient to preserve the alignment and prevent separation of the sections

820-3 CONSTRUCTION METHODS

Furnish concrete, install and anchor funnel, and place connector ring with gaskets in accordance with the details in the plans and in accordance with manufacturer's recommendations so water will flow freely into it without overflow or leakage. Securely join the funnel drain pipe to the funnel and backfill with sufficient care so that no part of the funnel or funnel drain pipe is displaced or moved out of alignment. Place backfill material in 6 inch layers and compact to a density comparable to the adjacent undisturbed material.

Construct a temporary construction berm to divert runoff into the funnel until paved ditch, paved berm or curb is constructed.

820-4 MEASUREMENT AND PAYMENT

Metal Funnels will be measured and paid in units of each for the actual number of funnels installed and accepted. No separate payment will be made for the concrete and the connector ring with gaskets as such work will be incidental to *Metal Funnels*.

___" *Funnel Drain Pipe* will be measured and paid as the actual number of linear feet of pipe incorporated into the completed and accepted work. Measurement will be made by counting the number of joints used and multiplying the length of the joint. Where partial joints are used, measurement will be made along the longest length of the partial joint to the nearest 0.1 feet.

___" *Funnel Drain Pipe Elbows* will be measured and paid in units of each for the actual number of elbows installed and accepted.

Such price and payment includes, but is not limited to, metal funnels, funnel drain pipe and elbows, all excavation and backfilling, and construction and maintenance of temporary berms for diversion in accordance with the contract.

Payment will be made under:

Pay Item	Pay Unit
Metal Funnels	Each
___" Funnel Drain Pipe	Linear Foot
___" Funnel Drain Pipe Elbows	Each

SECTION 825
INCIDENTAL CONCRETE CONSTRUCTION

825-1 DESCRIPTION

This section consists of the general requirements for the construction of all incidental concrete construction. The provisions of Sections 838, 840, 846, 848, 850, 852, 853, 854, 855, 857 and 858 will prevail over any conflicting requirements of this section.

825-2 FORMS

(A) General

Maintain forms true to the required lines, grades and dimensions. Construct forms with material of such strength and with sufficient rigidity to prevent any appreciable deflection between supports. Provide mortar-tight forms with a fillet at sharp corners when indicated in the plans.

Design clamps, pins, metal spacers, anchorages and other connecting devices to hold the forms rigidly together. Construct or install any metal spacers or anchorages that are required within the forms so that the metal work can be removed to a depth of at least 1 inch from the exposed surface of the concrete without injury to the surface. The recess thus formed in the concrete shall have a diameter no greater than 1.5 times the depth.

Maintain the shape, strength, rigidity and surface smoothness of forms that are to be re-used at all times. Thoroughly clean all dirt, mortar and foreign material from forms before reusing. Thoroughly coat all inside form surfaces with commercial quality form oil or other equivalent coating before placing concrete.

(B) Wood Forms

Provide forms with a smooth and uniform texture. Make joints between forms tight and even so that no appreciable form marks remain after the forms are removed.

Do not use plywood sheets showing torn grain, worn edges, patches or other defects that impair the texture of concrete surfaces exposed to view.

(C) Metal Forms

Use metal forms of such thickness and rigidity that the forms will remain true to shape. Counter-sink bolt and rivet heads. Use only metal forms that present a smooth surface and line up properly. Keep metal forms free from all foreign matter that will discolor the concrete.

825-3 REINFORCEMENT

Furnish and place reinforcement as shown in the plans and in accordance with Section 425.

825-4 PLACING CONCRETE

Do not place concrete until the foundation, the adequacy of the forms, the placing of reinforcement and other embedded items have been inspected and approved.

Place concrete in daylight unless an approved lighting system is provided.

Remove all debris from the interior of forms in preparation for placing concrete. Moisten earth or base course surfaces on which concrete is to be placed immediately before placing concrete. Do not place concrete on excessively wet or frozen surfaces.

Place concrete in its final position in the forms within the time stipulated in Subarticle 1000-4(E).

Section 825

1 Place concrete to avoid segregation of the materials and the displacement of the
2 reinforcement. Thoroughly work the concrete during placement. Bring mortar against the
3 forms to produce a smooth finish, substantially free from water and air pockets or
4 honeycombs.

5 Do not place concrete when the air temperature, measured at the location of the concrete
6 operation in the shade away from artificial heat, is below 35°F unless permission is otherwise
7 granted. When such permission is granted, uniformly heat the aggregates and water to
8 a temperature no higher than 150°F. Place the heated concrete at a temperature of at
9 least 55°F and no more than 80°F.

10 **825-5 SLUMP TESTS**

11 Test the slump of the concrete in accordance with Article 420-6.

12 **825-6 FINISHING**

13 **(A) General**

14 Provide the type of finish required by the contract directly applicable to the work being
15 constructed.

16 **(B) Ordinary Surface Finish**

17 Remove all form ties or metal spacers to a depth of at least 1 inch below the surface of
18 the concrete and clean and fill the resulting holes or depressions with grout. Metal
19 devices with exposed cross-sectional area not exceeding approximately 0.05 sq. inches on
20 surfaces permanently in contact with earth fill may be broken off flush with the surface of
21 the concrete.

22 Remove all fins caused by form joints and other projections. Remove stains and
23 discoloration. Clean all pockets and fill with grout as directed. Thoroughly soak the
24 surface of all concrete with water before the application of a grout repair.

25 Use grout consisting of one part cement and two parts sand. Use cement from the same
26 source as originally incorporated in work. Cure the grout for at least 3 days. After the
27 grout has thoroughly hardened, rub the patch with a carborundum stone as required to
28 match the texture and color of the adjacent concrete.

29 On surfaces that are to be backfilled or surfaces that are enclosed, the removal of form
30 marks, fins and pockets; the rubbing of grouted areas to uniform color; and the removal
31 of stains and discoloration will not be required.

32 **(C) Sidewalk Finish**

33 Strike off fresh concrete and compact until a layer of mortar is brought to the surface.
34 Finish the surface to grade and cross section with a float, trowel smooth and finish with
35 a broom.

36 **(D) Rubbed Finish**

37 After the ordinary surface finish has been completed, thoroughly wet and rub the entire
38 surface. Use a coarse carborundum stone or other equally good abrasive to bring the
39 surface to a smooth texture and remove all form marks. Carefully stroke the surface with
40 a clean brush to finish the paste formed by rubbing. Alternatively, spread the paste
41 uniformly over the surface and allow it to take a reset. Finish by floating with a canvas,
42 carpet-faced or cork float or rub down with dry burlap.

43 **(E) Float Finish**

44 Finish the surface with a rough carpet float or other suitable device leaving the surface
45 even but distinctly sandy or pebbled in texture.

1 825-7 REMOVING FORMS

2 Do not remove forms from freshly placed concrete until it has hardened sufficiently to resist
3 spalling, cracking or any other damage.

4 825-8 PROTECTION FROM COLD WEATHER

5 When it is anticipated that the atmospheric temperature will fall below 35°F, protect concrete
6 in accordance with Subarticle 420-7(C). Protect concrete containing fly ash or ground
7 granulated blast furnace slag for at least 7 curing days. Protect all other concrete for at
8 least 3 curing days.

9 825-9 CURING

10 Cure concrete in accordance with Subarticle 700-9(B) immediately after finishing operations
11 are completed and surface water has disappeared. Where forms are removed before the
12 expiration of the required curing period, apply the curing compound immediately after the
13 forms are removed.

14 Cure each mass for 7 curing days. A “curing day” shall be defined as any consecutive
15 24 hour period, after finishing operations of the mass is completed, when the air temperature
16 adjacent to the mass does not fall below 40°F.

17 825-10 JOINTS**18 (A) General**

19 Construct joints at right angles to the surface of the concrete. Locate joints at right angles
20 to the longitudinal centerline of curb, curb and gutter, gutter, island, median, median
21 barrier and all paved areas, except where different joint locations are called for in the
22 plans.

23 Where concrete is to be placed adjacent to any existing slab or pavement that has
24 a broken or irregular edge, provide a reasonably vertical edge by sawing.

25 (B) Grooved Contraction Joints

26 Form grooved contraction joints by a tool specifically constructed for this purpose or by
27 sawing with an approved concrete saw.

28 Groove contraction joints to the depth shown in the plans and to a width between
29 1/4 inch and 1/2 inch, unless otherwise shown in the plans. If formed by a tool, make a
30 radius of 1/8 inch at the corners of the adjacent concrete.

31 (C) Expansion Joints

32 Fill construction joints with an expansion joint filler. Cut the filler into the shape
33 necessary to fill the joint. Make the filler 1/2 inch thick unless indicated otherwise in the
34 plans. After the concrete has hardened cut the filler away to a depth of 1/2 inch to
35 provide space for the joint sealer.

36 Install an expansion joint adjacent to any existing slab, pavement or structure against
37 which new concrete is placed and at other locations detailed in the plans.

38 (D) Construction Joints

39 Construct construction joints as shown in the plans or where otherwise approved.

40 (E) Sawing Joints

41 Saw joints after the concrete has hardened sufficiently to be sawed without spalling and
42 raveling but no more than 24 hours after the concrete has been placed.

Section 828

1 (F) Sealing Joints

2 Seal all contraction and expansion joints, except otherwise specified, before the backfill
3 is placed.

4 Thoroughly clean the joint to remove all foreign matter. Dry joints before sealing.

5 Entirely fill joints to within 1/8 inch to 1/4 inch of the surface of the concrete with joint
6 sealer. Immediately remove any sealer spilled on the surface of the concrete.

7 Place joint sealer with equipment meeting the specifications of the manufacturer of the
8 sealer material.

9 **825-11 MEASUREMENT AND PAYMENT**

10 There will be no direct payment for the work covered by this section.

11 Payment at the contract prices for the various items covered by those sections of the *Standard*
12 *Specifications* directly applicable to the work being constructed will be full compensation for
13 all work covered by this section.

14 **SECTION 828** 15 **TEMPORARY STEEL COVER FOR MASONRY** 16 **DRAINAGE STRUCTURES**

17 **828-1 DESCRIPTION**

18 Install temporary steel plate covers on masonry drainage structures in accordance with the
19 details shown in the plans and as directed.

20 **828-2 MATERIALS**

21 Provide materials that are Grade A36 steel and the size and thickness shown on the detail in
22 the plans.

23 **828-3 MEASUREMENT AND PAYMENT**

24 *Temporary Steel Plate Covers for Masonry Drainage Structures* will be measured and paid in
25 units of each for the actual number of these items incorporated into the completed and
26 accepted work.

27 Payment will be made under:

Pay Item	Pay Unit
Temporary Steel Plate Covers for Masonry Drainage Structures	Each

28 **SECTION 830** 29 **BRICK MASONRY CONSTRUCTION**

30 **830-1 DESCRIPTION**

31 This work consists of the general requirements for all unreinforced brick masonry
32 construction. The requirements of Sections 838, 840 and 858 will prevail over any conflicting
33 requirements of this section.

34 **830-2 CONSTRUCTION METHODS**

35 Construct all concrete footings and all other concrete elements of the structure in accordance
36 with Section 825.

37 **830-3 MORTAR**

38 Machine mix mortar in accordance with Article 1040-9 for at least 90 seconds. Remove and
39 dispose of any mortar that has developed initial set or lost plasticity.

830-4 LAYING BRICK

Dampen brick when necessary to reduce the rate of absorption. Build brick masonry plumb and true to the required dimensions. Place a header course approximately mid height of the structure in structures less than 9 courses high. Place a header course every third course on structures 9 courses high or higher. Use other types of bonding where indicated in the plans.

Completely fill brick joints and cavities with mortar. Make mortar joint thickness at least 3/8 inch and no more than 5/8 inch. Finish joints that will remain exposed after backfill with a concave jointer. Flush cut all other joints.

Use spalls or bats only when shaping around irregular openings or when unavoidable to finish out a course. Place a full brick at the corner and place the bat in the interior of the course when necessary to finish out the course.

Clean spilled mortar from exposed exterior surfaces not backfilled.

830-5 PROTECTION FROM COLD WEATHER

Do not place masonry when the temperature is below 35°F unless adequate protection is provided by a pre-approved method.

When it is anticipated that the atmospheric temperature will fall below 35°F protect masonry, in accordance with Subarticle 420-7(C), for at least 3 curing days.

Define a “curing day” as any consecutive 24 hour period, beginning when the last masonry unit is placed in the completed structure, during which the air temperature adjacent to the structure does not fall below 40°F.

830-6 MEASUREMENT AND PAYMENT

There will be no direct payment for the work covered by this section.

Payment at the contract prices for the various items covered by those sections of the *Standard Specifications* directly applicable to the work being constructed will be full compensation for all work covered by this section.

SECTION 832**REINFORCED BRICK MASONRY CONSTRUCTION****832-1 DESCRIPTION**

This work shall consist of the general requirements for all reinforced brick masonry construction. The requirements of Section 838 will prevail over any conflicting requirements of this section.

832-2 CONCRETE CONSTRUCTION

Construct concrete footings and all other concrete elements of the structure in accordance with Section 825. Furnish and place reinforcement as shown in the plans and in accordance with Section 425. Use Class A concrete for footings unless otherwise indicated in the plans. Use Class B concrete in reinforcement cavities. Rod Class B concrete in reinforcement cavities to provide a dense, homogeneous concrete. Do not vibrate.

832-3 MORTAR

Machine mix mortar that meets Article 1040-9 for at least 90 seconds. Remove and dispose of any mortar that has developed initial set or lost plasticity.

832-4 LAYING BRICK

Dampen brick when necessary to reduce the rate of absorption. Construct the type of bond called for in the plans. Build reinforced brick masonry plumb and true to the required dimensions.

Section 834

1 Lay brick with completely filled mortar joints. Make mortar joint thickness at least 3/8 inch
2 and no more than 5/8 inch. Finish joints that will remain exposed after backfill, with a
3 concave jointer. Flush cut all other joints.

4 Use spalls or bats only when shaping around irregular openings. Place a full brick at the
5 corner and place the bat in the interior of the course when necessary to finish out a course.

6 Clean spilled mortar from exposed exterior surfaces not backfilled.

832-5 PROTECTION FROM COLD WEATHER

8 Refer to Article 830-5.

832-6 MEASUREMENT AND PAYMENT

10 There will be no direct payment for the work covered by this section.

11 Payment at the contract unit prices for the various items covered by those sections of the
12 Specifications directly applicable to the work being constructed will be full compensation for
13 all work covered by this section.

SECTION 834 BLOCK MASONRY CONSTRUCTION

834-1 DESCRIPTION

17 This work consists of constructing concrete block masonry. The requirements of
18 Sections 840, 858 and 859 will prevail over any conflicting requirements of this section.

834-2 CONCRETE CONSTRUCTION

20 Construct concrete footings and all other concrete elements of the structure in accordance
21 with Section 825.

834-3 MORTAR

23 Machine mix mortar in accordance with Article 1040-9 for at least 90 seconds. Remove and
24 dispose of any mortar that has developed initial set or has lost plasticity.

834-4 LAYING CONCRETE BLOCK

26 Build block masonry plumb and true to the required dimensions. Stagger vertical joints. Set
27 the block with the cells vertical. Spread mortar on the bearing members and fill the vertical
28 joints with mortar. Dampen block when necessary to reduce the rate of absorption.

29 Make joints straight, level, plumb, and neat at intersection. Make mortar joint thickness at
30 least 3/8 inch and no more than 5/8 inch. Finish joints that will remain exposed after backfill,
31 with a concave jointer. Flush cut all other joints. Clean exposed exterior surfaces of spilled
32 mortar that are not backfilled.

834-5 PROTECTION FROM COLD WEATHER

34 Refer to Article 830-5.

834-6 COMPENSATION

36 There will be no direct payment for the work covered by this section.

37 Payment at the contract prices for the various items covered by those sections of the *Standard*
38 *Specifications* directly applicable to the work being constructed will be full compensation for
39 all work covered by this section.

**SECTION 836
SLUICE GATE**

8366-1 DESCRIPTION

Construct a sluice gate on an endwall in accordance with the details in the contract and the manufacturer's recommendations.

8366-2 MATERIALS

Sluice gates shall meet the manufacturer's recommendations for the corresponding pipe size. Due to variations in individual manufacturer's products, a slight variation from the size specified may be allowed. Submit the proposed catalog cut to the Engineer for approval prior to use.

8366-3 CONSTRUCTION METHODS

Provide a gate that forms a watertight seal when closed.

8366-4 MEASUREMENT AND PAYMENT

____" *Sluice Gate* will be measured and paid as each for the actual number of sluice gates incorporated into the completed and accepted work. Such prices and payment will be full compensation for all materials, labor, tools, equipment and incidentals necessary to complete the work.

The endwall will be measured and paid in accordance with Article 838-4.

Payment will be made under:

Pay Item	Pay Unit
____" Sluice Gate	Each

**SECTION 838
ENDWALLS**

838-1 DESCRIPTION

Perform the work covered by this section including but not limited to excavation, hauling, disposal of materials, furnishing and placing backfill materials, subsurface drainage, concrete, brick masonry, mortar, grout, and furnishing and placing reinforcing steel to construct Portland cement concrete or brick masonry endwalls, either plain or reinforced, in accordance with the contract.

838-2 MATERIALS

Refer to Division 10:

Item	Section
Brick	1040-1
Curing Agents	1026
Mortar	1040-9
Precast Concrete Units	1077
Portland Cement Concrete, Class A	1000
Reinforcing Steel	1070-2
Select Material	1016
Subsurface Drainage Materials	1044

Use Portland cement concrete, brick masonry or precast concrete for the endwall unless otherwise specified in the plans.

If precast sections are proposed, submit in writing for approval.

Section 838

1 **838-3 CONSTRUCTION METHODS**

2 **(A) Foundation**

3 Do not place concrete or masonry until the foundation is approved.
4 Excavate foundation to a firm surface, make level or stepped and clean surfaces of loose
5 material. Make excavation true to lines and dimensions shown on plans.
6 Where the foundation material is found to be of poor supporting value or of rock, the
7 Engineer may make minor adjustments in the location of the structure to provide a more
8 suitable foundation. Where this is not practical, undercut the foundation and condition by
9 backfilling with an approved select material.

10 **(B) Concrete and Masonry**

11 Construct concrete in accordance with Section 825 and give an ordinary surface finish.
12 Construct brick masonry in accordance with Sections 830 and 832. Furnish and place
13 reinforcing steel in accordance with Section 425.
14 Provide the class of concrete indicated in the plans.
15 Obtain approval if field conditions necessitate a variance from the plan dimensions of the
16 structure and footings.
17 Construct endwalls on the end of a full joint of pipe and in accordance with the details in
18 the plans.
19 Any endwall that incorporates an opening for circular pipe 54 inches or greater shall be
20 reinforced.

21 **(C) Backfill**

22 Complete endwall construction, and remove all forms. Backfill with approved material
23 after the concrete or brick masonry has cured for at least 7 curing days unless otherwise
24 permitted. A “curing day” is defined in Article 830-5. Within 4 calendar days after the
25 completion of the 7 day curing period, shape, compact and complete backfill in
26 accordance with the contract.

27 **838-4 MEASUREMENT AND PAYMENT**

28 *Endwalls* will be measured and paid in cubic yards of concrete or brick completed and
29 accepted. This quantity will be computed from the dimensions shown in the plans or from
30 revised authorized dimensions. Where precast concrete units have been approved and are
31 used instead of cast-in-place units the quantity to be paid will be computed the same as if
32 cast-in-place units were used, as no reduction in pay quantity will be made due to the use of
33 precast instead of cast-in-place endwalls.

34 *Reinforced Endwalls* will be measured and paid in cubic yards of concrete or brick completed
35 and accepted. This quantity will be computed from the dimensions shown in the plans or
36 from revised authorized dimensions. Where precast concrete units have been approved and
37 are used instead of cast-in-place units the quantity to be paid will be computed the same as if
38 cast-in-place units were used, as no reduction in pay quantity will be made due to the use of
39 precast instead of reinforced cast-in-place endwalls.

40 Payment will be made under:

Pay Item	Pay Unit
Endwalls	Cubic Yard
Reinforced Endwalls	Cubic Yard

SECTION 840
MINOR DRAINAGE STRUCTURES

840-1 DESCRIPTION

Perform the work covered by this section including, but not limited to, excavation; providing protection of employees in excavation; hauling; disposal of materials; removing existing pipe and drainage structures at the site of the work; furnishing, transporting and placing foundation conditioning material, backfill material, subsurface drainage, concrete, brick masonry, block masonry, precast units, mortar, grout, reinforcing steel, hardware, castings and miscellaneous metal; fabrication; welding; and galvanizing to construct cast-in-place concrete, brick masonry, block masonry or precast concrete inlets, catch basins, junction boxes, spring boxes, manholes, concrete aprons and other minor drainage structures excluding endwalls, with all necessary metal grates, covers, frames, steps and other hardware, in accordance with the contract.

Use cast-in place concrete, brick masonry, block masonry or precast concrete construction as shown on approved plans.

840-2 MATERIALS

Refer to Division 10.

Item	Section
Brick	1040-1
Concrete Block	1040-2
Curing Agents	1026
Fabricated Steel Grates	1074-9
Gray Iron Castings	1074-7
Joint Fillers	1028-1
Joint Sealers	1028-2
Mortar	1040-9
Precast Drainage Structure Units	1077
Portland Cement Concrete, Class B	1000
Reinforcing Steel	1070
Select Materials	1016
Steps	1074-8
Structural Steel	1072

Use grout in precast structures consisting of one part Portland cement to two parts of mortar sand.

Use foundation conditioning material meeting Article 1016-3 for Class V or VI select material as shown in the contract or as directed.

840-3 CONSTRUCTION METHODS**(A) Excavation**

Perform excavation with equipment of adequate weight, size and capability. Where necessary, provide a competent person and protection of personnel in excavation by sloping, shoring or bracing in accordance with Federal, State or local standards and Article 107-1.

(B) Foundation

Do not place masonry drainage structure until the foundation has achieved adequate strength.

Where the foundation material is found to be of poor supporting value or of rock, minor adjustments in the location of the structure may be approved to provide a more suitable

Section 840

1 foundation. Where this is not practical, undercut the foundation and condition by
2 backfilling with an approved select material.

3 Set precast foundation slabs to within $\pm 1/2$ inch of grade on a 2 inch to 3 inch thick bed
4 of compacted foundation conditioning material.

5 (C) Cast-In-Place Concrete, Brick and Block Masonry

6 Install drainage structures to plan line and grade or approved to meet drainage conditions.
7 Do not modify the drainage structure by corbeling or use of concrete slabs unless
8 otherwise directed.

9 Construct concrete in accordance with Section 825 and give an ordinary surface finish.
10 Construct brick masonry in accordance with Section 830. Construct block masonry in
11 accordance with Section 834. Furnish and place reinforcing steel in accordance with
12 Section 425.

13 Obtain approval if field conditions necessitate a variance from the plan dimensions of the
14 structure or footings.

15 (D) Installation of Precast Units

16 Install drainage structures to plan line and grade or approved to meet drainage conditions.
17 Do not modify the drainage structure by corbeling or use of concrete slabs unless
18 otherwise directed.

19 Assemble the precast drainage structure units in accordance with the manufacturer's
20 instructions. Subarticle 840-3(C) applies where it is necessary to use cast-in-place
21 concrete, brick masonry or block masonry construction as part of the structure. Fill any
22 void greater than 1 inch with a brick or block bat fully encased in mortar.

23 Obtain approval if field conditions necessitate a variance from the plan dimensions of the
24 structure or footings.

25 (E) Fittings and Connections

26 As the work is built up, accurately space, align and thoroughly bond fittings that enter the
27 structure.

28 Make pipe connections so the pipe does not project beyond the inside wall of the
29 drainage structure and grout as necessary to make smooth and uniform surfaces on the
30 inside of the structure.

31 Set metal frames for grates and covers in full mortar beds or secure by approved methods.

32 (F) Backfill

33 Complete drainage structure and remove all forms and falsework. Backfill with approved
34 material, compacted to the density required by Subarticle 235-3(C), after the drainage
35 structure has cured for at least 7 curing days, unless otherwise permitted. Define
36 a "curing day" in accordance with Article 825-9 for concrete or Article 830-5 for brick or
37 block masonry.

38 (G) Pipe Collars and Pipe Plugs

39 Construct pipe collars and pipe plugs in accordance with the details shown in the plans or
40 as directed.

41 Use any class of Portland cement concrete contained within Section 1000 for pipe collars.

42 Construct pipe plugs with either brick masonry or any class of Portland cement concrete
43 contained within Section 1000.

(H) Concrete Aprons

Construct concrete aprons in accordance with the details in the plans. Use Class B or higher compressive strength concrete.

840-4 MEASUREMENT AND PAYMENT

Masonry Drainage Structure that incorporate an opening for circular pipe not exceeding 48 inches in diameter will be measured and paid in units of each for the actual number completed and accepted.

Masonry Drainage Structure exceeding a height of 5.0 feet will be measured and paid in linear feet for the portion of the drainage structure exceeding a height of 5.0 feet. The height will be measured vertically to the nearest 0.1 feet from the top of the bottom slab to the top of the wall. For that portion of *Masonry Drainage Structure* measured above a height of 10.0 feet, payment will be made at 1.3 times the contract unit price per linear foot for *Masonry Drainage Structure*.

Masonry Drainage Structures that incorporate an opening for circular pipe exceeding 48 inches in diameter, or for pipe arch of any size, will be measured and paid on a volume basis as provided below.

Masonry to be paid will be the number of cubic yards of cast-in-place concrete brick or block that has been incorporated into the completed and accepted structure. This quantity will be computed from the dimensions shown in the plans or from revised dimensions authorized by the Engineer. Where the wall thickness is greater than the wall thickness shown in the plans due to the use of oversize brick or for any other reason, the wall thickness shown in the plans will be used to compute quantities except where an increase in wall thickness has been authorized by the Engineer.

Pipe Collars will be measured and paid in cubic yards of concrete or brick that has been incorporated into the completed work. The cubic yards of pipe collars will be computed from the dimensions shown in the plans or from revised dimensions authorized by the Engineer.

Pipe Plugs will be measured and paid in cubic yards of concrete or brick that has been incorporated into the completed and accepted pipe plug. The cubic yards of pipe plugs will be computed from the dimensions shown in the plans or from revised dimensions authorized by the Engineer.

Frame with Grate and Hood, Std. ____ will be measured and paid in units of each for actual number of assemblies incorporated into the completed work. No separate measurement will be made of grates, hoods, and covers that are part of the assembly, as the grates, hoods and covers will be considered to be part of the complete assembly.

Frame with Grate, Std. ____ will be measured and paid in units of each for actual number of assemblies incorporated into the completed work. No separate measurement will be made of grates, hoods, and covers that are part of the assembly, as the grates, hoods and covers will be considered to be part of the complete assembly.

Frame with Two Grates, Std. ____ will be measured and paid in units of each for actual number of assemblies incorporated into the completed work. No separate measurement will be made of grates, hoods, and covers that are part of the assembly, as the grates, hoods and covers will be considered to be part of the complete assembly.

Frame with Cover, Std. ____ will be measured and paid in units of each for actual number of assemblies incorporated into the completed work. No separate measurement will be made of grates, hoods, and covers that are part of the assembly, as the grates, hoods and covers will be considered to be part of the complete assembly.

Steel Frame with Two Grates, Std. ____ will be measured and paid in units of each for the actual number of fabricated steel grates incorporated into the completed work.

Section 846

1 No separate payment will be made for concrete aprons shown in *Roadway Standard Drawings*
2 No. 840.17, 840.18, 840.19, 840.26, 840.27 and 840.28, as this work will be incidental to the
3 other work in this section.

4 *Foundation Conditioning Material, Minor Structures* will be paid as provided in Article
5 300-9.

6 The above prices and payments will be full compensation for all work covered by this section.

7 Payment will be made under:

Pay Item	Pay Unit
Masonry Drainage Structures	Each
Masonry Drainage Structures	Linear Foot
Masonry Drainage Structures	Cubic Yard
Pipe Collars	Cubic Yard
Pipe Plugs	Cubic Yard
Frame with Grate and Hood, Std. _____	Each
Frame with Grate, Std. _____	Each

8 **SECTION 846**

9 **CONCRETE CURB, CURB AND GUTTER, CONCRETE**
10 **GUTTER, SHOULDER BERM GUTTER, CONCRETE EXPRESSWAY**
11 **GUTTER AND CONCRETE VALLEY GUTTER**

12 **846-1 DESCRIPTION**

13 Construct Portland cement concrete curb, concrete curb and gutter, concrete gutter, shoulder
14 berm gutter, concrete expressway gutter and 4 inch concrete valley gutter as shown in the
15 contract.

16 **846-2 MATERIALS**

17 Refer to Division 10.

Item	Section
Curing Agents	1026
Joint Fillers	1028-1
Joint Sealers	1028-2, 1028-3
Portland Cement Concrete, Class B	1000

18 **846-3 CONSTRUCTION METHODS**

19 **(A) General**

- 20 Construct concrete in accordance with Section 825, except as provided herein.
- 21 Give surface a light broom finish with brush marks parallel to the curb line or gutter line.
- 22 Prepare foundation and compact base or subgrade to the degree required by the
- 23 applicable section of the *Standard Specifications* before placing forms.

24 **(B) Forms**

- 25 Use forms that have no more than 1/8 inch in 10 feet deflection from true line
- 26 horizontally and vertically to adequately support the concrete and construction
- 27 equipment.
- 28 Obtain approval before placing concrete.

(C) Joints

Locate joints as shown in the plans except as provided herein.

Space joints no closer than 5 feet.

Locate joints to line up with the joints in concrete pavement when placed adjacent to concrete pavement.

Form grooved contraction joints as required by Subarticle 825-10(B).

Construct grooved butt joint between the work and adjacent pavement except where expansion joints are required by the plans. Form butt joints as required by Subarticle 825-10(B) for grooved contraction joints and seal.

Seal all joints except for joints in curb sections not having an integral gutter.

Fill joints in gutter with joint sealer to the top surface of the gutter.

Seal joints before backfilling or performing adjacent operations.

(D) Surface Tolerances

Finish surface within 1/4 inch when checked longitudinally with a 10 foot straightedge.

(E) Backfilling

Do not place backfill or pavement adjacent to the curb, curb and gutter, gutter, shoulder berm gutter, expressway gutter or concrete valley gutter until at least 3 curing days, as defined in Article 825-9, have elapsed.

Complete backfill within 4 calendar days after the completion of the 3 day curing period unless otherwise approved.

Compact backfill to an approved density.

(F) Opening to Traffic

Vehicles may be permitted on the completed work after the following curing days, as defined in Article 825-9, have elapsed. For regular strength concrete, cure for at least 7 curing days. For high early strength concrete, cure for at least 3 curing days.

846-4 MEASUREMENT AND PAYMENT

__" x __" Concrete Curb will be measured and paid in linear feet, accepted in place, along the surface of the top of the curb.

__' __" Concrete Curb and Gutter will be measured and paid in linear feet, accepted in place. Measurement will be made along the surface of the top of the curb.

__' Concrete Gutter will be measured and paid in linear feet accepted in place. Measurement will be made along the surface of the top of the curb.

Shoulder Berm Gutter will be measured and paid in linear feet, accepted in place. Measurement will be made along the surface of the top of the curb.

Concrete Expressway Gutter will be measured and paid in linear feet, accepted in place. Measurement will be made along the surface of the top of the curb.

Concrete Valley Gutter will be measured and paid in linear feet, accepted in place. Measurement will be made along the surface of the top of the curb.

Work includes providing all materials, placing all concrete, excavating and backfilling, forming, finishing, constructing and sealing joints, and all incidentals necessary to complete the work.

Section 848

2 **SECTION 848**
 3 **CONCRETE SIDEWALKS, DRIVEWAYS AND CURB RAMPS**

4 **848-1 DESCRIPTION**

5 Construct Portland cement concrete sidewalks, driveways and curb ramps in accordance with
6 the contract.

7 **848-2 MATERIALS**

8 Refer to Division 10.

Item

Section

Curing Agents	1026
Joint Fillers	1028-1
Joint Sealers	1028-2, 1028-3
Portland Cement Concrete, Class B	1000

9 Detectable warning for curb ramps shall consist of raised truncated domes. Use material for
10 detectable warning systems as shown herein. Material and coating specifications must be
11 stated in the Manufacturers Type 3 Certification and all Detectable Warning systems must be
12 on the NCDOT APL.

13 Install detectable warnings created from one of the following materials: precast concrete
14 blocks or bricks, clay paving brick, gray or ductile iron castings, mild steel, stainless steel,
15 and engineered plastics, rubber or composite tile. Only one material type for detectable
16 warning will be permitted per project, unless otherwise approved by the Engineer.

17 Detectable Warnings shall consist of a base with integrated raised truncated domes, and when
18 constructed of precast concrete they shall conform to the material requirements.

19 Detectable Warnings shall consist of a base with integrated raised truncated domes, and may
20 be comprised of other materials including, but not limited to, clay paving brick, gray iron or
21 ductile iron castings, mild steel, stainless steel, and engineered plastics, rubber or composite
22 tile, which are applied directly to the curb ramps by incorporating into or attaching to the
23 existing ramp floor. The material shall have an integral color throughout the thickness of the
24 material. The detectable warning shall include fasteners, anchors, or adhesives for attachment
25 in the existing ramp and shall be furnished as a system from the manufacturer.

26 Prior to installation, the Contractor shall submit to the Engineer assembling instructions from
27 the manufacturer for each type of system used. The system shall be furnished as a kit
28 containing all consumable materials and consumable tools, required for the application. They
29 shall be capable of being affixed to or anchored in the concrete curb ramp, including green
30 concrete (concrete that has set but not appreciably hardened). The system shall be solvent
31 free and contain no volatile organic compounds (VOC). The static coefficient of friction shall
32 be 0.8 or greater when measured on top of the truncated domes and when measured between
33 the domes in accordance with ASTM C1028 (dry and wet). The system shall be resistant to
34 deterioration due to exposure to sunlight, water, salt or adverse weather conditions and
35 impervious to degradation by motor fuels, lubricants and antifreeze.

1 When steel or gray iron or ductile iron casting products are provided, only products that meet
2 the requirements of Subarticle 106-1(B) may be used. Submit to the Engineer a Type 6
3 Certification, catalog cuts and installation procedures at least 30 days prior to installation for
4 all.

5 **848-3 CONSTRUCTION METHODS**

6 Where it is necessary to remove a portion of existing sidewalks or driveways, saw a neat edge
7 along the pavement to be retained approximately 2 inches deep with a concrete saw before
8 breaking the adjacent pavement away.

9 Construct concrete in accordance with Section 825 and give a sidewalk finish, except as
10 otherwise provided herein.

11 Broom the concrete surface in a transverse direction to traffic. Make joint spacing no less
12 than 5 feet. Where existing sidewalks are being widened, line up new transverse joints with
13 existing joints in the adjacent sidewalk. Seal expansion joints where sidewalk and curb ramps
14 are placed adjacent to concrete curb and/or gutter. Do not seal grooved joints.

15 Do not place backfill adjacent to the sidewalk, driveway or curb ramp until at least 3 curing
16 days, as defined in Article 825-9, have elapsed unless otherwise approved. Compact backfill
17 to a degree comparable to the adjacent undisturbed material.

18 Do not place vehicles on the completed work until 7 curing days, as defined in Article 825-9,
19 have elapsed. When high early strength concrete is used, vehicles will be permitted on the
20 completed work after 3 curing days have elapsed.

21 Install detectable warnings for proposed curb ramps in accordance with the contract
22 documents.

23 Prior to placing detectable warnings in existing concrete curb ramps, saw cut to the full depth
24 of the concrete, for other material remove as necessary, and adjust the existing subgrade to the
25 proper grade.

26 Place all detectable warnings in accordance to manufacturer's recommendations.

27 **848-4 MEASUREMENT AND PAYMENT**

28 ___" *Concrete Sidewalk* will be measured and paid in square yards, measured along the surface
29 of the completed and accepted work. Such price includes, but is not limited to, excavating
30 and backfilling, sawing the existing sidewalk, furnishing and placing concrete, and
31 constructing and sealing joints.

32 ___" *Concrete Driveway* will be measured and paid in square yards, measured along the
33 surface of the completed and accepted work. Such price includes, but is not limited to,
34 excavating and backfilling, sawing the existing driveway, furnishing and placing concrete,
35 and constructing and sealing joints.

36 *Concrete Curb Ramps* will be measured and paid in units of each. Such price includes, but is
37 not limited to, excavating and backfilling, sawing the existing sidewalk or driveway,
38 furnishing and placing concrete, curb and gutter, constructing and sealing joints and
39 furnishing and installing truncated domes shown in the *Roadway Standard Drawings*.

40 *Retrofit Existing Curb Ramps* with detectable warnings constructed of any type material will
41 be paid as the actual number of retrofitted curb ramps, completed and accepted. Such price
42 and payment will be full compensation for excavating and backfilling; sawing, repairing and
43 replacing portions of the existing curb ramp within the pay limits for retrofit shown on the
44 detail; pavement repairs; furnishing and placing detectable warnings, construction joints and
45 removing and disposing of portions of the existing curb ramp when required and for all
46 materials, labor, equipment, tools and incidentals necessary to complete the work.

Section 850

1 *Remove and Replace Curb Ramps* will be measured and paid in units of each. Such price
2 includes, but is not limited to, excavating and backfilling, sawing the existing sidewalk or
3 driveway and furnishing and installing truncated domes and constructing the new curb ramp.
4 Removal and disposal of existing curb ramps will be incidental to the work performed.

5 Payment will be made under:

Pay Item	Pay Unit
___" Concrete Sidewalk	Square Yard
___" Concrete Driveway	Square Yard
Concrete Curb Ramps	Each
Retrofit Existing Curb Ramps	Each
Remove and Replace Curb Ramps	Each

6 **SECTION 850**
7 **CONCRETE PAVED DITCH**

8 **850-1 DESCRIPTION**

9 Construct Portland cement concrete paved ditches as shown in the plans for the various types
10 of ditches. Work includes, but is not limited to, all excavating and backfilling, furnishing and
11 placing concrete, constructing curtain walls and constructing and sealing joints.

12 **850-2 MATERIALS**

13 Refer to Division 10.

Item	Section
Curing Agents	1026
Joint Fillers	1028-1
Joint Sealers	1028-2, 1028-3
Portland Cement Concrete, Class B	1000

14 **850-3 CONSTRUCTION METHODS**

15 Construct concrete in accordance with Section 825 and give a sidewalk finish, except as
16 otherwise provided herein.

17 Broom the concrete surface transverse to the longitudinal centerline of the paved ditch. Make
18 joint spacing no less than 5 feet.

19 Do not place backfill adjacent to the paved ditch until at least 3 curing days have elapsed,
20 unless otherwise approved. Compact backfill to a degree comparable to the adjacent
21 undisturbed material.

22 **850-4 MEASUREMENT AND PAYMENT**

23 ___" *Concrete Paved Ditch* will be measured and paid in square yards that is completed and
24 accepted. Longitudinal measurements will be made along the surface of the pavement at the
25 centerline of the ditch and transverse measurements will be made along the surface of the
26 pavement at right angles to the centerline. No measurement will be made of curtain walls at
27 the beginning or ends of the paved ditches.

28 Payment will be made under:

Pay Item	Pay Unit
___" Concrete Paved Ditch	Square Yard

SECTION 852
TRAFFIC ISLANDS AND MEDIANS

852-1 DESCRIPTION

Construct traffic islands and medians of the type required by the plans. Perform the work in accordance with the contract.

852-2 MATERIALS

Refer to Division 10.

Item	Section
Curing Agents	1026
Herbicide	1060-13
Joint Fillers	1028-1
Joint Sealers	1028-2, 1028-3
Portland Cement Concrete, Class B	1000

852-3 CONSTRUCTION METHODS

Construct curb and gutter and curb, in accordance with Section 846.

Uniformly grade and compact the earth or base course under any island or median to the same requirements as the surrounding material.

Where necessary, treat aggregate and subgrade beneath other types of bases or directly beneath any concrete with a herbicide in accordance with Article 1670-7.

Construct concrete in accordance with Section 825 and give a sidewalk finish, except as otherwise provided herein. Broom concrete surfaces in medians transverse to the direction of traffic unless otherwise directed. Locate joints in island and median covers to line up with the joints in the curb and curb and gutter wherever possible. Locate joints in monolithic concrete islands and medians constructed adjacent to concrete pavement to line up with the joints in the concrete pavement wherever possible. Seal all joints.

Form openings in the island or island cover to accommodate sign posts.

852-4 MEASUREMENT AND PAYMENT

___" *Concrete Island Cover* will be measured and paid in square yards of concrete island cover that has been placed and accepted. Measurement will be made along the top surface of the completed island cover. This work includes, but is not limited to, excavation and backfilling, constructing base, furnishing and placing concrete, forming holes for signposts and constructing and sealing joints.

___" *Monolithic Concrete Islands* () will be measured and paid in square yards of concrete island that has been placed and accepted. Measurement will be made parallel to the bottom surface of the island or median. This work includes, but is not limited to, excavation and backfilling, constructing base, furnishing and placing concrete, forming holes for signposts and constructing and sealing joints.

___" *Monolithic Concrete Median* () will be measured and paid in square yards of concrete median that has been placed and accepted. Measurement will be made parallel to the bottom surface of the island or median. This work includes, but is not limited to, excavation and backfilling, constructing base, furnishing and placing concrete, forming holes for signposts and constructing and sealing joints.

Concrete Transitional Section for Catch Basin will be measured and paid in units of each.

Concrete Transitional Section for Drop Inlet will be measured and paid in units of each.

Section 854

1 Payment for constructing earth fill will be made in accordance with Article 225-7 for
2 *Unclassified Excavation* or Article 230-5 for *Borrow Excavation*, depending on the source of
3 the material.

4 Payment for establishing a grass cover in unpaved island areas will be in accordance with
5 Article 1660-8.

6 Payment for constructing *Concrete Curb* and *Concrete Curb and Gutter* will be made in
7 accordance with Article 846-4.

8 Payment will be made under:

Pay Item	Pay Unit
—" Concrete Island Cover	Square Yard
—" Monolithic Concrete Islands ()	Square Yard
—" Monolithic Concrete Median ()	Square Yard
Concrete Transitional Section for Catch Basin	Each
Concrete Transitional Section for Drop Inlet	Each

9 **SECTION 854**
10 **CONCRETE BARRIER**

11 **854-1 DESCRIPTION**

12 Construct Portland cement concrete barrier in accordance with the contract. The concrete
13 barrier may be cast in place, slip formed or precast, unless otherwise specified in the contract.

14 **854-2 MATERIALS**

15 Refer to Division 10.

Item	Section
Connector Pins and Eye Assemblies	1072
Curing Agents	1026
Grout, Type 3	1003
Guardrail and Barrier Delineators	1088-2
Joint Fillers	1028-1
Joint Sealers	1028-3
Portland Cement Concrete, Class AA	1000
Reinforcing Steel	1070-2

16 Galvanize connector pins and eye assemblies in accordance with Section 1076.

17 Use clear curing compound.

18 **854-3 CONSTRUCTION METHODS**

19 **(A) Cast in Place or Slip Formed**

20 Construct concrete in accordance with Section 825 and give an ordinary surface finish,
21 except as otherwise provided herein.

22 Construct joints in accordance with the details shown in the plans. Seal expansion joints.

23 **(B) Precast**

24 Construct concrete in accordance with Section 825 and give an ordinary surface finish,
25 except as otherwise provided herein.

26 Do not handle or remove the forms from barrier until the strength of the concrete reaches
27 at least 2000 psi as evidenced by nondestructive tests made in place by a rebound
28 hammer in accordance with ASTM C805.

1 Construct the base beneath the precast units to be equivalent to the adjacent pavement
2 structure.

3 Lift and place precast units using a two-point pick up, or other approved method that will
4 not overstress or damage the concrete. Do not use connectors for lifting purposes. Do
5 not use lifting devices or methods that will mar the surface of the concrete. Do not use
6 any precast unit that has been cracked, damaged, chipped, scarred or otherwise
7 disfigured.

8 (C) Barrier Delineators

9 Use any of the several alternate delineator types for barrier shown in the plans, but only
10 one delineator type for barrier at any one time throughout the project.

11 The delineators consist of a reflector and base or casing. Attach the delineator to the
12 barrier as shown in the plans. Only one attachment position will be permitted throughout
13 the project length.

14 Position delineators perpendicular to the centerline of the road. Use yellow delineators in
15 the median and on the left side of one-way ramps, loops or other one-way facilities. Use
16 crystal delineators on the right side of divided highways, ramps, loops and all other one-
17 way or two-way facilities. In all cases, the color of the delineator shall supplement the
18 color of the adjacent edgelines.

19 854-4 MEASUREMENT AND PAYMENT

20 *Concrete Barrier, Type ____* will be measured and paid in linear feet of barrier that has been
21 completed and accepted. Measurement will be made along the top surface at the centerline of
22 the barrier completed and in place with no deduction made for joints.

23 *Variable Height Concrete Barrier, Type ____* will be measured and paid in linear feet of
24 barrier that has been completed and accepted. Measurement will be made along the top
25 surface at the centerline of the barrier completed and in place with no deduction made for
26 joints.

27 *Concrete Barrier Transition Section* will be measured and paid in units of each for transitions
28 completed and accepted.

29 There will be no measurement made of barrier delineators as they are incidental to the other
30 pay items in this section.

31 No direct payment will be made for the work of constructing any footing beneath the concrete
32 barrier or concrete barrier transition sections as payment at the various contract unit prices for
33 concrete barrier or concrete barrier transition sections will be full compensation for all such
34 work.

35 Price and payment includes, but is not limited to, excavating, furnishing and placing concrete,
36 reinforcing steel, grout and hardware; transporting and placing precast units; galvanizing;
37 constructing and sealing joints; and furnishing and installing barrier delineators.

38 Payment will be made under:

SECTION 857

PRECAST REINFORCED CONCRETE BARRIER – SINGLE FACED

857-1 DESCRIPTION

Construct precast reinforced Portland cement concrete barrier in accordance with the contract.

857-2 MATERIALS

Comply with Article 854-2.

857-3 CONSTRUCTION METHODS

Construct concrete in accordance with Section 825 and give an ordinary surface finish, except as otherwise provided herein.

Lift and place precast units using a two-point pick up or other approved method that will not overstress or damage the concrete. Do not use lifting devices or methods that will mar the surface of the concrete. Do not set any precast unit that is cracked, damaged, chipped, scarred or otherwise disfigured.

When barrier is being constructed near traffic, do not start installation of the precast concrete barrier until all components are prepared for a complete continuous installation, including the guardrail and guardrail anchors approaching the barrier. Once work has begun on a barrier installation, continue the work to its completion unless weather or other conditions beyond the control of the Contractor interfere with the work.

Use any of the several alternate delineator types for barrier shown in the plans, but only one delineator type for barrier at any one time throughout the project.

The delineators consist of a reflector and base or casing. Attach the delineator to the barrier as shown in the plans. Only one attachment position will be permitted throughout the project length.

Position delineators perpendicular to the centerline of the road. Use yellow delineators in the median and on the left side of one-way ramps, loops or other one-way facilities. Use crystal delineators on the right side of divided highways, ramps, loops and all other one-way or two-way facilities. In all cases, the color of the delineator shall supplement the color of the adjacent edgelines.

857-4 MEASUREMENT AND PAYMENT

There will be no measurement made of barrier delineators as they are incidental to the other pay items in this specification.

Precast Reinforced Concrete Barrier, Single Faced will be measured and paid in linear feet of barrier that has been completed, placed on the road and accepted. Measurement will be made along the top surface at the centerline of the barrier with no deduction made for joints. Price includes, but is not limited to, furnishing and placing concrete and reinforcing steel, transporting and placing precast units, grout, joint filler, hardware, galvanizing, constructing joints and furnishing and installing barrier delineators.

Concrete Barrier Transition Section will be paid in accordance with Section 854-4.

Payment will be made under:

Pay Item	Pay Unit
Precast Reinforced Concrete Barrier, Single Faced	Linear Foot

SECTION 858

**ADJUSTMENT OF CATCH BASINS, MANHOLES, DROP INLETS,
METER BOXES AND VALVE BOXES**

858-1 DESCRIPTION

Raise or lower existing catch basins, manholes, drop inlets, meter boxes and valve boxes encountered within the limits of the project to match the adjacent finished work.

858-2 MATERIALS

Refer to Division 10.

Item	Section
Asphalt Plant Mix	1020
Brick	1040-1
Concrete Block	1040-2
Curing Agents	1026
Grout, Type 3	1003
Joint Fillers	1028-1
Joint Sealers	1028
Mortar	1040-9
Portland Cement Concrete, Class B	1000
Precast Risers	1077
Reinforcing Steel	1070
Steps	1074-8

858-3 CONSTRUCTION METHODS

Perform the adjustment with brick masonry, block masonry or Portland cement concrete on existing walls in accordance with Subarticle 840-3(C).

Adjust manholes, meter boxes and valve boxes as provided above by using approved fittings. When fittings are used, leave the existing walls in place and securely attach the fittings to the existing walls or install in a manner that will eliminate movement of the fitting.

Backfill excavated areas in an existing pavement with Portland cement concrete. High early strength concrete may be used. Wait at least 72 hours after the placement of the concrete before placing any surfacing or resurfacing material over the concrete. This time period will not be required where the strength of the concrete is at least 2,500 psi as evidenced by nondestructive tests made in place by a rebound hammer in accordance with ASTM C805. Thoroughly compact backfill of other excavated areas.

In areas to be opened to traffic, construct a temporary ramp of asphalt plant mix 360° around the adjusted structures within one calendar day after completing the adjustment. Construct the ramp with a tapered slope of not less than one foot per inch of height in traffic sections with a speed limit of less than 35 mph and 1.5 feet per inch of height to a maximum of 3 feet from the structure in traffic sections with a speed limit of 35 mph or higher. Construct the ramp using any type of asphalt surface course plant mix meeting the requirements of any job mix formula issued by the Department for a Department project. Compact to an approved density.

Place bituminous plant mix flush with the top of the raised structure within 7 days after raising the structure.

Make the adjustments before the final layer of surfacing material is placed in areas to be surfaced or resurfaced. Salvage and reuse existing frames, grates, manhole covers, rings, meter boxes and valve boxes in the adjustment.

Section 859

1 **858-4 MEASUREMENT AND PAYMENT**

2 *Adjustment of Catch Basins* will be measured and paid in units of each for catch basins
3 satisfactorily adjusted.

4 *Adjustment of Drop Inlets* will be measured and paid in units of each for drop inlets
5 satisfactorily adjusted.

6 *Adjustment of Manholes* will be measured and paid in units of each for manholes satisfactorily
7 adjusted.

8 *Adjustment of Meter Boxes or Valve Boxes* will be measured and paid in units of each for
9 meter boxes or valve boxes satisfactorily adjusted.

10 Where any catch basin, drop inlet, manhole, meter box or valve box is adjusted more than
11 once because of milling operations, multiple adjustments will be counted as one adjustment.

12 Where a catch basin, manhole, drop inlet, meter box or valve box is raised more than 2 feet,
13 the number of linear feet exceeding 2 feet that such structure has been raised will be measured
14 and paid per linear foot as provided in Article 840-4 for *Masonry Drainage Structure*.
15 Measurement will be made by subtracting the elevation at the highest point of the original
16 structure from the elevation at the highest point of the adjusted structure and then subtracting
17 2 feet from the results.

18 Such price includes, but is not limited to, excavation and backfilling, removal of a portion of
19 the existing structure, brick masonry, mortar, grout, concrete, reinforcing steel, fittings,
20 furnishing and hauling asphalt plant mix and any other materials and placing, maintaining,
21 removing and disposing of traffic ramps.

22 Payment will be made under:

Pay Item	Pay Unit
Adjustment of Catch Basins	Each
Adjustment of Drop Inlets	Each
Adjustment of Manholes	Each
Adjustment of Meter Boxes or Valve Boxes	Each

23 **SECTION 859**

24 **CONVERTING EXISTING CATCH BASINS, DROP INLETS AND**
25 **JUNCTION BOXES**

26 **859-1 DESCRIPTION**

27 Convert existing catch basins, drop inlets and junction boxes to catch basins, drop inlets or
28 junction boxes, including all necessary construction and reconstruction in accordance with the
29 contract.

30 **859-2 MATERIALS**

31 Refer to Division 10.

1 **859-3 CONSTRUCTION METHODS**

2 Perform work in accordance with Article 840-3 and the details shown in the plans. Raise or
3 lower the existing catch basins and drop inlets as required by the plans and provisions.

4 **859-4 MEASUREMENT AND PAYMENT**

5 *Convert Existing Catch Basin to Junction Box* will be measured and paid in units of each
6 drainage structure that has been acceptably converted.

7 *Convert Existing Catch Basin to Drop Inlet* will be measured and paid in units of each
8 drainage structure that has been acceptably converted.

9 *Convert Existing Catch Basin to Junction Box with Manhole* will be measured and paid in
10 units of each drainage structure that has been acceptably converted.

11 *Convert Existing Drop Inlet to Junction Box* will be measured and paid in units of each
12 drainage structure that has been acceptably converted.

13 *Convert Existing Drop Inlet to Catch Basin* will be measured and paid in units of each
14 drainage structure that has been acceptably converted.

15 *Convert Existing Drop Inlet to Junction Box with Manhole* will be measured and paid in units
16 of each drainage structure that has been acceptably converted.

17 *Convert Existing Junction Box to Drop Inlet* will be measured and paid in units of each
18 drainage structure that has been acceptably converted.

19 *Convert Existing Junction Box to Catch Basin* will be measured and paid in units of each
20 drainage structure that has been acceptably converted.

21 If grates and frames are necessary in converting either catch basins or drop inlets or if frames
22 and covers are necessary for junction boxes, separate payment will be made for the grates and
23 frames or cover and frame in accordance with Section 840.

24 Such price will include, but is not limited to, excavating, hauling, removal of a portion of the
25 existing structures, disposal of materials, furnishing, transporting, placing backfill material,
26 subsurface drainage, concrete, brick masonry, mortar, grout, reinforcing steel, hardware,
27 casting, miscellaneous metal, fabricating, welding and galvanizing.

862-1 DESCRIPTION

Construct either permanent or temporary steel beam guardrail, in accordance with the contract and at the locations designated in the plans or as directed.

862-2 MATERIALS

Refer to Division 10.

Item	Section
Anchors	1046-5
Guardrail and Barrier Delineators	1088-2
Guardrail End Delineation	1088-3
Guardrail Steel Post (___')	1046-3
Hardware	1046-4
Organic Zinc Repair Paint	1076-7
Posts and Offset Blocks	1046-3
Rail Elements	1046-2
Select Material, Class VI	1016
Welded Wire Reinforcement	1070-3

Supply material in accordance with the Department’s Brand Certification Program for Guardrail.

Temporary guardrail shall be of the type called for in the plans and shall be fabricated from plates that are at least 12 gauge in thickness. Used materials are acceptable for temporary guardrail construction provided their condition is approved.

862-3 CONSTRUCTION METHODS

Erect the rail elements to produce a smooth continuous rail paralleling the line and grade of the highway surface or as shown in the plans. Lap the rail elements in the direction of traffic. Re-lap the rail elements if required by traffic phasing. Field drill holes for special details. Field punching holes is allowed. Attach terminal sections, when required, to the ends of each installation and lap on the face of the rail.

Install shop curve guardrail in accordance with the plans.

Posts may be power driven, or set by hand. Protect the top of steel posts by a suitable driving cap if power driven. If set by hand, dig post holes to the depth and at the locations shown in the plans. Thoroughly ram the bottom of the post holes so that the posts will have a stable foundation. Set the posts plumb and accurately space and line. Backfill the post holes in 6 inch layers with suitable material and thoroughly compact.

Where rock interferes with the proper installation of the post, excavate a shaft in the rock at least 9 inches wide, parallel to the roadway, by 23 inches long, perpendicular to the roadway and 24 inches deep. Place the post against the roadside edge of the shaft and fill in behind the post with Class VI select material, up to the top elevation of the rock. Fill the remainder of the hole with earth material. Where timber posts are to be driven in fill slopes 1.5:1 or steeper and the fill height is 15 feet or more, auger a 6 inches diameter pilot hole to the full depth of the post before driving.

Where steel posts are required to be installed at box culverts, weld the post to the anchor plate, cut off and align in accordance with the details shown in the plans or as directed.

Use the same type of guardrail posts and offset blocks throughout the project unless otherwise directed or detailed in the plans.

Extra length guardrail posts shall be installed in accordance with the Contract Documents.

1 The 25 foot Clear Span Guardrail Sections shall be constructed in accordance with the
2 *Roadway Standard Drawings*.

3 After galvanized guardrail has been erected, repair damaged coating in accordance with
4 Article 1076-7.

5 When guardrail is being constructed near traffic, conduct operations to constitute the least
6 hazard to the public. Schedule and conduct operations to construct and complete each
7 individual continuous guardrail installation in the least possible time.

8 Do not begin work on any section of new guardrail until preparations are made to fully
9 complete the installation of the section as a continuous operation. Once work begins on
10 a section, pursue the work to its completion unless inclement weather or other conditions
11 beyond the control of the Contractor interfere with the work. Begin attachment of the rail
12 elements at the approach end of the guardrail and continue in the same direction as the
13 movement of traffic.

14 When directed, install guardrail posts and blocks at locations that are in addition to those
15 required by the plans.

16 Install tubular triple corrugated steel beam guardrail on concrete bridges or driven posts or at
17 locations shown in the plans in accordance with the details shown in the plans and as directed.
18 Where the tubular triple corrugated steel beam guardrail is to be mounted on concrete, use
19 steel posts, weld the post to the anchor plate, cut off and align in accordance with the details
20 shown in the plans or as directed.

21 **862-4 GUARDRAIL DELINEATORS**

22 Use any of the several alternate delineator types for guardrail shown in the plans, but only one
23 delineator type for guardrail at any one time throughout the project.

24 The delineators consist of a reflector and base or casing. Attach the delineator to the guardrail
25 as shown in the plans. Only one attachment position will be permitted throughout the project
26 length.

27 Position delineators perpendicular to the centerline of the road. Use yellow delineators in the
28 median and on the left side of one-way ramps, loops or other one-way facilities. Use crystal
29 delineators on the right side of divided highways, ramps, loops and all other one-way or
30 two-way facilities. In all cases, the color of the delineator shall supplement the color of the
31 adjacent edgelines.

32 **862-5 TEMPORARY GUARDRAIL**

33 Temporary guardrail may be reused if it is in satisfactory condition. After temporary
34 guardrail is no longer needed, it becomes the property of the Contractor. Remove the
35 temporary guardrail from the project.

36 **862-6 MEASUREMENT AND PAYMENT**

37 *Steel Beam Guardrail* will be measured and paid in linear feet of guardrail that has been
38 satisfactorily completed and accepted exclusive of that length of guardrail that is within the
39 pay limits of guardrail anchors. Measurement will be made from center to center of the
40 outermost post in the length of guardrail being measured.

41 *Steel Beam Guardrail, Shop Curved* will be measured and paid in linear feet of guardrail that
42 has been satisfactorily completed and accepted exclusive of that length of guardrail that is
43 within the pay limits of guardrail anchors. Measurement will be made from center to center
44 of the outermost post in the length of guardrail being measured.

45 *Steel Beam Guardrail, Double Faced* will be measured and paid in linear feet of guardrail that
46 has been satisfactorily completed and accepted exclusive of that length of guardrail that is

Section 862

1 within the pay limits of guardrail anchors. Measurement will be made from center to center
2 of the outermost post in the length of guardrail being measured.

3 *Triple Corrugated Steel Beam Guardrail* will be measured and paid in linear feet of guardrail
4 that has been satisfactorily completed and accepted exclusive of that length of guardrail that is
5 within the pay limits of guardrail anchors. Measurement will be made from center to center
6 of the outermost post in the length of guardrail being measured.

7 *20 Inch Tubular Triple Corrugated Steel Beam Guardrail* will be measured and paid in linear
8 feet of guardrail that has been satisfactorily completed and accepted exclusive of that length
9 of guardrail that is within the pay limits of guardrail anchors. Measurement will be made
10 from center to center of the outermost post in the length of guardrail being measured.

11 *Temporary Steel Beam, Guardrail* will be measured and paid in linear feet of guardrail that
12 has been satisfactorily completed and accepted exclusive of that length of guardrail that is
13 within the pay limits of guardrail anchors. Measurement will be made from center to center
14 of the outermost post in the length of guardrail being measured.

15 *Temporary Steel Beam Guardrail, Shop Curved* will be measured and paid in linear feet of
16 guardrail that has been satisfactorily completed and accepted exclusive of that length of
17 guardrail that is within the pay limits of guardrail anchors. Measurement will be made from
18 center to center of the outermost post in the length of guardrail being measured.

19 *Temporary Steel Beam Guardrail, Double Faced* will be measured and paid in linear feet of
20 guardrail that has been satisfactorily completed and accepted exclusive of that length of
21 guardrail that is within the pay limits of guardrail anchors. Measurement will be made from
22 center to center of the outermost post in the length of guardrail being measured.

23 *Steel Beam Guardrail Terminal Section* and *Temporary Steel Beam Guardrail Terminal*
24 *Sections* will be measured and paid in units of each completed and accepted, exclusive of
25 terminal sections that are within the pay limits of guardrail anchors.

26 *Triple Corrugated Steel Beam Guardrail Terminal Sections* will be measured and paid in
27 units of each completed and accepted, exclusive of terminal sections that are within the pay
28 limits of guardrail anchors.

29 *Guardrail End Units, Type ____* and *Temporary Guardrail End Units Type ____* will be
30 measured and paid as units of each completed and accepted. No separate measurement will
31 be made of any rail, terminal sections, posts, offset blocks, concrete, hardware or any other
32 components of the completed unit that are within the pay limits shown in the plans for the unit
33 as all such components will be considered to be part of the unit.

34 *W-TR Steel Beam Guardrail Transition Sections* will be measured and paid in units of each
35 completed and accepted.

36 The quantity of *25' Clear Span Guardrail Sections* will be measured and paid in units of each
37 which have been completed and accepted.

38 *Extra Length Guardrail Post* will be measured and paid for in units of each that have been
39 installed and accepted.

40 *Additional Guardrail Posts* will be measured and paid in units of each for additional posts
41 required but not shown in the plans.

42 There will be no measurement or payment made for guardrail delineators or guardrail end
43 delineation as they are incidental to the other pay items in this section.

44 Such price and payment includes, but is not limited to, furnishing and erecting posts, offset
45 blocks, rail, terminal sections, miscellaneous hardware and all other materials; field curving
46 and shop curving of the rail; removing temporary guardrail; excavation; furnishing and
47 installing additional guardrail posts and additional offset blocks; backfilling; fabrication;
48 welding; galvanizing; and furnishing and installing guardrail delineators and end delineation.

1 Payment will be made under:

Pay Item	Pay Unit
Steel Beam Guardrail	Linear Foot
Steel Beam Guardrail, Shop Curved	Linear Foot
Steel Beam Guardrail, Double Faced	Linear Foot
Triple Corrugated Steel Beam Guardrail	Linear Foot
20" Tubular Triple Corrugated Steel Beam Guardrail	Linear Foot
Temporary Steel Beam Guardrail	Linear Foot
Temporary Steel Beam Guardrail, Shop Curved	Linear Foot
Temporary Steel Beam Guardrail, Double Faced	Linear Foot
Temporary Guardrail End Units, Type _____	Each
Temporary Steel Beam Guardrail Terminal Sections	Each
Steel Beam Guardrail Terminal Sections	Each
Triple Corrugated Steel Beam Guardrail Terminal Sections	Each
Guardrail End Units, Type _____	Each
W-TR Steel Beam Guardrail Transition Sections	Each
25' Clear Span Guardrail Sections	Each

Additional Guardrail Posts	Each

2

SECTION 863

3

REMOVE EXISTING GUARDRAIL AND GUIDERAIL

4

863-1 GENERAL

5

Dismantle, remove and dispose of existing guardrail, guiderail and anchors of any type at locations shown in the plans or established by the Engineer.

7

863-2 CONSTRUCTION METHODS

8

Remove guardrail, guiderail and posts beginning at the trailing end and continuing towards the approach end. Remove the posts immediately after the rail or cable is removed.

10

Complete post removal so that no posts without rail or cable attached are present at the end of

11

any day's operations. Exercise care not to damage adjoining structures or other

12

appurtenances. Fill any void created by post or anchor removal and repair all damages. All

13

guardrail, guiderail and components removed are the property of the Contractor.

14

863-3 MEASUREMENT AND PAYMENT

15

Remove Existing Guardrail and *Remove Existing Guiderail* will be measured and paid in

16

linear feet of guardrail or guiderail that has been satisfactorily removed. Measurement will be

17

made to the nearest 1.0 feet from center to center of the outermost post or end shoe center bolt

18

in the length of the guardrail or guiderail being removed. Measurement will be made before

19

removing the guardrail or guiderail.

20

The work to fill any void or fix all damage created by post or anchor removal is incidental to

21

the work of this section.

22

Payment will be made under:

Pay Item	Pay Unit
Remove Existing Guardrail	Linear Foot
Remove Existing Guiderail	Linear Foot

Section 864

SECTION 864

REMOVE AND RESET EXISTING GUARDRAIL AND GUIDERAIL

864-1 GENERAL

Remove and reset existing guardrail, guiderail and anchors of any type at locations shown in the plans and the contract.

864-2 CONSTRUCTION METHODS

Exercise care not to damage adjoining structures or other appurtenances. Fill any void created by post or anchor removal and repair all damage at no cost to the Department. Reset existing guardrail and guiderail in accordance with Articles 862-3 and 865-3. Reset guardrail and guiderail in a condition that is equal to or better than the condition that exists before the guardrail and guiderail is removed. Replace any of the guardrail and guiderail components unnecessarily damaged.

864-3 MEASUREMENT AND PAYMENT

Remove and Reset Existing Guardrail will be measured and paid in linear feet of guardrail and anchors that has been removed, reset and accepted. Measurement will be made after the guardrail has been reset.

Remove and Reset Existing Guiderail will be measured and paid in linear feet of guiderail and anchors that has been removed, reset and accepted. Measurement will be made after the guiderail has been reset.

Such price will include, but is not limited to, removing and resetting the guardrail, guiderail and anchors and for furnishing all equipment, labor and incidentals necessary to complete the work.

Payment will be made under:

Pay Item	Pay Unit
Remove and Reset Existing Guardrail	Linear Foot
Remove and Reset Existing Guiderail	Linear Foot

**SECTION 865
CABLE GUIDERAIL**

865-1 DESCRIPTION

Construct cable guiderail in accordance with the contract and at the locations designated in the plans or as directed. Install additional double faced cable guiderail posts without cable at median hazards as shown in *Roadway Standard Drawings*.

865-2 MATERIALS

Refer to Division 10.

Item	Section
Hardware	1046-4
Portland Cement Concrete, Class A	1000
Posts	1046-3
Precast Concrete Anchors	1077
Rail Elements	1046-2
Select Material, Class VI	1016

Manufacture cable in accordance with AASHTO M 30, Type I, Class A. The cable shall be pre-inspected at the producer’s facility before shipment.

Additional guiderail posts shall be double faced guiderail intermediate posts.

1 **865-3 CONSTRUCTION METHODS**

2 Erect the rail elements to produce a smooth continuous rail paralleling the line and grade of
3 the highway surface or as shown in the plans.

4 Posts may be power driven or set by hand. Protect the top of steel posts by a suitable driving
5 cap if power driven. If set by hand, dig post holes to the depth and at the locations shown in
6 the plans. Thoroughly ram the bottom of the post holes so that the posts will have a stable
7 foundation. Set the posts plumb and accurately space and align. Backfill the post holes in 6
8 inch layers with suitable material and thoroughly compact by tamping or puddling.

9 Where rock interferes with the proper installation of the post, excavate a shaft in the rock at
10 least 9 inches wide, parallel to the roadway, by 23 inches long, perpendicular to the roadway,
11 and 24 inches deep. Place the post against the roadside edge of the shaft and fill in behind the
12 post with Class VI select material, up to the top elevation of the rock. Fill the remainder of
13 the hole with earth material. Where timber posts are to be driven in fill slopes 1.5:1 or steeper
14 and the fill height is 15 feet or more, auger a 6 inch diameter pilot hole to the full depth of the
15 post before driving.

16 When guiderail is being constructed near traffic, conduct operations to constitute the least
17 hazard to the public. Schedule and conduct operations to construct and complete each
18 individual continuous guiderail installation in the least possible time.

19 Do not begin work on any section of new guiderail until preparations are made to fully
20 complete the installation of the section as a continuous operation. Once work begins on
21 a section, pursue the work to its completion unless inclement weather or other conditions
22 beyond the control of the Contractor interfere with the work. Begin attachment of the cable
23 elements at the approach end of the guiderail and continue in the same direction as the
24 movement of traffic.

25 **865-4 MEASUREMENT AND PAYMENT**

26 *Cable Guiderail* will be measured and paid in linear feet of guiderail that has been
27 satisfactorily completed and accepted exclusive of that length of guiderail that is within the
28 pay limits of guiderail anchors. Measurement will be made from center to center of the
29 outermost post in the length of guiderail being measured. Such price will include, but is not
30 limited to, furnishing and erecting posts, cable, miscellaneous hardware, concrete, delineators
31 and all incidentals necessary to complete the work.

32 *Double Faced Cable Guiderail* will be measured and paid in linear feet of guiderail that has
33 been satisfactorily completed and accepted exclusive of that length of guiderail that is within
34 the pay limits of guiderail anchors. Measurement will be made from center to center of the
35 outermost post in the length of guiderail. Such price will include, but is not limited to,
36 furnishing and erecting posts, cable, miscellaneous hardware, concrete, delineators and all
37 incidentals necessary to complete the work.

38 *Cable Guiderail Anchor Units* will be measured and paid in units of each completed and
39 accepted.

40 *Additional Guiderail Posts* will be measured and paid in units of each completed and
41 accepted.

42 No separate measurement will be made of any cable, posts, concrete, hardware or any other
43 components of the completed anchor units that are within the pay limits shown in the plans.

44 Payment will be made under:

Pay Item	Pay Unit
Cable Guiderail	Linear Foot
Double Faced Cable Guiderail	Linear Foot
Cable Guiderail Anchor Units	Each
Additional Guiderail Posts	Each

866-1 DESCRIPTION

Furnish and erect woven wire, chain link and barbed wire fence with gates in conformity with the details shown in the plans and at locations as shown in the plans.

866-2 MATERIALS

Refer to Division 10.

Item	Section
Barbed Wire	1050-4
Chain Link Fabric	1050-6
Fence Materials	1050-1
Fittings and Accessories	1050-7
Metal Posts and Rails	1050-3
Organic Zinc Repair Paint	1076-7
Timber Posts and Braces	1050-2
Woven Wire	1050-5

Use Class B concrete for anchors. Instead of Class B concrete, pre-mixed commercially bagged dry concrete mix may be used if the concrete meets the minimum strength requirements for Class B concrete when mixed with the quantity of water shown on the instructions printed on the bag.

866-3 CONSTRUCTION METHODS

(A) Clearing and Grubbing

Only clear the ground that is necessary to erect a clear fence line. Clearing includes satisfactory removal and disposal of all trees, brush, stumps, existing fence or other objectionable material. Erect the fence to conform to the general contour of the ground. Place the bottom of the fabric or wire no more than 6 inches above the natural ground, except where the Engineer directs that ditches and depressions are to be spanned by using extra length posts in conjunction with additional barbed wire installed between the bottom of the fence wire or fabric and the ground surface. Grade along the fence line to meet the above requirement such that no obstructions to proper drainage are created.

(B) Setting Posts and Braces

Set and maintain all posts in a vertical position. Line posts may be hand set or set with a post driver. Thoroughly tamp all backfilled material if hand set. If power driven, wood posts may be sharpened to a dull point. Remove and replace posts that are damaged by power driving.

Set posts in concrete anchors to maintain the position and alignment of the post when required in the plans or where dictated by soil conditions. Forms are not required for the concrete. Trowel the top of the concrete to a smooth finish and slope to drain away from the post. The concrete anchors require at least a 3 day curing period before any load is placed on the post.

Instead of setting roll formed steel line posts in concrete, such posts may be driven provided they are not part of a line brace assembly. Drive the posts at least 3 feet into the ground. Provide adequate protection to the post tops to prevent damage from the driving operations. Repair damage to the zinc coating in accordance with Article 1076-7. Set posts in concrete anchors where soil conditions are such that the posts cannot be driven without deformation, or where soils are encountered that does not provide adequate in-ground stability.

1 Where rock or concrete pavement or slabs are encountered within the required depth
2 where fence posts are to be erected, drill a hole in the rock or concrete of a diameter
3 slightly larger than the largest dimension of the post in the rock or concrete and grout in
4 the post. The depth of post embedment shown in the plans will not be required and the
5 post may be shortened as necessary, provided the post is embedded within the rock or
6 concrete pavement or slab to a minimum depth of 12 inches.

7 Do not fabricate extra length posts by welding short sections of posts together.

8 Place line braces at the end of each roll or piece of woven wire.

9 Do not use pieces of woven wire fabric less than 100 feet in length, unless otherwise
10 directed. When the use of short pieces of woven wire is permitted, furnish and install the
11 additional required brace posts and braces. Approved splicing sleeves may be used
12 instead of providing such brace posts and braces.

13 (C) Installing Fabric and Wire

14 (1) Chain Link Fence

15 Attach chain link fabric to tubular end, gate, corner or brace posts with stretcher bars
16 and stretcher bar bands as shown in the plan. Fasten the fabric to line posts and to
17 top and brace rails with wire fasteners spaced and wound as shown in the plans.
18 Fasten the fabric to the tension wire by hog rings spaced at 24 inch intervals or
19 weave the tension wire through the fabric. Make hog ring ties at fabric joints with
20 the hog ring passing completely around the fabric joint.

21 Place chain link fabric by securing or fastening on end and applying sufficient
22 tension to remove all slack before making permanent attachments elsewhere. Apply
23 the tension for stretching by mechanical fence stretchers designed for this purpose.

24 Connect rolls and pieces of chain link fabric to each other by field weaving provided
25 that such weaving is identical in appearance and strength as the machine weaving
26 done at the factory.

27 Attach barbed wire used in conjunction with chain link fabric, to the post by eyebolt
28 or by a tie wire passing through holes drilled in the metal post to prevent any vertical
29 movement of the barbed wire. Wrap the ends and beginnings of strands around the
30 post twice and securely fasten by winding the end around the wire near the post.
31 Splice barbed wire only at posts.

32 Install additional barbed wire when shown in the plans or where directed.

33 (2) Woven Wire Fence

34 Stretch woven wire fabric taut and securely attach to each post with one or more
35 staples in each line of wire. Use as many staples as required to firmly secure the
36 wire at the location and elevation required by the plans. When woven wire is
37 attached to metal posts, use at least five clips at each post to fasten the individual
38 strands of wire to the post except where wrapping of the strand around the post is
39 required. Stretch with an approved stretcher that will produce equal tension in each
40 line of wire.

41 At each end or gate post, at the center post in each line brace and at corner posts
42 except as otherwise shown in the plans, cut out all vertical strands of wire and wrap
43 each horizontal strand of wire around the post and securely fasten by winding the
44 end around the strand of wire near the post.

45 Do not splice fabric between the posts of a brace post assembly. Do not splice
46 between other posts, unless the splicing sleeves are approved.

Section 866

1 Pull woven wire taut and securely attach to each post by methods described for
2 woven wire when used in conjunction with woven wire fabric. Do not splice woven
3 wire between posts.

4 Install additional woven wire as shown in the plans or where directed.

5 (3) Barbed Wire Fence

6 Install barbed wire fence in accordance with the plans and as directed.

7 Pull barbed wire taut and securely attach to each post by methods described for
8 woven wire. Do not splice barbed wire between posts.

9 **866-4 MEASUREMENT AND PAYMENT**

10 *Woven Wire Fence, ___* Fabric will be measured and paid in linear feet of fence, measured in
11 place from center of each post or gate post to center of end post or gate post exclusive of gate
12 sections, that has been completed and accepted.

13 *Chain Link Fence, ___* Fabric will be measured and paid in linear feet, of fence measured in
14 place from center of each post or gate post to center of end post or gate post exclusive of gate
15 sections, that has been completed and accepted.

16 *___ Strand Barbed Wire Fence with Posts* will be measured and paid in linear feet of fence
17 measured in place from center of each post or gate post to center of end post or gate post
18 exclusive of gate sections that has been completed and accepted. All posts used for the
19 barbed wire fence are included in the price of the barbed wire fence and will not be paid
20 separately.

21 *___ Timber Fence Posts, ___* will be measured and paid in units of each for the several sizes
22 and kinds of posts installed on the project, including timber line posts, brace posts, gate posts
23 and posts erected as barriers at driveways and entrances. The actual length of timber posts in
24 linear feet of variable length and extra length posts shall be measured as placed and converted
25 to an equivalent number of standard length posts of the same size for which a pay item has
26 been established. In converting to equivalent numbers of standard length posts, any fractional
27 portion of a post remaining from the division of a total number of linear feet by a standard
28 post length shall be considered as equal to one post. Where the Contractor has elected to use
29 pieces of woven wire shorter than 100 feet in length, as permitted by Subarticle 866-3(B), on
30 the condition that he furnish and install at no additional cost to the Department line braces at
31 the ends of short pieces, timber fence posts shall include the number of line posts made
32 unnecessary by such line braces but shall exclude the posts used in the line braces.

33 *Metal Line Posts for ___ Chain Link Fence* will be measured and paid in units of each for the
34 several sizes and kinds of posts actually installed on the project. For extra length metal posts,
35 the actual length of post in place in excess of the standard pay length for each post shall be
36 measured in linear feet, and half of such length shall be converted to an equivalent number of
37 standard length posts of the same size for which a pay item has been established. In
38 converting to equivalent numbers of standard length posts, any fractional portion of a post
39 remaining from the division of a total number of linear feet by a standard post length shall be
40 considered as equal to one post.

41 *Metal Terminal Posts for ___ Chain Link Fence* will be measured and paid in units of each for
42 all end, corner and brace posts installed on the project.

43 *Metal Gate Posts for ___ Chain Link Fence, Double Gate* will be measured and paid in units
44 of each for gateposts installed on the project.

45 *Metal Gate Posts for ___ Chain Link Fence, Single Gate* will be measured and paid in units of
46 each for gate posts installed on the project.

47 *Double Gates, ___High, ___Wide, ___ Opening* will be measured and paid in units of each for the
48 number of gates actually erected on the project. Double gates will be measured as one gate.

- 1 *Single Gates, __ High, __ Wide, __ Opening* will be measured and paid in units of each for the
2 number of gates actually erected on the project.
- 3 *Additional Barbed Wire* will be measured and paid in linear feet of wire installed in the work,
4 complete and in place. Measurement of additional barbed wire will be made along each
5 strand after the installation has been completed. No measurement will be made of any wraps,
6 nor will measurement be made of the upper or lower continuous strand of barbed wire that is
7 erected as part of woven wire fence.
- 8 Setting sleeves in retaining wall will not be paid as such work is incidental to the other pay
9 items in this specification.
- 10 Work includes, but is not limited to, clearing and grading; and furnishing and installing fence
11 fabric, barbed wire, staples, tie wires, stretcher bars, top rails, tension wire, posts and post
12 braces, concrete, gates, fittings and any other materials, furnishing and installing sleeves in
13 retaining walls and filling sleeves upon setting posts.
- 14 When the use of short pieces of woven wire is permitted, furnish and install the additional
15 required brace posts and braces at no additional cost to the Department.
- 16 Payment will be made under:

Pay Item	Pay Unit
Woven Wire Fence, __" Fabric	Linear Foot

SECTION 867 FENCE RESET

867-1 DESCRIPTION

20 Remove and reset existing fences of various types to the locations indicated in the plans or
21 where directed.

867-2 CONSTRUCTION METHODS

23 Reset the fence in a condition that is equal to or better than before the fence is removed.
24 Replace any of the fence components unnecessarily damaged by the Contractor's forces. Fill
25 any void created by fence removal.

26 The Contractor will be responsible for damage caused by livestock escaping or entering the
27 existing fenced area through the negligence of his forces.

28 If the owner of the fence desires to repair, rebuild or renew any parts of the fence and agrees
29 to furnish the materials without cost to the Contractor, then repair, rebuild, renew and reset
30 such fence using the material furnished by the owner at no additional cost to the owner or the
31 Department.

867-3 MEASUREMENT AND PAYMENT

33 ____ *Fence Reset* will be measured and paid in the linear feet of fence that has been
34 acceptably reset. Measurement will be made along the fence after it has been reset from
35 center of end post to center of end post. Such price includes, but is not limited to, removing,

Section 873

1 hauling and re-erecting the existing fence; and furnishing and installing any fence components
2 unnecessarily damaged by the Contractor's forces.

3 Payment will be made under:

Pay Item	Pay Unit
____ Fence Reset	Linear Foot

4 **SECTION 869**
5 **RELAPPING GUARDRAIL**

6 **869-1 DESCRIPTION**

7 Relap either existing or recently installed guardrail in accordance with the contract and where
8 directed.

9 **869-2 CONSTRUCTION METHODS**

10 Where required by the traffic phasing, at locations shown in the plans, or where directed,
11 relap guardrail to conform to the required traffic pattern. Complete all required relapping of
12 guardrail and have it inspected before shifting traffic into a new traffic pattern. All guardrail
13 shall be lapped in the direction of traffic before placing traffic next to the guardrail.

14 **869-3 MEASUREMENT AND PAYMENT**

15 *Relapping Guardrail* will be measured and paid in linear feet of guardrail that has been
16 satisfactorily relapped and accepted. Measurement will be made from center to center of the
17 outermost post in the length of guardrail being measured. Such price includes, but is not
18 limited to, providing all necessary labor, tools, equipment and materials necessary to
19 acceptably relap the guardrail.

20 Payment will be made under:

Pay Item	Pay Unit
Relapping Guardrail	Linear Foot

21 **SECTION 873**
22 **PREFORMED SCOUR HOLE WITH LEVEL SPREADER APRON**

23 **873-1 DESCRIPTION**

24 Construct and maintain preformed scour holes with spreader aprons at the locations shown on
25 the plans and in accordance with the details in the plans. Work includes excavation, shaping
26 and maintaining the hole and apron, furnishing and placing filter fabric, rip rap (class as
27 specified in the plans) and permanent soil reinforcement matting.

28 **873-2 MATERIALS**

29 Refer to Division

Item	Section
Plain Rip Rap	1042
Filter Fabric	1056

30 The permanent soil reinforcement matting shall be permanent erosion control reinforcement
31 mat and shall be constructed of synthetic or a combination of coconut and synthetic fibers
32 evenly distributed throughout the mat between a bottom UV stabilized netting and a heavy
33 duty UV stabilized top net. The matting shall be stitched together with UV stabilized
34 polypropylene thread to form a permanent three dimensional structure. The mat shall have
35 the following minimum physical properties:

Property	Test Method	Value Unit
Light Penetration	ASTM D6567	9 %
Thickness	ASTM D6525	0.40 in
Mass Per Unit Area	ASTM D6566	0.55 lb/sy
Tensile Strength	ASTM D6818	385 lb/ft
Elongation (Maximum)	ASTM D6818	49 %
Resiliency	ASTM D1777	>70 %
UV Stability *	ASTM 4355	≥80 %
Porosity (Permanent Net)	ECTC Guidelines	≥85 %
Maximum Permissible Shear Stress (Vegetated)	Performance Bench Test	≥8.0 lb/ft ²
Maximum Allowable Velocity (Vegetated)	Performance Bench Test	≥16.0 ft/s

1 *ASTM D1682 Tensile Strength and % strength retention of material after 1,000 hours of
2 exposure.

3 Submit a certification (Type 1, 2, or 3) from the manufacturer showing:

4 (A) The chemical and physical properties of the mat used, and

5 (B) Conformance of the mat with this specification.

6 **873-3 CONSTRUCTION METHODS**

7 All areas to be protected with the mat shall be brought to final grade and seeded in accordance
8 with Section 1660. The surface of the soil shall be smooth, firm, stable and free of rocks,
9 clods, roots or other obstructions that would prevent the mat from lying in direct contact with
10 the soil surface. Areas where the mat is to be placed will not need to be mulched.

11 **873-4 MEASUREMENT AND PAYMENT**

12 *Performed Scour Holes with Level Spreader Aprons* will be measured and paid as the actual
13 number incorporated into the completed and accepted work. Such price and payment will be
14 full compensation for all work covered by this provision.

15 Payment will be made under:

Pay Item	Pay Unit
Performed Scour Hole with Level Spreader Aprons	Each

16 **SECTION 876**

17 **RIP RAP**

18 **876-1 DESCRIPTION**

19 Supply and place rip rap and, if necessary, filtration geotextiles in accordance with the
20 contract and as directed.

21 **876-2 MATERIALS**

22 Refer to Division 10.

Item	Section
Geotextile for Drainage, Type 2	1056
Plain Rip Rap	1042

23 Provide Type 2 geotextile for filtration geotextiles and plain rip rap classes in accordance with
24 the contract.

Section 876

1 **876-3 PLAIN RIP RAP**

2 Grade locations for rip rap as shown in the plans. Use filtration geotextiles under rip rap
3 when shown in the plans and as directed. Do not leave geotextiles exposed for more than
4 7 days before covering with rip rap. Place filtration geotextiles on surfaces free of
5 obstructions, debris and soft pockets.

6 Overlap adjacent geotextiles at least 18 inches in the downhill and downstream direction to
7 prevent flow from lifting the edge of the top geotextile. Pull filtration geotextiles taut so they
8 are in tension and free of kinks, folds, wrinkles or creases. Hold geotextiles in place as
9 needed with wire staples or anchor pins. Do not displace or damage filtration geotextiles
10 while placing rip rap. Replace any damaged geotextiles to the satisfaction of the Engineer.

11 For rip rap at pipe outlets, place rip rap immediately after installing pipes. When rip rap is
12 required for channel changes and drainage ditches, place rip rap before diverting water into
13 channels and ditches.

14 Place rip rap such that the smaller stones are uniformly distributed throughout rip rap. Install
15 rip rap with mechanical methods and if necessary, by hand to form a well-graded, dense and
16 neat layer of rip rap.

17 **876-4 MEASUREMENT AND PAYMENT**

18 *Rip Rap, Class ____* will be measured and paid in tons. Plain rip rap will be measured by
19 weighing rip rap in trucks in accordance with 106-7.

20 *Geotextile for Drainage* will be measured and paid in square yards. Filtration geotextiles will
21 be measured along the ground surface as the square yards of exposed geotextiles before
22 placing rip rap. No measurement will be made for overlapping geotextiles.

23 The contract unit prices for *Rip Rap, Class ____* and *Geotextile for Drainage* will be full
24 compensation for providing, transporting and placing rip rap, filtration geotextiles, wire
25 staples and anchor pins.

26 Payment will be made under:

Pay Item	Pay Unit
Rip Rap, Class ____	Ton
Geotextile for Drainage	Square Yard

DIVISION 9 SIGNING

SECTION 900 GENERAL REQUIREMENTS FOR SIGNING

900-1 DESCRIPTION

Furnish, fabricate and erect complete traffic sign systems in accordance with the contract.

900-2 ACCEPTANCE OF SIGNS

Before final inspection of the signs, clean exposed sign and support surfaces and repair the site as may be deemed necessary to ensure the safety, effectiveness and neat appearance of the work.

Maintain responsibility for the signs until accepted. Any damaged sign will not be accepted. Any repairs to the signs before final acceptance of the project are to be approved.

Do not perform any repair work without written approval. Make repairs only in the presence of the Engineer.

Handle, transport and store all signs in accordance with the sheeting manufacturer's recommendations. Failure to comply with the manufacturer's recommendations during the handling, transporting and storing of the signs will be cause for rejection.

The Contractor may request early Department acceptance of part or all of the highway signs, including sign panels, retroreflective sheeting and associated hardware, before final project acceptance. Sign supports will not be accepted early. To be accepted before final project acceptance, the signs shall be required for traffic control at that phase of project construction.

If the Department accepts the signs, the Contractor will be relieved of the responsibility for any damage or theft that may occur to the signs, retroreflective sheeting or associated hardware, with exception of any damage caused by the Contractor or any subcontractor working on the project.

900-3 ALTERNATE DESIGN

Standard designs for Types A, B, C, D, E or F signs will be shown in the contract. Instead of the standard design, the Contractor may submit for approval an alternate design for sign panels differing in component parts and construction details from those shown in the contract. Provide any alternate designs that are in accordance with the MUTCD.

Submit complete details of the alternate sign designs to the Engineer for approval. Include the dimensions, thickness and alloys of the component parts, and typical shop drawings of all fabrication, erection and construction details.

Alternate design for supports and footings will not be permitted.

900-4 COVERING OF SIGNS

Cover signs or portions of signs with opaque material if erected on roads open to traffic and not yet applicable. Keep signs or portions of signs covered until instructed to remove the covering. Provide covering for entire signs by an approved method provided by sheeting manufacturer that will prevent the messages from being read or seen during both day and night conditions and that will cause no harm to the sheeting face.

901-1 DESCRIPTION

Fabricate and furnish signs, including sign face, supporting frames, hardware and package the signs for shipment.

901-2 MATERIALS

Refer to Division 10.

Item	Section
Retroreflective Sheeting	1092-2
Signs and Hardware	1092-1

901-3 CONSTRUCTION METHODS

(A) General

Details concerning the fabrication and erection of the signs are shown in the contract. Sign designs not shown in the contract are available from the Engineer.

Fabricate all items within 1/8 inch of design measurements. Scribe each sign, shield, arrow, overlay or blank on the back with the month and year.

Do not begin fabrication of Type A and B signs until S-dimension verification revisions have been approved.

Provide mounting holes in the Z-stringers of the signs in accordance with the details shown in the contract or approved shop drawings. Provide a space between the Z-bar and backing strip not greater than 1/8 inch.

Date the erection of all signs and sign assemblies using printed self-adhesive stickers designed for punching the appropriate day, month and year numbers with a hole punch. Place the sticker on the back of each sign in the lower corner nearest the roadway. The Sign Fabricator will provide a sufficient quantity of the stickers for each sign. Print on the back of each sign the size of that sign [e.g. 144 inches x 48 inches] with a black permanent marker with numbers at least 2 inches in height and located near the self-adhesive sticker.

Ship all multi-panel signs to the project intact, completely assembled and ready to be installed. Fabricate signs taller than 12 feet as two separate signs with a horizontal splice, ready to be spliced and installed. No assembly other than a horizontal splice will be permitted except when a route shield or copy is required to be attached because of the horizontal splice.

(B) Department and Contractor Furnished Signs

Use the contract to determine whether the signs are to be fabricated and furnished by the Contractor or whether the Department will provide them to the Contractor.

For both Department and Contractor Furnished Signs, the Contractor provides all mounting hardware consisting of, but not limited to, shims, backing plates, mounting bolts, washers and nuts.

The sign fabricator will provide vertical Z-bars required for attaching secondary signs to the primary signs.

Confirm in writing at least 4 months in advance, the actual date the Department furnished signs will be required. The signs will be made available to the Contractor for pickup at the North Carolina Department of Public Safety sign fabrication facility on N.C. 39 near Bunn, North Carolina, unless otherwise indicated in the contract. Provide for all transportation.

The Engineer will inspect and approve the signs before they are packaged and crated for shipment. Take delivery of all signs within 60 days of the date requested or the date they are made available, whichever occurs last, and within 96 hours of receiving the first sign. The Engineer shall approve any exception to the above delivery procedure. At the time the signs are delivered to the project, provide to the Engineer one copy of the sales ticket furnished with the signs.

After taking possession of the signs, the Contractor is responsible for any damage or theft that occurs to signs before final acceptance by the Engineer. Comply with the reflective sheeting manufacturer's recommendations for handling, transporting, erecting and storing of the signs. Acceptably repair or otherwise correct any damage to the signs or refabricate them. When requested by the Contractor, the Department may have the necessary repairs made or the signs refabricated, and deduct the associated cost thereof from monies due the Contractor.

(C) Signs

Construct all signs, supporting frames and assemblies in accordance with the details shown in the contract and Tables 901-1 and 901-2.

TABLE 901-1 SIGN TYPE PARAMETERS				
Sign Type	Vertical and Horizontal Dimensions	144"x 48" Aluminum Panels	Horizontal Z-Bars	Aluminum Thickness
A	Vertical or Horizontal > 144" or Vertical and Horizontal > 48"	Multiple	Yes	0.125"
B	Vertical and Horizontal ≤ 144" and Vertical or Horizontal ≤ 48"	Single	Yes	0.125"
D	-	Single	No	See Table 901-2
E	-	Single	No	See Table 901-2
F	-	Single	No	See Table 901-2

(1) Type A Signs

Fabricate Type A signs from multiple aluminum sheet increments of the thickness shown in Table 901-1, with welded studs for attachment to the supporting frame.

Use aluminum sheets with increments of 4 feet in width; except, for sign widths that are not multiples of 4 feet, a maximum of 2 panels may be cut to less than 4 feet. No panel may be cut to less than one foot. Mount aluminum sheet increments vertically and provide with backing strips at the vertical joints, held firmly in place, to keep the abutting sheets in proper alignment. Leave a space of 0.020 inch to 0.032 inch between each panel sheeted with non-prismatic sheeting. Prismatic sheeting is trimmed at a 45° angle from the edge of each panel.

Fabricate signs with a height of 12 feet or less, without horizontal joints. No more than two horizontal joints will be permitted for signs that are more than 12 feet in height. Locate the joint near the mid-height of the sign. Construct this joint according to the details in accordance with the contract.

Section 901

1 (2) Type B Signs

2 Fabricate Type B signs from multiple aluminum sheet increments of the thickness
3 shown in Table 901-1, with welded studs for attachment to the supporting frame.

4 (3) Types D, E and F Signs and Milemarkers

5 Fabricate Types D, E and F signs and milemarkers from single sheets of the
6 thickness shown in Table 901-2, with holes for bolting to the supports.

7 Construct Types E and F signs in accordance with the *FHWA Standard Highway*
8 *Signs*. Adequately identify each individual sign to the correct assembly. Following
9 the erection of Type E and F sign assemblies, leave the identification markings on
10 the individual signs until Department personnel have verified compliance with these
11 requirements.

12 (4) Overlays for Existing Signs

13 Manufacture all overlays for existing signs of the thickness shown in Table 901-2.
14 Do not make holes for rivets in the overlays during fabrication, but instead field-drill
15 them during the erection process.

16 (D) Aluminum

17 (1) Thickness Requirements

Vertical or Horizontal Dimension	Minimum Thickness
<i>Inches</i>	<i>Inches</i>
0-11.9	0.032
12-35.9	0.063
36-47.9	0.080
48 and larger	0.125
Milemarkers	0.080
Overlays	0.063

18 (2) Preparation of Aluminum Sign Surfaces

19 Do not handle any metal, except by appropriate handling devices or by workmen
20 wearing clean gloves, between the beginning of the coating operations and the
21 completion of the application of the retroreflective sheeting. Retreat aluminum sign
22 surfaces that come into contact with grease, oils or other contaminants before the
23 application of retroreflective sheeting.

24 Before applying retroreflective sheeting to the aluminum, treat the aluminum sign
25 surfaces with a chromate conversion coating. Such coating shall be applied
26 according to the manufacturer's instruction and shall conform to ASTM B449,
27 Class 2, and should range in color from silvery iridescent to pale yellow. The
28 coating weight shall be 10 mg/sf to 35 mg/sf on the entire surface area including
29 along the edges of the sign substrate with a median of 25 mg/sf as the optimum
30 coating weight. Ensure the coating does not appear dusty when wiped with a clean,
31 lint-free cloth and does not show excessive buildup at edges. Sand smooth all burrs
32 and scratches before applying retroreflective sheeting. Sheet all sanded aluminum
33 within the same day to prevent the formation of corrosion on the metal. Do not sand
34 or use abrasive materials on sheeted faces. Aluminum products shall be randomly
35 tested.

1 (E) Supporting Frames

2 Use supporting frames for Types A and B signs consisting of 2 or more horizontal
3 aluminum Z-stringers with vertical aluminum bar stiffeners in accordance with the details
4 and dimensions shown in the contract. Use a nylon washer to attach all thru bolts with
5 a play of at least 1/16 of an inch and no more than 1/8 of an inch. Provide stringers with
6 necessary holes and slots for bolting stiffeners, attaching aluminum sheet increments and
7 mounting to supports. Do not field drill holes in any part of the structural assembly,
8 except the field drilling of horizontal Z-bars for attaching new signs to existing supports
9 when necessary.

10 (F) Welding

11 Weld studs to aluminum sheets by the capacitor discharge method. If the studs are
12 welded after the retroreflective sheeting has been applied, insure that burn-through does
13 not damage the retroreflective sheeting.

14 Shoot a test stud on each Type A and B sign in the lower left corner of the most left panel
15 facing the back of the sign.

16 (G) Retroreflective Sheeting

17 Apply retroreflective sheeting to the aluminum sign panels in accordance with the
18 retroreflective sheeting manufacturer's recommendations. For each multi-panel
19 increment sign using glass beaded materials, sheet the entire sign from the same roll.

20 If a sign panel needs to be replaced after sign fabrication, the replacement panel may be
21 sheeted with retroreflective materials from a different lot or drum number than the
22 remainder of the sign; however, use material that visually color matches and meets
23 Article 1092-2.

24 Take retroreflectometer readings on all 4 corners of each panel and document the
25 readings on the sign design drawings.

26 Overlap all splices of any encapsulated or enclosed lens sheeting to allow water to run off
27 without running into the splice. All prismatic sheeting will be butt spliced.

28 Remove all foreign materials on the sheeted face with compressed air.

29 Keep a sample of each roll of sheeting and test for retroreflective compliance.

30 Patch wrinkles in the sheeting around thru bolts by removing the affected sheeting from
31 the metal. Then patch this area with a circular patch encompassing an area 1/4
32 inch outside the affected area. This patch shall not exceed the standard patching limits
33 shown in Table 901-3.

34 Ensure that all patches on the sign have a 1 inch minimum width or as recommended by
35 the sheeting manufacturer.

36 Maintain documentation of the lot, drum, inspector, roll size, date received, date sheeted
37 and metal treater on all signs, slip sheeting, copy, borders, shields, overlays, arrows and
38 panels and retroreflectometer readings.

39 Obtain and assign to the Department in writing warranties for sign sheeting used in the
40 fabrication of all permanent signs from the sheeting manufacturer. Warrant the signs
41 against defective sheeting per the requirements outlined in the contract.

42 Define "permanent signs" as Types A, B, C, D, E and F signs, overlays for all sign types
43 and milemarkers, and exclude any signs used only for traffic control while the project is
44 under construction.

Section 901

1 The reflective sheeting may be patched to repair incidental damage to the sheeting that
2 might occur during manufacture, in transit or after installation; however, the patches
3 cannot exceed the limits in Table 901-3.

Sign Area	Maximum Number and Size of Patches During Fabrication		Maximum Number and Size of Additional Patches After Field Erection	
	<i>Max. Number per Sign</i>	<i>Max. Size in Sq.In.</i>	<i>Max. Number per sign</i>	<i>Max. Patch Size in Sq.In.</i>
0 to 15.0	0	0	0	0
15.1 to 50.0 (Single Panel)	1	1	1	1
30.0 to 80.0 (Increment Panel)	2	2	1	2
80.1 and Greater	A	3	A	3

4 **A.** Average not to exceed one patch per panel per sign. Maximum of 3 patches per
5 panel allowed during fabrication with one additional patch per panel allowed after
6 field erection.

7 **(H) Reflectorized Letters, Numerals, Symbols, Border and Shields**

8 (1) General

9 Use direct-applied retroreflective sheeting, approved digital imaging or demountable
10 retroreflective sheeting letters, numerals, borders, shields and arrows as indicated on
11 the sign designs.

12 Use designs of letters and numerals that conform to the *FHWA Standard Highway*
13 *Signs*. Use border widths, design of route shields and arrows that conform to the
14 MUTCD.

15 Route shields used on Type A or B signs or overlays shall be demountable or as
16 approved digital imaging.

17 Space and size all legends and borders in accordance with the contract or approved
18 shop drawings. Any loose, deformed or misplaced legends and borders will be cause
19 for rejection of the entire sign.

20 (2) Direct Applied

21 Provide direct-applied reflectorized letters, numerals, arrows and borders that are of
22 the type and color of retroreflective sheeting shown in the contract for each sign. All
23 direct applied copy or border not permanently affixed may be removed and replaced
24 on signs if necessary during manufacture.

25 (3) Demountable

26 Attach demountable letters, numerals, borders, shields, arrows and alphabet
27 accessories directly to sign faces with rivets as shown in the contract.

28 Use letters, numerals, arrows, borders and shields made of adhesive-coated
29 retroreflective sheeting, permanently adhered to a flat aluminum backing, in
30 accordance with the contract.

31 Use aluminum backing of at least .032 inch thick aluminum sheeting of 3004 H38,
32 5052 H38 or 6061 T6 alloy. Treat with a light, tight, amorphous chromate-type
33 coating in accordance with the recommendations of the retroreflective sheeting

1 manufacturer. Apply the retroreflective sheeting to the properly prepared aluminum
2 using the method and equipment prescribed by the sheeting manufacturer.

3 Supply each letter, numeral, arrow, border and shield with mounting holes, and
4 secure to the sign surface with non-twist corrosion resistant aluminum rivets. Use
5 letters, numerals, arrows and borders that have rivets on all sides and ends spaced not
6 more than 6 inches on centers, measured along the edges. Make sure that each
7 legend piece has at least one rivet in each corner and at least 2 rivets in each end.
8 Attach route shields as part of Type A or B signs with aluminum rivets spaced not
9 more than 9 inches apart, measured along the edges of the shield.

10 Use a 1/4 inch diameter nylon washer under the head of all pull through type rivets
11 for all demountable copy and shields.

- 12 (4) If approved, use digital printing equipment to image or reverse image on
13 retroreflective sheeting for letters, numerals, borders, shields and arrows on digitally
14 approved retroreflective sheeting for traffic control signs on aluminum or digitally
15 printed traffic sign faces intended to be applied to a sign substrate.

16 (I) Silk Screening

17 Apply all legends and borders on Type E and F signs by silk-screening or reverse
18 silk-screening after the sheeting is attached to the panels. Perform all screening as
19 recommended by the manufacturer of the retroreflective sheeting. Use the color of all
20 legends, borders and backgrounds, and their placement on the sign, in accordance with
21 the contract.

22 Use opaque black ink for nonreflectorized message application, as manufactured or
23 recommended by the manufacturer of the retroreflective sheeting.

24 Use transparent ink and thinner, for application on signs reflectorized with white
25 retroreflective sheeting, as manufactured or recommended by the manufacturer of the
26 retroreflective sheeting. Use colors that conform to the *FHWA Color Tolerance Charts*
27 and AASHTO M 268 when thoroughly dry.

28 Test all lots of transparent ink for compliance with the minimum coefficient of
29 retroreflection equal to 70% of the specified minimum retroreflection of the
30 corresponding sheeting color and document the retroreflection value.

31 Inspect the first 5 signs of each screening and then every fifth sign. When unacceptable
32 signs are found, all signs shall be inspected individually.

33 Only 3 nonwets per sf, no larger than 1/16 inch in diameter, covering no more than 1/3 of
34 the total area of the sign are allowable. This includes nonwets from either the sheeting or
35 the screen-printing.

36 Only one tadpole per 6 sf, no longer than 1 1/2 inch and not readily visible under lighted
37 inspection is allowable.

38 (J) Mounting Hardware

39 Provide all mounting hardware consisting of, but not limited to, shims, backing plates,
40 mounting bolts, washers and nuts. Provide mounting holes in the Z-stringers of the
41 ground mounted signs in accordance with the details shown in the contract.

42 (K) Packaging, Shipping and Storing

43 Protect all signs during shipment and storage. Before shipping, make sure that all signs
44 are free of moisture and that all inks are thoroughly dry. Do not apply adhesive tapes to
45 any sign surface. Keep all packaged signs entirely dry.

46 Use assembled or partially assembled signs other than flat sheet signs that have sufficient
47 braces securely attached to prevent buckling or warping at all times.

Section 901

- 1 Affix a label outlining the retroreflective sheeting manufacturer's recommendations for
- 2 handling, transporting and storing all types of signs to each shipping carton or crate.
- 3 Provide full details of such recommendations with each shipment of signs.
- 4 Label each crate or package of signs or panels as to the contents (arrows, shields, etc.),
- 5 WBS number and sequence of packages if more than one package is for a single sign.
- 6 Maintain documentation of the lot, drum, inspector, roll size, date received, date sheeted,
- 7 metal treater on all signs, slipsheeting, copy, borders, shields, overlays, arrows, panels
- 8 and retroreflectometer readings.
- 9 Individually rack or separate by foam or slip sheeting on A-frame racks all sheeted
- 10 panels. Do not use spliced, overlapped, ripped or torn slipsheeting or foam.
- 11 Store all packed signs standing at a 75° to 90° angle.
- 12 Turn all panels and sign faces to the inside of the crates, whenever possible.
- 13 When crating a one-panel sign, provide the face side with an extra piece of foam and
- 14 cardboard taped to the outside of the face side of the package.
- 15 Pack panels of 102 inches in length or longer in only 2 per package.
- 16 Ensure all signs are debris free on the back side, with no misplaced writing, tape or
- 17 extraneous sheeting.
- 18 Crate to allow a 2 inch space on the inside dimensions larger than the size of the largest
- 19 package.
- 20 Store completed Type A and B signs back to back with at least 12 inches between faces.
- 21 When crating 2 panels of different sizes, place the smaller panel with its face to the back
- 22 of the larger panel and package with an extra piece of foam and cardboard taped to the
- 23 outside of the larger panel, with its face to the outside of the crate. Provide extra
- 24 packaging on both outsides of the package for double-faced signs.
- 25 Crate packaged panels to allow the passage of a 1/8 inch spacer on the inside of each side
- 26 of the crate, so that the panels are not overly tight or binding in crate.
- 27 Inspect all signs and packaging before shipping to assure compliance with the contract
- 28 and the *Standard Specifications*. The Department retains the right to inspect the signs
- 29 and packaging before shipping.

30 (L) Transparent Films

- 31 Use transparent films instead of silk screening when authorized by the Department.
- 32 Transparent film is a durable, transparent, acrylic colored film coated with transparent,
- 33 pressure-sensitive adhesive. When the film is applied over reflective sheeting, the
- 34 coefficient of retroreflectivity shall meet the color and type of sheeting in Tables 1092-3,
- 35 1092-4 and 1092-5. Use Department approved transparent film approved by the
- 36 manufacturer of the reflective sheeting to insure the materials meet the manufacturer's
- 37 warranty and obligation in Subarticle 1092-2(B).

38 (M) Digital Printing

- 39 Use digital Printing instead of silk screening or transparent films when authorized by the
- 40 Department. Digital print technologies consists of digital reflective sheeting, digital ink
- 41 systems, and clear overlay film. The manufacturing application process and the materials
- 42 must be approved by the sheeting manufacturer to insure it meets the manufacturer's
- 43 warranty and obligation in Subarticle 1092-2(B). May apply all legends and borders on
- 44 Type E and F signs using digital printing.
- 45 Use opaque black ink for nonreflectorized message application, as manufactured or
- 46 recommended by the manufacturer of the retroreflective sheeting.

1 Retroreflective sheeting shall consist of white or colored sheeting having a smooth outer
2 surface and that essentially has the property of a retroreflector over its entire surface.
3 Retroreflective sheeting shall conform to all requirements to the FHWA Color Tolerance
4 Charts and AASHTO M 268 when thoroughly dry Digital printed ink systems used to
5 print traffic signs must meet and comply with daytime and nighttime chromaticity (color
6 standards) as recognized in ASTM D4956 “Standard Specification for retroreflective
7 Sheeting”.

8 Digital printed ink systems must meet 70% of the initial retroreflectivity in Table 1092-3
9 and the coefficient of retroreflectivity for color and type of sheeting in Tables 1092-3,
10 1092-4 and 1092-5.

11 All digital inks and digital reflective sheeting shall be listed on the NCDOT APL and
12 tested on AASHTO NTPEP test deck for 3 years prior to consideration to insure the
13 digital printed ink system meets the warrant obligation listed in Subarticle 1092-2(B) for
14 the respective sheeting grade.

15 Permanent traffic signs printed with digital ink systems will be fabricated with a full sign
16 Protective Overlay Film designed to protect the entire sign from fading and UV
17 degradation. The over laminate will comply with the retroreflective sheeting
18 manufacturer’s recommendations to ensure proper adhesion and transparency and will
19 also meet the reflective film durability in Subarticle 1092-2(B).

20 Temporary signs printed with black ink only will not require a Protective Overlay Film as
21 long as the finished sign is warranted for a minimum outdoor durability of three years by
22 the sheeting manufacturer.

23 **901-4 SIGN QUALITY**

24 Provide signs that present a uniform appearance free from color match problems, non-uniform
25 color, streaks, spots, abrasions, blistering or other defects in the sheeting.

26 Sheeting may be inspected before application to sign blanks, after installation to sign blanks,
27 after completion of the sign in the sign fabricator's facility and after installation. Clean all
28 installed signs before final field inspection.

29 The retroreflective sheeting will be unsatisfactory if it has deteriorated due to any cause
30 except defacement resulting from vandalism or damage resulting from impact by a motor
31 vehicle or other object to the extent that:

32 (A) The sign is ineffective for its intended purpose when viewed from a moving vehicle
33 under normal day and night driving conditions, or

34 (B) The coefficient of retroreflection is less than the minimum specified for that sheeting as
35 shown in Tables 1092-3, 1092-4 and 1092-5 when measured by a Department approved
36 retroreflectometer, or

37 (C) The screened message and border or reverse screened background has stained,
38 discolored, streaked, faded, turned dark or has developed cracks, scaling, pitting and/or
39 blistering, or

40 (D) The sign is unsatisfactory with regard to uniform appearance due to cracking, streaking,
41 delamination, blistering, crazing or discoloration of the sheeting, or

42 (E) The sign is unsatisfactory with regard to remaining uniform in color over the entire
43 reflecting surface both day and night and displaying the same color both in daylight and
44 under lights at night.

45 (1) For glass bead material, sheeting will be subjected to a visual test with the human
46 eye as the test instrument. Objectionable non-uniformity of color and reflectivity
47 (retroreflection) under light at night is cause for the sign to be tested for
48 retroreflection to determine compliance with the following requirements:

Section 902

1 The retroreflection values on any sign shall not vary from each other by more than
2 a ratio of 1.10 (1.20 white) at any 2 points at least 12 inches apart, nor more than
3 1.30 (1.30 white) at any 2 points anywhere on the sign, nor more than,
4 1.10 (1.20 white) at any 2 points on the border or between any 2 adjacent letters,
5 numerals or symbols. Failure to meet the above requirements will result in sign
6 rejection. Retroreflection will be tested using a Delta RetroSign retroreflectometer.

7 (2) For prismatic material, sheeting will be subjected to a visual test with the human eye
8 as the test instrument.

9 **901-5 MEASUREMENT AND PAYMENT**

10 Sign fabrication will be measured and paid as the actual number of square feet of sign face
11 areas of each type, including milemarkers and overlays acceptably fabricated. In measuring
12 this quantity, the sign face areas will be calculated to the nearest 1/100 of a sf, using the
13 dimensions shown in the contract.

14 The areas of odd-shaped signs (e.g. stop signs and shield-shaped route markers) will be
15 calculated as squares or rectangles using the dimensions shown in the contract. The areas of
16 round, diamond and triangular signs will be calculated for their true shapes using plan
17 dimensions.

18 Repair or otherwise correct any damage to the signs or refabricate them at no cost to the
19 Department. When requested by the Contractor, the Department may have the necessary
20 repairs made or the signs refabricated, and deduct the associated costs thereof from monies
21 due the Contractor.

22 Payment will be made under:

Pay Item	Pay Unit
Contractor Furnished, Type ____ Sign	Square Foot

23 **SECTION 902**
24 **FOUNDATIONS FOR GROUND MOUNTED SIGNS**

25 **902-1 DESCRIPTION**

26 Construct foundations for sign supports including locating, staking, excavating, shoring,
27 backfilling, forming, landscaping and other necessary tasks as required.

28 **902-2 MATERIALS**

29 Refer to Division 10.

Item	Section
Joint Sealer	1028-2
Organic Non-Aerosol Zinc Repair Paint	1080-7
Portland Cement Concrete Production and Delivery	1000
Reinforcing Steel	1070
Select Material and Borrow Material	1016 and 1018

30 **902-3 CONSTRUCTION METHODS**

31 Establish the proper offset, longitudinal location and foundation elevation of each ground
32 mounted sign support. Provide proper level and orientation of all supports.

33 Thoroughly compact all backfill in 6 inch layers. Remove all unneeded excavated material
34 from the site.

35 Perform all excavation necessary for foundation construction to the elevations and dimensions
36 shown in the contract. Place concrete against undisturbed soil.

1 Construct concrete sign foundations in accordance with Section 825. Construct either
 2 reinforced or plain Class A concrete foundations in accordance with the contract. Shape the
 3 tops of the foundations to conform to finished ground elevations such that water will not
 4 collect against the supports. No construction joints will be permitted.

5 Form the top 6 inches of foundations by approved methods. Center the supports in the
 6 foundations, securely brace and hold in proper position and alignment during placement of the
 7 concrete. Provide an ordinary surface finish to the concrete.

8 **902-4 MEASUREMENT AND PAYMENT**

9 The quantity of reinforced and plain concrete to be paid will be the actual number of cubic
 10 yards of concrete incorporated into the completed and accepted foundation. Computing the
 11 number of cubic yards of concrete will be done from the dimensions shown in the contract or
 12 from revised dimensions authorized by the Engineer, calculated to the nearest 1/100 of a cy.

13 Payment will be made under:

Pay Item	Pay Unit
Reinforced Concrete Sign Foundations	Cubic Yard
Plain Concrete Sign Foundations	Cubic Yard

14 **SECTION 903**
 15 **GROUND MOUNTED SIGN SUPPORTS**

16 **903-1 DESCRIPTION**

17 Furnish, fabricate, clear for sight distance and install ground mounted and barrier mounted
 18 signs supports.

19 The types of supports covered by this section are:

20 (A) Breakaway steel beam sign supports

21 (B) Simple steel beam sign supports

22 (C) 3-lb steel U-channel supports

23 (D) 2-lb steel U-channel supports

24 (E) Barrier sign support assembly

25 (F) Wood supports

26 (G) Steel square tube supports

27 **903-2 MATERIALS**

28 Refer to Division 10.

Item	Section
Breakaway or Simple Steel Beam Sign Supports (W- or S-Shapes)	1094-1(A)
Ground Mounted Signs	1094
Joint Sealer	1028-2
Organic Non-Aerosol Zinc Repair Paint	1080-7
Signing Materials	1092
Steel Square Tube Supports	1094-1(D)
Steel U-Channel Supports	1094-1(B & C)

Section 903

1 **903-3 CONSTRUCTION METHODS**

2 **(A) Location and Field Verification**

3 The support lengths and dimensions for steel and wood ground mounted supports shown
4 in the contract are estimated for project bid purposes.

5 The Engineer or contract surveyor will establish the proper offset, longitudinal location;
6 foundation elevation and S-dimension of each ground mounted and barrier mounted sign
7 support. The Signing and Delineation Unit will issue a revision of the Sign Support
8 Chart Sheet following receipt of field-verified S-dimensions.

9 Order supports for ground mounted signs when the revised support lengths, dimensions
10 and sizes have been determined and the appropriate plan revision is completed.

11 Provide the proper vertical plumb, level and orientation of all signs and supports.

12 **(B) Clearing for Sign Sight Distance**

13 Clear vegetation in front of signs where necessary to achieve proper sight distance to the
14 sign. The sight distance area includes the triangular region of land extending from the
15 edge of the travel lane 800 feet in advance of the sign to 4 feet beyond the furthest edge
16 of the sign from the travel lane. The Engineer will determine where clearing is required
17 and the amount of clearing at the sign locations. Perform the clearing in accordance with
18 Section 200.

19 **(C) Breakaway Steel Beam and Simple Steel Beam**

20 Fabricate and install the supports in accordance with the contract. Punch, cut or weld
21 supports before galvanizing. Galvanize each component part in accordance with
22 ASTM A123 before assembly. Provide supports that are uniformly straight to within 1/8
23 inch tolerance for pieces less than 20 feet in length and 1/4 inch tolerance for pieces over
24 20 feet in length.

25 Cut the upper and middle sections of breakaway supports from the same member. Bolt
26 the hinge joint in the breakaway supports to ensure true alignment of the 2 sections.
27 After bolting of hinge connections make sure that the 2 sections are in the same position
28 relative to each other, as before being cut. Completely assemble breakaway supports
29 before erection.

30 Provide supports that are plumb. Do not shim the supports. Take adequate care during
31 erection of supports to prevent damage to the surface finish. Use 2 coats of an approved
32 organic non-aerosol zinc repair paint in touching up damaged areas on all galvanized
33 materials.

34 **(D) Steel Supports**

35 (1) General

36 Drive the supports to the required depth, being sure they are plumb. Drive the
37 supports by hand or by mechanical means. Protect the supports with an appropriate
38 driving cap. Concrete foundations are not required. In island applications, cored
39 holes shall be to the soil depth.

40 Replace any support that is bent, or otherwise damaged in driving.

41 Do not weld supports in the field. Use 2 coats of approved organic non-aerosol zinc
42 repair paint in touching up the tops of U-channel supports that may have been
43 damaged in driving. Cut ends of supports, frames, cross bracing and damaged areas
44 on these and all other galvanized materials.

45 Any steel supports cut in the field shall have two coats of approved organic non-
46 aerosol zinc repair paint.

1 Use supports of sufficient length to permit the appropriate sign mounting height.
2 Spliced supports are not permitted on new construction.

3 (2) U-Channel

4 Use 3-lb galvanized steel U-channel supports for Types D, E and F signs. Use
5 2-lb galvanized steel U-channel supports for milemarkers.

6 (3) Perforated Square Tubing

7 Use square tube supports in accordance with the contract.

8 **(E) Barrier Supports**

9 (1) Small

10 Attach brackets and U-channel supports to the median or shoulder barrier for the
11 erection of Type E or F signs or milemarkers in accordance with the contract.

12 (2) Large

13 Attach brackets, anchorage and pipe supports to the median or shoulder barrier for
14 the erection of Type E signs in accordance with the contract.

15 **(F) Wood Supports**

16 Use wood supports in accordance with the contract.

17 Replace any support that is damaged during erection.

18 Breakaway wood supports shall be drilled in accordance with the contract. All wood
19 supports larger than 4 inches x 4 inches that have not been drilled shall be behind
20 guardrail.

21 **903-4 MEASUREMENT AND PAYMENT**

22 The supports, specified in these *Standard Specifications*, installed and accepted, will be
23 measured for payment as follows:

24 *Supports, Breakaway Steel Beam* and *Supports, Simple Steel Beam* will be measured and paid
25 as the actual number of pounds of structural steel installed and accepted. The computed
26 nominal weights shown in the final revised plans will be used in determining this quantity.
27 Measurement will not be made of the weight of nuts, bolts and washers that are part of the
28 sign support, as they will be incidental to the work.

29 *Supports, 3-lb Steel U-Channel* will be measured and paid as the actual number of linear feet
30 of 3-lb steel U-channel supports incorporated into the completed and accepted supports and
31 assemblies. Measurements of length will be made to the nearest 1/10 of a foot.

32 *Supports, 2-lb Steel U-Channel* will be measured and paid as the actual number of
33 2-lb steel U-channel support installed and accepted.

34 *Supports, Barrier (Small)* will be measured and paid as the actual number of small barrier
35 supports installed and accepted.

36 *Supports, Barrier (Large)* will be measured and paid as the actual number of large barrier
37 supports installed and accepted.

38 *Supports, Wood* will be measured and paid as the actual number of linear feet of wood support
39 incorporated into the completed and accepted supports. Measurements of length will be made
40 to the nearest 1/10 of a linear foot. The computed linear feet of sign supports, as indicated in
41 the final revised plans will be used in determining this quantity.

42 *Supports, Steel Square Tube* will be measured and paid as the actual number of linear feet of
43 steel square tube supports incorporated into the completed and accepted supports and
44 assemblies. Measurements of length will be made to the nearest 1/10 of a foot.

2 **SECTION 904**
3 **SIGN ERECTION**

4 **904-1 DESCRIPTION**

5 Erect existing and proposed ground mounted and overhead signs to existing and proposed
6 supports and furnish mounting hardware. Relocate existing signs in accordance with the
7 contract and Specifications.

8 The types of signs covered by this section are as follows:

- 9 Type A signs
- 10 Type B signs
- 11 Type D signs
- 12 Type E signs
- 13 Type F signs
- 14 Milemarkers
- 15 Overlay signs
- 16 Reposition signs
- 17 Logo Trailblazer
- 18 Logo to panel
- 19 Relocation signs

20 **904-2 MATERIALS**

21 Refer to Division 10.

Item

Signing Materials
Organic Non-Aerosol Zinc Repair Paint

Section

1092
1080-7

22 **904-3 CONSTRUCTION METHODS**

23 **(A) General**

24 Provide new mounting bolts, washers, hex nuts, backing plates and all hardware for signs
25 to be mounted on existing or proposed supports. Do not weld, cut or fabricate in any
26 manner in the field, except for as allowed under Section 903 and for the drilling of holes
27 for attaching demountable legends and borders that cannot be attached in the shop. Field
28 drill Z-bars for attaching signs to supports as required.

29 Use 2 coats of an organic non-aerosol zinc repair paint in touching up field-drilled holes
30 and damaged areas on all galvanized materials as covered under Section 903.

31 Make sure that the horizontal edges of signs are level and that the faces of signs are
32 vertical.

1 Refer to Sections 900 and 901 for requirements of care and handling of signs, final clean
2 up and covering of signs.

3 **(B) Type A and B**

4 (1) General

5 Attach the signs to supports in accordance with the contract or the approved shop
6 drawings. Make sure that the face of the sign is flat. Any appreciable buckling or
7 warping of the sign face will be cause for rejection of the entire sign.

8 (2) Ground Mounted

9 Erect ground mounted Type A and B secondary signs by the required method of
10 attachment shown in the contract. Affix these signs by bolting the horizontal
11 Z-stringers directly to the supports or by bolting vertical Z-bars to the horizontal
12 Z-stringers of the primary sign.

13 (3) Overheads

14 For new overhead supports, erect overhead secondary signs in accordance with the
15 approved shop drawings.

16 For existing overhead supports, design and furnish all new structural members and
17 mounting hardware necessary to erect the new signs. Prepare and submit to the
18 Engineer for approval complete shop drawings and design computations for the
19 bracing and accessory hardware required to attach the sign to the existing overhead
20 sign support. Prepare the design in accordance with *AASHTO Structural Supports for*
21 *Highway Signs, Luminaires and Traffic Signals*. Upon request, the Engineer will
22 provide the Contractor with copies of the shop drawings for existing overhead sign
23 supports.

24 Attach a new sign above a designated existing overhead sign in accordance with the
25 contract. Furnish all new structural members and mounting hardware necessary to
26 erect the new sign.

27 **(C) Type D, E, F and Milemarkers**

28 Attach the signs to U-channel or perforated square tube supports

29 **(D) Overlay (Ground Mounted and Overhead)**

30 Attach overlays to designated existing ground mounted or overhead signs as required by
31 the contract.

32 Remove and dispose of all conflicting demountable legends, borders and overlays before
33 attaching new overlays. Employ any method of removal necessary, provided it does not
34 damage the existing sign or the attached overlay. Perform such minor repairs to existing
35 signs as necessary before the attachment of overlays to ensure a finished sign face that is
36 completely flat.

37 Field-drill 5/32 inch holes in both the overlay and the existing sign simultaneously,
38 according to the rivet spacing requirements shown in the contract. Attach the proposed
39 overlays with 1/8 inch diameter aluminum rivets of the "pull-through" type. Exercise
40 sufficient care in attaching the overlays to ensure that the finished sign face is completely
41 flat and without any ripples and/or buckles.

42 **(E) Reposition Overhead Signs**

43 Reposition existing signs on existing overhead sign supports as required by the contract.
44 Reposition associated lighting systems and secondary signs along with the signs.

Section 904

1 When required, drill new holes in the existing vertical attachment members, in order to
2 maintain a minimum clearance of 17 feet to the roadway surface at the new location on
3 the structure. No other field drilling will be allowed.

4 Adjust and relocate conduit and junction boxes as required.

5 **(F) Logo Trailblazer**

6 All logos will be made available for pick up at the Division Traffic Services' sign shop.
7 Erect logos on U-channel or perforated square tube supports in accordance with
8 Type F sign details shown in the contract.

9 **(G) Logo to Panel**

10 All logos will be made available for pick up at the Division Traffic Services' sign shop.
11 Attach logos to the mainline signs with ten 1/8 inch diameter rivets of the pull through
12 type. Attach logos to the ramp signs with four 1/8 inch diameter rivets of the pull
13 through type. Drill 5/32 inch holes in the background signs to match those in the logos
14 for attaching the logos to the background signs. Place logos as shown on the contract.

15 **(H) Relocation (Ground Mounted) Signs**

16 Maintain signs in good serviceable condition throughout the duration of the project.
17 Repair any areas or materials within the project limits disturbed or damaged in
18 performance of the work required under this section as directed by the Engineer at no
19 cost to the Department.

20 Remove existing signs from their existing locations and relocate to their new location in
21 accordance with the contract. Repair or replace signs damaged in relocating at no cost to
22 the Department. Refer to Section 907 for disposal of sign components.

23 Erect signs and supports according to requirements of Sections 903 and 904.
24 Immediately relocate all warning and regulatory signs to new locations. Relocate all
25 other signs to new locations in no more than 12 hours.

26 **904-4 MEASUREMENT AND PAYMENT**

27 *Sign Erections (Ground Mounted and Overhead)* will be measured and paid as the actual
28 number of ground mounted and overhead signs erected and accepted. Each type F sign
29 assembly will be measured as one sign.

30 *Sign Erection, Relocate Type ____ (Ground Mounted)* will be measured and paid as the actual
31 number of signs acceptably relocated. Secondary signs will be incidental work in conjunction
32 with the primary sign. Sign assemblies consisting of more than one sign panel will be
33 considered one sign.

34 Payment will be made under:

Pay Item	Pay Unit
Sign Erection, Type ____ (Overhead)	Each

SECTION 906
OVERHEAD SIGN STRUCTURE

906-1 DESCRIPTION

Design, fabricate, furnish and erect various types of overhead sign assemblies. Fabricate supporting structures using tubular members of either aluminum or steel. The types of overhead sign assemblies included in this specification are span structures, cantilever structures and sign structures attached to bridges.

906-2 MATERIALS

Refer to Division 10.

Item	Section
Structural Steel	1072
Overhead Sign Structures	1096
Signing Materials	1092
Organic Zinc Repair Paint	1080-7
Reinforcing Steel	1070
Direct Tension Indicators	440 and 1072-5

906-3 CONSTRUCTION METHODS

(A) General

Fabricate overhead sign assemblies in accordance with the details shown in the approved working drawings and the requirements of these specifications.

No welding, cutting or drilling will be permitted in the field, unless approved by the Engineer.

Drill bolt holes and slots to finished size. Holes may also be punched to finish size, provided the diameter of the punched holes is at least twice the thickness of the metal being punched. Flame cutting of bolt holes and slots is not permitted.

Erect sign panels in accordance with the requirement for Type A or B signs as indicated in the plans or Roadway Standard Drawings. Field drill two holes per connection in the Z bars for attaching signs to overhead structures. Provide two U-bolts at each U-bolt connection such as each truss chord to sign hanger and each truss chord to walkway support or light support. Provide two U-bolts at each U-bolt connection where ends of truss chords are supported. The minimum diameter of all U-bolts is 1/2 inch.

For all U-bolt connections of hanger beams to overhead assembly truss chords, provide all U-bolts with a flat washer and double nuts at each end of the U-bolts. All double nuts that are on any U-bolt shall be the same thickness and weight. When assembled, the double nuts shall be brought tight against each other by the use of two wrenches.

Use two coats of a zinc-rich paint to touch up minor scars on all galvanized materials.

For high strength bolted connections, use direct tension indicators. When galvanized high strength bolts are required, use bolts, nuts and washers meeting Subarticle 1072-5(F).

(B) Shop Drawings

Design the overhead sign supports, including foundations, prior to fabrication. Submit design calculations and working drawings of the designs to the Engineer for review and acceptance.

Have a professional engineer registered in the State of North Carolina, perform the computations and render a set of sealed, signed and dated drawings detailing the construction of each structure.

Section 906

1 Submit to the Engineer for review and acceptance complete design and fabrication details
2 for each overhead sign assembly, including foundations and brackets for supporting the
3 signs and maintenance walkways, if applicable, electrical control boxes, and lighting
4 luminaires. Base design upon the revised structure line drawings, wind load area and the
5 winds speed shown in the plans, and in accordance with the AASHTO *Standard*
6 *Specifications for Structural Structures for Highway Signs, Luminaires and Traffic*
7 *Signals, 6th Edition, 2013 and 2015 Interim Revisions.*

8 Submit electronic (.pdf) copies of completely detailed working drawings and the design
9 calculations including all design assumptions for each overhead sign assembly to the
10 Engineer for approval prior to fabrication. Working drawings shall include complete
11 design and fabrication details, including foundations, provisions for attaching signs,
12 maintenance walkways, when applicable, lighting luminaires to supporting structures,
13 applicable material specifications, and any other information necessary for procuring and
14 replacing any part of the complete overhead sign assembly.

15 Allow 40 days for initial working drawing review after the Engineer receives them. If
16 revisions to working drawings are required, an additional 40 days shall be required for
17 review and approval of the final working drawings.

18 Approval of working drawings by the Engineer shall not relieve the Contractor of
19 responsibility for the correctness of the drawings, or for the fit of all shop and field
20 connections and anchors.

21 (C) Design and Fabrication

22 (1) The following criteria govern the design of overhead sign assemblies:

23 Design shall be in accordance with the AASHTO *Standard Specifications for*
24 *Structural Structures for Highway Signs, Luminaires and Traffic Signals, 6th*
25 *Edition, 2013 and 2015 Interim Revisions.*

26 There are several design criteria that are specified. They include:

- 27 (a) Overhead cantilever sign structures shall include galloping loads (exclude four-
28 chord horizontal trusses)
- 29 (b) The Yearly Mean Velocity, V_{mean} , in North Carolina shall be assumed to be 11.6
30 mph.
- 31 (c) The Fatigue Importance Category used in the design, for each type of structure,
32 shall be for:
 - 33 (i) Cantilevered structures with span greater than 50 feet - Fatigue Importance
34 Category I.
 - 35 (ii) Cantilevered structures with span less than or equal to 50 feet - Fatigue
36 Importance Category II.
 - 37 (iii) Non-Cantilevered structures – Fatigue Importance Category II.

38 (2) The following interpretations or criteria shall be used in the design of overhead sign
39 assemblies:

- 40 (a) For design of supporting upright posts or columns, the effective length factor for
41 columns “K”, as provided for in Appendix B, Section B.5 of the AASHTO
42 *Standard Specifications for Structural Structures for Highway Signs, Luminaires*
43 *and Traffic Signals, 6th Edition, 2013 and 2015 Interim Revisions,* shall be
44 taken as the following, unless otherwise approved by the Engineer:
 - 45 (i) Case 1: For a single upright post of cantilever or span type overhead sign
46 structure, the effective column length factor, “K”, shall be taken as 2.0.

1 (ii) Case 2: For twin post truss-type upright post with the post connected to one
 2 chord of a horizontal truss, the effective column length factor for that column
 3 shall be taken as 2.0.

4 (iii) Case 3: For twin post truss-type upright post with the post connected to two
 5 truss chords of a horizontal tri-chord or box truss, the effective column length
 6 factor for that column shall be taken as 1.65.

7 (b) For twin post truss-type uprights, the unbraced length of the post shall be from the
 8 chord to post connection to the top of base plate.

9 (c) For twin post truss-type uprights, when the post is subject to axial compression,
 10 bending moment, shear, and torsion, the post shall satisfy the AASHTO *Standard*
 11 *Specifications for Structural Structures for Highway Signs, Luminaires and Traffic*
 12 *Signals, 6th Edition, 2013 and 2015 Interim Revisions* Equations 5.12.2.1-1,
 13 5.12.2.1-2 and 5.12.2.1-5. To reduce the effects of secondary bending, in lieu of
 14 Equation 5.12.2.1-2, the following equation may be used:

$$\frac{f_a}{F_a} + \frac{f_b}{\left(1 - \frac{0.6f_a}{F_E}\right) F_b} + \left(\frac{f_v}{F_v}\right)^2 \leq 1.0$$

15
 16 Where f_a = Computed axial compression stress at base of post

17 (d) The base plate thickness for all uprights and poles shall be a minimum of 2 inches
 18 but not less than that determined by the following criteria and design:

19 (i) Case 1: Circular or rectangular solid base plates with the upright pole welded to
 20 the top surface of the base plate with full penetration butt weld, and where no
 21 stiffeners are provided. A base plate with a small center hole, which is less than
 22 1/5 of the upright diameter, and located concentrically with the upright pole,
 23 may be considered as a solid base plate.

24 The magnitude of bending moment in the base plate, induced by the anchoring
 25 force of each anchor bolt shall be calculated as

$$M = (Px D_1)/2.$$

26
 27 (ii) Case 2: Circular or rectangular base plate with the upright pole socketed into
 28 and attached to the base plate with two lines of fillet weld, and where no
 29 stiffeners are provided, or any base plate with a center hole that is larger in
 30 diameter than 1/5 of the upright diameter. The magnitude of bending moment
 31 induced by the anchoring force of each anchor bolt shall be calculated as

$$M = P x D_2$$

Where:

M = Bending moment at the critical section of the base plate induced by one anchor bolt

P = Anchoring force of each bolt

D₁ = Horizontal distance between the center of the anchor bolt and the outer face of the upright, or the difference between the radius of the bolt circle and the radius of the upright

D₂ = Horizontal distance between the face of the upright and the face of the anchor bolt nut

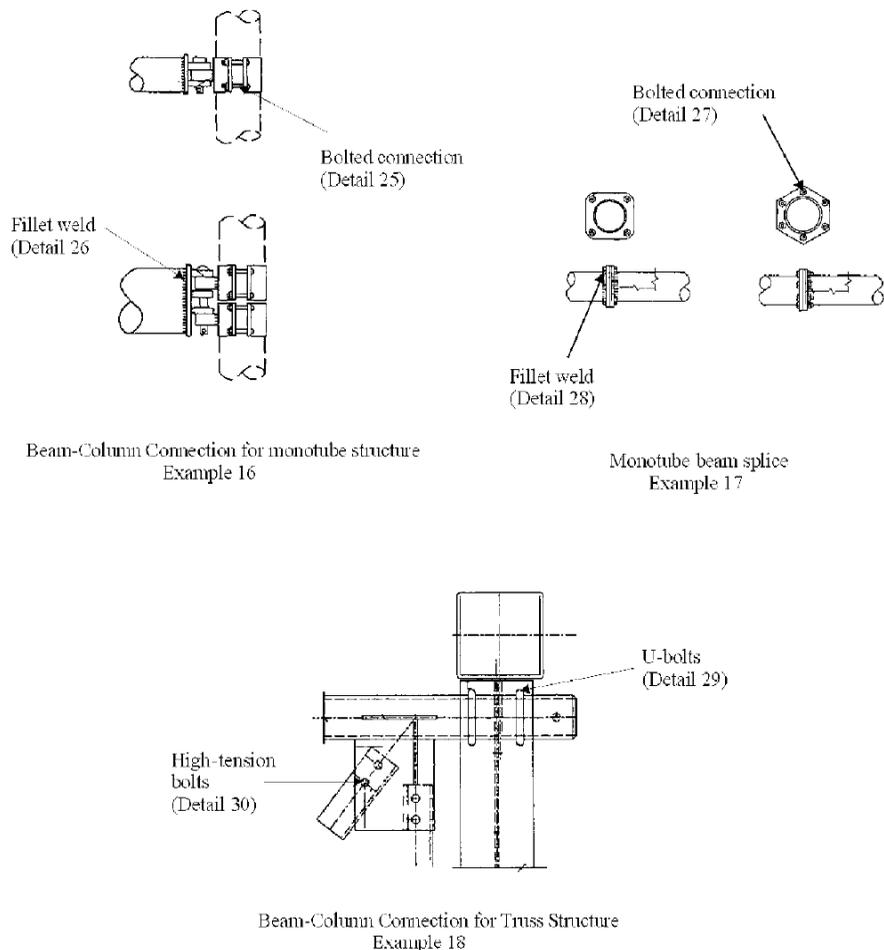

32 (e) The critical section shall be located at the face of the anchor bolt and perpendicular
 33 to the radius of the bolt circle. The overlapped part of two adjacent critical sections
 34 shall be considered ineffective.

Section 906

- 1 (f) The thickness of Case 1 base plate shall not be less than the calculated based on
- 2 formula for Case 2.
- 3 (g) Uprights, foundations, and trusses that support overhead signs shall be designed in
- 4 accordance with the contract for the effects of torsion. Torsion shall be considered
- 5 from dead load eccentricity of these attachments, as well as for the attachments such
- 6 as supporting brackets, lights, etc., that add to the torsion in the assembly. Truss
- 7 vertical and horizontal truss diagonals in particular and any other assembly members
- 8 shall be appropriately sized for these loads.
- 9 (h) Uprights, foundations, and trusses that support overhead mounted signs shall be
- 10 designed for the proposed sign wind area as noted in the contract drawings. Truss
- 11 vertical and horizontal truss diagonals in particular and any other assembly members
- 12 shall be appropriately sized for these loads.

13 For non-cantilevered monotube sign support structures, Table 906-1 and Figure 906-1 are
 14 considered as a required addition to the AASHTO *Standard Specifications for Structural*
 15 *Structures for Highway Signs, Luminaires and Traffic Signals, 6th Edition, 2013 and 2015*
 16 *Interim Revisions:*

TABLE 906-1				
NON-CANTILEVERED MONOTUBE SIGN SUPPORT STRUCTURES				
Construction	Detail	Stress Category	Application	Example

From NCHRP Report 494 dated 2003

Figure 906-1. Details shown in Table 906-1.

- 1 Fabricate all overhead sign assemblies, including but not limited to foundations, in
- 2 accordance with the details shown on the approved shop drawings and with the requirements
- 3 of these Specifications.
- 4 Fabricate the span and cantilever supporting structures using tubular members of either
- 5 aluminum or steel, using only one type of material throughout the project. Sign support
- 6 structures that are to be attached to bridges shall be fabricated using other structural shapes.
- 7 Horizontal components of the supporting structures for overhead signs may be of a truss
- 8 design or a design using singular (monotube) horizontal members to support the sign panels.
- 9 Truss or singular member centerline must coincide with the centerline of sign design area
- 10 shown on the structure line drawing.
- 11 Provide permanent camber in addition to dead load camber in accordance with the AASHTO
- 12 *Standard Specifications for Structural Structures for Highway Signs, Luminaires and Traffic*
- 13 *Signals, 6th Edition, 2013 and 2015 Interim Revisions.* Indicate on the shop drawings the
- 14 amount of camber provided and the method employed in the fabrication of the support to
- 15 obtain the camber.

Section 907

1 Use cantilever sign structures that meet the following design criteria:

2 (A) Do not exceed an $L/150$ vertical dead load deflection at the end of the arm due to
3 distortions in the arm and vertical support, where L is the length of the arm from the
4 center of the vertical support to the outer edge of the sign.

5 (B) Do not exceed an $L/40$ horizontal deflection at the end of the arm due to distortions in the
6 arm and vertical support, as a result of design wind load.

7 Fabricate attachment assemblies for mounting signs in a manner that allows easy removal of
8 sign panels for repair.

9 **906-4 MEASUREMENT AND PAYMENT**

10 *Supports, Overhead Sign Structure @ Sta _____* will be paid for at the contract lump sum for
11 each structure. Such price will be full compensation for design, fabrication, construction,
12 transportation, erection of the complete overhead sign structure, supporting structure
13 hardware, lighting support brackets, preparing and furnishing shop drawings, and attaching
14 the signs to the overhead assembly.

15 Payment will be made under:

Pay Item

Supports, Overhead Sign Structure at Sta. __ _____

Pay Unit

Lump Sum

16 **SECTION 907** 17 **DISPOSAL AND STOCKPILING OF SIGNING COMPONENTS**

18 **907-1 DESCRIPTION**

19 Properly dispose of or stockpile signing components.

20 **907-2 CONSTRUCTION METHODS**

21 **(A) General**

22 Repair any areas or materials within the project limits disturbed or damaged in
23 performance of the work required under this section as directed by the Engineer.

24 **(B) Removal**

25 Do not remove existing signing components until required replacements have been
26 erected and are available for use by traffic or are available for immediate replacement.

27 Remove signing components by methods that will not damage other portions of the
28 project or facility. Repair any damage by methods satisfactory to the Engineer.

29 Cut and remove electrical conduit to at least 18 inches below finished ground elevation.
30 Plug or seal the ends of the cut conduit by methods approved by the Engineer.

31 Remove foundations, including any reinforced steel or anchor bolts, to a minimum depth
32 of 2 feet below the finished ground elevation unless otherwise indicated by the contract.

33 Promptly backfill and compact areas disturbed by removal of foundations with suitable
34 materials and match the finished ground elevation. Seed disturbed areas in accordance
35 with Section 1661.

36 **(C) Disposal**

37 All materials to be removed and disposed of will become the property of the Contractor.
38 Promptly transport the materials from the project after they have been removed unless
39 otherwise permitted by the Engineer.

40 Promptly dispose of the concrete, reinforcing steel and anchor bolts from the project.

1 **(D) Stockpile**

2 Before stockpiling, remove signs from supports. The Department maintains ownership of
 3 all materials to be stockpiled. Transport and stockpile designated items to locations
 4 approved by the Engineer. Sort and stockpile all materials neatly in stacks or storage
 5 bins. Repair or replace materials damaged in removal or while in storage.

6 **907-3 MEASUREMENT AND PAYMENT**

7 *Disposal of ____ and Stockpile ____* will be measured and paid as the actual number of
 8 signing components acceptably disposed or stockpiled. Removal is incidental to stockpiling
 9 and disposal. Secondary signs will be incidental work in conjunction with the primary sign.
 10 Sign assemblies consisting of more than one sign panel will be considered one sign.
 11 Overhead sign systems include signs, supports, walkways and all electrical components. Sign
 12 systems include signs, supports and foundations. Supports include any foundations.

13 Repair or replacement of any materials or areas within the project limits disturbed or damaged
 14 in performance of the work required under this section will be at no cost to the Department.

15 Payment will be made under:

Pay Item	Pay Unit
Disposal of Sign System, Overhead	Each
Disposal of Sign System, Steel Beam	Each
Disposal of Sign System, U-Channel	Each
Disposal of Sign System, Wood	Each
Disposal of Sign, A and B, (Ground Mounted)	Each

DIVISION 10 MATERIALS

SECTION 1000

PORTLAND CEMENT CONCRETE PRODUCTION AND DELIVERY

1000-1 DESCRIPTION

This section addresses Portland cement concrete to be used for pavement, structures and precast and incidental construction. Produce Portland cement concrete composed of Portland cement, fine and coarse aggregates, water and supplementary cementitious material (optional). Include chemical admixtures as required or needed. Ground granulated blast furnace slag, fly ash or silica fume may be substituted for a portion of the Portland cement. Type IL, IP, IS or IT blended cement may be used instead of Portland cement.

Mixes for all Portland cement concrete shall be designed by a Certified Concrete Mix Design Technician or an Engineer licensed by the State of North Carolina.

When concrete for any one pour is furnished by multiple concrete plants, use the same mix design for all concrete, including sources and quantities of ingredients.

If any major change is made to the mix design, submit a new mix design (with the exception of an approved pozzolan source change).

If any change is made to the mix design, also submit new test results showing the mix design conforms to the criteria. Define a major change to the mix design as:

(A) A source change in coarse aggregate, fine aggregate or cement.

(B) A pozzolan class or type change (e.g. Class F fly ash to Class C fly ash)

(C) A quantitative change in coarse aggregate (applies to an increase or decrease greater than 5%), fine aggregate (applies to an increase or decrease greater than 5%), water (applies to an increase only), cement (applies to a decrease only), or pozzolan (applies to an increase or decrease greater than 5%).

Use materials which do not produce a mottled appearance through rusting or other staining of the finished concrete surface.

1000-2 MATERIALS

Refer to Division 10.

Item	Section
Air Entraining Agent	1024-3
Calcium Nitrite Corrosion Inhibitor	1024-3
Chemical Admixtures	1024-3
Coarse Aggregate	1014-2
Fine Aggregate	1014-1
Fly Ash	1024-5
Ground Granulated Blast Furnace Slag	1024-6
Portland Cement	1024-1
Silica Fume	1024-7
Type IL Blended Cement	1024-1
Type IP Blended Cement	1024-1
Type IS Blended Cement	1024-1
Type IT Blended Cement	1024-1
Water	1024-4

Section 1000

1 1000-3 PORTLAND CEMENT CONCRETE FOR PAVEMENT

2 (A) Composition and Design

3 Submit concrete paving mix design in terms of saturated surface dry weights on Materials
4 and Tests Form 312U for approval at least 30 days before proposed use. Use a mix that
5 contains at least 526 lbs. of cement per cubic yard, a maximum water cement ratio of
6 0.559, an air content in the range of 4.5% to 5.5%, a maximum slump of 1.5 inches, a
7 minimum flexural strength of 650 psi at 28 days and a minimum compressive strength of
8 4,500 psi at 28 days.

9 Fly ash may be substituted for cement in the mix design up to 30% at a rate of 1.0 lb. of
10 fly ash to each pound of cement replaced.

11 The cement content of the mix design may be reduced by no more than 50% and replaced
12 with blast furnace slag pound for pound.

13 Include in the mix design the source of aggregates, cement, fly ash, slag, water and
14 admixtures; the gradation and specific gravity of the aggregates; the fineness modulus of
15 the fine aggregate; and the dry rodded unit weight and size of the coarse aggregate.
16 Submit test results showing that the mix design conforms to the criteria, including the
17 1, 3, 7, 14 and 28-day strengths of the average of two 6 inch x 6 inch x 20 inch beams and
18 the average of two 6 inch x 12 inch cylinders for each age made and tested in accordance
19 with AASHTO R 39, T22 and T97 from a certified laboratory. Design the mix to produce
20 an average strength sufficient to indicate that a minimum strength of 650 psi in flexure
21 and 4,500 psi in compression will be achieved in the field within 28 days.

22 Where concrete with a higher slump for hand methods of placing and finishing is
23 necessary, submit an adjusted mix design for approval to provide a maximum slump of
24 3 inches and to maintain the water-cementitious material ratio established by the original
25 mix design.

26 (B) Air Entrainment

27 Entrain air in the concrete by the use of an approved air entraining agent dispensed with
28 the mixing water, unless prohibited.

29 Provide an air content of $5.0\% \pm 1.5\%$ in the freshly mixed concrete. The air content will
30 be determined in accordance with AASHTO T 121, T152 or T196. At the option of the
31 Engineer, the air content may be measured by the Chace Indicator, in which case
32 sufficient tests will be made to establish correlation with the test methods of AASHTO
33 T 121, T152 or T196. Concrete will not be rejected based on tests from the Chase
34 Indicator.

35 (C) Slump

36 Provide concrete with a maximum slump of 1.5 inches where placed by a fully
37 mechanized paving train and no more than 3 inches where placed by hand methods.

38 The sample taken for determination of slump will be obtained immediately after the
39 concrete has been discharged onto the road.

40 (D) Set Retarding Admixture and Water Reducing Admixture

41 With permission, the Contractor may use an approved set retarding admixture,
42 an approved water reducing admixture or both to facilitate placing and finishing. Use
43 a quantity of set retarding admixture or water reducing admixture within the range shown
44 on the current list of approved admixtures maintained by the Materials and Tests Unit.

(E) Contractor's Responsibility for Process Control

Before or at the preconstruction conference, submit a plan detailing the process control and the type and frequency of testing and inspection necessary to produce concrete that meets the Specifications. During all batching and delivery operations assign a Certified Concrete Batch Technician on site whose sole duty is to supervise the production and control of the concrete. This duty includes the following:

- (1) Tests and inspections necessary to maintain the stockpiles of aggregates in an unsegregated and uncontaminated condition.
- (2) Calibration of admixture dispensing systems, weighing systems and water gauges.
- (3) Tests and adjustments of mix proportions for moisture content of aggregates.
- (4) Mixer performance tests before reducing mixing time of central mix plant to less than 90 seconds and at other times when deemed necessary by the Engineer.
- (5) Verifying the actual mixing time of the concrete after all materials are introduced into the mixer at the beginning of paving operations and at least once each month.
- (6) Testing all vibrators.
- (7) Tests necessary to document the slump and air content of the mix produced. Determine air content at least twice each day.
- (8) Tests for depth of the pavement in the plastic state.
- (9) Furnishing data to verify that the approved theoretical cement content has been met at intervals not to exceed 50,000 sy of pavement.
- (10) Signing all plant reports, batch tickets and delivery tickets.

The Department certifies technicians who satisfactorily complete examinations prepared and administered by the Department.

Perform all test procedures in compliance with the appropriate articles of Section 1000.

Tests may be witnessed by the Engineer. Document the results of all tests and inspections and make a copy available to the Engineer upon request. Take prompt action to correct conditions that have resulted in or could result in the submission of materials, products, or completed construction that do not conform to the *Standard Specifications*.

(F) Contractor Not Relieved of Responsibility for End Result

The Contractor will not be relieved of his obligation to produce a uniform pavement meeting Specifications by reason of:

- (1) The acceptance or approval by the Engineer of the concrete mix design or any adjustments;
- (2) Compliance with the concrete mix design and compliance with the testing requirements and other process control requirements by the Contractor; or
- (3) The failure of the Engineer to perform any tests in the process control, nor the performance of any tests in the process control that indicate compliance with the Specifications.

Section 1000

1 1000-4 PORTLAND CEMENT CONCRETE FOR STRUCTURES AND 2 INCIDENTAL CONSTRUCTION

3 (A) Composition and Design

4 Provide the class of concrete required by the contract.

5 Submit proposed concrete mix designs for each class of concrete to be used in the work.
6 Mix proportions shall be determined by a testing laboratory approved by the Department.
7 Base mix designs on laboratory trial batches that meet Table 1000-1 and this section.

8 Submit mix designs in terms of saturated surface dry weights on Materials and Tests
9 Form 312U at least 35 days before proposed use. Adjust batch proportions to compensate
10 for surface moisture contained in the aggregates at the time of batching. Changes in the
11 saturated surface dry mix proportions will not be permitted unless revised mix designs
12 have been submitted to the Engineer and approved.

13 Accompany Materials and Tests Form 312U with a listing of laboratory test results of
14 aggregate gradation, air content, slump and compressive strength from a certified
15 laboratory. List the compressive strength of at least three 6 inch x 12 inch or 4 inch x
16 8 inch cylinders at the age of 7 and 28 days.

17 Perform laboratory tests in accordance with the following test procedures:

Property	Test Method
Aggregate Gradation	AASHTO T 27
Air Content	AASHTO T 152
Slump	AASHTO T 119
Compressive Strength	AASHTO T 22 and T23

18 The Engineer will review the mix design for compliance with the Specifications and
19 notify the Contractor as to its acceptability. Do not use a mix until written notice has
20 been received. Acceptance of the mix design does not relieve the Contractor of his
21 responsibility to furnish a product that meets the contract. Upon written request from the
22 Contractor, a mix design accepted and used satisfactorily on any Department project may
23 be accepted for use on other projects.

24 (B) Air Entrainment

25 Entrain air in the concrete unless otherwise indicated in the plans or in the Specifications.
26 Add an air entraining agent at the time of mixing to produce an air content in the freshly
27 mixed concrete of $6.0\% \pm 1.5\%$ when tested at the job site. Determine the air content in
28 accordance with AASHTO T 121, T152 or T196. Measurement of air content may also
29 be performed by the Chace Indicator, in which case sufficient tests will be made in
30 accordance with AASHTO T 121, T152 or T196 to establish correlation with the Chace
31 Indicator. Concrete for structures will not be rejected based on tests made with the Chace
32 Indicator. Concrete for incidental construction may be rejected based on an average of
33 3 or more tests made with the Chace Indicator.

34 Air entraining agent may be added at the job site when permitted by the Engineer.

35 (C) Strength of Concrete

36 The compressive strength of the concrete will be considered the average compressive
37 strength test results of two 6 inch x 12 inch cylinders, or two 4 inch x 8 inch cylinders if
38 the aggregate size is not larger than size 57 or 57M. Make cylinders in accordance with
39 AASHTO T 23 from the concrete delivered to the work. Make cylinders at such
40 frequencies as the Engineer may determine and cure them in accordance with AASHTO
41 T 23 as modified by the Department. Copies of these modified test procedures are
42 available upon request from the Materials and Tests Unit.

1 When the average compressive strength of the concrete test cylinders is less than the
2 minimum strength specified in Table 1000-1 and the Engineer determines it is within
3 reasonable close conformity with strength requirements, concrete strength will be
4 considered acceptable. When the Engineer determines average cylinder strength is below
5 the specification, the in-place concrete will be tested. Based on these test results, the
6 concrete will either be accepted with no reduction in payment or accepted at a reduced
7 unit price or rejected as set forth in Article 105-3.

8 **(D) Temperature Requirements**

9 The concrete temperature at the time of placement shall be not less than 50°F nor more
10 than 95°F except where other temperatures are required by Articles 420-4, 420-7, 420-14
11 and 420-15.

12 Do not place concrete without permission when the air temperature measured at the
13 location of the concrete operation in the shade away from artificial heat is below 35°F.

14 When such permission is granted, uniformly heat the aggregates and/or water to
15 a temperature not higher than 150°F. Heated concrete shall be between 55°F and 80°F at
16 the time of placement.

Section 1000

1 (E) Elapsed Time for Placing Concrete

- 2 Regulate the delivery so the maximum interval between the placing of batches at the
3 work site does not exceed 20 minutes. Place concrete before exceeding the times in
4 Table 1000-2. Measure the elapsed time as the time between adding the mixing water to
5 the mix and placing the concrete.

**TABLE 1000-2
ELAPSED TIME FOR PLACING CONCRETE**

Air or Concrete Temperature Whichever is Higher	Maximum Elapsed Time	
	No Retarding Admixture Used	Retarding Admixture Used
90°F or above	30 minutes	1 hr. 15 minutes
80°F through 89°F	45 minutes	1 hr. 30 minutes
79°F or below ^A	60 minutes	1 hr. 45 minutes
70°F through 79°F ^B	60 minutes	1 hr. 45 minutes
69°F or below ^B	1 hr. 30 minutes	2 hr. 15 minutes

1 **A.** Applicable to Class AA, A and Drilled Pier concrete.

2 **B.** Applicable to Class B concrete.

3 **(F) Use of Set Retarding Admixtures**

4 Use an approved set retarding admixture in all concrete placed in the superstructure of
5 bridges such that the concrete will remain workable until the entire operation of placing
6 and finishing, including corrective measures, if necessary, has been completed. The
7 Engineer may waive the use of set retarding admixture when conditions clearly indicate
8 that it is not needed.

9 Other structural concrete may contain an approved set retarding admixture when
10 permitted by the Engineer.

11 Use a quantity of set retarding admixture within the range shown on the current list of
12 approved admixtures issued by the Materials and Tests Unit.

13 **(G) Use of Water Reducing Admixtures**

14 By permission of the Engineer, the Contractor may use an approved water reducing
15 admixture to facilitate placing and finishing.

16 Use a quantity of water reducing admixture within the range shown on the current list of
17 approved admixtures issued by the Materials and Tests Unit.

18 **(H) Use of Calcium Chloride**

19 Calcium chloride may be used as a set accelerating agent where permitted by the
20 Engineer. Use one lb. of calcium chloride per 100 lbs. of cement except where lesser
21 amounts are directed. Do not use calcium chloride where steel reinforcement, metal
22 conduit or other metals will be in contact with the concrete. Do not use calcium chloride
23 in concrete that has a temperature higher than 70°F, or when the air temperature is greater
24 than 70°F. Provide cold weather protection for concrete containing calcium chloride in
25 the same manner as is provided for concrete without calcium chloride.

26 Use calcium chloride in liquid form. Use a solution of one lb. or less of calcium chloride
27 per one quart of water and mix well. To avoid incompatibility with other additives, add
28 the calcium chloride to the batch after all other ingredients have been put into the mixer.

29 **(I) Use of Fly Ash**

30 Fly ash may be substituted for cement in the mix design up to 30% at a rate of 1.0 lb. of
31 fly ash to each pound of cement replaced. Use Table 1000-1 to determine the maximum
32 allowable water-cementitious material (cement + fly ash) ratio for the classes of concrete
33 listed.

34 **(J) Use of Ground Granulated Blast Furnace Slag**

35 For mixes that contain cement and ground granulated blast furnace slag, the
36 water-cementitious ratio (cement and slag) shall not exceed the water-cement ratio shown
37 in Table 1000-1.

Section 1000

1 (K) Use of Calcium Nitrite Corrosion Inhibitor

2 Units with calcium nitrite in a quantity less than specified are subject to rejection.
3 Furnish concrete powder drilled from representative cylinders to the Engineer, in a
4 quantity to be specified, to verify the concentrations of calcium nitrite in hardened
5 concrete. Concrete that fails to contain calcium nitrite at the required concentrations as
6 tested is subject to rejection. Use air-entraining, water-reducing and/or set-controlling
7 admixtures compatible with calcium nitrite solutions. Strictly adhere to the
8 manufacturer's written recommendations regarding the use of admixtures, including
9 storage, transportation and method of mixing. If preferred, use calcium nitrite, which
10 acts as an accelerator, in conjunction with a retarder to control the set of concrete, as per
11 the manufacturer's recommendation. Add an approved calcium nitrite corrosion inhibitor
12 (30% solids) to the concrete mix at the batch plant for the bridge elements identified by
13 the plan notes. Use the inhibitor at a minimum rate of 3.0 gal/cy. Ensure that the
14 hardened concrete contains at least 5.8 lbs/cy nitrite (NO₂) when tested in accordance
15 with Materials and Tests Method Chem. C-20.0. The preceding paragraph does not apply
16 to concrete used in prestressed concrete members. Concrete used in prestressed concrete
17 members shall be tested in accordance with Subarticle 1078-4(G).

18 1000-5 HIGH EARLY STRENGTH PORTLAND CEMENT CONCRETE

19 Use high early strength Portland cement concrete when required by contract. When not
20 required, it may be used at the Contractor's option with approval of the Engineer.

21 For all classes of concrete, high early strength concrete may be produced by using
22 Type III Portland cement. To produce high early strength concrete with regular cement, use
23 a higher class of concrete as follows:

24 For Class A and Class B, use Class AA with a cement content of at least 677 lbs/cy. Other
25 classes that lend themselves to high early strength with regular cement will be reviewed by
26 the Engineer on a case-by-case basis.

27 1000-6 FLOWABLE FILL

28 Flowable fill consists of Portland cement, water, supplementary cementitious materials and/or
29 fine aggregate and, optionally, concrete admixtures.

30 Submit the proposed mix design on Materials and Tests Form 312U at least 35 days before
31 use. Use a testing laboratory approved by the Department to determine mix proportions based
32 on laboratory trial batches meeting Table 1000-1.

33 State on Form 312U the intended use of the material (excavatable or non-excavatable).
34 Accompany Form 312U with a listing of compressive strength of at least three 4 inch x 8 inch
35 cylinders at the age of 28 or 56 days, depending on whether the mix is to be excavated or not.
36 Air cure the cylinders during the entire period before testing. The Engineer will advise the
37 Contractor in writing of the acceptability of the mix design.

38 1000-7 LATEX MODIFIED CONCRETE

39 (A) Materials

40 Refer to Division 10.

Item	Section
Coarse Aggregate, standard size No. 78M	1014-2
Fine Aggregate	1014-1
Portland Cement	1024-1
Type IL Blended Cement	1024-1
Type IP Blended Cement	1024-1
Type IS Blended Cement	1024-1
Type IT Blended Cement	1024-1
Water	1024-4

- 1 Do not use Type III high early strength cement.
- 2 Use a formulated latex admixture that is a non-hazardous, film forming and polymeric
3 emulsion in water and is homogeneous and uniform in composition. Add all stabilizers at
4 the point of manufacture.
- 5 Use a latex modifier conforming to Table 1000-3.

Property	Requirement
Polymer Type	Styrene Butadiene: 68 ± 4% Styrene 32 ± 4% Butadiene
Average Polymer Particle Size	1500 to 2500 Angstroms
Emulsion Stabilizers	Anionic and non-ionic surfactants
Percent Solids	46.5% to 49.0%
Weight per gallon at 75°F	8.40 to 8.60 lb
pH	9.5 to 11.0
Shelf Life	2 Years
Color	White

- 6 Provide a Type 5 material certification for each load of latex emulsion admixture in
7 accordance with Article 106-3. Test admixture samples to verify compliance with the
8 requirements before use. Allow 7 days for sampling and testing after delivery to the
9 project.
- 10 Do not allow the temperature of latex emulsion admixture to fall below 35°F at any time
11 or exceed 85°F after delivery to the project.
- 12 For latex emulsion that has been in storage, use a transfer pump and lines to recirculate it
13 before using and sampling.
- 14 For latex modified concrete, use a workable mixture that meets Table 1000-4.
- 15 Measure the slump 4 to 5 minutes after discharge from the mixer.
- 16 Submit the latex modified concrete mix design, completed by the latex emulsion
17 manufacturer, to the Engineer for review.

Property	Requirement
Cement Content, lb/cy	658 min.
Latex Emulsion Admixture, gal/cy	24.5 min.
Air Content of Plastic Mix, %	3.5 - 6.5
Slump, inches	3 - 6
% Fine Aggregate as percent of total aggregate by weight	50 - 55
7 day Compressive Strength, psi	3,000 min.
Water-Cement Ratio by weight	0.40 max.

18 (B) Equipment

- 19 Before beginning any work, obtain approval for all equipment to be used for deck
20 preparation, mixing, placing, finishing and curing the latex modified concrete.
- 21 Use sandblasting equipment capable of removing all clay, salt deposits, oil and grease
22 deposits and all other foreign matter. Provide traps or separators to remove oil and water
23 from the compressed air. Use traps or separators of adequate size and drain them

Section 1000

- 1 periodically during operations. For proportioning and mixing, use self-contained, mobile
2 and continuously mixing equipment that meets the following requirements:
- 3 (1) Use a self-propelled mixer that is capable of carrying sufficient unmixed dry, bulk
4 cement, sand, coarse aggregate, latex modifier and water to produce at least 6 cy of
5 concrete on site.
 - 6 (2) Use a mixer that is capable of positive measurement of cement introduced into the
7 mix. Use a recording meter that is visible at all times and equipped with a ticket
8 printout to indicate the quantity of cement.
 - 9 (3) Calibrate the mixers to accurately proportion the specified mix. Before placing latex
10 modified concrete, perform calibration and yield tests under the Engineer's
11 supervision in accordance with the Department's written instructions. Copies of
12 these written instructions are available from the Materials and Tests Unit. Perform
13 the calibration and yield tests using the material to be used on the project.
14 Recalibrate the mixer after any major maintenance operation on the mixer, anytime
15 the source of materials changes or as directed. Furnish all materials and equipment
16 necessary to perform the calibrations and yield tests.
 - 17 (4) Use a mixer that controls the flow of water and latex emulsion into the mix.
18 Measure the flow rate of water and the latex emulsion with a calibrated flowmeter
19 coordinated with both the cement and aggregate feeding mechanisms and the mixer.
20 Adjust the flow rate, as necessary, to control the slump and ensure that the water-
21 cement ratios are met. In addition to flowmeters, use mixers with accumulative
22 water and latex meters capable of indicating the number of gallons, to the nearest
23 0.1 gallon, introduced into the mixer. Filter water and latex with a suitable mesh
24 filter before it flows through the accumulative water and latex meters.
 - 25 (5) Calibrate the mixer to automatically proportion and blend all components of the
26 indicated composition on a continuous or intermittent basis as the finishing operation
27 requires. Provide a mixer that discharges mixed material through a conventional
28 chute and is capable of spraying water over the placement width as it moves ahead to
29 ensure that the surface to be overlaid is wet before receiving the modified material.
 - 30 (6) Mount a tachometer on the unit to indicate the drive shaft speed.
 - 31 (7) Use adequate hand tools for placing and leveling concrete down to approximately the
32 correct level for striking off with the screed.
 - 33 (8) Use a finishing machine that meets the approval of the Engineer and the
34 requirements of the contract. Use a self-propelled finishing machine capable of
35 forward and reverse movement under positive control. Use a machine with at least 2
36 finishing devices, one that is a vibrating screed and the other either a vibrating
37 screed, oscillating screed, or one or more rotating cylindrical drums 48 inches long
38 or less and operating between 1,500 and 2,500 vpm. Make certain the finishing
39 machine can finish the surface to within 1 foot of the edges of the area being placed.
40 Raise all screeds when the finishing machine is moving backwards over the screeded
41 surface.
 - 42 (9) Use screeds with a vibration frequency that is variable between 3,000 and 6,000 vpm
43 with positive controls. Use screeds with a metal covered bottom face not less than
44 4 inches wide. Provide screeds with positive control of the vertical position.
 - 45 (10) Use supporting rails for travelling of the finishing machine rigid enough to eliminate
46 deflection from the weight of the machine.

(C) Proportioning and Mixing of Modified Compositions

Use mobile continuous mixers that accurately proportion all materials for the specified mixture. Operate the proportioning equipment at the manufacturer's recommended speed verified with the tachometer during calibration and normal operations.

Yield checks and other checks are permitted.

(D) Contractor's Responsibility for Process Control

Before or at the preconstruction conference, submit a plan detailing the process control and the type and frequency of testing and inspection necessary to produce concrete that meets the Specifications. During all batching and delivery operations assign a Certified Concrete Batch Technician on site whose sole duty is to supervise the production and control of the concrete. This duty includes the following:

- (1) Tests and inspections necessary to maintain the stockpiles of aggregates in an unsegregated and uncontaminated condition.
- (2) Calibration of admixture dispensing systems, weighing systems and water gauges.
- (3) Tests and adjustments of mix proportions for moisture content of aggregates.
- (4) Mixer performance tests before reducing mixing time of central mix plant to less than 90 seconds and at other times when deemed necessary by the Engineer.
- (5) Verifying the actual mixing time of the concrete after all materials are introduced into the mixer at the beginning of paving operations and at least once each month.
- (6) Testing all vibrators.
- (7) Tests necessary to document the slump and air content of the mix produced. Determine air content at least twice each day.
- (8) Tests for depth of the pavement in the plastic state.
- (9) Furnishing data to verify that the approved theoretical cement content has been met at intervals not to exceed 50,000 sy of pavement.
- (10) Signing all plant reports, batch tickets and delivery tickets.

The Department certifies technicians who satisfactorily complete examinations prepared and administered by the Division of Highways.

Perform all test procedures in compliance with the appropriate articles of Section 1000.

Tests may be witnessed by the Engineer. Document the results of all tests and inspections and make a copy available to the Engineer upon request. Take prompt action to correct conditions that have resulted in or could result in the submission of materials, products, or completed construction that do not conform to these specifications.

1000-8 MEASURING MATERIALS**(A) Weighing Cement**

Measure cement by weight on scales separate from those used for other materials and in a hopper that is entirely free and independent of the hoppers used for weighing the aggregates. When the quantity of cement in a batch exceeds 30% of the full capacity of the scale, ensure the quantity of cement as indicated by the scale is within $\pm 1\%$ of the required weight. For smaller batches, ensure the quantity of cement as indicated by the scale be not less than the required amount or more than 4% in excess. Equip all beam type scales with a tare beam.

Section 1000

1 (B) Weighing Aggregates

2 Measure aggregates by weight. Base batch weights on saturated surface dry materials
3 which is the required weight plus the total weight of surface moisture contained in the
4 aggregate. Ensure the individual aggregates, as weighed, are within $\pm 2\%$ of the required
5 weights.

6 (C) Water

7 Measure water by volume or by weight. Ensure the quantity of water measured is
8 within $\pm 1\%$ of the required amount.

9 (D) Admixture Dispensing Systems

10 Provide a separate dispensing system with separate fill and discharge lines for each type
11 of admixture to be used, except that admixtures may be measured and introduced into the
12 mix manually if approval has been obtained. Ensure each system is capable of
13 measuring, displaying and discharging the required amount of admixture into the mix.
14 Keep dispensing systems clean and in good operating condition. Use a dispensing system
15 that is either:

16 (1) Manually operated, self-contained; or

17 (2) Semi-automatic or automatic, self-contained; or

18 (3) Interfaced to operate automatically with the concrete batching control panel.

19 Have the admixture dispenser dispense the required quantity of admixture for each
20 concrete batch within an accuracy of $\pm 3\%$. Check the accuracy of the dispenser as
21 provided below. Check the accuracy at the point of discharge, or through a bypass valve
22 suitable for obtaining a calibrated sample of admixture and at the volumes normally used
23 for one half mixer capacity and for full mixer capacity. Determine the accuracy at the
24 time of installation and check daily during the early part of each day's operation.

25 Include in each system a graduated measuring unit into which the admixture is batched to
26 permit a quick visual check of accuracy before its discharge. Ensure the measuring unit
27 is clearly graduated and be of sufficient size to hold the maximum anticipated dose for
28 one batch. Clearly mark the measuring unit for the type of admixture to be used.

29 Control the discharge sequence so an admixture will not be brought into contact with raw
30 cement or another admixture before being diluted through contact with the mixing water
31 in the mixer. Where 2 types of admixtures are being used, do not discharge them into the
32 mix simultaneously. Add the air entraining agent with the first addition of water and add
33 any other chemical admixture with the final addition of water, unless otherwise
34 permitted.

35 Construct the discharge lines to completely empty after each cycle. Locate the admixture
36 dispensing systems so the batching plant operator will have a visual verification of the
37 actual quantity of admixture batched.

38 Use air entraining admixtures in accordance with the manufacturer's recommendations
39 and in such quantity to provide the specified air content in freshly mixed concrete. Use
40 a quantity of set retarding admixture and of water reducing admixture per 100 lbs. of
41 cement that is within the range recommended on the current list of approved admixtures
42 issued by the Materials and Tests Unit.

43 1000-9 BATCHING PLANT

44 (A) General

45 Plants located on the Department rights of way shall conform to Article 107-3.

46 Have ready mixed concrete plants inspected and approved by the Department before they
47 are used to produce concrete, either paving, structural or incidental, for the project.

1 Plants shall meet all the applicable requirements of these *Standard Specifications*, and in
2 addition, ensure each ready mix plant provides at least three acceptable truck mixers or
3 truck agitators available for use. Use trucks that have an identifying number. Plants
4 approved by the Department will be placed on a list of approved plants available to the
5 Contractor. All plants will be subject to reinspection at intervals selected by the
6 Engineer. Reapproval after each inspection will be contingent on continuing compliance
7 with the *Standard Specifications*.

8 (B) Bins and Hoppers

9 Provide bins with separate compartments for fine aggregates and for each required size of
10 coarse aggregate in the batching plant. Design each compartment to discharge efficiently
11 and freely into the weighing hopper. Provide control so, as the quantity desired is being
12 approached, the material may be added slowly and shut off with precision. Construct
13 weighing hoppers to eliminate accumulation of tare materials and to discharge fully
14 unless otherwise permitted. Provide a port or other opening for removing an overload of
15 any one of the several materials from the hopper.

16 (C) Scales

17 Use either the beam type, load cell type or the springless dial type scales for weighing
18 aggregates and cement. Ensure the minimum graduation on beam or dial is not more than
19 0.1% of the total capacity of the scale. Methods of weighing, other than beam or
20 springless dial scales, may be approved by the Engineer provided they meet the required
21 weighing tolerances. Ensure the scales are accurate within 0.5% under operating
22 conditions. Make available ten 50 lb. test weights at the plant for checking accuracy.
23 Use test weights which meet the U.S. Bureau of Standards requirements for calibrating
24 and testing equipment. Keep all exposed fulcrums, clevises and similar working parts of
25 scales clean. When beam type scales are used, make provisions for indicating to the
26 operator that the required load in the weighing hopper is being approached. Ensure the
27 device indicates at least the last 50 lbs. of load and design it to give a positive indication
28 of overload of the scales. During charging of the hopper, have all indicating devices in
29 full view of the operator and provide convenient access to all controls. Ensure the
30 indicating devices are in the immediate vicinity of the operator and easily readable by the
31 operator.

32 (D) Water Measuring Devices

33 Use devices for measurement of the water which are readily adjustable and are capable of
34 being set to deliver the required amount and cut off the flow automatically when this
35 amount has been discharged. Under all operating conditions the device shall have
36 accuracy within 1% of the quantity of water required for the batch. Arrange the device so
37 variable pressures in the water supply line will not affect the measurements. Use
38 measuring tanks of adequate capacity to furnish the maximum mixing water required and
39 equip them with outside taps and valves to provide for checking their calibration unless
40 other means are provided for readily and accurately determining the amounts in the tank.

41 1000-10 MIXERS AND AGITATORS

42 (A) General

43 Mixers are defined as equipment to mix concrete and may be stationary or truck
44 mounted. Agitators are defined as equipment used to haul central mixed concrete and
45 may be truck mixers or truck agitators. Provide a metal plate or plates attached to each
46 mixer and agitator in a prominent place on which the manufacturer has plainly marked
47 the mixing speed of the drum or paddles and the maximum capacity of the drum or
48 container in terms of volume of mixed concrete. On truck mixers and agitators, show the
49 manufacturer's recommended agitating and mixing speed of rotation of the mixing drum
50 or blades. Equip stationary mixers with an acceptable timing device that will not permit
51 the batch to be discharged until the specified mixing time has elapsed. Equip truck

Section 1000

1 mixers with counters to verify the number of revolutions of the drum or blades. Actuate
2 the counters at the initial time the drums have reached mixing speed.

3 Examine mixers and agitators periodically for changes in condition due to accumulation
4 of hard concrete or mortar, wear of blades or any other condition which decreases mixing
5 efficiency. Mixers are unacceptable when the radial height or other dimension of the
6 blade has worn below 90% of the original dimension. This radial height excludes any
7 lips on the blade and is the height of the blade running perpendicular to the shell of the
8 drum. Where such conditions are found, do not use the units until they are corrected.

9 Also examine mixers and agitators periodically for general mechanical condition,
10 including water measuring and discharge apparatus, identifying number on trucks,
11 condition of the blades, speed of rotation of the drum and condition of the drum.

12 (B) Mixer Capacity

13 Do not load truck mixers with concrete with more than 63% of the gross volume of the
14 drum. Use mixers capable of combining the ingredients of the concrete into a thoroughly
15 mixed and uniform mass and of discharging the concrete with a satisfactory degree of
16 uniformity. Use stationary mixers, when loaded at the manufacturers guaranteed mixing
17 capacity and the concrete mixed for the prescribed mixing time, capable of combining the
18 ingredients of the concrete into a thoroughly mixed and uniform mass and discharging
19 the concrete with satisfactory uniformity.

20 Use at least 20% of the rated mixing capacity as the minimum quantity of concrete
21 permitted to be mixed or agitated in any mixer.

22 (C) Agitator Capacity

23 Load the agitator to not exceed 80% of the gross drum volume and have it be capable of
24 maintaining the concrete in a thoroughly mixed and uniform mass and of discharging the
25 concrete with a satisfactory degree of uniformity.

26 (D) Consistency Tests

27 The Engineer may, from time to time, make slump tests to measure consistency of the
28 concrete. Take individual samples at approximately the 1/5th point, the midpoint and the
29 4/5th point of the load, using AASHTO T 119. Such tests will be made within
30 20 minutes of discharge of that portion of the load. If the results vary by more than 1
31 inch in slump, do not use the mixer or agitator unless the condition is corrected.

32 1000-11 MIXING AND DELIVERY

33 (A) General

34 Mix and deliver concrete to the site of the work by one of the following methods, except
35 where other methods are approved. Maintain responsibility for controlling the materials
36 and operations as to produce uniform concrete meeting Specifications requirements.

37 When concrete is being produced for structures and incidental construction in accordance
38 with Article 1000-4, have present during all batching operations a Certified Concrete
39 Batch Technician employed by the Contractor or concrete supplier. During batching and
40 delivery, the sole duty of this employee is to supervise the production and control of the
41 concrete. Perform moisture tests, adjust mix proportions of aggregates for free moisture,
42 complete and sign Batch Tickets (Materials and Tests Form 903) or approved delivery
43 tickets and assure quality control of the batching. Delivery tickets will be permitted
44 instead of batch tickets (Materials and Tests Form 903) provided they have been
45 reviewed and approved by the Materials and Tests Unit. The Department certifies
46 technicians who satisfactorily complete examinations prepared and administered by the
47 Department.

1 (1) Central Mixed Concrete

2 Concrete that is mixed completely in a stationary mixer and the mixed concrete
3 transported to the point of delivery in a truck agitator or in a truck mixer operating at
4 agitating speed or in non-agitating equipment approved by the Engineer. Perform
5 mixing within the capacity and at the mixing speeds recommended by the
6 manufacturer.

7 (2) Transit Mixed Concrete

8 Concrete that is mixed completely in a truck mixer while at the batching plant, in
9 transit, or at the work site.

10 (3) Shrink Mixed Concrete

11 Concrete that is mixed partially in a stationary mixer at a central mixing plant and
12 completed as transit mixed concrete. Place all ingredients for a batch in the
13 stationary mixer, partially mix before any concrete is discharged to the truck mixer
14 and do not exceed the rated capacity of the equipment for the batch size. The mixing
15 time at the stationary mixer may be reduced to the minimum necessary to
16 intermingle the ingredients, and the mixing may be completed in the truck mixer.
17 Use the number of mixing revolutions in the truck mixer as specified for transit
18 mixed concrete or reduce as indicated by mixer performance tests.

19 **(B) Mixing Time for Central Mixed Concrete**

20 Mixing time begins when all solid materials are in the mixing compartment and ends
21 when any part of the concrete begins to discharge. In charging the mixer, water will enter
22 in advance of cement and aggregate. Ensure all the water is substantially in the drum
23 before 1/3 of the specified mixing time has elapsed. Count transfer time in multiple drum
24 mixers as part of the mixing time.

25 Where mixer performance tests are not made, use a minimum mixing time of 90 seconds,
26 providing that blending of materials during charging is achieved to the satisfaction of the
27 Engineer. The minimum mixing time for an individual mixer is that which, as shown by
28 mixer performance tests, will produce concrete in accordance with Table 1000-5, except
29 that the mixing time shall not be less than 50 seconds under any circumstances.
30 Maximum mixing time excluding discharge time is 150 seconds.

31 Sampling and testing for mixer performance tests will be done as provided below.
32 Charge the mixer to its rated capacity with the materials and proportions to be used in the
33 work and mixed at the recommended mixing speed to the target time. Stop mixing and
34 begin discharging. Two samples of sufficient size to make the required tests will be
35 taken after discharge of approximately 15% and 85% of the load.

**TABLE 1000-5
REQUIREMENTS FOR UNIFORMITY OF CONCRETE**

Property	Requirement	Test Method
Difference in Test Samples Air Content, percent by volume of concrete	1.0%	AASHTO T 152
Slump	1.0"	AASHTO T 119
Coarse aggregate content, portion by weight of each sample retained on the No. 4 sieve	6.0%	AASHTO M 157
Weight	1.0 lb	AASHTO T 121
Average Compressive Strength at 7 days, percent of average	10.0% ^A	AASHTO T 22 AASHTO T 23

36 **A.** Tentative approval may be granted pending 7 day compressive strength tests.

Section 1000

1 Each of the two samples of concrete will be separately tested for the properties listed in
2 Table 1000-5. Tests will be conducted in accordance with the test procedures specified
3 in Table 1000-5 or procedures established by the Materials and Tests Unit.

4 The mixer performance test described above will be performed on at least two batches of
5 concrete. For the performance test to be acceptable, have all tests in each batch tested
6 meet the requirements listed above.

7 The Engineer may recheck mixer performance at any time when, in his opinion,
8 satisfactory mixing is not being accomplished.

9 Where satisfactory mixing cannot be accomplished in 90 seconds, the Engineer may
10 increase the mixing time or require that the mixer be repaired or replaced before any
11 further mixing can be done.

12 (C) Truck Mixers and Truck Agitators

13 When a truck mixer is used for complete mixing, mix each batch of concrete for at least
14 70 revolutions of the drum or blades at the rate of rotation designated by the
15 manufacturer of the equipment as mixing speed, unless otherwise directed by the
16 Engineer. Unless the mixer is equipped with a counter which will distinguish between
17 mixing and agitating speeds, perform the minimum required number of revolutions of the
18 drum at mixing speed as directed, either at the batching plant before the mixer leaves
19 for the work site and/or at the work site before the concrete is discharged.
20 Perform any additional mixing at the speed designated by the manufacturer of the
21 equipment as agitating speed. Put all materials including mixing water in the drum
22 before actuating the revolution counter for determining the number of revolutions of the
23 drum.

24 When a truck mixer or truck agitator is used to transport concrete that has been
25 completely mixed in a stationary mixer, perform mixing during transport at agitating
26 speed.

27 Provide concrete, when discharged from truck mixers or truck agitators, of the
28 consistency and workability required for the work. Control the rate of discharge of the
29 plastic concrete from the mixer drum by the speed or rotation of the drum in the
30 discharge direction with the discharge gate fully open. If additional mixing water is
31 necessary to produce the slump necessary for proper placement, add it only with
32 permission and rotate the truck mixer drum at least 25 revolutions at mixing speed before
33 discharge of any concrete. Additional mixing water will be allowed only if the maximum
34 specified water content per cubic yard is not exceeded.

35 (D) Delivery

36 Use a ticket system for recording the transportation of batches from the proportioning
37 plant to the site of the work. Use tickets furnished by the Engineer and fill it out in
38 accordance with instructions issued by the Engineer. Issue the tickets to the truck
39 operator at the proportioning plant for each load and have them signed by the plant
40 inspector, which will signify that the concrete in the truck has been inspected before
41 departure. Ensure each ticket shows the time batching was completed and if transit
42 mixed, the number of revolutions at mixing speed, if any, at the plant. Deliver the tickets
43 to the inspector at the site of the work. Do not use loads which do not carry such tickets
44 and loads which do not arrive in satisfactory condition within the time limits specified in
45 the work.

46 1000-12 VOLUMETRIC MIXED CONCRETE

47 Upon written request by the contractor, the Department may approve the use of concrete
48 proportioned by volume. The volumetric producer must submit and have approved a process
49 control plan and product quality control plan by the Materials and Tests Unit. If concrete is
50 proportioned by volume, the other requirements of these specifications with the following

1 modifications will apply. Unless otherwise approved by the Department, use of concrete
2 proportioned by volume shall be limited to Class B concrete and no more than 30 cy per unit
3 per day.

4 (A) Materials

5 Use materials that meet the requirements for the respective items except that they will be
6 measured by a calibrated volume-weight relationship.

7 Storage facilities for all material shall be designed to permit the Department to make
8 necessary inspections before the batching operations. The facilities shall permit
9 identification of approved material at all times and shall be designed to avoid mixing
10 with, or contaminating by, unapproved material. Coarse and fine aggregate shall be
11 furnished and handled so variations in the moisture content affecting the uniform
12 consistency of the concrete is avoided.

13 Moisture content of the coarse and fine aggregate will be made available onsite for the
14 Engineer's review for each load. The frequency of moisture testing will be dependent on
15 certain variables such as weather, season and source; however, moisture tests should be
16 performed at least once at the beginning of the work day for each source material.
17 Additional daily moisture tests for the coarse and fine aggregate shall be performed if
18 requested by the Engineer.

19 Unused materials should be emptied from hopper daily. Concrete should not be mixed
20 with materials left in the hopper overnight.

21 (B) Equipment

22 Provide volumetric mixers with rating plates indicating that the performance of the mixer
23 is in accordance with the Volumetric Mixer Manufacturer Bureau or equivalent. Mixers
24 must comply with ASTM C685. Unless otherwise specified, all mixing operations must
25 be in strict accordance with the manufacturer's recommended procedures. Such
26 procedures shall be provided to the Department for review upon request.

27 The volumetric mixer shall be capable of carrying sufficient unmixed dry bulk cement,
28 supplementary cementitious material (if required), fine aggregate, coarse aggregate,
29 admixtures and water, in separate compartments and accurately proportioning the
30 specified mix. Each batching or mixing unit (or both) shall carry in a prominent place a
31 metal plate or plates on which are plainly marked the gross volume of the unit in terms of
32 mixed concrete, discharge speed and the weight-calibrated constant of the machine in
33 terms of a revolution counter or other output indicator.

34 The concrete mixing device shall be an auger-type continuous mixer used in conjunction
35 with volumetric proportioning. The mixer shall produce concrete, uniform in color and
36 appearance, with homogeneous distribution of the material throughout the mixture.
37 Mixing time necessary to produce uniform concrete shall be established by the contractor
38 and shall comply with other requirements of these specifications. Only equipment found
39 acceptable in every respect and capable of producing uniform results will be permitted.

40 Each volumetric mixer shall be equipped with an onboard ticketing system that will
41 electronically produce a record of all material used and their respective weights and the
42 total volume of concrete placed. Alternate methods of recordation may be used if
43 approved by the Engineer. Tickets shall identify at least the following information:

- 44 (1) Contractor Name
- 45 (2) Contractor Phone Number
- 46 (3) NCDOT Project No. and TIP No.
- 47 (4) Date
- 48 (5) Truck No.
- 49 (6) Ticket No.
- 50 (7) Time Start/End of Pour

Section 1000

- 1 (8) Mix ID and Description (Strength)
- 2 (9) Aggregate Moisture Before Mixing

3 (C) Proportioning Devices

4 Volume proportioning devices, such as counters, calibrated gate openings or flow meters,
5 shall be easily accessible for controlling and determining the quantities of the ingredients
6 discharged. All indicating devices that affect the accuracy of proportioning and mixing
7 of concrete shall be in full view of and near enough to be read by the operator and
8 Engineer while concrete is being produced. In operation, the entire measuring and
9 dispensing mechanism shall produce the specified proportions of each ingredient.

10 Provide positive control of the flow of water and admixtures into the mixing chamber
11 with a volumetric mixer. Indicate water flow by a flow meter and be readily adjustable to
12 provide for slump control and/or minor variations in aggregate moisture. Provide a mixer
13 capable of continuously circulating or mechanically agitating the admixtures.

14 Dispense liquid admixtures through a controlled, calibrated flow meter. A positive means
15 to observe the continuous flow of material shall be provided. If an admixture requires
16 diluting, the admixture shall be diluted and thoroughly mixed before introducing the
17 admixture into the dispenser. When admixtures are diluted, the ratio of dilution and the
18 mixing shall be approved by and performed in the presence of the Department.

19 The volumetric mixer shall be capable of measurement of cement, supplementary
20 cementitious material (if required), liquids and aggregate being introduced into the mix.

21 (D) Calibration

22 Volume-weight relationships will be based on calibration. The proportioning devices
23 shall be calibrated by the contractor before the start of each NCDOT job and
24 subsequently at intervals recommended by the equipment manufacturer. Calibrations
25 will be performed in the presence of the Department and subject to approval from the
26 Department. Calibration of the cement and aggregate proportioning devices shall be
27 accomplished by weighing (determining the mass of) each component. Calibration of the
28 admixture and water proportioning devices shall be accomplished by weight (mass) or
29 volume. Tolerances in proportioning the individual components will be as follows:

Item	Tolerance
Cement, Weight (Mass) percent	0 to +4
Fine Aggregate, Weight (Mass) percent	± 2
Coarse Aggregate, Weight (Mass) percent	± 2
Admixtures, Weight (Mass) or Volume percent	± 3
Water, Weight (Mass) or Volume percent	± 1

30 Each volumetric mixer must be accompanied at all times by completed calibration
31 worksheets and they shall be made available to the Department upon request.

32 (E) Verification of Yield

33 Verification of the proportioning devices may be required at any time by the Department.
34 Verification shall be accomplished by proportioning the rock and sand based on the
35 cement meter count for each concrete mobile mixer. Once the count (revolutions) for
36 94 lbs. of cement has been determined then delivery of the correct amount of rock and
37 sand can be verified.

(F) Uniformity

When concrete is produced, have present during all batching operations a Certified Concrete Batch Technician. During batching and placement, the sole duty of this employee is to supervise the production and control of the concrete, perform moisture tests, adjust mix proportions of aggregates for free moisture, complete and sign approved delivery tickets and assure quality control of the batching.

Two samples of sufficient size to make the required tests will be taken after discharge of approximately 15% and 85% of the load. Each of the two samples of concrete will be separately tested for the properties listed in Table 1000-6. Tests will be conducted in accordance with the test procedures specified in Table 1000-6 or procedures established by the Materials and Tests Unit. The Engineer may recheck mixer performance at any time when, in his opinion, satisfactory mixing is not being accomplished.

SECTION 1002 SHOTCRETE PRODUCTION AND DELIVERY

1002-1 DESCRIPTION

This section addresses shotcrete to be used for temporary support of excavations and other applications in accordance with the contract. Produce shotcrete by either the dry-mix or wet-mix process composed of Portland cement, fine and/or coarse aggregates, water and at the Contractor's option, supplementary cementitious materials. Include chemical admixtures as required or needed for shotcrete produced by the wet-mix process. Ground granulated blast furnace slag, fly ash or silica fume may be substituted for a portion of the Portland cement. Type IL, IS, IP or IT blended cement may be used instead of Portland cement.

Mixes for all shotcrete shall be designed by a Certified Concrete Mix Design Technician or an engineer licensed by the State of North Carolina. Shotcrete shall be applied by a nozzelman certified as an ACI Shotcrete Nozzelman in accordance with *ACI Certification Publication CP-60*. Nozzlemen shall be certified in either dry-mix or wet-mix shotcrete based on the process to be used for the work.

1002-2 MATERIALS

Refer to Division 10.

Item	Section
Chemical Admixtures	1024-3
Coarse Aggregate	1014-2
Fine Aggregate	1014-1
Fly Ash	1024-5
Ground Granulated Blast Furnace Slag	1024-6
Portland Cement	1024-1
Silica Fume	1024-7
Type IL Blended Cement	1024-1
Type IP Blended Cement	1024-1
Type IS Blended Cement	1024-1
Type IT Blended Cement	1024-1
Water	1024-4

1002-3 SHOTCRETE FOR TEMPORARY SUPPORT OF EXCAVATIONS**(A) Composition and Design**

Submit proposed shotcrete mix designs for each shotcrete mix to be used in the work. Mix proportions shall be determined by a testing laboratory approved by the Department. Submit shotcrete mix designs in terms of saturated surface dry weights on Materials and Tests Form 312U at least 35 days before proposed use. Adjust batch proportions to compensate for surface moisture contained in the aggregates at the time of batching.

Section 1002

1 Changes in the saturated surface dry mix proportions will not be permitted unless revised
2 shotcrete mix designs have been submitted to the Engineer and approved.

3 The Engineer will review the shotcrete mix design for compliance with the contract and
4 notify the Contractor as to its acceptability contingent upon compressive strength test
5 results for cores from preconstruction test panels. Do not use a shotcrete mix until
6 written notice has been received. Acceptance of the shotcrete mix design does not relieve
7 the Contractor of his responsibility to furnish a product that meets this contract. Upon
8 written request from the Contractor, a shotcrete mix design accepted and used
9 satisfactorily on any Department project may be accepted for use on other projects.

10 **(B) Chemical Admixtures**

11 Use a quantity of chemical admixture within the range shown on the current list of
12 approved admixtures issued by the Materials and Tests Unit.

13 **(C) Strength of Shotcrete**

14 Provide shotcrete with a compressive strength at 3 and 28 days of at least 2,000 psi and
15 4,000 psi, respectively. The compressive strength of the shotcrete will be considered the
16 average compressive strength test results of 3 cores from the same test panel at each age.

17 **(D) Preconstruction Test Panels**

18 Before beginning construction, provide one preconstruction test panel for each shotcrete
19 mix design and nozzlemen using the same equipment that will be used for the work. Use
20 3 feet x 3 feet forms at least 3.5 inches thick for preconstruction test panels.

21 Batch, deliver, mix and apply shotcrete in accordance with Subarticles 1002-3(E)
22 and 1002-3(F) and the contract. Make preconstruction test panels in the presence of the
23 Engineer with forms in a vertical position and from the same shooting position
24 anticipated for construction. Do not disturb test panels for the first 24 hours after
25 shotcreting.

26 **(E) Mixing and Delivery**

27 Produce shotcrete of required strength, consistency, quality and uniformity with
28 minimum rebound. Do not use rebound or previously expanded material in the shotcrete
29 mix. Thoroughly mix materials in sufficient quantity to place shotcrete continuously.
30 Regulate the delivery so the maximum interval between the shooting of batches at the
31 work site does not exceed 20 minutes. Comply with Articles 1000-9 through 1000-12 to
32 the extent applicable for shotcrete instead of concrete.

33 **(F) Shooting Requirements**

34 Use equipment capable of handling and shooting shotcrete at a steady uninterrupted flow.
35 Use air supply systems that supply clean, dry air free of contamination and capable of
36 maintaining sufficient nozzle velocity at all times. Apply shotcrete with the same
37 equipment and methods as used for the preconstruction test panels.

38 The shotcrete temperature at the time of shooting shall be not less than 50°F nor more
39 than 90°F. Do not apply shotcrete during heavy rains or runoff or high winds so the
40 nozzle stream separates during shooting. Do not apply shotcrete if surface to receive
41 shotcrete is frozen or the air temperature measured at the location of the shotcreting
42 operation in the shade away from artificial heat is below 40°F. Apply shotcrete before
43 the time between adding the mixing water to the shotcrete mix and shooting the shotcrete
44 exceeds 60 minutes.

45 **(G) Production Test Panels**

46 Provide one production test panel for every 33 cy of shotcrete with at least one test panel
47 for each day shotcreting occurs. Use 18 inch x 18 inch forms at least 3.5 inches thick for
48 production test panels. Make production test panels with forms in a vertical position from

1 the same shooting position and at the same time as shotcreting is done. Do not disturb
2 test panels for the first 24 hours after shotcreting.

3 **(H) Handling and Storing Test Panels**

4 Notify the Area Materials Engineer when preconstruction or production test panels are
5 made within 24 hours of shooting the panels. Field cure and protect test panels from
6 damage in accordance with ASTM C1140. The Contractor shall core the panels in the
7 presence of the Engineer. The Department transports core to a Materials and Tests
8 Regional Laboratory for testing.

9 **SECTION 1003** 10 **GROUT PRODUCTION AND DELIVERY**

11 **1003-1 DESCRIPTION**

12 This section addresses cement grout to be used for structures, foundations, retaining walls,
13 concrete barriers, embankments, pavements and other applications in accordance with the
14 contract. Produce non-metallic grout composed of Portland cement and water and at the
15 Contractor's option or as required, aggregate and supplementary cementitious materials.
16 Include chemical admixtures as required or needed. Provide sand cement or neat cement
17 grout as required. Define "neat cement grout" as grout without aggregate.

18 The types of grout with their typical uses are as shown below:

19 **Type 1** – A cement grout with only a 3 day strength requirement and a fluid consistency that
20 is typically used for filling subsurface voids.

21 **Type 2** – A nonshrink grout with strength, height change and flow conforming to ASTM
22 C1107 that is typically used for foundations, ground anchors and soil nails.

23 **Type 3** – A nonshrink grout with high early strength and freeze-thaw durability requirements
24 that is typically used in pile blockouts, grout pockets, shear keys, dowel holes and recesses for
25 concrete barriers and structures.

26 **Type 4** – A neat cement grout with low strength, a fluid consistency and high fly ash content
27 that is typically used for slab jacking.

28 **Type 5** – A low slump, low mobility cement grout with minimal strength that is typically
29 used for compaction grouting.

30 **1003-2 MATERIALS**

31 Refer to Division 10.

Item	Section
Chemical Admixtures	1024-3
Fine Aggregate	1014-1
Fly Ash	1024-5
Ground Granulated Blast Furnace Slag	1024-6
Portland Cement	1024-1
Silica Fume	1024-7
Water	1024-4

32 Do not use grout that contains soluble chlorides or more than 1% soluble sulfate.

33 At the Contractor's option, use an approved packaged grout instead of the materials above
34 except for water. Use packaged grouts that are on the NCDOT APL.

35 Use admixtures for grout that are on the NCDOT APL or other admixtures in accordance with
36 Subarticle 1024-3(E) except do not use concrete additives or unclassified or other admixtures
37 in Type 4 or 5 grout. Use Class F fly ash for Type 4 grout and Type II Portland cement for
38 Type 5 grout.

Section 1003

1 Use well graded rounded aggregate with a gradation, liquid limit (LL) and plasticity index
2 (PI) that meet Table 1003-1 for Type 5 grout. Fly ash may be substituted for a portion of the
3 fines in the aggregate. Do not use any other supplementary cementitious materials in Type 5
4 grout.

Gradation		Maximum Liquid Limit	Maximum Plasticity Index
Sieve Designation per AASHTO M 92	Percentage Passing (% by weight)		
3/8"	100	N/A	N/A
No. 4	70 – 95		
No. 8	50 – 90		
No. 16	30 – 80		
No. 30	25 – 70		
No. 50	20 – 50		
No. 100	15 – 40		
No. 200	10 – 30	25	10

5 **1003-3 COMPOSITION AND DESIGN**

6 When using approved packaged grout, a grout mix design submittal is not required.
7 Otherwise, submit proposed grout mix designs for each grout mix to be used in the work.
8 Mixes for all grout shall be designed by a Certified Concrete Mix Design Technician or an
9 Engineer licensed by the State of North Carolina. Mix proportions shall be determined by a
10 testing laboratory approved by the Department. Base grout mix designs on laboratory trial
11 batches that meet Table 1003-2 and this section. With permission, the Contractor may use a
12 quantity of chemical admixture within the range shown on the current list of approved
13 admixtures maintained by the Materials and Tests Unit.

14 Submit grout mix designs in terms of saturated surface dry weights on Materials and Tests
15 Form 312U at least 35 days before proposed use. Adjust batch proportions to compensate for
16 surface moisture contained in the aggregates at the time of batching. Changes in the saturated
17 surface dry mix proportions will not be permitted unless revised grout mix designs have been
18 submitted to the Engineer and approved.

19 Accompany Materials and Tests Form 312U with a listing of laboratory test results of
20 compressive strength, density and flow or slump and if applicable, aggregate gradation, height
21 change and durability from a certified laboratory. List the compressive strength of at least
22 three 2 inch cubes at the age of 3 and 14 or 28 days per Table 1003-2 for Type 1 through 4
23 grouts. List the compressive strength of at least three 6 inch x 12 inch cylinders at the age of
24 3 and 28 days for Type 5 grout.

25 The Engineer will review the grout mix design for compliance with the contract and notify the
26 Contractor as to its acceptability. Do not use a grout mix until written notice has been
27 received. Acceptance of the grout mix design or use of approved packaged grouts does not
28 relieve the Contractor of his responsibility to furnish a product that meets the contract. Upon
29 written request from the Contractor, a grout mix design accepted and used satisfactorily on
30 any Department project may be accepted for use on other projects.

1 Perform laboratory tests in accordance with the following test procedures:

Property	Test Method
Aggregate Gradation ^A	AASHTO T 27
Compressive Strength	AASHTO T 106
Density (Unit Weight)	AASHTO T 121 AASHTO T 133 ^B , ANSI/API RP ^C 13B-1 ^B (Section 4, Mud Balance)
Durability	AASHTO T 161 ^D
Flow	ASTM C939 (Flow Cone)
Height Change	ASTM C1090 ^E
Slump	AASHTO T 119 (Except do not rod grout)

- 2 **A.** Applicable to grout with aggregate.
 3 **B.** Applicable to Neat Cement Grout.
 4 **C.** American National Standards Institute/American Petroleum Institute Recommended
 5 Practice.
 6 **D.** Procedure A (Rapid Freezing and Thawing in Water) required
 7 **E.** Moist room storage required.

8 1003-4 GROUT REQUIREMENTS

9 Provide grout types in accordance with the contract. Use grouts with properties that meet
 10 Table 1003-2. For Type 1 through 4 grouts, the compressive strength of the grout will be
 11 considered the average compressive strength test results of three 2 inch cubes at the oldest age
 12 per Table 1003-2. Make cubes that meet AASHTO T 106 from the grout delivered for the
 13 work or mixed on-site. Make cubes at such frequencies as the Engineer may determine and
 14 cure them in accordance with AASHTO T 106. For Type 5 grout, the compressive strength of
 15 the grout will be considered the average compressive strength test results of three 6 inch x
 16 12 inch cylinders at the age of 28 days. Make cylinders in accordance with AASHTO T 23
 17 except do not rod grout. Make cylinders at such frequencies as the Engineer may determine
 18 and cure them in accordance with AASHTO T 23.

**TABLE 1003-2
GROUT REQUIREMENTS**

Type of Grout	Minimum Compressive Strength at			Height Change at 28 days	Flow ^A /Slump ^B	Minimum Durability Factor
	3 days	14 days ^C	28 days			
1	3,000 psi	-	-	-	10 – 30 sec	-
2	Table 1 ^D				Fluid Consistency ^D	-
3	5,000 psi ^E	5,000 psi	-	0 – 0.2%	Per Accepted Grout Mix Design/ Approved Packaged Grout ^F	80
4 ^G	600 psi	-	1,500 psi	-	10 – 26 sec	-
5	100 psi	-	250 psi	-	< 2"	-

Section 1005

- 1 **A.** Applicable to Type 1 through 4 grouts.
- 2 **B.** Applicable to Type 5 grout.
- 3 **C.** Not applicable to Type 2 grout
- 4 **D.** ASTM C1107.
- 5 **E.** Minimum compressive strength at 3 days is only required to approve Type 3 grout mix
- 6 designs or evaluate Type 3 packaged grouts for the NCDOT APL.
- 7 **F.** Add mixing water to Type 3 packaged grout at the manufacturer's recommended rate to
- 8 produce grout with the designed consistency and required 3 day strength.
- 9 **G.** Use Type 4 grout with proportions by volume of 1 part cement and 3 parts fly ash.

10 **1003-5 TEMPERATURE REQUIREMENTS**

11 When using an approved packaged grout, follow the manufacturer's instructions for grout and
12 air temperature at the time of placement. Otherwise, the grout temperature at the time of
13 placement shall be not less than 50°F nor more than 90°F. Do not place grout when the air
14 temperature measured at the location of the grouting operation in the shade away from
15 artificial heat is below 40°F.

16 **1003-6 ELAPSED TIME FOR PLACING GROUT**

17 Agitate grout continuously before placement. Regulate the delivery so the maximum interval
18 between the placing of batches at the work site does not exceed 20 minutes. Place grout
19 before exceeding the times in Table 1003-3. Measure the elapsed time as the time between
20 adding the mixing water to the grout mix and placing the grout.

21

TABLE 1003-3
ELAPSED TIME FOR PLACING GROUT
(with continuous agitation)

Air or Grout Temperature, Whichever is Higher	Maximum Elapsed Time	
	No Retarding Admixture Used	Retarding Admixture Used
90°F or above	30 minutes	1 hr. 15 minutes
80°F through 89°F	45 minutes	1 hr. 30 minutes
79°F or below	60 minutes	1 hr. 45 minutes

22 **1003-7 MIXING AND DELIVERY**

23 Use grout free of any lumps and undispersed cement. When using an approved packaged
24 grout, mix grout in accordance with the manufacturer's instructions. Otherwise, comply with
25 Articles 1000-8 through 1000-12 to the extent applicable for grout instead of concrete.

26 **SECTION 1005** 27 **GENERAL REQUIREMENTS FOR AGGREGATE**

28 **1005-1 GENERAL**

29 Obtain aggregates from sources participating in the Department's Aggregate QC/QA Program
30 as described in Section 1006. Obtain aggregates from pre-approved sources, or have the
31 source approved before use. Approval of such sources is based not only on the quality of the
32 aggregate, but also on satisfactory production facilities and procedures. A list of approved
33 aggregate sources participating in the Department's Aggregate QC/QA Program in North
34 Carolina and adjoining states is available from the Materials and Tests Unit. This list includes
35 aggregates meeting Specification requirements but whose use is restricted due to history of
36 unsatisfactory service performance. Use of aggregates is allowed in the work provided they
37 have been properly stockpiled in units of not less than 300 tons, tests of representative
38 samples of these aggregates indicate satisfactory compliance with the Specifications and the
39 source meets all the requirements of the Aggregate QC/QA Program.

1 Separate aggregate containing rock of more than one identifiable rock type or particles of
 2 visibly different degrees of weathering in amounts of 10% or more into each individual type.
 3 Aggregate is acceptable only if each type does not exceed the percentage of wear specified for
 4 a particular use.

5 Blended aggregates from different sources are allowed if all aggregates meet the
 6 Specifications for soundness or resistance to abrasion.

7 **1005-2 HANDLING AND STORING AGGREGATES**

8 Handle and stockpile aggregates in such a manner to minimize segregation.

9 Provide sites for aggregate stockpiles that are cleared, grubbed and cleaned with a firm,
 10 smooth and well drained ground surface. Maintain a cover of at least 3 inches of aggregate
 11 over the ground surface to avoid the inclusion of soil or foreign material. Operate trucks or
 12 other equipment on a stockpile in an acceptable manner.

13 Space or separate with suitable walls or partitions stockpiles of different types or sizes of
 14 aggregates to prevent the mixing of the aggregates. Do not allow the stockpile to become
 15 contaminated with foreign matter or degrade excessively. Failure of aggregate samples to
 16 meet all gradation requirements due to excessive degradation will be determined by sieve tests
 17 of samples taken from any portion of the stockpile and is cause for discontinuance of such
 18 stockpiling procedure.

19 Use material that consists mainly of rock dust produced through normal handling of the
 20 aggregate and that is essentially free from clay or shale.

21 **1005-3 GRADATION**

22 Grade all standard sizes of aggregate to meet Tables 1005-1 or 1005-2.

23 **1005-4 TESTING**

24 Aggregates will be tested in accordance with the test methods below except where other test
 25 procedures are required by other articles covering a particular application.

Property	Test Method
Gradation	AASHTO T 27 and T11, AASHTO T 88 as Modified for Base Course and Stabilizer
Liquid Limit	AASHTO T 89 as Modified
Plasticity Index	AASHTO T 90
Resistance to Abrasion (Percentage of Wear)	AASHTO T 96
Soundness	AASHTO T 104 Using Sodium Sulfate

26 Copies of modified test procedures are available from the Materials and Tests Unit.

**TABLE 1005-1

A. See Subarticle 1005-4(A). **B.** See Subarticle 1005-4(B). **C.** For Lightweight Aggregate used in Structural Concrete, see Subarticle 1014-2(E)6

Section 1005

- 1 (A) When aggregates are used for Portland cement concrete, asphalt treatment and asphalt
 2 plant mix, the requirements pertaining to material passing the No. 200 sieve are as
 3 follows:
- 4 (1) When tested in a stockpile at the quarry site, the amount of material passing the
 5 No. 200 sieve shall be no greater than 1.0%.
- 6 (2) When tested at the job site before use, the amount of material passing the
 7 No. 200 sieve shall:
- 8 (a) Be no greater than 1.5% for aggregate used in Portland cement concrete or
 9 asphalt surface treatment.
- 10 (b) Be no greater than 2.0% for aggregate used in asphalt plant mix.
- 11 (3) If a stockpile at the job site is found to contain in excess of the specified amount of
 12 material passing the No. 200 sieve before use, the Engineer may approve its use
 13 provided:
- 14 (a) For aggregate used in Portland cement concrete, the total percentage by weight
 15 passing the No. 200 sieve in the combined coarse and fine aggregate in the mix
 16 does not exceed 3.5%, and provided no increase in water-cement ratio is
 17 required by the use of this aggregate.
- 18 (b) For aggregate used in asphalt plant mix, the total percentage by weight of minus
 19 No. 200 material in the plant mix being produced, as determined by the
 20 extraction test, can be maintained within the limits allowed by the job mix
 21 formula.
- 22 (B) For ABC and ABC(M), in addition to the gradation requirements, the material passing
 23 the No. 40 sieve shall not have a LL in excess of 30 nor a PI in excess of 4. For ABC
 24 used in asphalt plant mix, when tested during production, in a stockpile at the quarry site
 25 or at the job site before use, the amount of material passing the No. 200 sieve shall be
 26 from 0.0% to 12.0% by weight and the gradation requirements for material passing the
 27 No. 10 sieve (soil mortar) required in Section 1010 for ABC will not apply. For ABC not
 28 used in asphalt plant mix, the gradation requirements for material passing the
 29 No. 10 sieve (soil mortar) will be as required in Section 1010.

TABLE 1005-2									
AGGREGATE GRADATION FINE AGGREGATE									
Std. Size #	Percentage of Total by Weight Passing								Remarks

- 30 A. When tested at the job site before use, the amount of material passing the
 31 No. 200 sieve shall not be greater than 10%.

Section 1010

SECTION 1006

AGGREGATE QUALITY CONTROL/QUALITY ASSURANCE

The Aggregate QC/QA Program is designed to give aggregate producers more responsibility for controlling the quality of material they produce and to use the quality control information they provide in the acceptance process by the Department. It requires aggregate producers to perform quality control sampling, testing and record keeping on aggregates they ship for use by the Department. It requires the Department to perform quality assurance sampling, testing and record keeping confirming the performance of the producers' control plan. The program is described in the *Aggregate QC/QA Program Manual*.

Participation in this program does not relieve the producer of the responsibility of complying with all requirements of the Department's *Standard Specifications*.

SECTION 1008

AGGREGATE FOR STABILIZATION

1008-1 AGGREGATE STABILIZATION

(A) General

Aggregates consist of crushed stone, crushed gravel, uncrushed gravel or other similar material having hard, strong, durable particles free of adherent coatings.

Supply aggregates from approved sources participating in the Department's Aggregate QC/QA Program in accordance with Sections 1005 and 1006. Sources will not be approved unless the material has satisfactory soundness and satisfactory resistance to abrasion. Satisfactory soundness will be a loss in weight of not greater than 15% when subject to 5 alternations of the soundness test. Satisfactory resistance to abrasion will be a percentage of wear of not greater than 55%.

(B) Sampling and Acceptance

Sampling and acceptance for the determination of gradation, LL and PI will be performed as described in the *Aggregate QC/QA Program Manual* and the *Aggregate Sampling Manual* using the versions in effect at the time material is shipped.

SECTION 1010

AGGREGATE FOR NON-ASPHALT TYPE BASES

1010-1 AGGREGATE BASE COURSE

(A) General Requirements

Aggregate base course material consists of crushed stone, crushed gravel, uncrushed gravel or other similar material having hard, strong, durable particles free of adherent coatings.

Provide aggregates from approved sources participating in the Department's Aggregate QC/QA Program in accordance with Sections 1005 and 1006. Sources will not be approved unless the material has satisfactory soundness and resistance to abrasion. Satisfactory soundness will be a weighted average loss of not greater than 15% when subjected to five alternations of the soundness test. Satisfactory resistance to abrasion will be a percentage of wear of not greater than 55%.

(B) Sampling and Acceptance

Sampling and acceptance for the determination of gradation, LL and PI will be performed as described in the *Aggregate QC/QA Program Manual* and the *Aggregate Sampling Manual* using the versions in effect at the time material is shipped.

1010-2 AGGREGATE FOR PLANT MIXED CEMENT TREATED BASE COURSE

Provide aggregate meeting Article 1010-1, except as modified herein. Sources of aggregate will not be approved unless the material has a percentage of wear of not greater than 65%.

**SECTION 1012
AGGREGATE FOR ASPHALT PAVEMENTS
AND SURFACE TREATMENTS**

1012-1 AGGREGATE FOR ASPHALT PLANT MIXES**(A) General**

Design the asphalt plant mix with coarse and fine aggregate that meet Section 1005, except as noted herein. Size, uniformly grade and combine the aggregate fractions in such proportions that the resulting mixture meets the grading and physical requirements of these Specifications for the specified mix type. Materials that will not produce a mixture within the design criteria required by these Specifications will be rejected, unless otherwise approved.

The consensus property criteria in Table 1012-1 apply to the design aggregate blend. Source property criteria apply to individual aggregate sources.

For all dense-graded surface course mixes, that are the top or final layer, limit the amount of coarse aggregate or fine aggregate produced from crystalline limestone, crystalline-dolomitic limestone or marble to no more than 50% of the total amount of coarse aggregate or fine aggregate in the asphalt mixture. For open-graded asphalt friction course and ultra-thin bonded wearing course, do not use aggregates produced from crystalline limestone, crystalline-dolomitic limestone or marble.

(B) Coarse Aggregate**(1) General**

Use coarse aggregate consisting of crushed stone, crushed gravel, a mixture of uncrushed gravel with either crushed stone or crushed gravel or other inert material having similar characteristics. Provide coarse aggregate composed of clean, tough, durable fragments free from an excess of flat or elongated pieces and free of organic matter and deleterious substances.

Use coarse aggregate from sources participating in the Department's Aggregate QC/QA Program as described in Section 1006. A list of sources participating in the Department's Aggregate QC/QA Program in North Carolina and adjoining states is available from the Materials and Tests Unit in Raleigh.

(2) Gradation

Use standard size coarse aggregate meeting Table 1005-1 and these *Standard Specifications* unless otherwise approved.

(3) Coarse Aggregate Angularity (Fractured Faces)

Use coarse aggregate meeting Table 1012-1 for coarse aggregate angularity (fractured faces) when tested in accordance with ASTM D5821.

(4) Flat and Elongated Pieces

Use coarse aggregate meeting Table 1012-1 for flat and elongated pieces when tested in accordance with ASTM D4791 on the No. 4 sieve and larger with a 5:1 aspect ratio (maximum to minimum) for all pavement types, except there is no requirement for Types S4.75A, SF9.5A and S9.5B.

Section 1012

1 (5) Soundness

2 The maximum weighted average soundness loss of individual coarse aggregate
3 sources when subjected to 5 cycles using sodium sulfate when tested in accordance
4 with AASHTO T 104 is 15%.

**TABLE 1012-1
AGGREGATE CONSENSUS PROPERTIES^A**

Mix Type	Coarse Aggregate Angularity ^B	Fine Aggregate Angularity % Minimum	Sand Equivalent % Minimum	Flat and Elongated 5 : 1 Ratio % Maximum
<i>Test Method</i>	<i>ASTM D5821</i>	<i>AASHTO T 304</i>	<i>AASHTO T 176</i>	<i>ASTM D4791</i>
S4.75A; SF9.5A; S9.5B	75 / -	40	40	-
I19.0B; B25.0B	75 / -	40	40	10
S9.5C; S12.5C; I19.0C; B25.0C	95 / 90	45	45	10
S9.5D; S12.5D; I19.0D	100 / 100	45	50	10
OGAFC	100 / 100	45	45	10
UBWC	100 / 85	45	45	10

5 **A.** Requirements apply to the design aggregate blend.

6 **B.** 95/90 denotes that 95% of the coarse aggregate has one fractured face and 90% has
7 2 or more fractured faces.

8 (6) Toughness (Resistance to Abrasion)

9 The maximum allowable percentage of loss of each individual coarse aggregate
10 source for all plant mix types except open-graded asphalt friction course, shall
11 be 55% when tested in accordance with AASHTO T 96. The maximum percentage
12 loss for aggregate used in OGAFC shall be 45%. The percentage loss for aggregate
13 used in UBWC shall be no more than 35%.

14 (7) Deleterious Materials

15 The maximum allowable percentage by weight of clay lumps and friable particles in
16 individual aggregate sources shall be 0.3% when tested in accordance with
17 AASHTO T 112.

18 (8) Durability (Micro-Deval test)

19 The maximum allowable abrasion loss for aggregate used in UBWC shall be 18%
20 when tested in accordance with AASHTO T 327.

21 (C) Fine Aggregate

22 (1) General

23 Use fine aggregate that is consistently graded from coarse to fine and consists of
24 natural sand, stone screenings, or a blend of natural sand and stone screenings. Use
25 aggregate composed of rough surfaced and angular grains of quartz or other hard
26 durable rock.

1 Use fine aggregate from sources participating in the Department's Aggregate
2 QC/QA Program as described in Section 1006. A list of sources participating in the
3 Department's QC/QA Program in North Carolina and adjoining states is available
4 from the Department's Materials and Tests Unit in Raleigh. If a natural sand source
5 is owned by the same owner as the asphalt plant where the material is used,
6 participation in the Aggregate QC/QA Program is not required.

7 Furnish sand from approved sources. Do not use sources contaminated by industrial
8 waste. A sufficient number of samples of fine aggregate, but in no case less than
9 three, will be taken to indicate any variation within any stockpile or source of supply.

10 Do not use fine aggregate containing sticks, roots, trash, visible lumps of clay, or
11 other unsatisfactory material unless all undesirable material is removed to the
12 satisfaction of the Engineer before the aggregate is used in the asphalt mixture.

13 Use natural sand that is non-plastic when tested in accordance with AASHTO T 90.

14 Produce stone screenings from stone that has a maximum percentage of wear of 55%
15 when tested in accordance with AASHTO T 96 using test grading A.

16 (2) Gradation

17 Use stone screenings that are consistently graded with not more than 20% by weight
18 passing the No. 200 sieve when tested by dry sieving in accordance with
19 AASHTO T 27. Use natural sand that is consistently graded.

20 (3) Clay Content (Sand Equivalent)

21 Use a fine aggregate blend that has a minimum sand equivalent percentage as
22 indicated in Table 1012-1 when tested in accordance with AASHTO T 176.

23 (4) Soundness

24 The maximum weighted average soundness loss of individual fine aggregate sources
25 when subjected to 5 cycles using sodium sulfate shall be 15% when tested in
26 accordance with AASHTO T 104.

27 Natural sand that contains grains of questionable hardness will be subjected to
28 5 cycles of the soundness test. The weighted average loss shall be not more
29 than 15%. The soundness test will be performed before establishing the mix design.

30 (5) Deleterious Materials

31 The maximum percentage by weight of clay lumps and friable particles in individual
32 fine aggregate sources shall be 0.3% when tested in accordance with
33 AASHTO T 112.

34 (6) Fine Aggregate Angularity

35 Use a fine aggregate blend that has a minimum fine aggregate angularity as indicated
36 in Table 1012-1 when tested in accordance with AASHTO T 304, Method A.

37 **(D) Mineral Filler**

38 Use mineral filler consisting of limestone dust, dolomite dust, Portland cement, or other
39 inert mineral matter that conforms to AASHTO M 17.

40 **(E) Reclaimed Asphalt Shingles (RAS)**

41 For use in asphalt mix, Reclaimed Asphalt Shingles (RAS) can be either manufacturer-
42 waste shingles or post-consumer shingles that have been processed into a product that
43 meets the requirements of this section.

Section 1012

1 Manufacturer-waste RAS (MRAS) are processed shingle materials discarded from the
2 manufacturing of new asphalt shingles. It may include asphalt shingles or shingle tabs
3 that have been rejected by the shingle manufacturer.

4 Post-consumer RAS (PRAS) are processed shingle materials recovered from mixed
5 roofing material scrap removed from existing structures. Tear-off shingle scrap must be
6 sorted and other roofing debris, including nails, plastic, metal, wood, coal tar epoxy,
7 rubber materials, or other undesirable components, shall be removed. This sorting of the
8 scrap must be done prior to grinding of the PRAS for use in asphalt production.

9 Sample and test PRAS for asbestos and provide results demonstrating that the bulk
10 samples contain less than one percent of asbestos containing material in accordance with
11 Federal, State of North Carolina, and Local regulations. Use NC-accredited Asbestos
12 Inspectors or Roofing Supervisors to sample the PRAS to meet the above criteria.
13 Maintain records on-site indicating shingle source(s), asbestos operation plan approved
14 by Division of Public Health's Health Hazards Control Unit, and all asbestos analytical
15 reports. All documentation will be subject to review by the Department.

16 Process RAS by ambient grinding or granulating methods such that 100% of the particles
17 will pass the 9.50 mm (3/8 inch) sieve when tested in accordance with AASHTO T27.
18 Perform sieve analysis on processed asphalt shingles prior to ignition or solvent
19 extraction testing.

20 RAS shall contain no more than 0.5% by total cumulative weight of deleterious materials.
21 These materials include, but are not limited to, excessive dirt, debris, concrete, metals,
22 glass, paper, rubber, wood, plastic, soil, brick, tars, or other contaminating substances.

23 Blend RAS with fine aggregate or RAP, meeting the requirements of this Section, if
24 needed to keep the processed material workable.

25 MRAS and PRAS shall not be blended together for the production of hot mix asphalt.

26 (1) Mix Design RAS

27 Incorporate RAS from stockpiles that have been tested for uniformity of gradation
28 and binder content prior to use in an asphalt mix design.

29 (2) Mix Production RAS

30 New Source RAS is defined as acceptable material which was not included in the
31 stockpile when samples were taken for mix design purposes. Process new source
32 RAS so that all materials will meet the gradation requirements prior to introduction
33 into the plant mixer unit.

34 After a stockpile of processed RAS has been sampled and mix designs made from
35 these samples, do not add new source RAS to the original stockpile without prior
36 field testing to insure gradation and binder uniformity. Sample and test new source
37 RAS before blending with the existing stockpile.

38 Store new source RAS in a separate stockpile until the material can be sampled and
39 tested for comparison with the original recycled mix design data. New source RAS
40 may also be placed against the existing stockpile in a linear manner provided it is
41 sampled for mix design conformity prior to its use in the recycled mix. Store RAS
42 materials in such a manner as to prevent contamination.

43 Field approval of new source RAS will be based on the table below and volumetric
44 mix properties on the mix with the new source RAS included. Provided these
45 tolerances are met, volumetric properties of the new mix will then be performed. If
46 all volumetric mix properties meet the mix design criteria for that mix type, the new
47 source RAS may continue to be used.

1 If the gradation, binder content, or any of the volumetric mix properties are not
 2 within the allowable tolerances of the table below, do not use the new source RAS
 3 unless approved by the Engineer. The Contractor may elect to either not use the
 4 stockpile, to request an adjustment to the JMF, or to redesign the mix.

TABLE 1012-2
NEW SOURCE RAS BINDER AND GRADATION TOLERANCES
(Apply Tolerances to Mix Design Data)

P_b %	± 2.5
<i>Sieve Size, mm</i>	<i>Tolerance</i>
4.75	± 5
2.36	± 4
1.18	± 4
0.300	± 4
0.150	± 4
0.075	± 2.0

5 **(F) Reclaimed Asphalt Pavement (RAP)**

6 (1) Mix Design RAP

7 Incorporate RAP from stockpiles or other sources tested for uniformity of gradation
 8 and binder content before use in an asphalt mix design. Use RAP that meets all
 9 requirements specified for the following classifications.

10 (a) Millings

11 Existing RAP that is removed from its original location by a milling process as
 12 specified in Section 607. Millings should be such that it has a uniform gradation
 13 and binder content and all materials will pass a 2 inch sieve before introduction
 14 into the plant mixer unit.

15 (b) Processed RAP

16 RAP that is processed in some manner (possibly by crushing and/or use of
 17 a blending method) to produce a uniform gradation and binder content in the
 18 RAP before use in a recycled mix. Process RAP so all materials have a uniform
 19 gradation and binder content and will pass a 1 inch sieve before introduction
 20 into the plant mixer unit.

21 (c) Fractionated RAP

22 Fractionated RAP is defined as having 2 or more RAP stockpiles, where the
 23 RAP is divided into coarse and fine fractions. Grade RAP so all materials will
 24 pass a 1 inch sieve. The coarse RAP stockpile shall only contain material
 25 retained on a 3/8 inch screen, unless otherwise approved. The fine RAP
 26 stockpile shall only contain material passing the 3/8 inch screen, unless
 27 otherwise approved. The Engineer may allow the Contractor to use an alternate
 28 to the 3/8 inch screen to fractionate the RAP. The maximum percentages of
 29 fractionated RAP may be comprised of coarse, fine, or the combination of both.
 30 Use a separate cold feed bin for each stockpile of fractionated RAP introduced
 31 into the mix.

32 (d) Approved Stockpiled RAP

33 Approved Stockpiled RAP is defined as fractionated RAP which has been
 34 isolated and tested for asphalt content, gradation and asphalt binder
 35 characteristics with the intent to be used in mix designs with higher RAP
 36 contents as specified in Article 610-3. Fractionate the RAP in accordance with

Section 1012

1 Subsection 1012-1(F)(1)(c). Use a separate cold feed bin for each approved
2 stockpile of RAP used.

3 Perform extraction tests at a rate of one per 1,000 tons of RAP, with at least
4 five tests per stockpile to determine the asphalt content and gradation. Separate
5 stockpiles of RAP material by fine and coarse fractions. Erect and maintain
6 a sign satisfactory to the Engineer on each stockpile to identify the material.
7 Assure that no deleterious material is allowed to contaminate any stockpile. The
8 Engineer may reject by visual inspection any stockpiles that are not kept clean,
9 separated and free of foreign materials.

10 Submit requests for RAP stockpile approval to the Engineer with the following
11 information at the time of the request:

- 12 (i) Approximate tons of materials in stockpile,
- 13 (ii) Name or Identification number for the stockpile,
- 14 (iii) Asphalt binder content and gradation test results, and
- 15 (iv) Asphalt characteristics of the stockpile.

16 For the Stockpiled RAP to be considered for approval, the gradation and asphalt
17 content shall be uniform. Individual test results, when compared to the target,
18 will be accepted if within the tolerances listed in Table 1012-3.

TABLE 1012-3
APPROVED STOCKPILED RAP GRADATION AND BINDER TOLERANCES^A
(Apply Tolerances to Mix Design Data)

P_b %	± 0.3%
<i>Sieve Size, mm</i>	<i>Tolerance</i>
25.0	± 5%
19.0	± 5%
12.5	± 5%
9.50	± 5%
4.75	± 5%
2.36	± 4%
1.18	± 4%
0.300	± 4%
0.150	± 4%
0.075	± 1.5%

19 **A.** If more than 20% of the individual sieves are out of the gradation tolerances, or
20 if more than 20% of the asphalt binder content test results fall outside the
21 appropriate tolerances, the RAP shall not be used in HMA unless the RAP
22 representing the failing tests is removed from the stockpile.

23 Do not add additional material to any approved RAP stockpile, unless otherwise
24 approved by the Engineer.

25 Maintain a record system for all approved RAP stockpiles at the plant site.
26 Include at a minimum the following: Stockpile identification and a sketch of all
27 stockpile areas at the plant site; all RAP test results (including asphalt content,
28 gradation and asphalt binder characteristics).

(2) Mix Production RAP

During mix production, use RAP that meets the criteria for one of the following categories:

(a) Mix Design RAP

RAP contained in the mix design stockpiles as described above may be used in all applicable JMFs. These stockpiles have been pretested; however, they are subject to required QC/QA testing in accordance with the *HMA/QMS Manual*.

(b) New Source RAP

Define “new source RAP” as any acceptable material that was not included in the stockpile or other source when samples were taken for mix design purposes. Process new source RAP so all materials have a uniform gradation and binder content and will pass a 2 inch sieve before introduction into the plant mixer unit.

TABLE 1012-4
NEW SOURCE RAP GRADATION AND BINDER TOLERANCES
(Apply Tolerances To Mix Design Data)

	0 - 20% RAP			20 - 30 % RAP			> 30 % RAP		
Pb, %	± 0.7%			± 0.4%			± 0.3%		
Sieve Size, mm	Mix Type			Mix Type			Mix Type		
	Base	Inter.	Surf.	Base	Inter.	Surf.	Base	Inter.	Surf.
25.0	±10	-	-	±7	-	-	±5	-	-
19.0	±10	±10	-	±7	±7	-	±5	±5	-
12.5	-	±10	±6	-	±7	±3	-	±5	±2
9.50	-	-	±8	-	-	±5	-	-	±4
4.75	±10	-	±10	±7	-	±7	±5	-	±5
2.36	±8	±8	±8	±5	±5	±5	±4	±4	±4
1.18	±8	±8	±8	±5	±5	±5	±4	±4	±4
0.300	±8	±8	±8	±5	±5	±5	±4	±4	±4
0.150	-	-	±8	-	-	±5	-	-	±4
0.075	±4	±4	±4	±2	±2	±2	±1.5	±1.5	±1.5

After a stockpile of millings, processed RAP or fractionated RAP has been sampled and mix designs made from these samples, do not add new source RAP to the original stockpile without prior field testing to insure gradation and binder uniformity. Sample and test new source RAP before blending with the existing stockpile.

Store new source RAP in a separate stockpile until the material can be sampled and tested for comparison with the original recycled mix design data. New source RAP may also be placed against the existing stockpile in a linear manner provided it is sampled for mix design conformity before its use in the recycled mix.

Unprocessed RAP is asphalt material that was not milled and/or has not been processed to obtain a uniform gradation and binder content and is not representative of the RAP used during the applicable mix design. Unprocessed RAP shall not be incorporated into any JMFs before processing. Different sources of unprocessed RAP may be stockpiled together provided it is generally free of contamination and will be processed before use in a recycled mix. RAP contamination in the form of excessive dirt, debris, clean stone, concrete, etc. will not be allowed. Incidental amounts of dirt, concrete and clean stone may be acceptable. Unprocessed RAP may be processed and then classified as a new source RAP as described above.

Section 1012

1 Field approval of new source RAP will be based on Table 1012-4 and
2 volumetric mix properties on the mix with the new source RAP included.
3 Provided the Table 1012-4 tolerances are met, volumetric properties of the new
4 mix will then be performed. If all volumetric mix properties meet the mix
5 design criteria for that mix type, the new source RAP may continue to be used.

6 If the gradation, binder content, or any of the volumetric mix properties are not
7 within the allowable tolerances of Table 1012-4, do not use the new source RAP
8 unless approved by the Engineer. The Contractor may elect to either not use the
9 stockpile, to request an adjustment to the JMF, or to redesign the mix.

10 **1012-2 AGGREGATES FOR ASPHALT SURFACE TREATMENT**

11 **(A) General**

12 Use coarse aggregate consisting of crushed stone, crushed gravel, crushed slag, or other
13 inert material having similar characteristics. Adequately wash coarse aggregate so it is
14 free from clay, loam, dust and other adherent materials.

15 Adequately clean all fine aggregate so it is free from sticks, roots, visible lumps of clay or
16 other unsatisfactory material before use.

17 **(B) Gradation**

18 Use coarse aggregate for mat and seal coat and AST as required by Section 660, unless
19 otherwise required by the contract. Use aggregate meeting the applicable gradation
20 requirements of Table 1005-1.

21 Remix aggregate that has become segregated until it meets the applicable gradation
22 requirements.

23 **(C) Fractured Faces**

24 Use coarse aggregate that contains at least 75% by weight of crushed pieces having 2 or
25 more fractured faces and at least 90% by weight of crushed pieces having one or more
26 fractured faces on that portion retained on the No. 4 sieve.

27 **(D) Soundness**

28 The maximum weighted average loss of either coarse or fine aggregate when subjected
29 to 5 cycles using sodium sulfate when tested in accordance with AASHTO T 104 is 15%.

30 **(E) Toughness (Resistance to Abrasion)**

31 The maximum percentage loss of coarse aggregate for asphalt surface treatment when
32 tested in accordance with AASHTO T 96 is 55%.

33 **(F) Blending of Aggregates**

34 Blending of two or more aggregates will not be permitted regardless of the origin of the
35 aggregates if any one of the aggregates fails to meet the requirements for soundness or
36 resistance to abrasion.

37 **(G) Weight of Slag**

38 The minimum weight of crushed slag is 70 lbs/cf as determined in accordance with
39 AASHTO T 19.

40 **1012-3 BLOTTING SAND**

41 Blotting sand is fine aggregate consisting of natural sand, commercial sand, manufactured
42 sand, coarse screenings, or other inert material having similar characteristics.
43 Subarticles 1012-2(D) and 1012-2(F) will be applicable to blotting sand. Adequately clean
44 the fine aggregate so it is free from sticks, roots, visible lumps of clay or other unsatisfactory
45 material before use.

1 **1012-4 LIGHTWEIGHT AGGREGATE**

2 Lightweight aggregates used in asphalt surface treatments shall be produced by the rotary kiln
 3 process and shall come from an approved Department source meeting applicable requirements
 4 of Section 1005 and 1006. The aggregate shall meet Table 1012-8 and AASHTO M 195 with
 5 the exception of Sections 3, 6, 8 and any other references to concrete samples or concrete
 6 strength.

TABLE 1012-5 LIGHTWEIGHT AGGREGATE PHYSICAL PROPERTIES		
Property	Specification (maximum limit)	Test Method
Sodium Sulfate Soundness	5%	AASHTO T 104
Los Angeles Abrasion	45%	AASHTO T 96 (B grading)
Percent Absorption	10%	AASHTO T 19
Micro-Deval	18%	AASHTO T 327

7 **SECTION 1014**
 8 **AGGREGATE FOR PORTLAND CEMENT CONCRETE**

9 **1014-1 FINE AGGREGATE**10 **(A) General**

11 Use fine aggregate from sources participating in the Department's Aggregate QC/QA
 12 Program as described in Section 1006. A list of sources participating in the Department's
 13 QC/QA Program in North Carolina and adjoining states is available from the Materials
 14 and Tests Unit.

15 Use fine aggregate consisting of natural sand or manufactured sand having clean, durable,
 16 hard, uncoated particles, or other inert materials having similar characteristics. Produce
 17 manufactured sand from fractured stone material. Use fine aggregate free from dirt,
 18 wood, paper, burlap and all other foreign material.

19 To permit excess water to drain and the moisture content to become uniform, stockpile
 20 the aggregates either at the producer's plant or at the batch plant site for at least 24 hours
 21 before use in the concrete. Build open stockpiles of fine aggregate at the batch plant on
 22 concrete surfaces. Do not add new material to the stockpile during the 24 hour period.
 23 When the aggregates have a low and uniform moisture content and the consistency of the
 24 concrete can be satisfactorily controlled without stockpiling the aggregates for 24 hours,
 25 the minimum stockpiling period may be reduced or waived entirely by the Engineer.

26 The Department's list of approved sources of fine aggregate shows the target fineness
 27 modulus of each aggregate as established by the producer. Do not use fine aggregate
 28 with a fineness modulus that varies more than 0.2 from the target value until the concrete
 29 mix proportions are adjusted.

30 **(B) Soundness**

31 When subjected to 5 cycles of the soundness test, the weighted average loss shall not be
 32 more than 15%.

33 **(C) Deleterious Substances**

34 Determine the percentage of deleterious substances (clay lumps and friable particles) in
 35 accordance with AASHTO T 112. The amount of deleterious substances shall not exceed
 36 2.0% by weight for natural sand or 1.0% by weight for manufactured sand.

Section 1014

1 (D) Organic Impurities

2 The color of each source of fine aggregate will be determined annually in accordance
3 with AASHTO T 21. Should the fine aggregate show a darker color than samples
4 previously approved from the same source, withhold its use until tests have been made to
5 determine the quality of the sand.

6 (E) Mortar Strength

7 Mortar made with the fine aggregate shall have a compressive strength at the age of
8 3 and 7 days using Type III Portland cement, or 7 and 28 days using Type I or II Portland
9 cement, of not less than 95% of that developed by a comparison mortar. Make the
10 comparison mortar with the same cement, graded Ottawa sand with a fineness modulus of
11 2.40 ± 0.05 , and the same water-cement ratio and consistency as the test mortar. Test the
12 mortar strength in accordance with AASHTO T 106.

13 Fine aggregate that fails the mortar strength may be used with the approval of the
14 Engineer, provided that when it is tested in concrete cylinders the compressive strength of
15 the concrete at 14 days is equal to or greater than the strength of cylinders made with
16 an identical mix using an acceptable sand.

17 (F) Gradation

18 Natural sand shall meet the gradation for standard size No. 2S fine aggregate.
19 Manufactured sand shall meet the gradation for standard size No. 2MS fine aggregate.

20 (G) Blending Fine Aggregate

21 Blending fine aggregates to obtain the required gradation will be permitted if test results
22 of each aggregate meet the durability requirements and test results of the combination
23 indicate acceptable quality. Blend aggregates by weighing them separately at the time of
24 batching or by other means acceptable to the Engineer.

25 When natural sand is blended with natural sand, the blend shall meet the gradation for
26 No. 2S fine aggregate. When manufactured sand is blended with natural sand or with
27 manufactured sand, the blend shall meet the gradation for No. 2MS fine aggregate and
28 neither component shall exceed the gradation limits on the No. 200 sieve shown in
29 Table 1005-2.

30 1014-2 COARSE AGGREGATE

31 (A) General

32 Use coarse aggregate from sources participating in the Department's Aggregate QC/QA
33 Program as described in Section 1006. A list of these sources in North Carolina and
34 adjoining states is available from the Materials and Tests Unit in Raleigh.

35 Use coarse aggregate that consists of crushed stone, crushed or uncrushed gravel, crushed
36 air-cooled blast furnace slag or other inert materials that have similar characteristics.
37 Wash all coarse aggregate for Portland cement concrete to remove clay, loam, dust and
38 similar adherent materials unless otherwise permitted by the Engineer in writing. Keep
39 coarse aggregate free from dirt, wood, paper, burlap and all other foreign material.

40 To permit excess water to drain and the moisture content to become uniform, stockpile
41 the aggregates either at the producer's plant or at the batch plant site for at least 24 hours
42 before use in the concrete. Build open stockpiles of coarse aggregate at the batch plant
43 on concrete surfaces. Do not add new material to the stockpile during the 24 hour period.
44 Where the aggregates have low and uniform moisture content and the consistency of the
45 concrete can be satisfactorily controlled without stockpiling the aggregates for 24 hours,
46 the minimum stockpiling period may be reduced or waived entirely by the Engineer.

47 Do not mix coarse aggregate from different sources or use it in alternate batches except
48 where permitted by the Engineer in writing. Blending of coarse aggregates to obtain the

1 required gradation will be permitted if the different sizes are from the same source.
 2 Blend coarse aggregates by weighing them separately at the time of batching or by other
 3 means acceptable to the Engineer.

4 **(B) Soundness**

5 When subjected to 5 cycles of the soundness test, the weighted average loss shall not
 6 exceed 15%. For concrete with a 28 day design compressive strength greater than
 7 6,000 psi, the loss shall not exceed 8%.

8 **(C) Deleterious Substances**

9 Determine the percentage of deleterious substances (clay lumps and friable particles) in
 10 accordance with AASHTO T 112. The amount of deleterious substances shall not exceed
 11 3.2% by weight.

12 **(D) Resistance to Abrasion**

13 The percentage of wear of crushed stone or gravel shall not exceed 55%. For concrete
 14 with a 28 day design strength greater than 6,000 psi, the wear shall not exceed 40%.

15 **(E) Aggregate Sizes**

16 (1) General

17 Use standard size No. 57, No. 67, or No. 78M coarse aggregate in Portland cement
 18 concrete unless otherwise indicated.

19 (2) Latex Modified Concrete

20 Use standard size No. 78M coarse aggregate in latex modified concrete.

21 (3) Prestressed and Precast Concrete

22 Use standard size No. 67 or No. 78M coarse aggregate in prestressed and precast
 23 concrete.

24 (4) Use of More Than One Size

25 All concrete used in a single component of any structure shall be made with the same
 26 size aggregate.

27 (5) Portland Cement Concrete Pavement

28 Use standard size No. 57, No. 57M, No. 67 or No. 78M coarse aggregate in concrete
 29 for Portland cement concrete pavement unless otherwise specified by the Engineer.

30 (6) Sand Lightweight Concrete

31 Use the following gradation for the lightweight coarse aggregate

TABLE 1014-1	
GRADATION FOR LIGHTWEIGHT COARSE AGGREGATE	
Sieve Size	Passing Square Opening Sieves (Percent by Weight)
1"	100
3/4"	90 - 100
3/8"	10 - 50
No. 4	0 - 15

32 (7) Drilled Pier Concrete

33 Use standard size No. 78M coarse aggregate in Drilled Pier concrete.

Section 1016

**SECTION 1016
SELECT MATERIALS**

1016-1 DESCRIPTION

Select material is suitable material classified by gradation and performance characteristics as shown in this section. Use select material called for on the contract.

1016-2 USES

Select material may be specified for use in:

Subgrade	Slope and shoulder embankment
Backfill in undercut	Rock embankment in open water
Core material	Material placement over fabric
Foundation conditioning	Pipe backfill

With written approval and without additional compensation, a higher class of material may be substituted than stated in the contract.

1016-3 CLASSIFICATIONS

CLASS I

Class I select material is silty or clayey soil material meeting AASHTO M 145 for soil classification A-4. Soil materials which meet AASHTO M 145 for soil classifications A-2, A-5, A-6 and A-7 are acceptable provided such materials do not have a LL greater than 50, nor a PI of less than 7 or greater than 20.

CLASS II

Type 1 Select Material

Type 1 select material is a fine aggregate material consisting of crushed stone screenings (washed or unwashed) meeting the gradation in Table 1016-1.

TABLE 1016-1 GRADATION FOR CLASS II, TYPE 1 SELECT MATERIAL	
Sieve	Percent Passing
3/8"	100
No. 4	80 - 100
No. 10	65 - 95
No. 40	25 - 55
No. 200	0 - 20
LL	≤ 30
PI	≤ 6

Type 2 Select Material

Type 2 select material is a granular soil material meeting AASHTO M 145 for soil classifications A-2-4 with a maximum PI of 6 and A-4 soil containing 45% maximum passing a No. 200 sieve and a maximum PI of 6.

When a type is not specified, either type may be used, but no additional compensation will be made.

CLASS III

Type 1 Select Material

Type 1 select material is a natural or manufactured fine aggregate material meeting the gradation requirements of standard size 2S or 2MS in Table 1005-2 as described in Sections 1005 and 1006.

1 **Type 2 Select Material**

2 Type 2 select material is a granular soil material meeting AASHTO M 145 for soil
3 classification A-1 or A-3.

4 **Type 3 Select Material**

5 Type 3 select material is a natural or manufactured fine aggregate material meeting the
6 following gradation requirements and as described in Sections 1005 and 1006.

TABLE 1016-2	
GRADATION FOR CLASS III, TYPE 3 SELECT MATERIAL	
Sieve	Percent Passing
3/8"	100
No. 4	95 - 100
No. 8	65 - 100
No. 16	35 - 95
No. 30	15 - 75
No. 50	5 - 50
No. 100	0 - 25
No. 200	0 - 8

7 When a type is not specified, Type 1, Type 2 or Type 3 may be used, but no additional
8 compensation will be made.

9 **CLASS IV**

10 Select material is a coarse aggregate material meeting the gradation requirements of standard
11 size ABC as described in Section 1010.

12 **CLASS V**

13 Select material is a coarse aggregate material meeting the gradation requirements of standard
14 size 78M in Table 1005-1 as described in Sections 1005 and 1006.

15 **CLASS VI**

16 Select material is a coarse aggregate material meeting the gradation requirements of standard
17 size 57 in Table 1005-1 as described in Sections 1005 and 1006.

18 **CLASS VII**

19 Select material is clean, unweathered durable, blasted rock material. While no specific
20 gradation is required, the below criteria will be used to evaluate the materials for visual
21 acceptance by the Engineer.

22 (A) At least 50% of the rock has a diameter of from 1.5 feet to 3 feet,

23 (B) 30% of the rock ranges in size from 2 inches to 1.5 feet in diameter, and

24 (C) Not more than 20% of the rock is less than 2 inches in diameter. No rippable rock will be
25 permitted.

26 **SECTION 1018**
27 **BORROW MATERIAL**

28 **1018-1 GENERAL**

29 Borrow material is used for embankments, backfill or other intended uses. Material that
30 contains roots, root mats, stumps or other unsatisfactory material will not be acceptable.

Section 1018

1 **1018-2 APPROVAL OF BORROW SOURCE**

2 The approval of borrow sources is subject to Section 230.

3 **(A) Statewide Criteria for Acceptance of Borrow Material**

4 See exceptions in Subarticle 1018-2(B).

5 Use only natural earth materials as borrow material. Any other materials are subject to
6 rejection.

TABLE 1018-1 PIEDMONT AND WESTERN AREA CRITERIA FOR ACCEPTANCE OF BORROW MATERIAL	
Soil with PI of 25 or less	Acceptable
Soil with PI of 26 through 35	Acceptable, but not to be used in top 3 ft of embankment or backfill
Soil with PI of more than 35	Not Acceptable

7 **(B) Exceptions to Statewide Criteria for Acceptance of Borrow Material**

8 (1) Soils in the Coastal Plain (area described below) will be accepted in accordance with
9 the Table 1018-2.

TABLE 1018-2 COASTAL AREA CRITERIA FOR ACCEPTANCE OF BORROW MATERIAL	
Soil with PI of 15 or less	Acceptable
Soil with PI of 16 through 20	Acceptable, but not to be used in top 3 ft of embankment or backfill
Soil with PI of more than 20	Not Acceptable

10 Areas where Table 1018-2 is applicable are as follows:

- Division 1 Entire Division except Northampton (West of I-95)
- Division 2 Entire Division
- Division 3 Entire Division
- Division 4 Edgecombe, Wayne, Johnston (East of US 301), Wilson (East of I-95), Nash (East of I-95), Halifax (East of I-95)
- Division 6 Bladen, Columbus, Robeson, Cumberland, Harnett (South of NC 27)
- Division 8 Scotland, Hoke, Moore (Southeast of US 15-501, NC 73, NC 211), Richmond (East of US 220 North and US 1 South)

11 Table 1018-2 shall be applicable to the flood plains of the Roanoke, Tar, Neuse,
12 Cape Fear and Lumber Rivers and their tributaries that are outside the above
13 described areas.

14 (2) Waste or by-products from industrial processes or mining operations are not
15 acceptable except by specific written approval.

16 (3) When tested, soils having a pH of less than 5.5 or an organic content more than 4.0%
17 may be rejected.

18 (4) When material is to be used for placing embankments or backfilling of undercut
19 areas that are excessively wet, the material shall consist of Class II, III or IV select
20 material.

SECTION 1019
SHOULDER AND SLOPE MATERIAL

1019-1 GENERAL

Use shoulder and slope material to construct shoulders and plate slopes with materials capable of supporting vegetation. Material that contains roots, root mats, stumps or other unsatisfactory material will not be acceptable.

1019-2 SHOULDER AND SLOPE BORROW

Use borrow sources in accordance with Article 1018-2.

Use soil consisting of loose, friable, sandy material with a PI greater than 6 and less than 25 and a pH ranging from 5.5 to 7.0. Remove stones and other foreign material 2 inches or larger in diameter.

Soil consisting of a pH ranging from 4.0 to 5.5 may be accepted if the following limestone application used. Substitute listed limestone application rates when performing seeding and mulching operations. Standard lime application rate is 4000 lbs. per acre. Soil type should be identified during the soil analysis. Soils with a pH below 4.0 should not be used. Soils with a pH above 7.0 require acidic amendments to be added. Contract the Roadside Environmental Unit for recommendations to lower pH below 7.0.

pH Test Result	TABLE 1019-1 LIMESTONE APPLICATION RATE (lbs / acre) TO RAISE pH		
	Sandy Soils	Silt Loam Soils	Clay Loam Soils
4.0 to 4.4	4000 + 1000	4000 + 4000	4000 + 6000
4.5 to 4.9	4000 + 500	4000 + 3000	4000 + 5000
5.0 to 5.4	4000	4000 + 2000	4000 + 4000

1019-3 AGGREGATE SHOULDER BORROW

Use aggregate shoulder borrow (ASB) that meets the following gradation in Table 1019-2.

TABLE 1019-2 GRADATION OF AGGREGATE SHOULDER BORROW	
Sieve	Percentage Passing
1 1/2"	100
1/2"	55-95
#4	35-74

SECTION 1020
ASPHALT MATERIALS AND ADDITIVES

1020-1 DELIVERY AND ACCEPTANCE OF ASPHALT MATERIALS

Asphalt materials are accepted at the source of shipment subject to the conditions herein.

All asphalt transport tankers, including rail and truck tankers, shall have a sampling valve in accordance with Asphalt Institute Publication MS-18, AASHTO R66, ASTM D140 or a comparable device acceptable to the Engineer.

Each transport tanker delivering asphalt materials to the project or rail siding shall keep a running log showing the date, destination and type and grade of material hauled on each trip. Print, stamp, or write in ink information appearing in the log and have available for examination upon request.

Section 1020

1 Furnish with each shipment 2 copies of a delivery ticket. Ensure both copies accompany the
2 shipment and are delivered to the Engineer or his representative at the destination. The
3 delivery ticket shall contain the following information:

- 4 (A) Name of Producer/Supplier and location
- 5 (B) A statement that the material has been tested and meets AASHTO specifications or is
6 being provided by an approved supplier under Approved Supplier Certification (ASC)
- 7 (C) The grade of the material
- 8 (D) If applicable, the rotational viscosity in Pascal-Seconds (Pa-S) at 135°C and 165°C
- 9 (E) If applicable, the recommended laboratory mixing and compaction temperature (°C for
10 the PGAB)
- 11 (F) Delivery ticket number
- 12 (G) Date and time loaded (mm/dd/yyyy AM:PM)
- 13 (H) Date and time shipped (mm/dd/yyyy AM:PM)
- 14 (I) State project or purchase order number
- 15 (J) NCDOT assigned batch number
- 16 (K) Destination
- 17 (L) Name of consignee
- 18 (M) Trailer or car number
- 19 (N) Producer's or Supplier's storage tank and batch number
- 20 (O) Quantity loaded in tons or gallons (kg/L) at 60°F
- 21 (P) Specific Gravity or lbs/gal (kg/L) at 60°F
- 22 (Q) Loading temperature
- 23 (R) Net gallon at 60°F
- 24 (S) If applicable, the brand, grade and percentage or quantity of anti-strip additive
- 25 (T) See below for the required certification format

26 When anti-strip additive is introduced into the asphalt binder, ensure the delivery ticket notes
27 the brand, grade and percentage or quantity at which the additive was introduced.

28 The Contractor's asphalt materials supplier shall furnish to the Materials and Tests Unit
29 a typical viscosity-temperature chart at the beginning of each calendar year and a new chart
30 whenever a change in production results in a shift of 5°F or more.

31 Furnish a statement of certification from the supplier and a separate statement of certification
32 from the transporter. Sign each certification by an authorized representative of the supplier or
33 transporter. Stamp, write or print these certifications on the delivery ticket, or attach to the
34 delivery ticket.

35 Unless otherwise approved by the Engineer, the following form shall be used in the supplier's
36 certification:

37 This is to certify that this shipment of _____ gallons/liters or
38 tons/metric tons of _____ grade asphalt including _____
39 gallons/liters of _____ anti-strip meet all requirements of
40 NC Department of Transportation Specifications.

41 Signed _____
42 Authorized Representative of Supplier

43 When no anti-strip additive is included with the load, the supplier shall indicate zero (0) in the
44 gallons field and "NA" in the anti-strip field on the above certification.

1 Unless otherwise approved by the Engineer, the following form shall be used in the
2 transporter's certification:

3 This is to certify that this transport tank was clean and free from
4 contaminating materials when loaded. The material transported on the
5 previous load in this tanker was _____.

6 Signed _____
7 Authorized Representative of Transporter

8 Failure to sign the certifications by either the supplier or transporter will be cause to withhold
9 use of the material until a sample can be taken and tested, except where an alternative testing
10 and invoicing procedure has been pre-approved by the Engineer.

11 The Engineer reserves the right to sample and test any shipment regardless of whether or not
12 the above conditions have been met and to reject any material not meeting the Specifications.

13 **1020-2 ASPHALT BINDER**

14 Use performance graded asphalt binder meeting AASHTO M 320 Table 1. See Article 610-3
15 for the specified grades.

16 Submit a Quality Control Plan for asphalt binder production in conformance with
17 AASHTO R 26 to the Materials and Tests Unit. The Department's Performance Graded
18 Asphalt Binder QC/QA Program shall be implemented in accordance with Article 1020-6.

19 Where modification of the asphalt binder is required to meet the specified grade, accomplish
20 the modification using a styrene butadiene styrene (SBS), styrene butadiene rubber (SBR),
21 styrene butadiene (SB) polymer or other modifiers approved by the Engineer to modify
22 asphalt to meet the grade specified before delivery to the asphalt plant. Other polymers shall
23 be pre-approved and listed by the Materials and Tests Unit. Air blown asphalt will not be
24 permitted.

25 **1020-3 ASPHALT EMULSION**

26 Submit a QC Plan for asphalt emulsion. The Department's Asphalt Emulsion
27 QC/QA Program shall be implemented in accordance with Article 1020-6.

28 **(A) Anionic**

29 Use asphalt emulsion that meets AASHTO M 140.

30 Perform the testing of the asphalt in accordance with AASHTO T 59 except as follows:

- 31 (1) The determination of coating test, oil distillate, pH, solubility of residue, ash and
32 particle charge will be made when deemed necessary.
- 33 (2) Use Materials and Tests Method A-24 to determine the coating ability and water
34 resistance using either crushed or uncrushed aggregate from a source selected by the
35 Department.

36 **(B) Cationic**

37 Asphalt emulsion shall meet AASHTO M 208 or M 316 except as follows:

- 38 (1) All polymer or latex modified cationic asphalt emulsion materials, CRS-2P and
39 CRS-2L, are subject to the following requirements:
- 40 (a) The sieve shall be no more than 0.15%.
- 41 (b) The elastic recovery (AASHTO T 301) at 77°F shall be 60% minimum.
- 42 (c) The ring and ball softening point (AASHTO T 53) shall be 110°F minimum.
- 43 (d) Penetration on residue at 77°F is not performed on CRS-2L.

Section 1020

- 1 (e) Polymer content may be analyzed, if deemed necessary.
- 2 (2) Perform the testing of the asphalt in accordance with AASHTO T 59 except as
3 follows:
- 4 (a) Referee testing will be performed in accordance with AASHTO T 59.
- 5 (b) The determination of coating test, oil distillate, pH, solubility of residue, ash and
6 particle charge will be made when deemed necessary by the Engineer.
- 7 (c) Materials and Tests Method A-24 is used to determine the coating ability and
8 water resistance using either crushed or uncrushed aggregate from a source
9 selected by the Department.

1020-4 POLYMER MODIFIED EMULSION MEMBRANE

11 Use polymer modified emulsion membrane consisting of styrene butadiene block copolymer
12 modified asphalt emulsion to form a water impermeable seal and bond the new hot mix to the
13 existing surface. Complete polymer modification of base asphalt before emulsification.
14 Conform to Table 1020-1.

Property	Requirement		Test Method
	Min.	Max.	
EMULSION:			
Viscosity @ 77°F, SFS	20	100	AASHTO T-59
Sieve Test, %		0.1	AASHTO T-59
24-Hour Storage Stability, % ^A		1	AASHTO T-59
Residue from Distillation @ 400°F, % ^B	63		AASHTO T-59
Oil portion from distillation ml of oil per 100 g emulsion		2.0	
Demulsibility	60		AASHTO T-59
RESIDUE:			
Solubility in TCE, % ^C	97.5		AASHTO T-44
Elastic Recovery, 50°F			
20 cm elongation % ^D	60		AASHTO T-301
Penetration @ 77°F, 100 g, 5 sec, d _{mm}	60	150	AASHTO T-49

- 15 **A.** After standing undisturbed for 24 hours, the surface shall show no white, milky colored
16 substance, but shall be a smooth homogeneous color throughout.
- 17 **B.** AASHTO T-59 with modifications to include a 400°F ± 10°F maximum temperature to
18 be held for 15 minutes.
- 19 **C.** ASTM D5546 may be substituted where polymers block the filter in Method D-2042.
- 20 **D.** ASTM D6084 except that the elongation is 20 cm and the test temperature is 50°F.

1020-5 PRIME COAT MATERIALS

22 Supply prime coat materials from pre-approved sources in accordance with Materials and
23 Tests Unit Method A and listed by the Materials and Tests Unit. Verification samples taken
24 at the point of application (destination) are subject to the following conditions:

- 25 **(A)** All prime coat materials shall be delivered to the project ready for use.
- 26 **(B)** Sampling will be made at the point of application. The Department reserves the right to
27 sample all materials used for prime coat applications, either at the destination or at the
28 point of origin, and to withhold acceptance of material until analysis of such samples
29 have been made. When a material meets specification requirements, but has a history of
30 unsatisfactory service performance, its use for construction or maintenance purposes may
31 be restricted by the Department and such restriction will be noted on the list of approved
32 products.

- 1 (C) Proposed materials for prime coat applications that are not listed as approved will be
 2 investigated upon the request of the supplier or Contractor. The maximum volatile
 3 organic compounds for the products (materials) on the approved list for prime coat
 4 applications shall not exceed 6.8 ounces per gallon of material or the current applicable
 5 regulatory limit. Submit a MSDS and a 2 quart sample from three different batches of
 6 the same material to the Materials and Tests Unit for evaluation.
- 7 (D) The sand penetration results for a material used as a prime coat are penetration depth of at
 8 least 12 mm and penetration time of not more than 90 seconds. Copies of the *Sand*
 9 *Penetration Test Procedure* are available upon request from the Materials and Tests Unit.
- 10 (E) Materials used as a prime coat shall have a minimum rating of fair on the No-Tracking
 11 Time Test. Copies of the *No-Tracking Time Test Procedures* are available upon request
 12 from the Materials and Tests Unit.
- 13 (F) Materials used as a prime coat shall have a minimum rating of fair on the coating ability
 14 and water resistance test in accordance with AASHTO T-59.
- 15 (G) For materials stored longer than one day at the destination point (Contractors'/Divisions'
 16 tanks), submit to the Engineer a certified laboratory report on the performance of the
 17 material for storage stability test in accordance with AASHTO T-59.
- 18 (H) The diluted materials shall be tested for asphalt residue percent in accordance with
 19 AASHTO T-59, Section 55, and shall have a minimum asphalt residue percent of 15%.

20 **1020-6 PERFORMANCE GRADED ASPHALT BINDER AND ASPHALT**
 21 **EMULSION QUALITY CONTROL/QUALITY ASSURANCE**

22 The Performance Graded Asphalt Binder and Asphalt emulsion QC/QA Programs are
 23 designed to give asphalt binder and asphalt emulsion producers/suppliers (henceforth
 24 Producer designates Producer/Supplier) more responsibility for controlling the quality of
 25 material they produce and to use the quality control information they provide in the
 26 acceptance process by the Department. It requires asphalt binder and asphalt emulsion
 27 producers to perform quality control sampling, testing and record keeping on materials they
 28 ship for use by the Department. It documents that the Department will perform quality
 29 assurance sampling, testing and record keeping confirming the performance of the producers'
 30 control plan. In addition, the Producer is required to participate in independent assurance
 31 comparative sample activities. The program is described in the *Performance Graded Asphalt*
 32 *Binder and Asphalt Emulsion QC/QA Program Manuals*. An electronic copy of the program
 33 manuals may be obtained by accessing the Materials and Tests website.

34 The types of samples and the lot sizes required by the Producers and the Department are
 35 described in detail in the *Performance Graded Asphalt Binder and Asphalt Emulsion*
 36 *QC/QA Program Manuals*.

37 Acceptance or rejection of material will be based on the total program. Therefore,
 38 a comparison of the quality control, quality assurance and other sample data may be used by
 39 the Department for acceptance or rejection of a lot of material.

40 Participation in this program does not relieve the producer of the responsibility of complying
 41 with all requirements of the *Standard Specifications*.

42 **1020-7 WATERPROOFING AND DAMPPROOFING MATERIALS**

43 **(A) Asphalt Primer**

44 Asphalt primer shall meet ASTM D41.

45 **(B) Asphalt Binder**

46 Asphalt Binder shall meet Article 1020-2, Grade PG 64-22.

Section 1020

1 (C) Tar

2 Tar shall meet ASTM D490.

3 (D) Woven Cotton Fabric

4 Bitumen-saturated woven cotton fabric for waterproofing shall meet ASTM D173.

5 1020-8 ANTI-STRIP ADDITIVES

6 Anti-strip additives may either be hydrated lime or a chemical additive or a combination of
7 both. Use an anti-strip additive capable of preventing the separation of the asphalt binder
8 from the aggregate and achieving the required tensile strength ratio (TSR) on the asphalt mix
9 when tested in accordance with AASHTO T 283 as modified by the Department.

10 Use hydrated lime conforming to AASHTO M 303. Add hydrated lime used of anti-strip
11 purposes at a rate of not less than 1.0% by weight of the total dry aggregate.

12 Add chemical anti-strip additives to the asphalt binder before introduction into the mix. Do
13 not use any chemical additive or particular concentration of chemical additive found to be
14 harmful to the asphalt material or which causes the performance grading of the original
15 asphalt binder to be out of specifications for the grade required.

16 1020-9 SILICONE

17 Silicone additives shall be pre-approved by the Materials and Tests Unit.

18 1020-10 FIBER STABILIZING ADDITIVES

19 Use fiber stabilizing additives that are capable of stabilizing the asphalt film surrounding the
20 aggregate particles to reduce drain-down of the asphalt binder. A fiber stabilizer such as
21 mineral fiber or cellulose may be used. The selected fiber shall meet the properties described
22 below. Dosage rates given are typical ranges but the actual dosage rate used will be approved
23 by the Engineer.

24 (A) Mineral Fibers

25 Mineral fibers shall be made from virgin basalt, diabase or slag treated with a cationic
26 sizing agent to enhance disbursement of the fiber as well as increase adhesion of the fiber
27 surface to the asphalt binder. Mineral fibers shall be in accordance with Table 1012-5.
28 Add the fiber at a dosage rate between 0.2% and 0.4% by weight of total mix, as
29 approved.

**TABLE 1020-2
MINERAL FIBER PROPERTIES**

Property	Requirement	Test Method
Average Fiber length	0.25" maximum	-
Average Fiber thickness	0.0002" maximum	-
Shot Content Passing No. 60 sieve	90 - 100%	ASTM C612
Shot Content Passing No. 230 sieve	65 - 100%	ASTM C612
Degradation	30% maximum	GDT-124/McNett Fractionation

1 **(B) Cellulose Fibers**

2 Add cellulose fibers at a dosage rate between 0.2% and 0.4% by weight of total mix as
3 approved. Fiber properties shall be in accordance with the following table.

TABLE 1020-3 CELLULOSE FIBER PROPERTIES	
Property	Requirement
Average Fiber Length	0.25" maximum
Alpine Sieve Method Passing No. 100 Sieve	60 - 80%
Ro-Tap Sieve Method Passing No. 20 Sieve	80 - 95%
Ro-Tap Sieve Method Passing No. 40 Sieve	45 - 85%
Ro-Tap Sieve Method Passing No. 100 Sieve	5 - 40%
Ash Content	18% \pm 5% non-volatiles
pH	7.5 \pm 1
Oil Absorption	5.0 \pm 1 (times fiber weight)
Moisture Content	5.0 maximum

4 **(C) Cellulose Pellets**

5 Cellulose pellets consist of a 50/50 blend of cellulose fiber and asphalt binder. Use
6 cellulose that complies with Subarticle 1020-10 (B) and the following table. Add the
7 cellulose pellets at a dosage rate between 0.4% and 0.8% by weight of total mix, as
8 approved.

TABLE 1020-4 CELLULOSE PELLET PROPERTIES	
Property	Requirement
Pellet Size	1/4 cu.in. maximum
Asphalt	25 - 80 pen.

9

SECTION 1024

10

MATERIALS FOR PORTLAND CEMENT CONCRETE

11

1024-1 PORTLAND CEMENT

12 Supply Portland cement that meets AASHTO M 85 for Type I, II or III except that the
13 maximum fineness requirements of AASHTO M 85 do not apply to cement used in precast
14 concrete products. Throughout these Specifications Types I and II cement are referred to as
15 regular Portland cement and Type III as high early strength Portland cement.

16 Certain combinations of cement and aggregate exhibit an adverse alkali-silica reaction. The
17 alkalinity of any cement, expressed as sodium-oxide equivalent, shall not exceed 1.0%. For
18 mix designs that contain non-reactive aggregates and cement with an alkali content less than
19 0.6%, straight cement or a combination of cement and fly ash, cement and ground granulated
20 blast furnace slag or cement and microsilica may be used. The supplementary cementitious
21 material (SCM) quantity shall not exceed the amount shown in Table 1024-1. For mixes that
22 contain cement with an alkali content between 0.6% and 1.0% and for mixes that contain a
23 reactive aggregate documented by the Department, use a supplementary cementitious material
24 in the amount shown in Table 1024-1.

Section 1024

- 1 Obtain the list of reactive aggregates documented by the Department at the Materials and
2 Tests Unit website.

TABLE 1024-1 SUPPLEMENTARY CEMENTITIOUS MATERIAL FOR USE IN PORTLAND CEMENT CONCRETE	
SCM	Rate
Class F Fly Ash	20% - 30% by weight of required cement content with 1.0 lb Class F fly ash per lb of cement replaced
Ground Granulated Blast Furnace Slag	35%-50% by weight of required cement content with 1.0 lb slag per lb of cement replaced
Microsilica	4%-8% by weight of required cement content with 1.0 lb microsilica per lb of cement replaced

- 3 Type IP or IS blended cement is allowed for the cement-and-fly-ash or cement-and-slag
4 portion of the mix. Type IT may be allowed for the cement-and- supplementary cementitious
5 portion of the mix with the permission of the Engineer. Do not substitute fly ash or slag for a
6 portion of Type IP, IS or IT cement or for Portland cement in high early strength concrete.
- 7 Use white cement that meets ASTM C150, except that the ferric oxide content is limited
8 to 0.5%.
- 9 Use Type IP blended cement that meets AASHTO M 240, except that the pozzolanic content
10 is limited to between 17 and 23% by weight and the constituents shall be interground.
- 11 Use Type IS blended cement that meets AASHTO M 240 except that the slag content is
12 limited to between 35% and 50% by weight and the constituents are interground.
- 13 Use Type IT blended cement that meets AASHTO M 240. The Engineer will evaluate the
14 blend of constituents for acceptance in Department work.
- 15 Use Type IL blended cement that meets AASHTO M 240, except the constituents shall be
16 interground. Class F fly ash can replace a portion of Type IL blended cement and shall be
17 replaced as outlined in Subarticle 1000-4(I) for Portland cement. For mixes that contain
18 cement with alkali content between 0.6% and 1.0% and for mixes that contain a reactive
19 aggregate documented by the Department, use a pozzolan in the amount shown in Table
20 1024-1.
- 21 Do not use air-entraining Portland cement. Do not mix different types of cement, different
22 brands of cement, or the same brand from different mills nor use them alternately except
23 when authorized in writing by the Engineer.
- 24 Protect cement from contamination or damage during handling and storage. Do not use
25 cement that is damaged, partially set, lumpy or caked.
- 26 All cement is sampled and tested by the Department as it arrives on the project or at the
27 precasting plant at such frequency as established by the Department.

28 **1024-2 AGGREGATE**

- 29 Provide aggregate that meets Section 1014.

30 **1024-3 ADMIXTURES**

31 **(A) Basis of Acceptance**

- 32 Admixtures from an approved source are accepted without prior testing. Do not use
33 admixtures that are not from an approved source until the admixture is approved by the
34 Department.

(B) Approved Sources

An approved source is considered to be any manufacturer of admixtures who complies with this subarticle.

The manufacturer shall submit to the Product Evaluation Program an application and certified reports of tests that show that the admixture meets the applicable Specifications. Tests shall be performed by AASHTO's designated National Transportation Product Evaluation Program (NTPEP) laboratory for concrete admixture testing. Admixtures that contain chloride other than calcium chloride as provided herein are not permitted. The manufacturer is required to state in writing that no chloride was added during the manufacture of the admixture.

After an admixture is accepted, the manufacturer is required to submit to the Product Evaluation Program on or before February 1 of each year a notarized certification that shows that the material is of the same composition as originally accepted and has not been changed or altered. If an admixture is changed or altered, approval of the source in accordance with the above requirements is necessary before using the admixture.

The Engineer has the option to perform tests deemed desirable to verify the manufacturer's certification. Failure of the admixture in such tests is cause for discontinuation of its use. Failure of an admixture to perform satisfactorily under job conditions is cause for rejection of the source.

The Engineer maintains a list of approved sources on file.

(C) Air Entraining Agent

Provide air entraining agents that meet AASHTO M 154.

(D) Chemical Admixtures**(1) Set Retarding Admixtures**

Use set retarding admixtures that meet AASHTO M 194 for Type D, water reducing and retarding admixtures.

(2) Water Reducing Admixtures

Use water reducing admixtures that meet AASHTO M 194 for Type A admixtures.

(3) Calcium Chloride

Provide calcium chloride that meets AASHTO M 144 for Type 2, concentrated flake, pellet or other granular calcium chloride. The Engineer may waive the gradation requirement.

(4) High-Range Water Reducing Admixtures

Use high-range water reducing admixtures that meet AASHTO M 194 for Type F or Type G.

(5) Calcium Nitrite Corrosion Inhibitor

Use an approved calcium nitrite corrosion inhibitor that contains 30% solids.

(E) Other Admixtures

Admixtures not otherwise classified will be reviewed on a case-by-case basis by the Materials and Tests Unit.

1024-4 WATER

Ensure that water used to condition, wash, or as an integral part of materials is clear and free from injurious amounts of oil, acid, alkali, organic matter, or other deleterious substance. It shall not be salty or brackish. Water used in the production of concrete or grout shall be from

Section 1024

1 wells or public water systems which are suitable for drinking and must meet the criteria listed
2 in Table 1024-2.

3 Test all water from wells and public water supplies from all out of state locations and in the
4 following counties: Beaufort, Bertie, Brunswick, Camden, Carteret, Chowan, Craven,
5 Currituck, Dare, Gates, Hyde, New Hanover, Onslow, Pamlico, Pasquotank, Pender,
6 Perquimans, Tyrell and Washington unless the Engineer waives the testing requirements.
7 Water from a municipal water supply in all other NC counties may be accepted by the
8 Engineer without testing.

Property	Requirement	Test Method
Compressive Strength, minimum percent of control at 3 and 7 days	90%	NCDOT Modified / AASHTO T 106
Time of set, deviation from control	From 1:00 hr. earlier to 1:30 hr. later	NCDOT Modified / AASHTO T 131
pH	4.5 to 8.5	NCDOT Modified / AASHTO T 26
Chloride Ion Content, Max.	250 ppm	ASTM D512
Total Solids Content (Residue), Max.	1,000 ppm	NCDOT Modified / Standard Methods for Examination of Water and Wastewater
Resistivity, Min.	0.500 kohm-cm	NCDOT Modified / ASTM D1125
Sulfate as SO ₄ , Max.	1,500 ppm	NCDOT Modified / ASTM D516
Presence of Sugar	None	NCDOT Procedure
Dissolved Organic Matter	None	NCDOT Modified / AASHTO T 26

9 **1024-5 FLY ASH**

10 Provide fly ash that meets ASTM C618 for Class F or Class C, except ensure that the loss on
11 ignition does not exceed 4%. Use fly ash that meets the optional physical requirements for
12 uniformity shown in Table 2 of ASTM C618.

13 Do not use Class C fly ash in Portland cement concrete if the alkali content of the cement
14 exceeds 0.4%.

15 All fly ash is sampled and tested by the Department as it arrives on the project at such
16 frequency as established by the Department.

17 **1024-6 GROUND GRANULATED BLAST FURNACE SLAG**

18 Use blast furnace slag that meets AASHTO M 302, Grade 100. All slag is sampled and tested
19 by the Department as it arrives on the project at such frequency as established by the
20 Department.

21 **1024-7 SILICA FUME**

22 Provide silica fume (microsilica) that meets Tables 1, 2 and 3 of ASTM C1240. All silica
23 fume is sampled and tested by the Department as it arrives on the project at such frequency as
24 established by the Department.

Section 1028

1 1028-2 HOT APPLIED JOINT SEALER

2 Provide a hot applied joint sealer that conforms to ASTM D6690 and has been evaluated by
3 NTPEP. Furnish a Type 3 material certification in accordance with Article 106-3 for each lot
4 of the joint sealer supplied to each project.

5 1028-3 LOW MODULUS SILICONE SEALANT

6 Provide a cold applied, single component, chemically curing low modulus silicone sealant
7 from the Department’s approved list on the website and evaluated by NTPEP. Acid cure
8 sealants are not acceptable for use on Portland cement concrete. Bond breakers shall meet
9 Article 1028-4.

10 (A) Silicone Sealant Types

11 (1) Type NS

12 A non-sag silicone for use in sealing horizontal and vertical joints in Portland cement
13 concrete pavements and bridges. Tooling is required.

14 (2) Type SL

15 A self-leveling silicone used to seal horizontal joints in Portland cement concrete
16 pavements and bridges. Tooling is not normally required.

17 (B) Requirements

TABLE 1028-1 PHYSICAL PROPERTIES OF SEALANT		
Property	Requirement	Test Method
Peel	Minimum of 20 lb/in of width with at least 75% cohesive failure	ASTM D903 bonded on concrete block
Movement Capability and Adhesion	No adhesive or cohesive failure after 10 cycles of test movements of +100% (extension) and -50% (compression)	ASTM C719

18 Silicone sealant shall meet the Table 1028-1, ASTM D5893 and shall have been
19 evaluated by NTPEP.

20 Furnish a Type 3 material certification in accordance with Article 106-3 for each lot of
21 joint sealer material supplied to each project. Deliver each lot of sealant in containers
22 plainly marked with the manufacturer’s name or trademark, lot number and date of
23 manufacture.

24 1028-4 BOND BREAKER

25 Install silicone sealant over a bond breaker to prevent the sealant from bonding to the bottom
26 of the joint. Use bond breakers that do not stain or adhere to the sealant and are chemically
27 inert and resistant to oils. Furnish a Type 3 material certification in accordance with
28 Article 106-3 for each lot of bond breaker material supplied to each project.

29 (A) Type L

30 Type L backer rod is a closed-cell expanded polyethylene foam backer rod. Use this
31 backer rod in roadway and bridge joints and with Type NS silicone only. Use
32 Type L backer rod that complies with Table 1028-2.

1 **(B) Type M**

2 Type M backer rod is a closed-cell polyolefin foam backer rod which has a closed-cell
3 skin over an open cell core. Use this backer rod in roadway and bridge joints with both
4 silicone sealant types. Use Type M backer rod that complies with Table 1028-2.

TABLE 1028-2		
PHYSICAL PROPERTIES OF TYPE L AND TYPE M BACKER ROD		
Property	Requirement	Test Method
Min. Density	2.0 lb/cf	ASTM D 1622
Min. Tensile Strength	25 psi	ASTM D 1623
Max. Water Absorption	0.5% by volume	ASTM C 509

5 **(C) Type N**

6 Provide bond breaking tape made from extruded polyethylene that has a pressure
7 sensitive adhesive on one side. Bond breaking tape may be used with both types of
8 silicone but is suitable for bridge joints only. Bond breaking tapes shall be at least
9 0.005 inch in thickness.

10 **SECTION 1032**
11 **CULVERT PIPE**

12 **1032-1 CORRUGATED METAL CULVERT PIPE**

13 Use corrugated metal culvert pipe from sources on the Department's approved list and that
14 participate in the Department's Brand Registration program for metal culvert pipe available
15 from the website or the Materials and Tests Unit's Central Laboratory. The Department will
16 remove a manufacturer of metal culvert pipe from this program if the monitoring efforts
17 indicated that non-specification material is being provided or test procedures are not being
18 followed.

19 The following types of steel and aluminum alloy pipe and all associated accessories may be
20 accepted under this program.

21 **(A)** Coated corrugated metal culvert pipe and pipe arches,

22 **(B)** Coated corrugated metal end sections, coupling band and other accessories,

23 **(C)** Corrugated aluminum alloy structural plate pipe and pipe arches,

24 **(D)** Corrugated aluminum alloy end sections, coupling band and other accessories, and

25 Field joints for each type of corrugated steel pipe or corrugated aluminum pipe shall maintain
26 pipe alignment during construction and prevent infiltration of fill material during the life of
27 the installation. Coupling bands may be of the following types: bands with annular
28 corrugations; bands with helical corrugations; bands with projections (dimples); channel
29 bands for upturned flanges, with or without annular corrugations; flat bands; and smooth
30 sleeve-type couplers. Coupling bands shall be installed in accordance with details in plans
31 and/or in accordance with manufacturer's recommendations.

32 Corrugated metal pipe and coupling bands shall conform to ASTM B745 for Corrugated
33 Aluminum Pipe, ASTM A796 for Corrugated Steel Pipe, ASTM A760 for Aluminized Coated
34 Corrugated Steel Pipe, and ASTM A762 for Polymer Pre-coated Corrugated Steel Pipe.

35 **1032-2 CORRUGATED ALUMINUM ALLOY CULVERT PIPE**36 **(A) Corrugated Aluminum Alloy Culvert Pipe**

37 Corrugated aluminum alloy culvert pipe shall meet AASHTO M 196, except that
38 Type IA pipe will not be permitted.

Section 1032

1 When elongated pipe is called for by the contract, use pipe that is shop formed to provide
2 for a 5% vertical elongation.

3 (1) Coupling Bands

4 (a) Use corrugated coupling bands except as otherwise provided below.

5 (b) A hugger type corrugated band having one annular corrugation at each outside
6 edge of the band will be acceptable.

7 (c) Coupling bands with projections (dimples) may be used where it is necessary to
8 join new pipe to existing pipe having helical corrugations at the joint locations.
9 The bands shall be formed with projections in annular rows with one projection
10 for each corrugation of helical pipe. Use an approved sealer with this type of
11 coupling band. Coupling bands with projections (dimples) may be used for
12 circumferential pipe, heliacal pipe, or a combination of both.

13 (d) Fasten coupling bands on the ends with at least two 1/2 inch bolts.

14 (e) Annular corrugated bands shall have a minimum width of 10 1/2 inches where
15 2 2/3 inches x 1/2 inch corrugations are used.

16 (B) Corrugated Aluminum Alloy Pipe Tees and Elbows

17 Corrugated aluminum alloy pipe tees and elbows shall meet all applicable requirements
18 of AASHTO M 196.

19 (C) Acceptance

20 Acceptance of corrugated aluminum alloy culvert pipe and its accessories will be based
21 on, but not limited to, visual inspections, classification requirements and check samples
22 taken from material delivered to the project and conformance to the annual Brand
23 Registration.

24 Culvert pipe materials not meeting the above requirements will be rejected, unless written
25 approval is obtained from the State Materials Engineer.

26 1032-3 CORRUGATED STEEL CULVERT PIPE

27 (A) Corrugated Steel Culvert Pipe and Pipe Arch

28 Corrugated steel culvert pipe and pipe arch shall meet AASHTO M 36 with the following
29 exceptions:

30 (1) Coupling Bands

31 (a) Use corrugated coupling bands except as otherwise provided below.

32 (b) A hugger type corrugated band having one annular corrugation at each outside
33 edge of the band will be acceptable.

34 (c) Coupling bands with projections (dimples) may be used where it is necessary to
35 join new pipe to existing pipe having helical corrugations at the joint locations.
36 The bands shall be formed with projections in annular rows with one projection
37 for each corrugation of helical pipe. Use an approved sealer with this type of
38 coupling band. Coupling bands with projections may be used for circumferential
39 pipe, heliacal pipe, or a combination of both.

40 (d) Fasten coupling bands on the ends with at least two 1/2 inch bolts.

41 (e) Annular corrugated bands shall have a minimum width of 10 1/2 inches where
42 2 2/3 inches x 1/2 inch corrugations are used.

1 (2) Corrugations

2 Where 1/4 inch deep corrugations are permitted by AASHTO M 36, the maximum
3 pitch of the corrugations shall be 1 7/8 inches.

4 Where 3 inches x 1 inch corrugations are required, the Contractor will be permitted
5 to use 5 inches x 1 inch corrugations.

6 Pipe with helical corrugations shall have rerolled ends with at least 2 annual
7 corrugations at each end.

8 (3) Elongated Pipe

9 When elongated pipe is called for by the contract, use pipe that is shop formed to
10 provide for a 5% vertical elongation.

11 (4) Lifting Straps

12 The pipe may be furnished either with or without lifting straps for handling. Attach
13 the lifting straps by bolting or by welding. Bolt holes for attaching the straps shall be
14 a smooth hole that is either punched or drilled. No burning of holes will be
15 permitted. Design the lifting straps so the holes can be plugged to prevent
16 infiltration of backfill material.

17 Design the placement of lifting straps to ensure the pipe is equally supported along
18 its axis.

19 (5) Coating Repair

20 Repair shall be in accordance with Section 1076-7.

21 (6) Type IA Pipe

22 Type IA pipe will not be permitted.

23 (7) Aluminized Pipe

24 Aluminized pipe shall meet all requirements herein except that the pipe and coupling
25 bands shall be fabricated from aluminum coated steel sheet meeting
26 AASHTO M 274.

27 (8) Marking Requirements

28 Pipe sections and special attachments for pipe 60 inches or larger diameter pipe shall
29 be alphanumerically match-marked at the plant site before shipping. There may be
30 additional markings as required by the Department's Brand Certification Program.

31 **(B) Prefabricated Corrugated Steel Pipe End Sections**

32 Corrugated steel end sections shall be in accordance with the details shown in the plans
33 and Subarticle 1032-3(A). Repair end sections on which the spelter coating has been
34 bruised or broken either in the shop or in shipping in accordance with AASHTO M 36.

35 **(C) Corrugated Steel Pipe Tees and Elbows**

36 Corrugated steel tees and elbows shall be in accordance with Subarticle 1032-3(A).

37 **(D) Corrugated Steel Eccentric Reducers**

38 Corrugated steel eccentric reducers shall be in accordance with Subarticle 1032-3(A) and
39 the additional requirements shown below.

40 Construct the eccentric reducer so the invert or flow line from the large pipe through the
41 reducer and into the small pipe is a continuous straight line.

42 Make the reducer from the same thickness corrugated metals as the large diameter pipe.
43 The reducing section may be riveted or welded.

Section 1032

1 (E) Acceptance

2 Acceptance of corrugated steel culvert pipe and its accessories will be based on, but not
3 limited to, visual inspections, classification requirements and check samples taken from
4 material delivered to the project and conformance to the annual Brand Registration.

5 Culvert pipe materials not meeting the above requirements will be rejected, unless written
6 approval is obtained from the State Materials Engineer.

7 The reducing section shall reduce in diameter no more than 3 inches in 24 inches of
8 length. Rivet or weld a 24 inches long constant diameter stub to each end of the reducing
9 section to form the complete reducer.

10 Have the completed reducer show careful, finished workmanship in all particulars.
11 Repair reducers on which the spelter coating has been bruised or broken either in the
12 shop or in shipping in accordance with AASHTO M 36. Reducers that show defective
13 workmanship will be rejected. The following defects are evidence of poor workmanship,
14 and the presence of any of them in any individual reducer will constitute sufficient cause
15 for rejection:

- 16 (1) Not meeting required dimensions,
- 17 (2) Not of the specified shape,
- 18 (3) Uneven laps,
- 19 (4) Ragged or diagonal sheared edges,
- 20 (5) Loose, unevenly lined or spaced rivets,
- 21 (6) Poorly formed rivet heads,
- 22 (7) Lack of rigidity,
- 23 (8) Dents or bends in the metal itself,
- 24 (9) Uneven welds, or
- 25 (10) Gaps in welds.

26 **1032-4 COATED, PAVED AND LINED CORRUGATED STEEL CULVERT PIPE**

27 (A) Coatings for Steel Culvert Pipe or Pipe Arch

28 The below coating requirements apply for steel culvert pipe, pipe arch, end sections, tees,
29 elbows and eccentric reducers.

30 (1) Steel Culvert pipe shall have an aluminized coating, meeting the requirement of
31 AASHTO M 274.

32 (2) When shown in the plans or as approved by the Engineer, a polymeric coating
33 meeting AASHTO M 246 for Type B coating may be substituted for aluminized
34 coating.

35 (B) Acceptance

36 Acceptance of coated steel culvert pipe and its accessories will be based on, but not
37 limited to, visual inspections, classification requirements and check samples taken from
38 material delivered to the project and conformance to the annual Brand Registration.

39 **1032-5 WELDED STEEL PIPE FOR DRAINAGE**

40 Welded steel pipe shall meet ASTM A139 for the grade of pipe called for in the plans.

41 Acceptance of welded steel culvert pipe and its accessories will be based on, but not limited
42 to, visual inspections, classification requirements and check samples taken from material
43 delivered to the project and conformance to the Department's welded steel pipe program.

44 Culvert pipe materials not meeting the above requirements will be rejected, unless written
45 approval is obtained from the State Materials Engineer.

1 1032-6 CONCRETE CULVERT PIPE**2 (A) General**

3 Use concrete pipe from sources participating in the Department's Concrete Pipe QC/QA
4 Program. A list of participating sources is available from the Materials and Tests Unit's
5 Central Laboratory. The Department will remove a manufacturer of concrete pipe from
6 this program if the monitoring efforts indicated that non-specification material is being
7 provided or testing procedures are not being followed.

8 (B) Reinforced Concrete Culvert Pipe

9 Reinforced concrete culvert pipe shall meet AASHTO M 170 for the class of pipe called
10 for in the plans except as follows:

- 11 (1) The permissible wall thickness outside of the joint configuration shall not be more
12 than that shown in the design by more than 5% or 3/16 inch, whichever is greater.
- 13 (2) The maximum weighted average loss for both fine and coarse aggregates shall be
14 15% when subjected to 5 cycles of the soundness test.
- 15 (3) The maximum percentage of wear for coarse aggregates is 55%.

16 The design wall thickness shall be either the wall thickness shown in AASHTO M 170
17 for the applicable class and wall or the wall thickness shown in a modified design that has
18 been approved by the Engineer. A wall thickness greater than permitted by the above
19 tolerance will be cause for rejection of the pipe. The circumferential steel in single cage
20 pipe shall not be more than 3 inches from either end of the pipe section excluding the
21 tongue and groove. On double cage pipe, extend one cage into the tongue or groove.
22 Place the other cage so a circumferential wire shall be not less than 2 inches from the
23 other end of the barrel of the pipe.

24 (C) Precast Concrete Pipe End Sections

25 Precast concrete pipe end sections shall meet AASHTO M 170 and Section 1077 except
26 those requirements pertaining to design.

27 Design concrete pipe end sections in accordance with the plans or with plans prepared by
28 the manufacturer which have been approved by the Engineer. Reinforce all concrete pipe
29 end sections. Use air entrained concrete in pipe end sections with a strength of 3,500 psi
30 when tested in accordance with AASHTO T 22.

31 (D) Concrete Pipe Tees and Elbows

32 Concrete pipe tees and elbows shall meet AASHTO M 170 for the class of pipe tee or
33 elbow called for in the plans.

34 (E) Marking

- 35 (1) Clearly etchmark the following information on the outside of each section of pipe,
36 pipe end section, tee and elbow:
 - 37 (a) Pipe class and type of wall if reinforced,
 - 38 (b) The date of manufacture, and
 - 39 (c) Name or trademark of the manufacturer.
- 40 (2) Clearly stamp, stencil, sticker or paint the following information on each section of
41 pipe, pipe end section, tee and elbow:
 - 42 (a) The State assigned plant number,
 - 43 (b) The inside diameter of the pipe product, and

Section 1032

1 (c) The year of manufacture. This marking shall be in the following format: State
2 plant number - diameter - year (CP99-24-06).

3 When concrete pipe, pipe end sections, tees and elbows have been inspected and accepted
4 they will be stamped with the Department seal of approval. Do not use pipe sections,
5 pipe end sections, tees, or elbows which do not have this seal of approval. Failure of as
6 much as 20% of any lot of pipe due to cracks, fractures, variation in alignment
7 or other manufacturing defects will be cause for the rejection of the entire lot.
8 The lots shall be as designated by the manufacturer before inspection.
9 Individual lengths of pipe within the lot which were not specifically rejected but which
10 are considered acceptable by the manufacturer may be removed from the rejected lot and
11 resubmitted for inspection as a separate lot.

12 (F) Joint Materials

13 Cement shall meet Article 1024-1. Sand shall meet Article 1014-1 for fine aggregate or
14 Article 1040-7 for mortar sand. Hydrated lime shall meet Article 1040-6.

15 Flexible plastic joint material shall meet AASHTO M 198 for Type B flexible plastic
16 gaskets, except as follows:

17 (1) The flash point, Cleveland Open Cup (C.O.C.) shall be at least 325°F.

18 (2) The fire point, C.O.C. shall be at least 350°F.

19 1032-7 CORRUGATED POLYETHYLENE (HDPE) CULVERT PIPE

20 (A) General

21 Use corrugated polyethylene pipe from sources participating in the Department's HDPE
22 Pipe QC/QA Program. A list of participating sources is available from the Materials and
23 Tests Unit. The Department will remove a manufacturer of polyethylene pipe from this
24 program if the monitoring efforts indicated that non-specification material is being
25 provided or test procedures are not being followed.

26 Use corrugated polyethylene culvert pipe that meets AASHTO M 294 for Type S or
27 Type D and has been evaluated by NTPEP.

28 (B) End Treatments, Pipe Tees and Elbows

29 End treatments, pipe tees and elbows shall meet AASHTO M 294, Section 7.8.

30 (C) Marking

31 Clearly mark each section of pipe, end section, tee and elbow and other accessories
32 according to the Department's HDPE Pipe QC/QA Program:

33 (1) AASHTO Designation

34 (2) The date of manufacture

35 (3) Name or trademark of the manufacturer

36 When polyethylene pipe, end sections, tees and elbows have been inspected and accepted
37 they will be stamped with the Department seal of approval. Do not use pipe sections,
38 flared end sections, tees or elbows which do not have this seal of approval.

39 1032-8 PVC PROFILE WALL DRAIN PIPE

40 PVC pipe shall conform to AASHTO M 304. When rubber gaskets are to be installed in the
41 pipe joint, the gasket shall be the sole element relied on to maintain a tight joint. Watertight
42 joints shall be watertight in accordance with AASHTO M 304, unless a higher pressure rating
43 is specified in the plans.

SECTION 1034
SANITARY SEWER PIPE AND FITTINGS

1034-1 CLAY PIPE

Use extra strength vitrified clay sewer pipe conforming to ASTM C700. Manufacture all joints and seals in accordance with ASTM C425.

1034-2 PLASTIC PIPE

(A) PVC Gravity Flow Sewer Pipe

Use PVC pipe that conforms to ASTM D3034 with a minimum SDR of 35. Use pipe with push-on type joints having bells made as an integral part of the pipe conforming to ASTM D3212.

(B) PVC Force Main Sewer Pipe

(1) Pressure Rated Pipe

Use PVC pipe conforming to ASTM D2241 or to ANSI/AWWA C905 with a minimum SDR of 21 and minimum pressure rating of 200 psi. Use pipe with push-on type joints having bells made as an integral part of the pipe conforming to ASTM D3139 or pipe with butt fused joints made from ASTM D1784 Class 12454B plastic formulated for fusing.

Use PVC pipe conforming to ASTM F1483 or to ANSI/AWWA C909 for molecularly oriented pipe with a minimum pressure rating of 200 psi. Use pipe with push-on type joints having bells made as an integral part of the pipe conforming to ASTM D3139.

(2) Pressure Class Pipe

Use PVC pipe conforming to ANSI/AWWA C900 with a minimum DR of 18 and a minimum pressure class of 235 psi. Use pipe with push-on type joints having bells made as an integral part of the pipe conforming to ASTM D3139 or pipe with butt fused joints made from ASTM D1784 Class 12454B plastic formulated for fusing.

(C) Polyethylene (PE) Pipe Force Main Sewer Pipe

Use PE pipe and tubing that conforms to AWWA C901 or AWWA C906 with a minimum pressure class of 200 psi.

1034-3 CONCRETE SEWER PIPE

Use reinforced concrete sewer pipe conforming to ASTM C76 or AASHTO M 170 with a Class III minimum rating. Use pipe with gasket joints conforming to ASTM C443 or AASHTO M 198 Type A or B.

1034-4 DUCTILE IRON PIPE

(A) Gravity Flow Sewer Pipe

Use ductile iron pipe that conforms to ASTM A746 or ANSI/AWWA C151/A21.51.

Use ductile iron pipe fittings and specials conforming to ANSI/AWWA C110/A21.10 for standard size fittings or ANSI/AWWA C153/A21.53 for compact fittings.

Use pipe and fittings with push-on joints conforming to ANSI/AWWA C111/A21.11.

(B) Force Main Sewer Pipe

Use ductile iron pipe that conforms to ANSI/AWWA C151/A21.51.

Use ductile iron pipe fittings and specials conforming to ANSI/AWWA C110/A21.10 for standard size fittings or ANSI/AWWA C153/A21.53 for compact fittings. Manufacture

Section 1036

1 fittings with a cement mortar lining and a seal coat in accordance with
2 ANSI/AWWA C104/A21.4.

3 Use pipe and fittings with either mechanical joints or push-on joints conforming to
4 ANSI/AWWA C111/A21.11. When required or necessary, use approved type joint
5 restraint devices with a minimum working pressure rating of 200 psi and a factor of
6 safety of 2.

SECTION 1036 WATER PIPE AND FITTINGS

9 1036-1 GENERAL

10 All materials when used to convey potable drinking water shall meet the National Sanitation
11 Foundation Standard No. 61. All materials in contact with potable water shall be in
12 conformance with Section 1417 of the Safe Drinking Water Act.

13 1036-2 COPPER PIPE

14 For indoor plumbing use copper pipe and sweated fittings conforming to ASTM B88 for the
15 type and temper called for in the plans and Specifications. Cast fittings for copper pipe shall
16 meet ASTM B61 or ASTM B62.

17 For buried service, use copper water pipe and tube conforming to ASTM B88 soft annealed
18 Type K. Use flared or compression type fittings conforming to ANSI/AWWA C800 and local
19 plumbing codes to connect pipe and tube.

20 1036-3 PLASTIC PIPE

21 (A) PVC Pipe

22 (1) Pressure Rated Pipe

23 Use PVC pipe conforming to ASTM D2241 or to ANSI/AWWA C905 with
24 a minimum SDR of 21 and minimum pressure rating of 200 psi. Use pipe with
25 push-on type joints having bells made as an integral part of the pipe conforming to
26 ASTM D3139 or pipe with butt fused joints made from ASTM D1784 Class 12454B
27 plastic formulated for fusing.

28 Use PVCO pipe conforming to ASTM F1483 or to ANSI/AWWA C909 for
29 molecularly oriented pipe with a minimum pressure rating of 200 psi. Use pipe with
30 push-on type joints having bells made as an integral part of the pipe conforming to
31 ASTM D3139.

32 (2) Pressure Class Pipe

33 Use PVC pipe conforming to ANSI/AWWA C900 with a minimum DR of 18 and
34 a minimum pressure class of 235 psi. Use pipe with push-on type joints having bells
35 made as an integral part of the pipe conforming to ASTM D3139 or pipe with
36 butt-fused joints made from ASTM D1784 Class 12454B plastic formulated for
37 fusing.

38 (B) Polyethylene (PE) Pipe

39 Use PE water pipe and tubing that conforms to AWWA C901 or AWWA C906 with
40 a minimum pressure class of 200 psi.

41 1036-4 STEEL PIPE

42 (A) Water Pipe

43 Use galvanized steel pipe meeting ASTM A53 for standard weight. Fittings for steel
44 water pipe shall meet ASTM A126 for Class B iron or of ASTM A197. Galvanize all
45 fittings in accordance with ASTM A153.

1 (B) Encasement Pipe

2 Use steel pipe meeting an ASTM specification with the minimum yield strength of
3 35,000 psi. Use pipe that is circular in shape and straight in length.

4 1036-5 DUCTILE IRON PIPE AND FITTINGS

5 Use ductile iron pipe that conforms to ANSI/AWWA C151/A21.51.

6 Use ductile iron pipe fittings and specials conforming to ANSI/AWWA C110/A21.10 for
7 standard size fittings or ANSI/AWWA C153/A21.53 for compact fittings. Manufacture
8 fittings with a cement mortar lining and a seal coat in accordance with
9 ANSI/AWWA C104/A21.4.

10 Use either mechanical joints or push-on joints conforming to ANSI/AWWA C111/A21.11.
11 When required or necessary, use approved type joint restraint devices with a minimum
12 working pressure rating of 200 psi and a factor of safety of 2.

13 1036-6 FIRE HYDRANTS

14 Use dry barrel type fire hydrants conforming to ANSI/AWWA C502 with a minimum 4 1/2
15 inch diameter valve opening with a 6 inch mechanical joint inlet connection, with two 2 1/2
16 inch hose connections and with one 4 1/2 inch pumper connection. Outlets shall have
17 national standard fire hose coupling threads. Use fire hydrants with a minimum bury length
18 of 36 inches. Securely chain nipple caps to the barrel. Paint hydrants with one coat of primer
19 paint and two coats of an approved paint of the owner's standard color. Apply the final coat
20 after hydrant installation.

21 1036-7 WATER VALVES**22 (A) Gate Valves**

23 Use iron body gate valves which conform to ANSI/AWWA C500 for bronze mounted,
24 double disc, parallel seat type valves or to ANSI/AWWA C509 for resilient seat-type
25 valves or to ANSI/AWWA C515 for reduced-wall, resilient seat gate valves. For buried
26 service use gate valves with non-rising stems, 2 inch square operating nuts, O-ring seals
27 and which open by turning counter clockwise. Gate valves shall have mechanical joint
28 ends conforming to ANSI/AWWA C111/A21.11. Gate valves shall have a design
29 working water pressure of 200 psi.

30 (B) Bronze Gate Valves

31 Use bronze gate valves conforming to ASTM B62 with tee head operating nuts and solid
32 wedges. Use valves with a design working pressure of 200 psi.

33 (C) Tapping Valves

34 Use tapping valves conforming to Subarticle 1036-7(A) with appropriately sized
35 openings, with flanged by mechanical joint ends and pressure rated at 200 psi.

36 1036-8 SLEEVES, COUPLINGS AND MISCELLANEOUS**37 (A) Tapping Sleeves**

38 Use cast iron, ductile iron or Type 304 stainless steel tapping sleeves pressure rated
39 at 200 psi. Use either the split sleeve type with mechanical joint ends or the full circle
40 type with double seals. Manufacture the outlet flange to mate with the tapping valve
41 flange.

42 (B) Transition Sleeves and Couplings

43 Use sleeve type couplings for transitioning between plain ends of different pipe types.
44 Manufacture couplings in conformance with ANSI/AWWA C219 for a rated working

Section 1040

1 pressure of 200 psi. Coat the coupling at the factory with an epoxy in conformance with
2 ANSI/AWWA C210 or ANSI/AWWA C213.

1036-9 SERVICE LINE VALVES AND FITTINGS

4 Use corporation stops and curb stops of all bronze material and high-pressure construction
5 conforming to ANSI/AWWA C800.

6 Use tapping saddles of high-pressure construction, shaped to conform to the pipe and in
7 conformance with ANSI/AWWA C800.

8 Use high-pressure fittings manufactured in conformance with ANSI/AWWA C800.

SECTION 1040 MASONRY

11 1040-1 BRICK

12 Use clay or shale brick that meets ASTM C62 for Grade SW, except as otherwise provided
13 herein.

14 Use brick of uniform standard commercial size, with straight and parallel edges and square
15 corners that are burned hard and entirely true, free from injurious cracks and flaws, tough,
16 strong and have a clear ring when struck together. The sides, ends and faces of all brick shall
17 be plane surfaces at right angles and parallel to each other.

18 Brick of the same manufacturer shall not vary more than $\pm 1/16$ inch in thickness, $\pm 1/8$ inch
19 in width and $\pm 1/4$ inch in length.

20 Concrete brick may be used instead of clay or shale brick when designated in the plans or in
21 the specifications. Concrete brick shall meet ASTM C55 for Grade S-II except that the
22 absorption of brick used in minor drainage structures shall not exceed 10 lbs/cf.

23 1040-2 CONCRETE BUILDING BLOCK

24 Use concrete building block from sources that participate in the Department's Solid Concrete
25 Masonry Brick/Unit QC/QA Program. A list of these sources in North Carolina and adjoining
26 states is available from the Materials and Tests Unit in Raleigh.

27 Use concrete building block that meets ASTM C90. Block shall be pink in color and
28 substantially free from chips and cracks.

29 Use solid concrete block instead of clay brick for minor drainage structures that meet
30 ASTM C139 except that the nominal dimensions shall be 4 inches x 8 inches x 16 inches.

31 Concrete block for block manholes shall meet ASTM C139.

32 1040-3 CONCRETE PAVING BLOCK

33 Use concrete paving block from sources that participate in the Department's Solid Concrete
34 Masonry Brick/Unit QC/QA Program. A list of these sources in North Carolina and adjoining
35 states is available from the Materials and Tests Unit in Raleigh.

36 Use concrete paving block that meet ASTM C139, except that the nominal dimensions shall
37 be 4 inches x 8 inches x 16 inches. The block shall have a uniform surface color and texture.

38 1040-4 SEGMENTAL RETAINING WALL UNITS

39 Use segmental retaining wall (SRW) units from sources that participate in the Department's
40 Solid Concrete Masonry Segmental Retaining Wall Units QC/QA Program. A list of these
41 sources in North Carolina and adjoining states is available from the Materials and Tests Unit
42 in Raleigh.

43 Use freeze-thaw durable SRW units when noted in the plans. Unless required otherwise in
44 the contract, provide SRW units with a vertical straight face and a concrete gray color with no

- 1 tints, dyes or pigments. Do not begin unit production until sample SRW units of the type,
 2 face and color proposed for the project are approved.
- 3 Use SRW units that meet ASTM C1372 except for Table 1040-1 requirements.

TABLE 1040-1 SRW UNIT REQUIREMENTS		
Property	Requirement	Test Method
Compressive Strength for SRW Units	4,000 psi min	ASTM C140
Compressive Strength for Freeze-Thaw Durable SRW Units	5,500 psi min	ASTM C140
Absorption	5% max	ASTM C140
Durability for Freeze-Thaw Durable SRW Units	1% max ^A	ASTM C1262

- 4 **A.** Weight loss for 4 of 5 specimens after 150 cycles in water.

5 **1040-5 CEMENT**

6 Portland cement shall meet Article 1024-1.

7 Masonry cement shall meet ASTM C91.

8 **1040-6 HYDRATED LIME**

9 Hydrated lime shall meet ASTM C207 for Type N.

10 **1040-7 MORTAR SAND**

11 Mortar sand shall meet Article 1014-1, except it shall meet the gradation requirements for
 12 No. 4S sand shown in Table 1005-2.

13 **1040-8 WATER**

14 Water shall meet Article 1024-4.

15 **1040-9 MORTAR**

16 Proportion mortar used in all brick and block masonry by volume as shown below. Do not
 17 add any more water than is necessary to make a workable mixture.

Mix No. 1: 1 part Portland cement
 1/4 part hydrated lime
 3 3/4 parts mortar sand (maximum)

Mix No. 2: 1 part Portland cement
 1 part masonry cement
 6 parts mortar sand (maximum)

18 Apply Articles 1040-4, 1040-5, 1040-6 and 1040-7 to all cement, hydrated lime, mortar sand
 19 and water.

20 For the hydrated lime and cement portion of Mix No. 1, the Contractor may substitute
 21 Type M or Type S masonry cement that meets ASTM C270 for Type S masonry cement the
 22 minimum compressive strength of the test specimens shall be 2,500 psi at 28 days and the test
 23 specimens shall be composed of one part Type S masonry cement and 3 parts sand. Furnish
 24 a Type 3 certification for the Type M or Type S masonry cement in accordance with
 25 Article 106-3.

26

27

SECTION 1042 RIP RAP MATERIALS

28 Use field stone or rough unhewn quarry stone for plain rip rap. Use stone that is sound,
 29 tough, dense, resistant to the action of air and water and suitable in all other respects for the
 30 purpose intended. Where broken concrete from demolished structures or pavement is
 31 available, it may be used in place of stone provided that such use meets with the approval of

Section 1043

1 the Engineer. However, the use of broken concrete that contains reinforcing steel will not be
2 permitted.

3 All stone shall meet the approval of the Engineer. While no specific gradation is required,
4 there shall be equal distribution of the various sizes of the stone within the required size
5 range. The size of an individual stone particle will be determined by measuring its long
6 dimension.

7 Stone or broken concrete for rip rap shall meet Table 1042-1 for the class and size
8 distribution.

Class	Required Stone Sizes, inches		
	Minimum	Midrange	Maximum
A	2	4	6
B	5	8	12
1	5	10	17
2	9	14	23

9 No more than 5.0% of the material furnished can be less than the minimum size specified nor
10 no more than 10.0% of the material can exceed the maximum size specified.

SECTION 1043 AGGREGATE FROM CRUSHED CONCRETE

1043-1 GENERAL

14 Aggregate from crushed concrete is a recycled product made by crushing concrete obtained
15 from concrete truck clean out, demolition of existing concrete structures or pavement, or
16 similar sources and transported from a crushing facility. It does not include concrete
17 pavements that are rubblized, broken or otherwise crushed in place on the roadway.

18 The crushed material must meet all sources approval requirements described in Sections 1005
19 and 1006 with the exception of the sodium sulfate test requirement. Deleterious materials
20 shall not be more than 3%.

21 Sampling and acceptance for the determination of gradation, LL and PI will be performed as
22 described in the *Aggregate QC/QA Program Manual* and the *Aggregate Sampling Manual*.

1043-2 AGGREGATE BASE COURSE

24 The material shall meet the ABC gradation. The LL of the material shall be raised 5 points to
25 no more than 35.

1043-3 AGGREGATE SHOULDER BORROW

27 The material shall meet Section 1019.

1043-4 CLEAN COARSE AGGREGATE FOR ASPHALT

29 The material shall meet the gradation of a standard size in Table 1005-1. Use of the material
30 shall be approved by the Engineer, and the mix shall meet all requirements.

1043-5 CLEAN COARSE AGGREGATE FOR CONCRETE

32 The material shall meet the gradation of a standard size in Table 1005-1. Use of the material
33 is restricted to Class B concrete mixes only. Use of the material shall be approved by the
34 Engineer, and the concrete shall meet all requirements.

Section 1046

1 1046-3 POSTS AND OFFSET BLOCKS

2 (A) General

- 3 (1) The Contractor may furnish any one of the following types of steel guardrail posts.
4 Only one type of post will be permitted at any one continuous installation.

5 Use structural steel posts throughout the project, unless otherwise directed or
6 detailed in the plans.

7 (a) Steel W6 x 8.5 or W6 x 9.0 posts

8 (b) Steel 4.5 inches x 6.0 inches C-shape posts

- 9 (2) The Contractor may at his option furnish either of the following types of treated
10 timber posts if specifically directed or detailed in the plans. Only one type of post
11 will be permitted at any one continuous installation.

12 (a) Timber 6 inch x 8 inch posts

13 (b) Timber 8 inch x 8 inch posts

14 (B) Structural Steel Posts

15 Fabricate steel posts for guardrail of the size and weight shown in the plans from
16 structural steel complying with Section 1072. Metal from which C-shape posts are
17 fabricated shall meet ASTM A1011 for any grade of steel except that mechanical
18 requirements that shall meet ASTM A36. Punch or drill the holes for connecting bolts.
19 Burning will not be permitted. After fabrication the posts shall be galvanized in
20 accordance with Section 1076.

21 (C) Treated Timber Posts

22 Timber guardrail posts shall be of treated southern pine meeting Articles 1082-2
23 and 1082-3.

24 Bore bolt holes to a driving fit for the bolts. A minus tolerance of 1% will be allowed in
25 the length of the post. Perform all framing and boring before the posts receive
26 preservative treatment.

27 (D) Offset Blocks

28 Provide 8 inch deep recycled plastic or composite offset blocks approved for use with the
29 guardrail shown in the *Roadway Standard Drawings* or plans. Only one type of offset
30 block will be permitted at any one continuous installation. Before beginning the
31 installation of recycled offset block, submit the FHWA acceptance letter for each type of
32 block to the Engineer for approval.

33 Treated timber offset blocks with steel beam guardrail will not be allowed unless required
34 by Specifications, directed by the Engineer or detailed in the plans. Steel offset blocks
35 with steel beam guardrail will not be allowed.

36 Recycled plastic or composite offset blocks shall be made from no less than 50%
37 recycled plastic or composite and shall meet the requirements in Table 1046-1.

TABLE 1046-1 WIRE DIAMETER	
Property	Requirement
Minimum Specific Gravity	0.950
Min. Compressive Strength in Lateral Direction	1,600 psi
Maximum Water Absorption	10% by weight
Maximum Termite and Ant Infestation	10%
Testing	Pass NCHRP Report 350, Test Level 3 by Crash Testing
Approval	Approved for use by the FHWA

1 **1046-4 HARDWARE**

2 Provide all hardware as indicated in the plans that is galvanized in accordance with
3 ASTM A153.

4 **1046-5 ANCHORS AND ANCHOR ASSEMBLIES**

5 Each shipment of guardrail terminal end sections, anchors and anchor assemblies shall be
6 shipped from the manufacture with a current parts list and installation guide. Units not having
7 the above documents will be rejected.

8 Articles 1046-1, 1046-2 and 1046-3 are applicable to rail elements, terminal sections, posts,
9 offset blocks and hardware.

10 Reinforcing steel shall meet Article 1070-2. Steel plates shall meet ASTM A36. Anchor rods
11 shall meet ASTM A663 for Grade 65.

12 Anchor cable shall be 3/4 inch wire rope having a minimum breaking strength of 21.4 tons
13 and galvanized. Use commercial quality galvanized steel cable thimbles. Use commercial
14 quality drop forged galvanized steel cable clips. The fitting and stud for the anchor cable
15 shall be suitable for cold swaging and be galvanized. After being swaged on the cable, the
16 fitting and stud assembly, including swaged joint and cable, shall have a minimum breaking
17 strength of 21.4 tons.

18 Perform welding in accordance with Article 1072-18.

19 Welded components shall be galvanized after welding in accordance with ASTM A123. All
20 other metal parts shall be galvanized in accordance with ASTM A153, except where
21 otherwise specified in Articles 1046-1, 1046-2 and 1046-3.

22 **1046-6 REPAIR OF GALVANIZING**

23 Perform repair of galvanizing in accordance with Article 1076-7.

24 **1046-7 CABLE GUIDERAIL**

25 Posts, hardware and miscellaneous components shall meet the applicable requirements of this
26 Section, the plans and the manufacture's requirements.

27 Furnish cable guiderail manufactured in accordance with AASHTO M 30, Type 1, Class A.

28 For concrete anchors, furnish Class A concrete if cast in place or use concrete meeting
29 Section 1077, if using precast concrete anchors.

30 Cable guiderail is not covered under the Brand Certification Program for guardrail materials.
31 Sample cable guiderail according to the *Minimum Sampling Guide*.

32 **1046-8 ACCEPTANCE**

33 Acceptance of guiderail materials and its accessories will be based on, but not limited to,
34 visual inspections, classification requirements and check samples taken from material
35 delivered to the project and conformance to the annual Brand Registration. Guiderail

Section 1050

1 materials not meeting the above requirements will be rejected, unless written approval is
2 obtained from the State.

3 **SECTION 1050**
4 **FENCE MATERIALS**

5 **1050-1 GENERAL**

6 All fencing material and accessories shall meet Section 106.

7 **(A) Chain Link Fence**

8 Furnish either galvanized steel fence framework or aluminum alloy fence framework
9 unless otherwise specified. Use the same type of fabric and framework materials
10 throughout the project.

11 Where galvanized steel framework is used, the fence fabric may be either galvanized
12 steel or aluminum coated steel, except where galvanized steel fabric is specified in the
13 contract. The Contractor may furnish any of the following galvanized steel framework
14 systems:

15 **System G1**

Line Posts:	Steel Pipe
Terminal Posts (End, Corner, or Brace Posts):	Steel Pipe
Gate Posts, Double Gate:	Steel Pipe
Gate Posts, Single Gate:	Steel Pipe
Brace Rail and Top Rail ^A	Steel Pipe

16 **System G2**

Line Posts:	Steel H Post
Terminal Posts (End, Corner, or Brace Posts):	Steel Pipe
Gate Posts, Double Gate:	Steel Pipe
Gate Posts, Single Gate:	Steel Pipe
Brace Rail and Top Rail ^A	Steel Pipe

17 **System G3**

Line Posts:	Roll Formed Steel
Terminal Posts (End, Corner, or Brace Posts):	Steel Pipe
Gate Posts, Double Gate:	Steel Pipe
Gate Posts, Single Gate:	Steel Pipe
Brace Rail and Top Rail ^A :	Steel Pipe or Roll Formed Pipe

18 **A.** Top rail to be used instead of tension wire only where called for in the itemized
19 proposal.

20 Where an aluminum alloy framework is used, the fence fabric may be either aluminum
21 alloy or aluminum coated steel. The Contractor may furnish any of the following
22 aluminum alloy framework systems:

23 **System A1**

Line Posts:	Aluminum Post
Terminal Posts (End, Corner, or Brace Posts):	Aluminum Pipe
Gate Posts, Double Gate:	Aluminum Pipe
Gate Posts, Single Gate:	Aluminum Pipe
Brace Rail and Top Rail ^A :	Aluminum Pipe

1 **System A2**

Line Posts:	Aluminum H Post
Terminal Posts (End, Corner, or Brace Posts):	Aluminum Pipe
Gate Posts, Double Gate:	Aluminum Pipe
Gate Posts, Single Gate:	Aluminum Pipe
Brace Rail and Top Rail ^A :	Aluminum Pipe

2 A. Top rail to be used instead of tension wire only where called for in the itemized
3 proposal.

4 **(B) Wire Gauge**

TABLE 1050-1 WIRE DIAMETER	
Size Coated Wire, gauge	Nominal Diameter of Wire, inch
6	0.192
7	0.177
9	0.148
10 1/2	0.128
11	0.120
11 1/2	0.113
12	0.106
12 1/2	0.099
13	0.092
13 1/2	0.086
14	0.080
15 1/2	0.067
16 1/2	0.058

5 Whenever the term gauge is used in this section to refer to a size of wire, it will be
6 construed to mean the United States Steel Wire Gauge, SWG (U.S.), regardless of
7 whether or not the base metal of the wire is steel or a nonferrous metal.

8 **1050-2 TIMBER POSTS AND BRACES**9 **(A) General**

10 Use treated southern pine meeting Articles 1082-2 and 1082-3 for all timber posts and
11 braces, except as otherwise specified herein. Posts and braces may be either round or
12 square provided that the same shape is used throughout the project for both the posts and
13 the braces. Post and brace sizes are shown in the plans in inches. The size refers to the
14 diameter for round pieces, or to the edge dimension for square pieces. Square posts and
15 braces shall be fully dressed S4S. An allowable tolerance of 1/2 inch scant for square
16 pieces will be permitted from the dimensions called for in the plans.

17 Cut round wood posts and braces from sound solid trees, free from short or reverse bends
18 in more than one plane. Do not use log veneer cores for posts and braces unless they
19 contain at least 1 inch of sapwood for their entire circumference on both ends. The post
20 or brace shall not deviate more than 1 inch at any point from a straightedge held
21 longitudinally against the piece.

22 All posts shall be free from ring shake, season cracks more than 1/4 inch wide, splits in
23 the ends and contain no unsound knots. Sound knots will be permitted provided the
24 width of the knot does not exceed 1/3 the diameter of the post where it occurs. Groups of
25 knots or any combination of defects that will impair the strength of the piece will not be
26 permitted. The pieces shall show not less than 3 annual rings per inch and not less than
27 30% of summer wood.

Section 1050

1 A tolerance of 1 inch plus and 1/2 inch minus will be allowed for the diameter of round
2 posts and braces, measured at the small end after peeling. Where they are out of round,
3 this tolerance will apply to the smaller diameter, and the larger diameter shall not exceed
4 the smaller by more than 20%. The maximum rate of increase in diameter at the butt
5 shall be 1 1/2 inches in 10 feet.

6 A minus tolerance of 1% will be allowed in the length of both round and square posts.
7 Cut the ends square.

8 **(B) Optional Steel Posts and Braces**

9 Steel posts and braces for woven wire fence instead of timber posts and braces are
10 permitted in areas located in or west of Vance, Franklin, Wake, Lee, Moore and
11 Richmond Counties. Use the same type of fence post and brace throughout the project.
12 The optional steel posts and braces shall meet Subarticle 1050-3(B).

13 **1050-3 METAL POSTS AND RAILS**

14 **(A) Chain Link Fence**

15 Posts shall meet AASHTO M 181 except as otherwise provided herein.

16 Steel H posts shall have a minimum yield strength of 45,000 psi and weigh 3.26 lbs/ft.
17 Galvanize steel H posts in accordance with ASTM F1043 with a Type A coating.
18 Aluminum H posts shall weigh 1.25 lbs/ft.

19 Roll formed steel line posts shall be a 1.625 inch x 1.875 inch section weighing
20 2.40 lbs/lf after galvanizing and be formed from 0.121 inch thick sheet having a
21 minimum yield strength of 45,000 psi. Roll formed steel brace rails and top rails shall be
22 a 1.250 inch x 1.625 inch section weighing 1.35 lbs/lf after galvanizing and be formed
23 from 0.080 inch thick sheet steel having a minimum yield strength of 45,000 psi.
24 Galvanize all roll formed members after fabrication in accordance with ASTM F1043
25 with a Type A coating.

26 Vinyl coated posts shall be pipe posts meeting AASHTO M 181 with a fusion bonded
27 vinyl coating at least 6 mils thick. The vinyl shall meet Section 6 of AASHTO M 181, or
28 if a standard color not listed in AASHTO M 181 is used, the vinyl shall meet the color
29 requirements in ASTM F934, Table 1.

30 Furnish brace rails with suitable metal connections to fasten them securely to the posts.
31 Provide the top rail not less than 6 inches long with a thickness of at least 0.051 inch if
32 steel, or 0.062 inch if 6063-T6 aluminum alloy and in lengths of at least 15 feet. The
33 complete top rail assembly shall form a continuous rail passing through the top fittings of
34 the line posts and be furnished with suitable metal connections to fasten it to the posts at
35 each end.

36 For pipe 1.90 inches O.D. and under, the outside diameter at any point shall not vary
37 more than 1/64 inch over no more than 1/32 inch under the standard specified. For pipe
38 2.375 inches O.D. and over, the outside diameter shall not vary more than $\pm 1\%$ from the
39 standard specified nor shall the minimum wall thickness at any point be more than 12.5%
40 under the nominal wall thickness specified.

41 A 10% minimum weight tolerance will be allowed for all steel posts and rails.

42 **(B) Woven Wire Fence**

43 Steel posts used instead of 4 inch timber posts shall be a standard studded T-section
44 7.5 feet long designed exclusively for use as a fence post and be equipped with a metal
45 anchor plate securely attached to the post. The T-posts shall weigh 1.33 lbs/lf exclusive
46 of the weight of the anchor plate, and have a total weight, including anchor plate, of
47 10.65 lbs. Nominal dimensions of the T-post shall be 1 3/8 inches wide and 1 3/8 inches
48 deep. A tolerance of $\pm 3/16$ inch will be permitted from these nominal dimensions. The

1 anchor plate shall be sufficiently sturdy to withstand the strain of driving with no loss of
2 effectiveness, and have a minimum area of 14.0 square inches.

3 Steel posts used instead of 5 inch timber posts may be either tubular posts or angle posts.
4 They shall be 8 feet long and be embedded in a concrete anchor at least 3.3 feet deep and
5 10 inches in diameter. Fit tubular posts with ornamental tops that fit over the top of the
6 post to cap against moisture. Fabricate the tubular posts from 2 inch diameter pipe
7 meeting AASHTO M 181 for Grades 1 or 2 metallic coated posts and rails. Fabricate
8 angle posts from angle sections measuring 2 1/2 inches x 2 1/2 inches x 1/4 inch,
9 ± 1/16 inch on the 2 1/2 inch dimensions and ± 0.015 inch on the 1/4 inch dimension and
10 weighing 4.10 lbs/ft.

11 Use steel braces with steel posts and either tubular braces or angle braces to match the
12 posts. Furnish the braces with suitable metal connections to fasten them securely to the
13 posts. Fabricate tubular braces from 1 1/4 inch diameter pipe meeting AASHTO M 181
14 for Grades 1 or 2 metallic coated posts and rails. Fabricate angle braces from angle
15 sections measuring 2 inches x 2 inches x 1/4 inch ± 3/64 inch on the 2 inch dimensions
16 and ± 0.010 inch on the 1/4 inch dimension and weighing 3.19 lbs/ft.

17 A 10% minimum weight tolerance will be allowed for all steel posts and braces.

18 For pipe 1.90 inches O.D. and under, the outside diameter at any point shall not vary
19 more than 1/64 inch over nor more than 1/32 inch under the standard specified. For pipe
20 2.375 inch O.D. and over, the outside diameter shall not vary more than ± 1% from the
21 standard specified nor shall the minimum wall thickness at any point be more than 12.5%
22 under the nominal wall thickness specified.

23 Galvanize all steel posts and braces other than tubular members in accordance with
24 ASTM A123.

25 **1050-4 BARBED WIRE**

26 Barbed wire shall meet ASTM A121 except as otherwise provided in this subarticle.

27 The barbed wire may be either galvanized steel or aluminum coated steel except that where
28 aluminum chain-link fabric is used, galvanized steel barbed wire shall not be used. Use the
29 same type of material throughout the project. All barbed wire shall have 4 point barbs spaced
30 not more than 5 inches apart. Single strand barbed wire will not be acceptable.

31 Two strand galvanized steel barbed wire shall be fabricated from either 12 1/2 gauge or
32 15 1/2 gauge strand wire with 4 point galvanized steel 14 gauge barbs. The 12 1/2 gauge shall
33 be Standard Grade with a Class 3 coating on the wire and a Class 1 coating on the barbs.
34 The 15 1/2 gauge shall be Chain Link Fence Grade with a Class 3 coating on both the wire
35 and barbs.

36 Two strand aluminum coated steel barbed wire shall be fabricated from two strands of
37 12 1/2 gauge aluminum coated steel wire with the 4-point barbs being either 14 gauge
38 aluminum coated steel or aluminum alloy wire.

39 **1050-5 WOVEN WIRE**

40 Woven wire fencing shall conform to ASTM A116 or AASHTO M 279. The fence fabric
41 shall be 47 inches high, with 10 horizontal strands. Space the strands 3 inches apart at the
42 bottom and 8 inches apart at the top with progressive spacing between. Space vertical strands
43 at 6 inch intervals. Any of the following styles and coating classes may be used.

44 (A) Style 1047-6-9, Grade 60 (all horizontal and vertical strands of wire shall be 9 gauge)
45 with a Class 3 zinc coating.

46 (B) Style 1047-6-11, Grade 60 (top and bottom horizontal strands to be 9 gauge wire, all
47 other strands to be 11 gauge) with a Class 3 zinc coating.

Section 1050

1 (C) Style 1047-6-12 1/2, Grade 125 (top and bottom horizontal strands of wire to be no
2 smaller than 10 1/2 gauge with a minimum breaking strength of 1610 lbs., all other
3 strands to be no smaller than 12 1/2 gauge with a minimum breaking strength
4 requirement for horizontal strands of 960 lbs. with a Class 3 coating.

5 Brace wire shall be a 9 gauge steel in accordance with ASTM A641, except that the minimum
6 zinc coating shall be 0.80 ounces per sf.

7 **1050-6 CHAIN LINK FABRIC**

8 Chain link fence fabrics shall meet AASHTO M 181. Galvanized steel fabric shall have
9 a Class D coating. Polyvinyl coated fabric shall be Type IV, Class A or B and the vinyl
10 coating shall be a standard color meeting AASHTO M 181 or ASTM F934 Table 1.
11 Glare screen fabric with a 0.5 inch mesh shall have a Class 1 zinc coating in accordance with
12 ASTM A392. The height of the chain link fence fabrics shall be as shown in the pay item
13 description. Weave the fabric from 11 gauge wire, unless otherwise required by the contract.
14 Glare screen fabric shall be 11 1/2 gauge unless otherwise required by the contract.

15 **1050-7 FENCE FITTINGS, HARDWARE AND ACCESSORIES**

16 All fittings, hardware and accessories shall meet AASHTO M 181, AASHTO M 232,
17 ASTM F626 OR ASTM A641 or ASTM A809 except for the size, type and coating
18 requirement as shown below in Table 1050-2 and elsewhere in this article.

19 Galvanize bolts, nuts, washers and other threaded items in accordance with AASHTO M 232.

20 Where shown in the plans, fit the posts with ornamental tops. The base of tops to be used
21 with pipe posts shall fit over the top of the post to guard against moisture.

22 Tension wire for use with galvanized steel chain link fabric shall meet AASHTO M 181 for
23 zinc coated tension wire. Tension wire for use with aluminum or aluminum coated chain link
24 fabric may be either aluminum coated tension wire meeting AASHTO M 181, or solid
25 aluminum wire with a minimum diameter of 0.192 inch. The aluminum for solid aluminum
26 wire shall meet ASTM B211 for Alloy 5056 or 6061, and have a minimum breaking strength
27 of 1,216 lbs. force and a minimum elongation of 10%. Tension wire for use with guardrail
28 mounted glare screen fabric shall be 6 gauge and for barrier mounted glare screen the wire
29 shall be 9 gauge unless otherwise required by the contract.

30 Vinyl coated fittings and accessories shall be galvanized steel or aluminum coated steel
31 meeting this article and have a bonded vinyl coating. The vinyl shall meet Section 6 of
32 AASHTO M 181 and be a standard color meeting AASHTO M 181 or ASTM F934 Table 1.
33 The vinyl coating shall be at least 6 mils thick, except that the coating on tension wire, hog
34 rings and tie wires shall be 6 to 10 mils thick.

35 **1050-8 REPAIR OF GALVANIZING**

36 Repair of galvanizing shall be in accordance with Article 1076-7. Do not use aerosol can
37 products for repairs

TABLE 1050-2 PROPERTIES OF FENCING MATERIALS				
Item	Gauge or Diameter, inch	Coating, oz/sf	Coating, oz/sf, Aluminum	Remarks
Tie wires, steel	9	0.90	0.40	For fastening chain link fabric and tension wire to tubular sections or to roll formed steel line posts.
Tie wires, Aluminum	6	-	-	Alloy 1350-H19 or approved equal.
Clips, steel wire	7	0.90	-	For fastening chain link fabric and tension wire to H- posts.
Clips, steel wire	11	0.85	-	For fastening woven wire fabric to steel posts.
Hog rings, steel	12	0.80	0.40	For fastening chain link fabric to tension wire.
Hog rings, aluminum	9	-	-	Alloy 1350-H19 or approved equal.
Truss rod, steel	5/16	2.00	-	-
Tension (stretcher) bars, steel	3/16 x 3/4	1.50	-	For connection of 1 3/4" or 2" fabric to end, gate and corner posts for fabric heights over 5 ft.
Tension (stretcher) bars, steel	3/16 x 5/8	1.50	-	For connection of 1 3/4" or 2" fabric to end, gate and corner posts for fabric heights up to 5 ft.
Tension (stretcher) bars, steel	1/4 x 3/8	1.50	-	For connection of 1" fabric to end, gate, and corner posts.
Staples, Nails or	9	0.35	-	For fastening woven wire to timber posts. Shall be the size and shape shown in the plans.
Tension wire braces	9	0.90	0.40	For woven wire fence.
Post and line caps	-	1.30	-	For installation on top of posts to guard against moisture.
Rail and brace ends (pressed steel or cast iron)	-	1.30	-	-
Top rail steel sleeves	0.051	1.30	-	For rail connections. shall be fabricated to prevent movement along the rail.
Tension band	14	1.30	-	For fastening tension bar to posts.
Brace band	12	1.30	-	For fastening rail to posts.
Barbed wire extension arms (pressed steel or cast iron)	14	1.30	-	Shall be fitted with clips or slots for attaching the barbed wire to the arms.
Hinges, latches	-	2.00	-	-

SECTION 1052

SALT AND LIME STABILIZERS

1052-1 SODIUM CHLORIDE

Sodium chloride shall meet AASHTO M 143.

1052-2 CALCIUM CHLORIDE

Calcium chloride shall be Class S or L meeting AASHTO M 144.

Section 1054

1 1052-3 LIME

2 (A) Chemical Requirements

3 Quicklime and hydrated lime for soil stabilization shall meet ASTM C977 except that it
4 shall contain at least 86% available calcium oxide (CaO) on an LOI-free basis.

5 (B) Physical Requirements

6 (1) Hydrated Lime

7 Hydrated lime shall have at least 85% passing a No. 200 sieve.

8 (2) Quicklime

9 Grade quicklime so 100% passes a 1/4 inch sieve.

10 (C) Sampling and Inspection

11 Furnish Type 1 or Type 2 material certifications with each shipment of lime attesting that
12 the lime meets the Specifications in accordance with Article 106-3; however, the material
13 will be subject to inspection, test or rejection by the Engineer at any time.

14 Lime from more than one source or more than one type may be used on the same project,
15 but the different limes shall not be mixed. Protect the lime from exposure until used and
16 sufficiently dry it to flow freely when handled.

17 SECTION 1054 **18 DRAINS**

19 1054-1 DECK DRAINS

20 Provide deck drains made of PVC pipe or of steel pipe. Use the type of pipe as shown in the
21 plans.

22 PVC pipe shall meet ASTM D1785 or D2665, and have four 1/2 inch square lugs shop glued
23 at approximately equal spacing around the pipe at 3 inches from the top end of each deck
24 drain.

25 Steel pipe shall meet ASTM A53 for standard weight galvanized pipe.

26 1054-2 FUNNELS AND FUNNEL DRAINS

27 (A) Funnels

28 Fabricate funnels for corrugated aluminum alloy pipe from clad aluminum alloy sheets
29 meeting AASHTO M 196. Perform fabrication by riveting. The completed funnel shall
30 meet AASHTO M 196.

31 Fabricate funnels for corrugated steel pipe of steel meeting AASHTO M 218.
32 Fabrication may be by riveting or by welding. The completed funnel shall meet
33 AASHTO M 36.

34 (B) Funnel Drain Pipe, Elbows and Fittings

35 Funnel drain pipe, elbows and other fittings may be, at the option of the Contractor, either
36 corrugated aluminum alloy or corrugated steel. Corrugated aluminum alloy pipe, elbows
37 and other fittings shall meet Article 1032-2. Corrugated steel pipe, elbows and other
38 fittings shall meet Article 1032-3.

SECTION 1056 GEOSYNTHETICS

1056-1 DESCRIPTION

Provide geosynthetics for subsurface drainage, separation, stabilization, reinforcement, erosion control, filtration and other applications in accordance with the contract. Use geotextiles, geocomposite drains and geocells that are on the NCDOT APL. Prefabricated geocomposite drains include sheet, strip and vertical drains (PVDs), i.e., “wick drains” consisting of a geotextile attached to and/or encapsulating a plastic drainage core. Geocells are comprised of ultrasonically welded polymer strips that when expanded form a 3D honeycomb grid that is typically filled with material to support vegetation. Define geotextiles, geogrids, geocomposite drains and geocells as geosynthetics.

If necessary or required, hold geotextiles, geogrids and sheet drains in place with new wire staples, i.e., “sod staples” that meet Subarticle 1060-8(D) or new anchor pins. Use steel anchor pins with a diameter of at least 3/16 inch and a length of at least 18 inches and with a point at one end and a head at the other end that will retain a steel washer with an outside diameter of at least 1.5 inches.

1056-2 HANDLING AND STORING

Load, transport, unload and store geosynthetics so geosynthetics are kept clean and free of damage. Label, ship and store geosynthetics in accordance with Section 7 of AASHTO M 288. Geosynthetics with defects, flaws, deterioration or damage will be rejected. Do not unwrap geosynthetics until just before installation. Do not leave geosynthetics exposed for more than 7 days before covering except for geotextiles for temporary wall faces and erosion control.

1056-3 CERTIFICATIONS AND IDENTIFICATION

Provide Type 1, Type 2 or Type 4 material certifications in accordance with Article 106-3 for geosynthetics except certifications are not required for Type 1 through Type 4 geotextiles marked with the product name. Define “machine direction” (MD), “cross-machine direction” (CD) and “minimum average roll value” (MARV) in accordance with ASTM D4439. Provide certifications with MARV for geosynthetic properties as required. Test geosynthetics using laboratories accredited by the Geosynthetic Accreditation Institute (GAI) to perform the required test methods. Sample geosynthetics in accordance with ASTM D4354.

Geotextiles will be identified by the product name printed directly on the geotextile by the Manufacturer. For all other geosynthetics and when geotextiles are not marked with a product name, geosynthetics will be identified by the product label attached to the original packaging or the geosynthetic itself by the Manufacturer.

Allow the Engineer to visually verify geosynthetic products before installation. Open packaged geosynthetics just before use in the presence of the Engineer to confirm the correct product. Geotextile rolls without the product name printed on the geotextile or the product label affixed to the geotextile or roll core by the Manufacturer will be rejected. Any other geosynthetics that are unwrapped, missing original packaging or previously opened may not be used unless approved by the Engineer.

1056-4 GEOTEXTILES

When required, sew geotextiles together in accordance with Article X1.1.4 of AASHTO M 288. Provide sewn seams with seam strengths meeting the required strengths for the geotextile type and class specified.

Provide geotextile types and classes in accordance with the contract.

Use woven or nonwoven geotextiles with properties that meet Table 1056-1.

Section 1056

**TABLE 1056-1
GEOTEXTILE REQUIREMENTS**

Property ^A	Requirement (MARV ^A)					Test Method
	Type 1	Type 2	Type 3 ^B	Type 4	Type 5 ^C	
<i>Typical Application</i>	<i>Shoulder Drains</i>	<i>Under Rip Rap</i>	<i>Silt Fence Fabric</i>	<i>Soil Stabilization</i>	<i>Temporary Walls</i>	
Elongation (MD & CD)	≥ 50%	≥ 50%	≤ 25%	< 50%	< 50%	ASTM D4632
Grab Strength (MD & CD)			100 lb ^A			ASTM D4632
Tear Strength (MD & CD)	Table 1 ^D , Class 3	Table 1 ^D , Class 1	-	Table 1 ^D , Class 3	-	ASTM D4533
Puncture Strength			-			ASTM D6241
Ultimate Tensile Strength (MD & CD)	-	-	-	-	2,400 lb/ft ^A (unless required otherwise in the contract)	ASTM D4595
Permittivity	Table 2 ^D , 15% to 50% <i>in Situ</i> Soil Passing 0.075 mm	Table 6 ^D , 15% to 50% <i>in Situ</i> Soil Passing 0.075mm	Table 7 ^D	Table 5 ^D	0.20 sec ^{-1.A}	ASTM D4491
Apparent Opening Size					0.60 mm ^E	ASTM D4751
UV Stability (Retained Strength)					70% ^A (after 500 hr of exposure)	ASTM D4355

- 1 **A.** MD, CD and MARV per Article 1056-3.
- 2 **B.** Minimum roll width of 36 inches required.
- 3 **C.** Minimum roll width of 13 feet required.
- 4 **D.** AASHTO M 288
- 5 **E.** Maximum average roll value.

1056-5 GEOCOMPOSITE DRAINS

7 Provide geocomposite drain types in accordance with the contract and with properties that
8 meet Table 1056-2.

**TABLE 1056-2
GEOCOMPOSITE DRAIN REQUIREMENTS**

Property	Requirement			Test Method
	Sheet Drain	Strip Drain	Wick Drain	
Width	≥ 12" (unless required otherwise in the contract)	12" ±1/4"	4" ±1/4"	N/A
In-Plane Flow Rate ^A (with gradient of 1.0 and 24-hour seating period)	6 gpm/ft @ applied normal compressive stress of 10 psi	15 gpm/ft @ applied normal compressive stress of 7.26 psi	1.5 gpm ^B @ applied normal compressive stress of 1.45 psi	ASTM D4716

- 9 **A.** MARV does not apply to thickness
- 10 **B.** Per foot of width tested

11 For sheet and strip drains, use accessories (e.g., pipe outlets, connectors, fittings, etc.)
12 recommended by the Drain Manufacturer. Provide sheet and strip drains with Type 1
10-78

- 1 geotextiles heat bonded or glued to HDPE, polypropylene or high impact polystyrene
2 drainage cores that meet Table 1056-3.

TABLE 1056-3			
DRAINAGE CORE REQUIREMENTS			
Property	Requirement (MARV)		Test Method
	Sheet Drain	Strip Drain	
Thickness	1/4"	1"	ASTM D1777 or D5199
Compressive Strength	40 psi	30 psi	ASTM D6364

- 3 For wick drains with a geotextile wrapped around a corrugated drainage core and seamed to
4 itself, use drainage cores with an ultimate tensile strength of at least 225 lbs. per 4 inch width
5 in accordance with ASTM D4595 and geotextiles with properties that meet Table 1056-4.

TABLE 1056-4		
WICK DRAIN GEOTEXTILE REQUIREMENTS		
Property	Requirement	Test Method
Elongation	≥ 50%	ASTM D4632
Grab Strength	Table 1 ^A ,	ASTM D4632
Tear Strength		ASTM D4533
Puncture Strength	Class 3	ASTM D6241
Permittivity	0.7 sec ⁻¹ . ^B	ASTM D4491
Apparent Opening Size (AOS)	Table 2 ^A ,	ASTM D4751
UV Stability (Retained Strength)	> 50% <i>in Situ</i> Soil Passing 0.075 mm	ASTM D4355

- 6 **A.** AASHTO M 288.
7 **B.** MARV per Article 1056-3

- 8 For wick drains with a geotextile fused to both faces of a corrugated drainage core along the
9 peaks of the corrugations, use wick drains with an ultimate tensile strength of at least 1,650
10 lbs/ft in accordance with ASTM D4595 and geotextiles with a permittivity, AOS and UV
11 stability that meet Table 1056-4.

12 **1056-6 GEOCELLS**

- 13 Manufacture geocells from virgin polyethylene resin with no more than 10% rework, also
14 called "regrind", materials. Use geocells made from textured and perforated HDPE strips
15 with an open area of 10% to 20% and properties that meet Table 1056-5.

Section 1060

**TABLE 1056-5
GEOCELL REQUIREMENTS**

Property	Minimum Requirement	Test Method
Cell Depth	4"	N/A
Sheet Thickness	50 mil -5%, +10%	ASTM D5199
Density	58.4 lb/cf	ASTM D1505
Carbon Black Content	1.5%	ASTM D1603 or D4218
ESCR ^A	5000 hr	ASTM D1693
Coefficient of Direct Sliding (with material that meets AASHTO M 145 for soil classification A-2)	0.85	ASTM D5321
Short-Term Seam (Peel) Strength (for 4" seam)	320 lb	USACE ^C Technical Report GL-86-19, Appendix A
Long-Term Seam (Hang) Strength ^B (for 4" seam)	160 lb	

- 1 **A.** Environmental Stress Crack Resistance.
2 **B.** Minimum test period of 168 hours with a temperature change from 74°F to 130°F in
3 1-hour cycles.
4 **C.** US Army Corps of Engineers

5 Provide geocell accessories (e.g., stakes, pins, clips, staples, rings, tendons, anchors,
6 deadmen, etc.) recommended by the Geocell Manufacturer.

7

8

9

SECTION 1060 LANDSCAPE DEVELOPMENT MATERIALS

10 **1060-1 GENERAL**

11 Supply certifications for all landscape development materials as required below. If no
12 certification is required, supply the Department with a statement certifying that all materials
13 conform to these Specifications and those of the NC Department of Agriculture and
14 Consumer Services (NCDA&CS) or both. All landscape development materials shall comply
15 with all applicable Federal and State domestic plant quarantines.

16 **1060-2 FERTILIZER**

17 The quality of all fertilizer and all operations in connection with the furnishing of this material
18 shall comply with the North Carolina Fertilizer Law and with the rules and regulations,
19 adopted by the North Carolina Board of Agriculture in accordance with said law, in effect at
20 the time of sampling. All fertilizer will be subject to sampling and testing by the Engineer, or
21 by an authorized representative of the North Carolina Department of Agriculture and
22 Consumer Services, or both.

23 Dry fertilizer shall be manufactured from cured stock. Care for the fertilizer during handling
24 and storing in such a manner that it will be protected against hardening, caking or loss of plant
25 food values. Pulverize any hardened or caked fertilizer to its original condition before using.

26 **1060-3 LIMESTONE**

27 The quality of all limestone and all operations in connection with the furnishing of this
28 material shall comply with the North Carolina Agricultural Liming Materials and Landplaster
29 Act, and with the rules and regulations, adopted by the North Carolina Board of Agriculture
30 and Consumer Services in accordance with said law, in effect at the time of sampling. All

1 limestone will be subject to sampling and testing by the Engineer, or by an authorized
2 representative of the North Carolina Department of Agriculture, or both.

3 Limestone shall be agricultural grade ground limestone. Either dolomitic or calcitic limestone
4 may be used.

5 All limestone shall contain not less than 90% calcium carbonate equivalents. Dolomitic
6 limestone shall contain not less than 10% of magnesium. Grade dolomitic limestone so at
7 least 90% will pass through a U.S. Standard 20 mesh screen and at least 35% will pass
8 through a U.S. Standard 100 mesh screen. Grade calcitic limestone so at least 90% will pass
9 through a U.S. Standard 20 mesh screen and at least 25% will pass through a U.S. Standard
10 100 mesh screen. Where the current grading requirements of the North Carolina Board of
11 Agriculture are different from the above, the requirements of the Board of Agriculture will
12 apply.

13 During handling and storing, care for the limestone in such manner that it will be protected
14 against hardening or caking. Pulverize any hardened or caked limestone to its original
15 condition before using.

16 **1060-4 SEED**

17 The quality of all seed and all operations in connection with the furnishing of this material
18 shall comply with the North Carolina Seed Law and with the rules and regulations, adopted
19 by the North Carolina Board of Agriculture and Consumer Services in accordance with said
20 law, in effect at the time of sampling, and with the quality requirements of the *Standard*
21 *Specifications*. All seed will be subject to sampling by the Engineer, or by an authorized
22 representative of the North Carolina Department of Agriculture and Consumer Services, or
23 both; and will be tested by the North Carolina Department of Agriculture. Supplementary
24 testing for seed germination may be performed by the Engineer.

25 The quality of all seed will be based on the percentage of pure live seed, which will be
26 computed by multiplying the percentage of purity by the percentage of germination and
27 dividing the result by 100.

28 Seed shall have been approved by the North Carolina Department of Agriculture and
29 Consumer Services before being sown. No seed will be accepted with a date of test more than
30 eight months before the date of sowing, excluding the month in which the test was completed.
31 Such testing, however, will not relieve the Contractor from responsibility for furnishing and
32 sowing seed that meets these *Standard Specifications* at the time of sowing. The Engineer
33 may retest seed for germination after 5 months of storage; at the beginning of each normal
34 seeding season for the particular kind of seed involved or at any time that the condition of the
35 seed appears to have deteriorated.

36 When a low percentage of germination causes the quality of the seed to fall below the
37 minimum pure live seed specified, the Contractor may elect, subject to the approval of the
38 Engineer, to increase the rate of application sufficiently to obtain the minimum pure live seed
39 content specified, provided that such an increase in the rate of application does not cause the
40 quantity of noxious weed seed per acre or square yard, as the case may be, to exceed the
41 quantity that would be allowable at the regular rate of application.

42 Furnish and deliver each of the species or varieties of seed in separate bags. If seed is to be
43 mixed before sowing, perform such mixing in a commercial seed mixing machine, or by
44 an equally thorough means, after sampling and testing have been completed.

45 During handling and storing, care for the seed in such a manner that it will be protected from
46 damage by heat, moisture, rodents or other causes.

47 **1060-5 MULCH FOR EROSION CONTROL**

48 Mulch for erosion control shall consist of grain straw, or other acceptable material, and be
49 approved by the Engineer before being used. All mulch shall be reasonably free from mature

Section 1060

1 seedbearing stalks, roots or bulblets of Johnson Grass, Nutgrass, Sandbur, Wild Garlic, Wild
2 Onion, Crotalaria, Witchweed and an excessive amount of restricted noxious weeds as
3 defined by the North Carolina Board of Agriculture at the time of use of the mulch. Loose
4 and separate straw mulch that is matted or lumpy before being used.

5 Material for holding mulch in place shall be asphalt or other approved binding material.

6 **1060-6 SPRIGS**

7 Sprigs shall consist of freshly dug live stolons or rhizomes of perennial grasses, at least 2
8 inches in length, and be first class representatives of the required species or varieties specified
9 in the specifications. The areas from which sprigs are to be obtained shall be free from
10 Johnson Grass, Nutgrass, Sandbur, Wild Garlic, Wild Onion, Crotalaria, Witchweed and an
11 excessive amount of restricted noxious weeds as defined by the North Carolina Board of
12 Agriculture at the time of digging the sprigs. The areas shall have been mowed and raked,
13 burned off, or otherwise prepared in a manner acceptable to the engineer before digging of
14 sprigs begins.

15 **1060-7 SOD**

16 Sod shall consist of a live, dense, well-rooted growth of permanent grasses, free from Johnson
17 Grass, Nutgrass, Sandbur, Wild Garlic, Wild Onion, Crotalaria, Witchweed and an excessive
18 amount of restricted noxious weeds as defined by the North Carolina Board of Agriculture
19 and Consumer Services at the time of cutting the sod. Mow the area from which sod is to be
20 obtained to a height of not more than 2 inches. Rake free of grass clippings and debris and
21 otherwise prepared in a manner satisfactory to the Engineer before cutting of sod begins.

22 Cut the sod into rectangular sections of sizes convenient for handling without breaking or loss
23 of soil. Cut it with a sod cutter or other acceptable means to a depth that will retain in the sod
24 practically all of the dense root system of the grass.

25 During wet weather, allow the sod to dry sufficiently before lifting to prevent tearing during
26 handling and placing. During extremely dry weather, water it before lifting if such watering
27 is necessary to insure its vitality and to prevent loss of soil during handling.

28 **1060-8 MATTING FOR EROSION CONTROL**

29 **(A) General**

30 Matting for erosion control shall be excelsior matting or straw matting. Furnish
31 a Type 3 material certification in accordance with Article 106-3 certifying that the
32 matting meets this article. Other acceptable material manufactured especially for erosion
33 control may be used when approved by the Engineer in writing before being used.
34 Matting for erosion control shall not be dyed, bleached or otherwise treated in a manner
35 that will result in toxicity to vegetation.

36 **(B) Excelsior Matting**

37 Excelsior matting shall consist of a machine produced mat of curled wood excelsior at
38 least 47 inches in width and weigh 0.975 lb/sy with a tolerance of $\pm 10\%$. At least 80%
39 of the individual excelsior fibers shall be 6 inches or more in length. Evenly distribute
40 the excelsior fibers over the entire area of the blanket. Cover one side of the excelsior
41 matting with an extruded plastic mesh. The mesh size for the plastic mesh shall be no
42 more than 1 inch x 1 inch.

43 **(C) Straw Matting**

44 Straw matting shall consist of a machine produced mat of 100% grain straw. The straw
45 matting shall have a width of at least 48 inches and no more than 90 inches and weighing
46 at least 0.50 lb/sy and no more than 0.75 lb/sy. Evenly distribute the straw over the entire
47 area of the blanket. Cover one side of the blanket with photodegradable netting with

1 a maximum mesh (netting) size of 0.75 inch x 0.75 inch sewn together with a degradable
2 thread. The grain straw shall contain no weed seeds. Package each roll separately.

3 **(D) Wire Staples**

4 Staples shall be machine made of No. 11 gauge new steel wire formed into a U-shape.
5 The size when formed shall be not less than 6 inches in length with a throat of not less
6 than 1 inch in width.

7 **1060-9 WATER**

8 Water used in the planting or care of vegetation shall meet Class C fresh waters as defined
9 in 15 NCAC 2B.0200.

10 **1060-10 NURSERY GROWN PLANT MATERIALS**

11 **(A) General**

12 Use all plants as called for by the contract.

13 Container grown plants may be used instead of balled and burlapped plants or bare rooted
14 plants provided written approval for such use has been obtained from Engineer.

15 Grading of plants, size of root balls and type and minimum dimensions of containers
16 shall conform to the *American Standard for Nursery Stock*. Do not cut back plants from
17 larger sizes to meet the sizes called for in the contract.

18 Botanical names referred to in the contract are taken from *Hortus Third, the Bailey*
19 *Hortorium* (MacMillan Publishing Co., Inc.). All plants delivered shall be true to name.
20 Each plant, or group of the same species, variety and size of plant, shall be legibly tagged
21 with the name and size of the plant.

22 All plants shall be first-class representatives of their species or varieties. The root system
23 shall be vigorous and well developed. The branch systems shall be of normal
24 development and free from disfiguring knots, sun scald injuries, abrasions of the bark,
25 dead or dry wood, broken terminal growth or other objectionable disfigurements. Trees
26 shall have reasonably straight stems and be well branched and symmetrical in accordance
27 with their natural habits of growth.

28 All plants shall be free from plant diseases and insect pests. All shipments of plants shall
29 comply with all nursery inspection and plant quarantine regulations of the states of origin
30 and destination, as well as with Federal regulations governing interstate movement of
31 nursery stock. Any nursery stock used on highway landscape projects shall be
32 accompanied by a valid copy of a certificate of inspection, which has been granted by the
33 North Carolina Department of Agriculture and Consumer Services, Entomology
34 Division. Fire ant treatment certification, where applicable, is required.

35 When nursery stock from other states is used on projects in North Carolina, this stock
36 shall be accompanied by a tag or certificate stating that the nursery stock has been
37 inspected and certified by an authorized official of the state of origin as apparently free
38 from injurious plant pests.

39 All plant materials are subject to inspection at any time by the Engineer. Any such
40 inspection before or during planting operations, however, will not be construed as final
41 acceptance of the plants involved.

42 All geophytes; bulbs, corms and tuberous plants; shall be synonymous to the term "plant"
43 within the contract. Examples include, but are not limited to, Narcissi (Daffodil), Tulipa
44 (Tulip), Iris and Canna; the terms "bulb", "corm", "tuber"; and specific plant names such
45 as "Daffodil", "Tulip", "Canna lily", etc.

Section 1060

1 (B) Balled and Burlapped Plants

2 Dig plants to be balled and burlapped so as to retain a firm ball of soil and the plant's
3 fibrous root system. The soil in the ball shall be the original and undisturbed soil in
4 which the plant has been grown. Dig, wrap, transport and handle the plant so the soil in
5 the ball shall not become frozen, loosened, cause stripping of the small feeding roots nor
6 movements of the soil away from contact with such roots.

7 (C) Container Grown Plants

8 Container grown plants shall be healthy, vigorous, well-rooted and established in the
9 container in which they are delivered. These plants shall be in the container long enough
10 for the fibrous roots to have developed so the root mass will retain its shape and hold
11 together when removed from the container. The container shall be sufficiently rigid to
12 firmly hold the soil protecting the root mass during transporting, handling and planting.
13 The soil shall not be allowed to become frozen.

14 (D) Bare Root Plants

15 Bare root plants shall have a heavy fibrous root system that has been developed by proper
16 cultural treatment. Dig, package, transport and handle bare root plants in a manner that
17 will prevent injury to or drying out of the trunks, branches or roots, or freezing of the
18 roots. Bare root plants damaged through improper handling, freezing, drying out, etc.
19 will result in rejection of material.

20 (E) Plant Substitution

21 No change in the *Standard Specifications* (species, variety, size, caliper, furnish) will be
22 made without written approval of the Engineer. Present all requests for substitutions in
23 writing and include a listing of the sources contacted in an attempt to secure specified
24 plant material. Requests for substitutions shall include the botanical name, common
25 name, cultivar, where applicable, size, caliper and furnish description of the proposed
26 substitute. No increase in compensation will be made to the Contractor as a result of the
27 use of approved substitute plants. The Department reserves the right to locate specified
28 plant material for the project when it has knowledge that specified material is available.

29 (F) Geophytes

30 Geophytes; bulbs, corms and tuberous plants; shall be healthy and free of disease caused
31 by fungi, nematodes, bacteria and wilt. Plants that are lightweight and lacking adequate
32 mass will result in rejection. Plants shall be firm and absent of discolored patches with
33 soft or spongy areas or signs of rot, slime or mold. Plants with new root growth will
34 result in rejection.

35 Dig, package, transport and handle these plants as to prevent injury, drying out, excessive
36 wetness or freezing. Damaged plants through improper handling, freezing, drying out or
37 excessive moisture will result in rejection.

38 All geophytes, bulbs, corms and tuberous plants shall be inspected for size and condition
39 and rejected plants shall be removed from the supply before planting.

40 1060-11 MULCH FOR PLANTING

41 Use mulch for planting as specified in the specifications, shown in the plans, or approved by
42 the Engineer. Mulch for planting shall not contain substances injurious to plants or which
43 will inhibit normal development and growth of plants. Mulch for a project shall come from
44 a single source, as approved by the Engineer, unless an additional source is submitted and
45 approved before use.

1 **1060-12 MATERIALS FOR STAKING OR GUYING**2 **(A) Stakes**

3 Use stakes made of cypress, cedar, oak, locust or other acceptable wood free from defects
4 that would compromise the strength of the stake. Stakes shall be at least
5 2 inches x 2 inches (nominal). Use stakes of the size and length as shown in the plans.

6 **(B) Wire**

7 Wire shall be new soft No. 14 gauge steel wire or as shown in the plans.

8 **(C) Hose**

9 Hose to be used with wire shall have a minimum inside diameter of 1/2 inch. All hose
10 shall be garden type hose composed of rubber and fabric, or as shown in the plans.

11 **(D) Other**

12 Other staking and guying materials may be used if a sample is submitted and approved by
13 the Engineer before use.

14 **1060-13 HERBICIDES**

15 The herbicide to be used for a particular application shall be as specified or approved by the
16 Engineer prior to their application.

17 Herbicides shall be properly labeled and registered with the United States Department of
18 Agriculture and the North Carolina Department of Agriculture and Consumer Services. A
19 container shall contain only the herbicide that meets the analysis guaranteed on the label.
20 Keep all herbicides in such original labeled containers until used.

21 Herbicide application shall only be conducted by individuals who possess a pesticide license
22 from the NC Department of Agriculture and Consumer Services or individuals under their
23 direction and who has read, understands, and follows the herbicide labeling before applying
24 the product.

25 **1060-14 COIR FIBER MAT**

26 Coir fiber mat shall consist of 100% coconut fiber (coir) twine woven into high strength
27 matrix. The coir fiber mat shall have a thickness of at least 0.30 inch and weigh at least 20
28 ounces per square yard. The coir fiber mat shall have a tensile strength of at least 1,348 x 626
29 lbs/ft and elongation of no more than 34% x 38%. The coir fiber mat shall have a flexibility
30 of 65,030 x 29,590 mg-cm. The coir fiber mat shall have an observed flow velocity of 11 feet
31 per second. The coir fiber mat shall have a C-Factor of 0.002. The size of the coir fiber mat
32 shall be 6.6 feet x 164 feet and the measured open area shall be 50%.

33 **1060-15 SPECIAL STILLING BASIN**

34 The special stilling basin shall be a bag constructed to a minimum size of 10 feet x 15 feet
35 made from a nonwoven fabric. It shall have a sewn-in 8 inches (maximum) spout for
36 receiving pump discharge. The bag seams shall be sewn with a double needle machine using
37 a high strength thread. The seams shall have a minimum wide width strength of 60 lbs. per
38 inch tested in accordance with ASTM D4884.

39 **SECTION 1070**
40 **REINFORCING STEEL**

41 **1070-1 GENERAL**

42 All reinforcing steel and welded wire reinforcement shall come from a NTPEP certified
43 facility for Reinforcing Steel and Welded Wire Reinforcement (REBAR/WWR). Standard
44 drawing details for reinforcement products are found in the *Roadway Standard Drawings*.

Section 1070

1 Steel reinforcement shall be stored above the surface of the ground on platforms, skids, or
2 other supports and shall be protected from mechanical injury and surface deterioration caused
3 by exposure to conditions producing rust. When placed in the work, reinforcement shall be
4 free from dirt, loose rust or scale, mortar, paint, grease, oil, or other nonmetallic coatings
5 which could reduce bond as determined by the Engineer. Reinforcing steel placement and
6 fastening shall conform to the requirements of AASHTO LRFD Bridge Construction
7 Specifications, Section 9 and these Specifications of which the more stringent shall apply.

8 When approved by the Engineer, field welding of reinforcing steel materials shall be
9 performed in accordance with Section 1072 and at a minimum, comply with the current
10 edition of AWS D1.4.

11 **1070-2 REINFORCEMENT STEEL BAR FOR ROADS AND STRUCTURES**

12 All reinforcing steel must be provided by a NCDOT approved facility. Supply deformed steel
13 bar reinforcement conforming to ASTM A615 for Grade 60. For un-coated deformed and/or
14 plan reinforcing, furnish the Engineer a Type 1 certification in accordance with Article 106-3
15 and attach it an M&T Form 913 for each shipment of reinforcing material. Bend and cut
16 during fabrication with tolerances in accordance with the *Manual of Standard Practice*
17 published by the Concrete Reinforcing Steel Institute and/or AASHTO LRFD Bridge
18 Construction Specifications, Section 9. Bend the bars cold to the details shown in the plans.

19 Weld steel bar reinforcement only where shown in the plans or approved by the Engineer.
20 When welding steel bar reinforcement use bars conforming to ASTM A706.

21 **1070-3 COLD DRAWN STEEL WIRE AND WIRE REINFORCEMENT**

22 Provide cold drawn steel wire for use as spirals or in fabricated form for the reinforcement of
23 concrete meeting AASHTO M 32. When required by the plans, apply epoxy coating by a
24 NCDOT approved facility.

25 Use smooth welded wire reinforcement conforming to AASHTO M 55.

26 Use deformed welded wire reinforcement conforming to AASHTO M 221.

27 **1070-4 REINFORCING STEEL BAR SUPPORTS**

28 Provide all wire bar supports of smooth cold drawn industrial quality basic wire having
29 a minimum tensile strength of 65,000 psi. When the legs of the bar supports are in contact
30 with the forms, ensure that the entire leg of the bar support is stainless steel wire or
31 a minimum thickness of 1/4 inch stainless steel at points of contact with the forms. Use
32 stainless steel wire meeting ASTM A493 except having a minimum chromium content of
33 16% and a minimum tensile strength of 95,000 psi. Ensure that wire sizes, height tolerance,
34 and leg spacing for wire bar supports are in accordance with the *Manual of Standard Practice*
35 published by the Concrete Reinforcing Steel Institute.

36 As an option to the stainless steel wire for the legs of bar supports at points of contact with the
37 forms, provide legs of cold drawn steel wire plastic protected in accordance with the *Manual*
38 *of Standard Practice* published by the Concrete Reinforcing Steel Institute, except provide
39 plastic protection by dipping or by premolded plastic tips. Do not use plastic legs molded to
40 the top wire.

41 Use plastic bar supports meeting the requirements listed in the *Manual of Standard Practice*
42 published by the Concrete Reinforcing Steel Institute only when approved by the Engineer.

43 **1070-5 PRESTRESSING STRAND**

44 Use prestressing strands for use in prestressed concrete consisting of seven wire strands, stress
45 relieved after manufacture to remove internal stresses. Use the size and the grade of the
46 strand as shown in the plans. Use strands conforming to AASHTO M 203 except provide
47 a specimen for test purposes, if required, from each reel of cable instead of each 20 ton
48 production lot.

1 For precast prestressed deck panels, use 3/8 inch round seven-wire stress-relieved Grades 250
2 or 270 prestressing strands meeting AASHTO M 203.

3 Mark the outer layer of each reel pack of strand with a wide color band as follows: white for
4 Grade 270 stress relieved strand, green for low relaxation strand, and a double marking of
5 green and red for special low relaxation strand. In addition, attach a metal tag to each reel
6 pack labeled in accordance with AASHTO M 203.

7 **1070-6 DOWELS AND TIE BARS FOR PORTLAND CEMENT CONCRETE**
8 **PAVEMENT**

9 Use smooth plain round steel dowel bars conforming to AASHTO M 31 Grade 60. Do not
10 use dowel bars with burred ends. A tolerance of $\pm 1/4$ inch is permitted from the dowel length
11 required by the plans. A straightness tolerance of 0.075 inch from a straight line is permitted.

12 When required by the plans, epoxy coat and fabricate all dowel bars/baskets by a NCDOT
13 approved facility.

14 Use dowel assemblies for supporting dowel bars of rigid construction capable of holding the
15 dowel bars in proper position during placing of concrete, and of such design to permit
16 unrestricted movement of the pavement slab. Use wire for dowel assemblies meeting
17 AASHTO M 32. Use a dowel assembly that holds the dowels in the required position within
18 a tolerance of $\pm 1/4$ inch in vertical and horizontal planes. Obtain written approval from the
19 Engineer for the dowel assembly before use.

20 Coat dowel bars and the entire dowel assembly with an approved wax base coating. Apply
21 the coating by dipping or spraying such that the wax coating on the dowel bars is of uniform
22 thickness sufficient to allow pulling of the dowel from the concrete as provided in
23 AASHTO T 253 Type B coated dowel.

24 When required by the Department's Minimum Sampling Guide, furnish for testing one dowel
25 basket assembly for each 200 assemblies incorporated into the project. Each Department
26 approved producer/supplier, coater and fabricator shall provide the Department a Type 1
27 material certification in accordance with Article 106-3, M&T DB-06 Dowel Basket
28 Fabrication Report and when required by the Engineer the M&T Form 913 for all coated
29 dowel baskets and loose dowels with each shipment.

30 Use deformed tie bars conforming to AASHTO M 31 for Grade 40 or Grade 60.

31 Storage, handling and transportation of epoxy coated dowel and/or tie bars shall be in
32 accordance with Section 1070-7(D).

33 **1070-7 EPOXY COATED REINFORCING STEEL**

34 **(A) General**

35 Coating and fabrication of epoxy coated reinforcing steel shall establish proof of their
36 competency and responsibility in accordance with the Concrete Reinforcing Steel
37 Institute's Fusion Bonded Epoxy Coating Applicator Plant Certification Program.
38 Registration and certification of the plant or shop under the CRSI Program and
39 submission of the valid annual certificate to the State Materials Engineer is required
40 before beginning any coating. The same requirement applies to coaters subcontracting
41 work from the coater directly employed by the contractor.

42 Obtain approval of each coater and/or fabricator of epoxy coated reinforcing steel before
43 coating or fabrication of bars. The coating applicator and/or fabricator is responsible for
44 establishing and maintaining an effective quality control program, and employ equipment
45 for cleaning, coating and/or fabricating that produces coated material conforming to the
46 *Standard Specifications*.

47 Include in requests for approval a well-defined quality control program and direct the
48 requests to the State Materials Engineer. Before Department approval is issued, the

Section 1070

1 condition of equipment for blast cleaning, coating and/or fabricating material is evaluated
2 by the Engineer for determining the equipment capability of producing a coated product
3 conforming to the *Standard Specifications*. Lists of Department approved epoxy coating
4 and fabricating companies are available from the State Materials Engineer.

5 (B) Coating Materials

6 Obtain approval for the epoxy resin powder before use. A list of prequalified powder
7 sources is available from the State Materials Engineer.

8 (C) Coated Reinforcing Steel

9 Use coated steel reinforcing bars meeting AASHTO M 31, Grade 60 and free of
10 contaminants such as oil, grease and paint. Use bars free of surface irregularities as
11 defined in ASTM A775 and/or that produce holidays in the coating.

12 (D) Handling, Storage and Transportation

13 When handling, storing and transporting coated steel reinforcing bars, all contact areas
14 shall be padded.

15 All bundling bands shall be padded or suitable banding shall be used to prevent damage
16 to the coating. All bundles of coated steel reinforcing bars shall be lifted with a strong
17 back, spreader bar, multiple supports, or a platform bridge to prevent bar-to-bar abrasion
18 from sags in the bundles of coated steel reinforcing bars. Packaging of uncoated and
19 coated bars is strictly prohibited. When loading/unloading coated bars; pallets, bags or
20 bundles shall not be dropped or dragged.

21 During storage, protect steel reinforcement at all times from damage and make sure it is
22 free from dirt, dust, loose mill scale, loose rust, paint, oil or other foreign materials until
23 the time of placement. For storage outside at the fabrication shop and project site, store
24 epoxy coated reinforcing steel bars at least 1 foot above the ground on wooden or padded
25 supports placed 10 feet apart, and completely cover with an opaque cloth, canvas or
26 woven fiber reinforced polyethylene white tarp. Storage of uncoated and coated material
27 shall not be mixed or in direct contact. Do not use solid plastic sheeting. Cover the bars
28 such that adequate ventilation is provided to prevent condensation from forming on the
29 material during storage, and completely protect the bars from direct sunlight. Do not
30 allow water to pond under the epoxy coated reinforcing steel. Do not expose epoxy
31 coated reinforcing steel to outdoor weather for more than 30 days. If the coated steel
32 reinforcing bars are stored outdoors without cover, the date on which the coated bars are
33 placed outdoors shall be recorded on the identification tag for the bundled steel.

34 Transport the bundled bars from the producer/supplier to the project site with padding,
35 such as carpet padding, placed over each bundle of steel upon which another bundle of
36 steel is placed unless wooden spacers are placed between each bundle to prevent contact.
37 Load all bundles of bars horizontally for transporting. Transport the bars on a flatbed
38 trailer. Do not allow the length of bars to exceed 8 feet beyond the trailer bed. Repair
39 coating damage associated with handling and transporting or other causes in accordance
40 to Section 1070-7 (E). Coated steel reinforcing bars should be off-loaded as close as
41 possible to their points of placement or under the crane so that the bars can be hoisted to
42 the area of placement to minimize re-handling. If the material is being transported in
43 adverse weather conditions the producer/supplier, coater, fabricator and/or Contractor
44 shall co-coordinate a material protection plan, test for the presence of chlorides, and, if
45 necessary, clean the material as directed by the Engineer.

1 **(E) Field Coating Repair**

2 The maximum amount of repaired damaged coating shall not exceed 1% of the total
 3 surface area in each 0.3 m [1 foot] of the bar. This limit on repaired damaged coating
 4 shall not include sheared or cut ends that are coated with patching material. When
 5 degraded coating is observed additional inspection or non-destructive testing may be
 6 required by the Engineer at no additional cost to the Department.

7 Ensure the Contractor uses a Department approved patching or repair material that is
 8 compatible with the coating and inert in concrete. When repair is required, clean the
 9 areas in accordance to SSPC SP-1 prior to performing additional surface preparation.
 10 Surface preparation shall be in accordance with SSPC SP-11 (Power Tool Cleaning to
 11 Bare Metal) and/or in accordance with the manufacturers recommendations. The more
 12 stringent of the two shall apply. Ensure that the material is suitable for making repairs
 13 with a minimum dry film thickness of 7 mils. Ensure that the Contractor has a copy of
 14 the manufacturer's written instructions for application of the patching material and the
 15 instructions are closely followed during any coating damage repair. Do not apply any
 16 patch material when the surface temperature of the steel or the air temperature is below
 17 40°F. Do not ship or place steel until the patch material is dry to the touch.

18 **1070-8 SPIRAL COLUMN REINFORCING STEEL**

19 Furnish spiral column reinforcing steel with the following areas and weights as required in
 20 Table 1070-1 and in the plans.

TABLE 1070-1			
SPIRAL COLUMN REINFORCEMENT STEEL PROPERTIES			
Material	Size	Area, sq.in.	Weight, lb/ft
Plain Cold Drawn Wire	W 20	0.20	0.668
	W 31	0.31	1.043
Deformed Cold Drawn Wire	D-20	0.20	0.680
	D-31	0.31	1.054
Plain or Deformed Bar	#4	0.20	0.668
	#5	0.31	1.043

21 Use cold drawn wire conforming to AASHTO M 32. Use plain or deformed bars conforming
 22 to AASHTO M 31 for Grade 60. Use deformed cold drawn wire conforming to
 23 AASHTO M 225.

24 The diameter of the spiral reinforcing steel is the outside to outside measurement of the bars
 25 or wire, with an allowance of 1/2 inch more or 1/2 inch less than the specified diameter as
 26 shown in the plans.

27 Furnish spirals with 1.5 extra turns at top and at bottom of the completed spiral cage. Where
 28 splicing of the spirals is necessary other than those shown in the plans, provide a minimum
 29 lap splice of 3 feet.

30 Do not weld on the spiral reinforcing steel.

31 When required by the plans, use epoxy coated spiral column reinforcing steel and spacers
 32 provided by a NCDOT approved facility.

33 Use the minimum number of spiral spacers as shown in the plans. Ensure a minimum section
 34 modulus per spiral spacer of 0.030 cu. in.

Section 1072

1 1070-9 MECHANICAL BUTT SPLICES

2 When called for by the contract or when directed by the Engineer, use a mechanical butt
3 reinforcing steel splice from an approved source. Use a standard metal filled sleeve, cement
4 mortar filled sleeve, threaded steel couplings, forged steel sleeve or cold-forged sleeve.
5 An exothermic process whereby molten filler metal, contained by a high strength steel sleeve
6 of larger inside diameter than the bars, is introduced into the annular space between the bars
7 and the sleeve and between the ends of the bars may be used. Provide a splice that is capable
8 of transferring at least 125% of the yield strength of the bars from one bar to the other by the
9 mechanical strength of the splice components.

10 For splices not on the approved list, before use and as a condition of approval, assemble three
11 test splices in the presence of the Engineer for each size of bar which is proposed for use on
12 the project. Forward the test splices to the Materials and Tests Unit in Raleigh, NC for testing
13 and approval.

14 1070-10 REJECTION

15 Reinforcing material that does not meet the *Standard Specifications* is rejected. When
16 required by the Engineer, replace reinforcing material that is bent, deformed, exhibits cracked
17 material or welds, contaminated and when the maximum amount of coating damage exceeds
18 the limits herein or degraded coating is observed and as determined by the Engineer.

19 SECTION 1072 20 STRUCTURAL STEEL

21 1072-1 GENERAL

22 Furnish and fabricate all structural steel and related incidental materials including sign
23 supports and high mount lighting standards and use materials in accordance with this section.

24 (A) Department Steel Bridge Qualification Program

25 Fabricators furnishing structural steel bridge members for Department projects shall
26 comply with this program. Qualifications shall be submitted prior to project letting.

27 (B) Fabricator Qualification

28 Use steel fabricators on the Department's Approved Structural Steel Fabricators List that
29 have undergone and successfully completed the Department's audit process for the type
30 work being performed as outlined below. The list is available from the Materials and
31 Tests Unit or on the Department's website.

32 Employ fabricators that possess an AISC Bridge Component Quality Management
33 Systems (QMS) Certified Component Manufacturer Certification (CPT) for the
34 following:

- 35 (1) High mount lighting standards in excess of 80 feet in length
- 36 (2) Structural steel components of fender systems,
- 37 (3) Solar array platforms
- 38 (4) Retaining walls and noise walls
- 39 (5) Sign supports and sign structures
- 40 (6) Expansion joints (except modular joints)

41 Employ fabricators that possess an AISC certification category of Simple Bridge
42 Requirement (SBR) for the following:

- 43 (1) Pot and expansion bearings

1 (2) Simple span rolled beams (unspliced rolled sections), including those requiring cover
2 plates,

3 (3) Pedestrian bridge truss sections

4 (4) Modular expansion joints

5 Employ fabricators of rail structures, heat curved rolled beams, rolled beams for
6 continuous spans and plate girders that are AISC certified bridge fabricator – Advanced
7 Bridge Requirement (ABR). Employ fabricators of fracture critical bridge beams and
8 girders that have a Fracture Critical Members Endorsement from AISC. Fabricators
9 performing shop coating applications shall meet the minimum requirements outlined in
10 Section 442.

11 When AISC certification is required, submit proof of registration and certification of the
12 plant or shop under the AISC program to the State Materials Engineer before beginning
13 fabrication and on an annual basis. The same requirements apply to fabricators
14 subcontracting work from the fabricator directly employed by the Contractor.

15 (C) Office

16 Ensure that fabricators of main structural steel components of bridges provide an office
17 area with an approximate floor space of 100 sf, a desk or drafting table, 2 chairs,
18 telephone, facilities for proper heating and cooling, telephone, internet access and
19 adequate lighting and located at the plant site for the exclusive use of the Engineer or
20 their designee. Ensure fabricators of other structural steel items furnish reasonable work
21 areas for the Engineer.

22 1072-2 SHAPES, PLATES, BARS AND SHEETS

23 Use shapes, plates, bars and sheets meeting AASHTO M 270 Grade 36 unless otherwise
24 required by the contract. For painted beams or girders, use sheet material of 1/32 inch in
25 thickness meeting ASTM A1008 or A1011, and sheet material of 1/16 inch through 5/32 inch
26 thickness meeting ASTM A1011 for Grades 36, 40 or 45. For unpainted beams or girders,
27 use sheet material less than 3/16 inch thickness meeting ASTM A606 for Type 4.

28 1072-3 BEARING PLATE ASSEMBLIES

29 Unless otherwise shown in the plans, galvanize steel bearing assemblies for both structural
30 steel beams and girders and prestressed concrete girders. Galvanize anchor bolts, nuts and
31 washers in accordance with AASHTO M 232. Cut pipe sleeves and collars from Schedule 40
32 PVC pipe meeting ASTM D1785.

33 Except for attachments of bearing plates to beams, fabricate and weld bearing plate
34 assemblies before galvanizing the steel. Seal all joints of welded parts with weld material.
35 After the fabrication of the bearing plate assembly is complete, galvanize the assembly in
36 accordance with AASHTO M 111. For prestressed concrete girders, clean welds made for
37 attaching bearing plates to beams or girders and give them two coats of organic zinc repair
38 paint having a minimum total coating thickness of 3 dry mils. For steel beams and girders,
39 clean and paint in accordance with Article 442-10.

40 Repair galvanized surfaces that are abraded or damaged at any time after the application of
41 the zinc coating by thoroughly wire brushing the damaged areas and removing all loose and
42 cracked coating, after which give the cleaned area two coats of organic zinc repair paint
43 having a minimum total coating thickness of 3 dry mils.

44 Use zinc rich paint meeting Article 1080-9.

45 1072-4 ANCHOR BOLTS

46 Unless otherwise stated herein, use anchor bolts meeting ASTM A307 for Grade A.

47 Provide anchor bolts for bearing plate assemblies meeting ASTM A449.

Section 1072

1 Swedge anchor bolts for a distance equal to the embedment length minus 3 inches measured
2 from the embedded end.

3 Hot-dip galvanize anchor bolts, nuts and washers in accordance with AASHTO M 232.

4 **1072-5 HIGH STRENGTH BOLTS, NUTS AND WASHERS**

5 **(A) General**

6 Furnish all high-strength bolts, nuts and washers, including direct tension indicators, in
7 accordance with the appropriate AASHTO or ASTM materials specifications as amended
8 and revised herein.

9 Furnish the Engineer a copy of the manufacturer's test report for each component.
10 Ensure the report indicates the testing date, the city and state where the components were
11 manufactured, the lot number of the material represented, the rotational capacity tests lot
12 number and the source identification marking used by the manufacturer of each
13 component. On test reports for direct tension indicators, include the tension load at
14 which indicators are tested, gap clearance, nominal size and coating thickness.

15 Produce each permanent fastener component installed in a structure from domestically
16 processed material containing the grade identification markings required by the
17 applicable reference specification and the manufacturer's source identification marking.
18 A copy of the source identification marking used by each manufacturer is on file with the
19 Department's Materials and Tests Unit.

20 Obtaining permanent bolts, nuts and washers in any one structure from different
21 manufacturers is allowed provided:

22 (1) All bolts are produced by only one manufacturer.

23 (2) All nuts are produced by only one manufacturer.

24 (3) All washers are produced by only one manufacturer.

25 Have all fasteners used in a structure furnished by the fabricator of the steel. When
26 required, submit the fasteners for sampling and testing at least five weeks before delivery
27 to the project site. The fabricator shall sample and test each diameter bolt, nut and
28 washer assembly to be used on the project. In accordance with Table 1072-1, a minimum
29 of three assemblies per Lot/Heat number shall be submitted by the fabricator to the
30 Materials and Test Laboratory.

**TABLE 1072-1
SAMPLING REQUIREMENTS FOR
HIGH STRENGTH BOLTS, NUTS AND WASHERS**

Lot / Heat Number	Number of Samples
0-800	3 Assemblies
801-8000	6 Assemblies
> 8000	9 Assemblies

31 Ship only those fasteners to the project that are sampled, tested and approved. Protect the
32 material from moisture during storage such that it does not contain any indication of rust
33 at the time of installation. Ensure that each component contains a thin coat of lubricant at
34 the time of installation.

35 When galvanized high strength bolts are required, use bolts, nuts and washers meeting
36 Subarticle 1072-5(F).

37 When corrosion resistant structural steel is required by the plans, provide fasteners with
38 atmospheric corrosion resistance and weathering characteristics comparable to that of the
39 structural steel.

1 (B) Specifications

2 Ensure that all bolts meet ASTM F3125.

3 Ensure that all nuts meet ASTM A194 as applicable or ASTM A563. Completely coat
4 each nut with a wax lubricant.

5 Ensure that all washers meet ASTM F436.

6 Ensure that all direct tension indicators meet ASTM F959.

7 (C) Manufacturing**8 (1) Bolts**

9 Hardness for bolts shall be in accordance with ASTM F3125.

10 (2) Nuts

11 (a) Heat treat galvanized nuts to Grades 2H, DH or DH3.

12 (b) Use plain (ungalvanized) nuts of Grades 2, C, D or C3 meeting the hardness
13 values in accordance with ASTM A194 or heat treat to Grades 2H, DH or DH3.

14 (c) Tap oversize galvanized nuts the minimum amount required by ASTM A563.
15 Overtap the nut such that the nut assembles freely on the bolt in the coated
16 condition and meets mechanical requirements of ASTM A563 and the
17 rotational-capacity test herein.

18 (3) Mark all bolts, nuts and washers in accordance with the appropriate ASTM
19 Specifications.

20 (4) Direct Tension Indicators

21 (a) For Type 3 high strength bolts, mechanically galvanize direct tension indicators
22 to ASTM B695, Class 55, and then apply baked epoxy to a thickness of 1 mil
23 minimum. Direct tension indicators need not be mechanically galvanized or
24 epoxy coated if they are made from material conforming to ASTM F3125,
25 Type 3 bolts.

26 (b) For plain Type 1 high strength bolts, provide direct tension indicators that are
27 plain or mechanically galvanized to ASTM B695, Class 55.

28 (c) For galvanized Type 1 high strength bolts, mechanically galvanize direct tension
29 indicators to ASTM B695, Class 55.

30 (D) Testing**31 (1) Bolts**

32 (a) Proof load tests in accordance with ASTM F606, Method 1, are required at the
33 minimum frequency as specified in ASTM F3125.

34 (b) Wedge tests on full size bolts in accordance with ASTM F606. If bolts are
35 galvanized, perform the tests after galvanizing. Test at a minimum frequency as
36 specified in ASTM F3125.

37 (c) If galvanized bolts are supplied, measure the thickness of the zinc coating. Take
38 measurements on the wrench flats or top of bolt head.

39 (2) Nuts

40 (a) Proof load tests in accordance with ASTM F606, Paragraph 4.2, are required at
41 the minimum frequency of as specified in ASTM A563 and ASTM A194. If
42 nuts are galvanized, perform the tests after galvanizing, overtapping and
43 lubricating.

Section 1072

1 (b) If galvanized nuts are supplied, measure the thickness of the zinc coating. Take
2 measurements on the wrench flats.

3 (3) Washers

4 (a) If galvanized washers are supplied, perform hardness testing after galvanizing.

5 (b) Remove the coating before taking hardness measurements.

6 (c) If galvanized washers are supplied, measure the thickness of the zinc coating.

7 (d) Test direct tension indicators in accordance with ASTM F959.

8 (4) Assemblies

9 Rotational-capacity tests are required to be performed by an AASHTO accredited
10 laboratory. Ensure the manufacturer or distributor perform such tests on all black or
11 galvanized (after galvanizing) bolt, nut and washer assemblies before shipping.
12 Washers are required as part of the test.

13 The following applies:

14 (a) Except as modified herein, perform the rotational-capacity test in accordance
15 with ASTM F3125.

16 (b) Test each combination of bolt production lot, nut lot and washer lot as
17 an assembly. Where washers are not required by the installation procedures,
18 do not include in the lot identification.

19 (c) Assign a rotational-capacity lot number to each combination of lots tested.

20 (d) The minimum frequency of testing is two assemblies per rotational-capacity lot.

21 (e) Assemble the bolt, nut and washer assembly in a Skidmore-Wilhelm Tension
22 Indicating Device (Calibrator) or an acceptable equivalent device (This
23 requirement supersedes the current ASTM F3125 requirement to perform the
24 test in a steel joint). For short bolts that are too short for assembly in the
25 Skidmore-Wilhelm, see Subarticle 1072-5(D)(4)(i).

26 (f) The minimum rotation, from a snug tight condition (10% of the specified proof
27 load), is: 240° (2/3 turn) for bolt lengths less than 4 diameters; 360° (1 turn) for
28 bolt lengths greater than 4 diameters and less than 8 diameters; 480° (1 1/3 turn)
29 for bolt lengths greater than 8 diameters.

30 (g) These values differ from ASTM F3125.

31 (h) Achieve tension at the above rotation equal to or greater than 1.15 times the
32 required installation tension. The installation tension and the tension for the turn
33 test are shown in Table 1072-2.

TABLE 1072-2
BOLT TENSION REQUIREMENTS

Diameter, inch	1/2"	5/8"	3/4"	7/8"	1"	1 1/8"	1 1/4"	1 3/8"	1 1/2"
Req. Installation Tension, kips	12	19	28	39	51	64	81	97	118
Turn Test Tension, kips	14	22	32	45	59	74	94	112	136

- 1 (i) After the required installation tension listed in Table 1072-2 is exceeded, one
 2 reading of tension and torque is taken and recorded. The torque value shall
 3 conform to the following equation:

$$\text{Torque} \leq 0.25(P \times D)$$

Where:

Torque = measured torque in foot-lbs.
P = measured bolt tension in lbs.
D = bolt diameter in feet

4 For bolts that are too short to test in a Skidmore-Wilhelm Calibrator, test in
 5 a steel joint. The tension requirement of Subarticle 1072-5(D)(4)(h) is
 6 computed using a value of **P** equal to the turn test tension shown in the
 7 Table 1072-2.

8 (5) Reporting

- 9 (a) Record the results of all tests, including zinc coating thickness, required herein
 10 and in the appropriate specifications.
 11 (b) Report the location where tests are performed and date of tests on the
 12 appropriate document.

13 (6) Witnessing

14 Witness of the test by an inspection agency is not required; however, ensure the
 15 manufacturer or distributor performing the tests certifies that the recorded results are
 16 accurate.

17 (7) Documentation

18 (a) Mill Test Report(s)

- 19 (i) Furnish Mill Test Report(s) for all mill steel used in the manufacture of the
 20 bolts, nuts or washers.
 21 (ii) Indicate in the Mill Test Report the place where the material was melted
 22 and manufactured, the lot number of the material represented and the source
 23 identification used by the manufacturer.

24 (b) Manufacturer Certified Test Report(s)

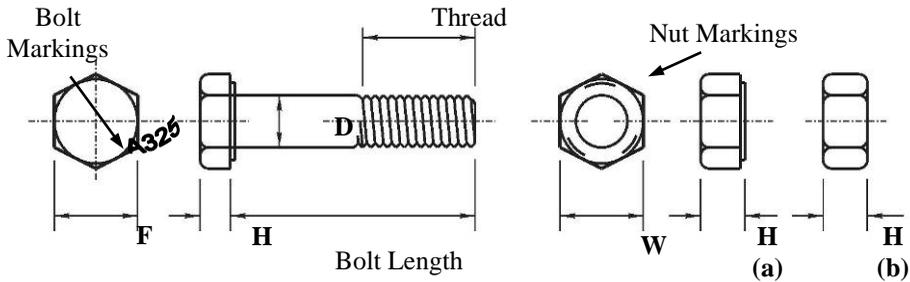

- 25 (i) Have the manufacturer of the bolts, nuts and washers furnish Manufacturer
 26 Certified Test Report(s) for the item furnished.
 27 (ii) Include in each Manufacturer Certified Test Report the relevant information
 28 required in accordance with Subarticle 1072-5(D)(5).
 29 (iii) Have the manufacturer or distributor performing the rotational-capacity test
 30 include on the Manufacturer Certified Test Report:
 31 A) The lot number of each of the items tested.
 32 B) The rotational-capacity lot number as required in Subarticle 1072-
 33 5(D)(4)(c).
 34 C) The results of the tests required in Subarticle 1072-5(D)(4).
 35 D) The pertinent information required in Subarticle 1072-5(D)(5)(b).
 36 E) A statement that the Manufacturer Certified Test Report for the items
 37 are in conformance to the *Standard Specifications* and the appropriate
 38 AASHTO specifications.
 39 F) The location where the bolt assembly components were manufactured.

Section 1072

- 1 (c) Distributor Certified Test Report(s)
- 2 (i) Ensure that the Distributor Certified Test Report(s) includes Manufacturer
- 3 Certified Test Reports above for the various bolt assembly components.
- 4 (ii) Ensure the rotational-capacity test is performed by a distributor or
- 5 a manufacturer and reported on the Distributor Certified Test Report.
- 6 (iii) Include in the Distributor Certified Test Report the results of the tests
- 7 required in Subarticle 1072-5(D)(4).
- 8 (iv) Include in the Distributor Certified Test Report the pertinent information
- 9 required in Subarticle 1072-5(D)(5)
- 10 (v) Include in the Distributor Certified Test Report the rotational-capacity lot
- 11 number as required in Subarticle 1072-5(D)(4)(c).
- 12 (vi) Ensure that the Distributor Certified Test Report certifies that the
- 13 Manufacturer Certified Test Reports are in conformance to this *Standard*
- 14 *Specifications* and the appropriate ASTM specifications.

15 (E) Shipping

- 16 (1) Ship bolts, nuts and washers, where required, from each rotational-capacity lot in the
- 17 same container. If there is only one production lot number for each size of nut and
- 18 washer, shipping of the nuts and washers in separate containers is allowed.
- 19 Permanently mark each container on the side with the rotational-capacity lot number
- 20 such that identification is possible at any stage before installation.
- 21 (2) Provide the appropriate MTR and MCTR or DCTR to the contractor or owner as
- 22 required by the contract.

- 1 **Figure 1072-1. Bolt and nut description.** Bolt and nut marking varies. Refer to
 2 Subarticle 1072-5(B). **F** is the width across the flats of the bolt. **H** is the height of the bolt or
 3 nut. Nuts may be washer facing as in (a) or double chamfered as in (b). **D** is the bolt
 4 diameter and nominal bolt size. **W** is the width across the flats of the nut.

**TABLE 1072-3
 HIGH STRENGTH BOLTS
 BOLT AND NUT DIMENSIONS**

Nominal Bolt Size, inch	Heavy Hexagon Structural Bolt Dimensions, inch			Semi-Finished Heavy Hexagon Nut Dimensions, inch	
	Width Across Flats	Height	Thread Length	Width Across Flats	Height
<i>(D)</i>	<i>(F)</i>	<i>(H)</i>	<i>(Thread)</i>	<i>(W)</i>	<i>(H)</i>
1/2	7/8	5/16	1	7/8	31/64
5/8	1 1/16	25/64	1 1/4	1 1/16	39/64

1 **A.** 3/16 inch nominal

2 **B.** 1/4 inch nominal

3 **(F) Galvanized High Strength Bolts, Nuts and Washers**

4 Use galvanized high strength bolts, nuts and washers meeting all other requirements of
5 this subarticle except as follows:

6 (1) Use Type 1 bolts.

7 (2) Quench and temper washers.

8 (3) Mechanically galvanize in accordance with ASTM B695, Class 55.

9 (4) Ship galvanized bolts and nuts in the same container.

10 (5) Use organic zinc repair paint for touch-up of galvanized surfaces meeting
11 Article 1080-9.

12 (6) Include in manufacturer's test reports results of the zinc coating thickness
13 measurements.

14 (7) Have each galvanized nut coated with a wax lubricant with a color contrast to that of
15 the zinc coating.

16 **1072-6 WELDED STUD SHEAR CONNECTORS**

17 Use Type B shear studs in accordance with the Bridge Welding Code as defined in
18 Article 1072-18.

19 Use and install welded stud shear connectors meeting Article 1072-18. Ensure that shear
20 studs and the areas of beams, girders or other structural steel to which the studs are welded are
21 free of rust, rust pits, oil, grease, moisture, paint, galvanizing, loose mill scale or other
22 deleterious matter which adversely affects the welding operation. Apply shear studs on steel
23 with tightly adhering mill scale as determined by the Engineer provided acceptable results are
24 achieved and the installed studs meet the Bridge Welding Code. Unless otherwise directed by
25 the Contract plans, studs shall be welded with automatically timed stud welding equipment
26 connected to a suitable source connected to an electrode negative (DCEN) power. Welding

1 voltage, current, time, and gun settings for lift and plunge should be set at optimum settings
2 based on past practice, recommendations of stud and equipment manufacturer, or both.

3 **1072-7 INSPECTION**

4 **(A) General**

5 Give the Materials and Tests Unit 72 hours' notice for in-state producers and 192 hours'
6 notice for producers out-of-state before beginning work in the shop. The "hours' notice"
7 is defined as working hours' Monday thru Friday, 8 AM to 5 PM. Do not manufacture or
8 fabricate any material, other than stock items, before the Materials and Tests Unit is
9 notified and the final shop drawings are reviewed, accepted and returned to the fabricator.
10 The fabricator shall have a stamped approved set of drawings assigned to the NCDOT
11 assigned inspection staff and delivered to him upon his/her arrival on site. Shop drawings
12 shall include all current revisions.

13 The shop inspection performed by the Department or inspection agency hired by the
14 Department is intended as QA to assure to the Department that the fabricator is following
15 all quality control requirements and is providing a product conforming to the Contract
16 requirements. The inspection is not expected to replace the fabricator's quality control.
17 The inspection and acceptance of the work performed by the Department or its
18 representative does not relieve the fabricator of providing materials and finished products
19 as specified.

20
21 The Department may reject defective or non-conforming materials at any time. Replace
22 rejected materials promptly at no additional cost to the Department.

23 The contractor/fabricator shall be responsible for and shall be required to perform all
24 quality control inspections and nondestructive testing in accordance with the Bridge
25 Welding Code as defined in Article 1072-18 and as required by the contract. Perform all
26 quality control inspection and nondestructive testing in the presence of the Department's
27 inspector unless otherwise approved by the Department's inspector. Obtain approval for
28 all quality control inspectors from the Department's inspector and ensure their
29 qualification in accordance with the Bridge Welding Code and these specifications.
30 Maintain all QC reports as required by the Bridge Welding Code, including, but not
31 limited to, visual and nondestructive testing reports and all phases of coating application
32 inspection. Provide copies of all QC reports, including all radiographic films, to the
33 Department inspector upon request. These copies become the property of the Department
34 and shall bear certification (written testimony) signature of the quality control inspector.
35 No separate payment is made for this inspection and testing. The entire cost of this work
36 is included in the unit contract price for the structural steel items involved.

37 Furnish facilities for the inspection of material and work in the mill and shop, and allow
38 the inspectors unescorted, free access to the necessary parts of the mill or shop. Do not
39 ship any member or component of the structural steel from the shop to the job site before
40 approval by the Department's inspector. Such approval is stamped on the member or
41 appropriate container by the fabricator's quality control and the Department's inspector
42 only after piece mark, quantity, and contract specifications compliance have been
43 verified.

44 Furnish the Engineer with as many copies of mill orders and shipping statements as
45 directed. The acceptance of any material or finished member by the Department's
46 inspector is not a bar to their subsequent rejection, if found defective. Replace rejected
47 material and correct rejected work promptly and satisfactorily.

Section 1072

1 (B) Shop and Mill Inspection

2 Shop inspection is performed on all structural steel used on any project. Mill inspection
3 of structural steel is performed when so noted in the plans or in the Specifications.
4 Furnish complete certified mill test reports for all structural steel used except
5 a Type 6 (Supplier Certification) material certification in accordance with Article 106-3
6 as to the grade of steel used is acceptable for small amounts of structural steel items
7 which are furnished from the supplier's stock and which are difficult to identify on any
8 mill test report.

9 Show in the supplier's certification the items fabricated from stock material and the
10 pounds of steel required for each item. A supplier's certification represents only anchor
11 bolts, pipe sleeves, masonry plates, sole plates, diaphragm tees, connector plates and web
12 stiffener plates. Represent all other items required for a structure by certified mill test
13 reports as specified above.

14 Indicate in the complete certified mill test reports the pounds of steel and the item or
15 items they represent and show heat number of steel, mechanical tests, chemical analyses,
16 Department's project number, station number, the ASTM or AASHTO specification to
17 which the material conforms and a signed statement certifying where the steel was melted
18 and manufactured.

19 Forward to the Materials and Tests Unit a letter which states by contract number, project
20 number, structure number and station number the items and pounds of steel that are
21 represented by a supplier's certification and those represented by the certified mill test
22 reports identifying the beam and/or plate material for each main member.

23 The Department reserves the right to select any item for test. Bear any expense of
24 obtaining the sample. The tests are performed at the Department's expense.

25 (C) Sampling Structural Steel

26 Furnish samples of structural steel at the beginning of fabrication when random sampling
27 is required.

28 Furnish one 2 1/2 inch x 26 inch sample for each grade of steel used on a project per
29 1,000,000 lbs. No more than 2 are required per project.

30 Take all samples at the location and in the manner directed by an authorized
31 representative of the Engineer. Furnish the necessary personnel and equipment for
32 obtaining samples and be responsible for providing a smooth finish to the areas from
33 which the samples are taken. Fabricator shall be responsible for obtaining representative
34 samples in the presence of the Department's inspector and submitting to the Materials
35 and Test Laboratory.

36 (D) Charpy V-Notch Tests

37 Furnish all structural steel for girders, beams and diaphragm components connecting
38 horizontally curved members meeting the longitudinal Charpy V-Notch Tests specified in
39 the supplementary requirements in AASHTO M 270 for Zone 1. Unless otherwise noted
40 in the plans, mark and test the materials as non-fracture critical. Sample and test in
41 accordance with AASHTO T 243 and use the (H) frequency of heat testing. Use the
42 grade or grades of structural steel required in the plans. Obtain and submit certified mill
43 test reports to the Materials and Tests Unit to show the results of each test required by the
44 *Standard Specifications*.

45 1072-8 WORKING DRAWINGS

46 Working drawings shall include Contract number, project number, structure number and
47 station number. Submit prints of checked structural steel shop drawings and changes thereto,
48 including shipping diagrams for review, comments, acceptance and distribution as follows:

- 1 (A) Submit two sets for review, comments and acceptance on all steel structures. After
2 review, comments and acceptance, submit 7 sets for distribution.
- 3 (B) Submit five sets for review, comments and acceptance for all bridges carrying railroad
4 traffic, and after acceptance, submit 9 sets for distribution.
- 5 (C) Furnish any additional sets requested by the Engineer or for his use, review, comments,
6 acceptance and/or distribution.

7 Shop drawings are not checked by the Engineer except to ascertain general compliance with
8 the design and the *Standard Specifications*. Thoroughly check all shop drawings in all
9 respects. Review, comments and acceptance of shop drawings by the Engineer is not
10 considered as relieving the Contractor of his responsibility for the accuracy of his drawings,
11 or for the fit of all shop and field connections and anchors.

12 The maximum size of prints for shop drawings is 22 inches x 36 inches, including borders
13 which are at least 1 inch at the left edge of the sheet. Provide shop drawings on any medium
14 provided they are legible and are reproducible. Upon completion of the project, furnish to the
15 Engineer one complete set of reproducible shop drawings that represent the as-built condition
16 of the structural steel including all approved changes if any. Supply drawings that are
17 22 inches x 36 inches. These drawings will become the property of the Department.

18 Changes on shop drawings after acceptance or distribution are subject to the approval of the
19 Engineer. Furnish a record of such changes.

20 Make substitution of sections different from those on the structure plans only when approved
21 in writing.

22 **1072-9 HANDLING AND STORING MATERIALS**

23 Load, transport, unload and store structural material so the metal is kept clean and free from
24 damage. Repair any coating damage per Section 442. Do not use chains, cables or hooks
25 without softeners that could result in damage or scarring of the material. Repair all materials
26 which are scarred or damaged and inspect at the fabricators expense as deemed necessary by
27 the Engineer.

28 Use lifting equipment and rigging equipment with adequate capacity to handle the material at
29 all times. Do not bend, twist, damage or excessively stress any materials. Do not perform
30 hammering which injures or distorts the members. In the event that damage or overstressing
31 does occur, prepare and submit an inspection and testing verification plan to the Engineer for
32 approval. Operate and maintain all lifting equipment in a safe manner and in accordance with
33 the manufacturer's directions.

34 When lifting main structural steel members, use spreader bars. Do not use one point pick-ups
35 on members over 50 feet in length. Use two point pick-ups so the amount of overhang and
36 the distance between hooks does not exceed the distances as noted in Table 1072-5.

TABLE 1072-5				
SPREADER BAR PICKUP REQUIREMENTS				
Property	Beam Size			
	30" or Less	33" WF	36" WF	Plate Girders
Maximum Distance Between Hooks	74 lf	80 lf	85 lf	100 lf
Maximum Overhang	25 lf	28 lf	30 lf	35 lf

37 Store structural material, either plain or fabricated, above the ground upon platforms, skids or
38 other supports. Keep free from blast media, dirt, grease, vegetation and other foreign matter,
39 and protect from corrosion.

40 Keep material clean and properly drained. Transport and store girders and beams with the
41 web in the vertical plane and the top flange up. Request permission in writing and await
42 approval to invert haunched girders and beams for transport for safety reasons. Use extreme

Section 1072

1 care in turn-over operations to prevent excessive bending stresses in the edge of flanges.
2 Support long members on blocking placed near enough together to prevent damage from
3 deflection.

4 Do not use any beam, girder, diaphragm, cross frame or other material, in any stage of
5 fabrication that will be permanently incorporated into the finished structure as a workbench,
6 lifting device or dunnage for any purpose for which it was not specifically intended.

7 **1072-10 STRAIGHTNESS, CAMBER AND DIMENSIONAL TOLERANCES**

8 **(A) General**

9 Ensure that rolled material, before being laid out or fabricated, is straight.
10 If straightening is necessary, use methods that do not damage the metal. Kinks or sharp
11 bends are cause for rejection of the material.

12 Ensure that heat straightened parts are substantially free from external forces, except
13 those resulting from mechanical means used in conjunction with the application of heat.

14 Heat curving and heat cambering shall be completely free from any external forces. Any
15 heating operation to address straightening, cambering, or curving shall be monitored by
16 the Fabricator's QC department. Personnel performing heating operations shall have
17 adequate training (documented), shall possess proper temperature indicating devices and
18 shall have received instructions for appropriate use.

19 After heating, allow the metal to cool, without artificial cooling, down to 600°F. Below
20 600°F, only dry compressed air is permitted to artificially cool steels having minimum
21 yield strength greater than 36,000 psi as indicated by a Type 1 (Certified Mill Test
22 Report) material certification in accordance with Article 106-3.

23 **(B) Straightening**

24 Straighten distorted members and bent material by mechanical means or, if approved, by
25 the carefully planned and supervised application of a limited amount of localized heat.
26 Do not allow the temperature of the heated area to exceed 1,150°F as controlled by
27 temperature indicating crayons or other approved methods.

28 Following the straightening of a bend or buckle, verify the surface is free of evidence of
29 fracture as indicated by visual inspection or, if directed, by appropriate nondestructive
30 testing.

31 Shop straighten the bottom flanges of steel beams or girders at bearings as necessary to
32 provide uniform contact between the flanges and the bearings. If bearings are to be field
33 installed, the Fabricator shall demonstrate appropriate bearing contact surfaces as defined
34 by the AWS Bridge Welding Code prior to shipping.

35 **(C) Camber**

36 Show the required camber on the drawings.

37 Make adequate provision in the fabrication of structural members to compensate for
38 change of camber due to welding of the shear connectors and other fabrication work.

39 Fabricate camber into the members on built-up plate girders and trusses. Where camber
40 is required on rolled sections, induce it by heat cambering, except that for rolled sections
41 within the depth, length and camber ordinate range shown in Table 1072-6, induce
42 camber by cold cambering or "gagging" at the mill or in the shop provided approval
43 procedures for cold cambering are employed.

44 Where reverse curvature is required in a single rolled shape, induce it by heat cambering.

45 Show camber diagrams showing the required offset at each tenth point of the span and at
46 any web splice or field splice location and blocking diagrams on the shop drawings.

47 Show additional points if desired by the fabricator. Ensure that the beams, girders or

1 other members with field splices meet all of the blocking ordinates without inducing
2 stress into the members.

3 Following cambering or camber correction, correct evidence of fracture indicated by
4 visual inspection or, if directed, by appropriate nondestructive testing.

5 Show camber and blocking diagrams on the shop drawings. Shop assemble continuous
6 beams meeting all the blocking ordinates without inducing stress into the members.

TABLE 1072-6		
ACCEPTABLE COLD CAMBER FOR ROLLED SECTIONS		
Beam Length, feet	Section Designation and Nominal Depth	
	W-Shapes 14" to 21" Inclusive S-Shapes 12" and Over	W-Shapes 24" and Over
Over 30 through 42	3/4" to 2 1/2" inclusive	1" to 2" inclusive
Over 42 through 52	1" to 3" inclusive	1" to 3" inclusive
Over 52 through 65	2" to 4" inclusive	2" to 4" inclusive
Over 65 through 85	2 1/2" to 5" inclusive	3" to 5" inclusive
Over 85 through 100	As directed by the Engineer	3" to 6" inclusive

7 **(D) Heat Cambering of Rolled Beams and Welded Plate Girders**

8 (1) General

9 Where heat cambering is used, only V-type heating is permitted. Perform V-type
10 heating by the carefully planned and supervised application of a limited amount of
11 localized heat.

12 When minor corrections in camber are required, use small localized heats limited to
13 the flange material. Perform major corrections in camber by V-type heating to
14 prevent web distortion.

15 Begin heating at the apex of the heating pattern and progress slowly towards the base
16 of the pattern as each area is brought up to temperature as stated in
17 Subarticle 1072-10(D)(5). Do not progress the heating torches toward the base of
18 the heating pattern until the apex of the pattern is brought up to the specified
19 temperature. Do not return the heating torch toward the apex of the heating triangle
20 after heating has progressed towards the base. Continue heating to successive areas
21 until the base of the triangular heating pattern is brought up to the required
22 temperature across the full width of the flange.

23 (2) Heat Cambering of Rolled Beams

24 Heat cambering of rolled beams is allowed to provide the required vertical curvature.
25 Space triangular heating patterns throughout the length of the member to provide the
26 required curvature. Locate the apex of the heating triangle at a point not less
27 than 75% of the depth of the member measured from the flange that is concave after
28 cambering. Limit the total included angle of the heating pattern to 20°.

29 Weld all detail material such as connection plates, bearing stiffeners and gusset
30 plates attached to the member to the rolled beam after the beam is cambered as
31 required.

32 (3) Heat Cambering of Welded Plate Girders

33 Heat cambering of welded plate girders is only permitted when approved in writing
34 as a necessary repair procedure for plate girders rejected for camber deviation.

35 When it is necessary to correct camber deviation in welded plate girders, heating is
36 permitted in V-type heating patterns centered on intermediate stiffeners and
37 connection plates. Where necessary, add stiffeners for this purpose if approved.

Section 1072

1 Locate the apex of the heating pattern not less than 3/4 of the depth of the member
2 from the flange that is shortened after cooling. The maximum included angle of the
3 heating pattern is 10°. The maximum width of the base of the heating pattern is 10
4 inches. Where shallow members or thin webs prescribe heating patterns with a
5 width substantially less than 10 inches at the junction of the web to flange, extend
6 the heating pattern in the flange at that location beyond the limits of the heating
7 pattern in the web by no more than 1 inch provided the total width of pattern in the
8 flange does not exceed the 10 inch limit stated above.

9 (4) Support of Members for Heat Cambering

10 Heat camber members with the web vertical and supports spaced to take the
11 maximum advantage of dead load in the member before applying heat. Ensure all
12 supports are approved by the Department's inspector before beginning work.

13 Do not place any combination of support system or external load on the member that
14 causes a compressive stress in the flange to exceed 20,000 psi before heating for
15 AASHTO M 270 Grades 36, 50 and 50W steels.

16 (5) Heating Process and Equipment

17 Confine heating to the patterns described herein and conduct to bring the steel within
18 the planned pattern to a temperature between 1,100°F and 1,150°F as rapidly as
19 possible without overheating the steel.

20 Any heating procedure which causes a portion of the steel to exceed a temperature
21 greater than 1,150°F is destructive heating and is automatically cause for rejection of
22 the steel. Steel rejected for destructive heating is investigated for re-acceptance,
23 repair or replacement if allowed by the Engineer. Bear the cost of such tests and any
24 necessary repair or replacement.

25 (6) Heat Measurement

26 Specified temperatures are checked using portable digital pyrometers or temperature
27 indicating crayon. When using a temperature indicating crayon, the following
28 procedure shall be employed; mark on the surface of metal or sheet with the required
29 crayon. Once the surface reaches the rated temperature of the crayon, the mark will
30 melt and show liquid smear appearance. At this point, the heating operation shall
31 cease to prevent overheating. Exceeding the specified temperature is strictly
32 prohibited.

33 (E) Heat Curving Girders

34 (1) Type of Heating

35 With approval, use continuous or V-type heating methods to curve girders. For the
36 continuous method, simultaneously heat a strip along the edge of the top and bottom
37 flanges that is of sufficient width and temperature to obtain the required curvature.
38 For V-type heating, heat the top and bottom flanges simultaneously in truncated
39 triangular or wedge-shaped areas. Position the areas with their base along the flange
40 edge and spaced at regular intervals along each flange. Set the spacing and
41 temperatures to approximate the required curvature by a series of short chords. Heat
42 along the top and bottom flanges at approximately the same rate.

43 For V-type heating, terminate the apex of the truncated triangular area applied to the
44 inside flange surface just before the juncture of the web and flange. To avoid web
45 distortion, make certain that heat is not applied directly to the web when heating the
46 inside flange surfaces (the surfaces that intersect the web). Extend the apex of the
47 truncated triangular heating pattern applied to the outside flange surface to the
48 juncture of the flange and web. Use an included angle of approximately 15° to 30°
49 in the truncated triangular pattern, but do not allow the base of the triangle to

1 exceed 10 inches. Vary the patterns prescribed above only with the Engineer's
2 approval.

3 For both types of heating, heat the flange edges that will be on the inside of the
4 horizontal curve after cooling. Concurrently heat both inside and outside flange
5 surfaces for flange thicknesses of 1.25 inches and greater. Adhere to the temperature
6 requirements presented below.

7 (2) Temperature

8 Conduct the heat curving operation so the temperature of the steel never exceeds
9 1,150°F as measured by temperature indicating crayons or other suitable means. Do
10 not artificially cool the girder until it naturally cools to 600°F. Below 600°F, use dry
11 compressed air to artificially cool the girder.

12 (3) Position for Heating

13 Heat-curving the girder with the web in either a vertical or horizontal position is
14 permitted. When curved in the vertical position, brace or support the girder so the
15 tendency of the girder to deflect laterally during the heat-curving process does not
16 cause the girder to overturn.

17 When curved in the horizontal position, support the girder near its ends and at
18 intermediate points, if required, to obtain a uniform curvature. Do not allow the
19 bending stress in the flanges to exceed 27,000 psi. To prevent a sudden sag due to
20 plastic flange buckling when the girder is positioned horizontally for heating, place
21 intermediate safety catch blocks at the midlength of the girder within 2 inches of the
22 flanges at all times during the heating process.

23 (4) Sequence of Operations

24 Conduct the heat-curving operation either before or after completing all the required
25 welding of transverse intermediate stiffeners to the web. However, unless provisions
26 are made for shrinkage, position and attach connection plates and bearing stiffeners
27 after heat-curving. In any event, weld the stiffeners, connection plates, and bearing
28 stiffeners to the girder flanges after the member is curved. If longitudinal stiffeners
29 are required, heat-curve or oxygen-cut these stiffeners separately before welding to
30 the curved girder.

31 (5) Camber and Curvature

32 Camber the girders before heat-curving. Cut the web to the prescribed camber
33 allowing for shrinkage due to cutting welding and heat-curving. If approved,
34 a carefully supervised application of heat is permitted to correct moderate deviations
35 from the specified camber.

36 Horizontal curvature and vertical camber is measured for final acceptance after all
37 welding and heating operations are complete and the flanges have cooled to
38 a uniform temperature. Horizontal curvature is checked with the web in the vertical
39 position by measuring offsets from a string line or wire attached to both flanges or by
40 using other suitable means. Camber is checked with the web in the horizontal
41 position. Camber the girder so it meets the horizontal and vertical curvature
42 ordinates without inducing stress into the girders by mechanical force.

43 Compensate for loss of camber in the heat-curved girders as residual stresses
44 dissipate during service life of the structure. Compute this anticipated loss of camber
45 in accordance with the *AASHTO LRFD Bridge Design Specifications*.

Section 1072

1 (6) Procedure Specification and Shop Drawings

2 Submit structural steel shop drawings, including a detailed written procedure
3 specification for heat curving the girders, supplemented by calculations and sketches,
4 for review, comments and acceptance. On the shop drawings, indicate the type,
5 location and spacing of heat sectors, if used, supports and catch blocking for each
6 field section of girders. Include suitable blocking diagrams for measuring horizontal
7 curvature similar to those usually prepared for camber and vertical curvature.

8 (F) Camber Measurement

9 At the time of acceptance at the shop and after erection, ensure that all stringers and
10 girders for bridges meet the required camber values within the tolerances specified in
11 Subarticle 1072-10(G). Follow the procedure for measuring camber as outlined below:

12 (1) Assemble the member at the shop as specified in Article 1072-19 and measure with
13 the member lying on its side.

14 (2) Camber repairs are only allowed when approved by the Engineer. Camber deviation
15 is judged irreparable if corrective measures in the shop produce web buckling in
16 excess of the specified tolerance, in which case the member is rejected.

17 (3) The final camber measurement is made by the Engineer in the field after erection.
18 At the time of this measurement, ensure that the members have all of the specified
19 camber less the dead load deflection of the steel as specified in
20 Subarticle 1072-10(G).

21 (G) Dimensional Tolerances

22 Ensure that dimensions of all material covered by Section 1072 conform to ASTM A6
23 when received at the fabrication shop. Fabricate member dimensions conforming to this
24 subarticle whether designated to be straight, cambered or curved and regardless of
25 whether curvature is heat-induced (when so permitted). Dimensional tolerances not listed
26 in this subarticle shall be as specified by the Bridge Welding Code as defined in
27 Article 1072-18 and applied to rolled shapes where applicable as well as to welded
28 members.

29 Place welded butt joints no further than 1/2 inch from the point detailed. Intermediate
30 stiffeners varying $\pm 1/2$ inch from the point detailed are allowed. Connector plates for
31 field connections varying $\pm 1/8$ inch from the point detailed are allowed. Ensure that the
32 actual centerline of bearing lies within the thickness of the bearing stiffener.

33 Members with end milled for bearing and members with faced end connection angles
34 deviating from the detailed length by $-0, +1/32$ inch are acceptable. All other members
35 varying from detailed length by $\pm 1/8$ inch are acceptable.

36 Align to within $\pm 1/8$ inch from the location shown on the approved shop drawings all
37 steel requiring shop assembly for reaming, drilling from the solid or weld joint
38 preparation.

39 Deviation from specified camber of fabricated members as verified during shop assembly
40 and before shipment from the fabrication shop is limited to:

41 -0;

42 $\frac{+3/32" \times \text{No. of ft from nearest bearing}}{10}$, up to 3/4" maximum.

43

1 Deviation from specified camber of erected steel bridge superstructures measured when
 2 the steel work is complete and the superstructure is subject to steel dead load stresses only
 3 is limited to:

4 -0;

5 $\frac{+1/8" \times \text{No. of ft from nearest bearing}}{10}$ up to 1" maximum.
 6

7 If the plans do not require shop induced camber, provide an actual member that is straight
 8 or one of the following:

9 (1) If natural camber "turned up" is required, the maximum plus camber is the algebraic
 10 sum of the allowable deviation, dead load deflection, vertical curve ordinate and
 11 superelevation ordinate;

12 (2) If natural camber "turned down" is required, the maximum negative camber is equal
 13 to the algebraic sum of the dead load deflection, vertical curve ordinate and
 14 superelevation ordinate.

15 Do not exceed 1/8 inch per 10 foot length for the actual deviation from curvature shown
 16 in the plans.

17 1072-11 OXYGEN CUTTING

18 Oxygen cutting of structural steel is allowed, provided a smooth surface free from cracks and
 19 notches is secured and an accurate profile is secured by the use of a mechanical guide. Hand
 20 cut only where approved and grind smooth leaving no burnt edges.

21 In all oxygen cutting, adjust and manipulate the cutting agent to avoid cutting beyond (inside)
 22 the prescribed lines. Provide oxygen cut surfaces meeting the ANSI surface roughness rating
 23 value of 1,000 except ensure that oxygen cut surfaces of members not subject to calculated
 24 stress meet the surface roughness value of 2,000 (AWS C4.1-G Surface Roughness Gauge).
 25 Round corners of oxygen cut surfaces of members carrying calculated stress to a 1/16 inch
 26 radius, or an equivalent flat surface at a suitable angle, by grinding after oxygen cutting.

27 Fillet re-entrant cuts to a radius of not less than 1 inch.

28 Remove surface roughness exceeding the above values and occasional notches and gouges not
 29 more than 3/16 inch deep on otherwise satisfactory oxygen cut surfaces by chipping or
 30 grinding. Such removal shall be faired to the material edge with a slope not steeper than one
 31 in ten and with machine and grinding marks parallel to the surfaces.

32 Repair occasional gouges of oxygen cut edges more than 3/16 inch deep, but not more than
 33 7/16 inch deep, by welding with low hydrogen electrodes not exceeding 5/32 inch in diameter
 34 and with a minimum preheat of 250°F. Grind the completed weld smooth and flush with the
 35 adjacent surface. Radiographically test any gouge repaired by welding.

36 1072-12 EDGE PLANING

37 Plane sheared edges of plates more than 5/8 inch in thickness that carry calculated stress to
 38 a depth of 1/4 inch. Pre-drill re-entrant cuts before cutting. Round all edges of plates and
 39 shapes parallel to calculated stress and all free edges of plates and shapes intended for coating
 40 or galvanizing to 1/16 inch radius or provide an equivalent flat surface at a suitable angle.
 41 Flame cut edges found to have a Rockwell Hardness Value of C 30 or greater will be
 42 considered unacceptable. A portable Rockwell Hardness Tester shall be employed by the
 43 Quality Control Inspector to determine conformance with these requirements. Unacceptably
 44 hard surfaces shall be removed by grinding, machining, or approved heat treating procedures.
 45 Grind edges of all other plates and shapes to remove burrs, slag or shear lip. The ends of all
 46 steel piles, intended for coating or galvanizing, are not required to be radiused, but remove all
 47 burrs, slag and shear lip.

Section 1072

1 1072-13 FACING OR BEARING SURFACES

2 Provide a surface finish of bearing and base plates and other bearing surfaces that come in
3 contact with each other or with concrete that meet Table 1072-7 following ANSI surface
4 roughness requirements as defined in ASME B46.1.

Item	ANSI Surface Roughness
Steel slabs	ASME 2,000
Heavy plates in contact in shoes to be welded	ASME 1,000
Milled ends of compression members, milled or ground ends of stiffeners and fillers	ASME 500
Bridge rollers and rockers	ASME 250
Pins and pin holes	ASME 125
Sliding bearings	ASME 125

5 1072-14 ABUTTING JOINTS

6 Face and bring to an even bearing abutting joints in compression members, girder flanges and
7 tension members where so indicated on the drawings. Where joints are not faced, do not
8 exceed an opening of 1/4 inch.

9 1072-15 BENT PLATES

10 Provide cold-bent, load carrying rolled-steel plates conforming to the following:

11 (A) Take from the stock plates so the bendline is at right angles to the direction of rolling.

12 (B) Use a radius of bends such that no cracking of the plate occurs. Use minimum bend radii,
13 measured to the concave face of the metal, as shown in Table 1072-8.

14 If a shorter radius is essential, bend the plates hot at a temperature not greater than
15 1,200°F and air cool slowly down to a temperature of 600°F. Below 600°F, use only dry
16 compressed air to artificially cool steels having a minimum yield strength greater than
17 36,000 psi. Use hot bent plates conforming to Subarticle 1072-15(A) above.

18 (C) Before bending, round the corners of the plates to a radius of 1/16 inch throughout the
19 portion of the plate at which bending occurs.

Plate Thickness (t)	Minimum Bend Radii, Ratio of Thickness
Up to 1/2"	2t
Over 1/2" to 1"	2 1/2t
Over 1" to 1 1/2"	3t
Over 1 1/2" to 2 1/2"	3 1/2t
Over 2 1/2" to 4"	4t

20 Hot bend low alloy steel in thicknesses over 1/2 inch for small radii, if required.

21 1072-16 HOLES FOR BOLTS AND OTHER FASTENERS

22 (A) General

23 Punch or drill all holes and remove any burrs. Punching material forming parts of
24 a member composed of not more than 5 thickness of metal 1/16 inch larger than the
25 nominal diameter of the fastener is allowed whenever the thickness of the material is not
26 greater than 3/4 inch for structural steel, 5/8 inch for high-strength steel or 1/2 inch for
27 quenched and tempered alloy steel, unless subpunching and reaming is required by
28 Subarticle 1072-16(D).

1 When there are more than five thicknesses or when any of the main material is thicker
2 than 3/4 inch for structural steel, 5/8 inch for high-strength steel or 1/2 inch for quenched
3 and tempered alloy steel, either subdrill and ream or drill all holes full size.

4 When required by Subarticle 1072-16(D), subpunch or subdrill all holes (subdrill if
5 thickness limitation governs) 1/4 inch smaller and, after assembling, ream 1/16 inch
6 larger or drill full size to 1/16 inch larger than the nominal diameter of the fastener.

7 **(B) Punched Holes**

8 Do not use a diameter of the die exceeding the diameter of the punch by more than
9 1/16 inch. If any holes require enlargement to admit the fasteners, ream such holes.
10 Clean cut holes without torn or ragged edges. Poor matching of holes is cause for
11 rejection. Grind all burrs smooth.

12 **(C) Reamed or Drilled Holes**

13 Make reamed or drilled holes cylindrical and perpendicular to the member complying
14 with the size requirements of Subarticle 1072-16(A). Where practicable, direct reamers
15 by mechanical means. Grind all burrs smooth. Poor matching of holes is cause for
16 rejection. Ream and drill with twist drills. If required, take assembled parts apart for
17 removal of burrs caused by drilling. Assemble connecting parts requiring reamed or
18 drilled holes, securely hold while reaming or drilling and match mark before
19 disassembling.

20 **(D) Subpunching and Reaming of Field Connections**

21 Subpunch or subdrill, if required according to Subarticle 1072-16(A), holes in all field
22 connections and field splices of main members of trusses, arches, continuous beam spans,
23 bents, towers (each face), plate girders, and rigid frames. Subsequently ream while
24 assembled as required by Article 1072-19. Subpunch and ream to a steel template or
25 ream while assembled all holes for floor beam and stringer field end connections. Ream
26 or drill full size field connection holes through a steel template after the template is
27 located with utmost care as to position and angle and firmly bolted in place. Use
28 templates for reaming matching members, or the opposite faces of a single member that
29 are exact duplicates. Accurately locate templates used for connections on like parts of
30 members such that the parts or members are duplicates and require no match-marking.

31 **(E) Accuracy of Punched and Subdrilled Holes**

32 Accurately punch or subdrill all holes punched full size, subpunched or subdrilled such
33 that after assembling, and before any reaming is done, a cylindrical pin 1/8 inch smaller
34 in diameter than the nominal size of the hole enters perpendicular to the face of the
35 member, without drifting, in at least 75% of the contiguous holes in the same plane. If
36 the requirement is not fulfilled, the badly punched pieces are rejected. If any hole does
37 not pass a pin 3/16 inch smaller in diameter than the nominal size of the hole, this is
38 cause for rejection.

39 **(F) Accuracy of Reamed and Drilled Holes**

40 When holes are reamed or drilled, ensure that 85% of the holes in any contiguous group,
41 after reaming or drilling, show no offset greater than 1/32 inch between adjacent
42 thicknesses of metal.

43 Use all steel templates with hardened steel bushings in holes accurately dimensioned
44 from the centerlines of the connection as inscribed on the template. Use the centerlines in
45 locating accurately by the template from the milled or scribed ends of the members.

46 **(G) Alternate Methods**

47 As an option, make the fastener holes by procedures other than those described in
48 Subarticles 1072-16(A) through 1072-16(F) provided that the requirements for quality

Section 1072

1 and for dimensional accuracy are met. Plasma cutting of holes for high strength fasteners
2 is prohibited. Wherever an alternate method is employed, demonstrate the ability of each
3 alternate method to produce holes and connections consistently meeting all requirements
4 for quality and dimensional accuracy for the type of joint fabricated. When such ability
5 of an alternate method is previously demonstrated on similar work for the Department,
6 continue its use by certifying, on each subsequent project, that the procedure and
7 equipment are the same as the method previously qualified, and that the equipment
8 involved is in good repair and adjustment. Failure of joints to meet the quality and
9 accuracy requirements is cause for rejection. In the case of repeated failures revise
10 and/or requalify the method or discontinue its use.

11 At the time of qualification of an alternate method, submit for approval a written
12 procedure specification describing the procedures and equipment and giving upper and
13 lower value limits and tolerances for all pertinent variables. Accurately reflect the actual
14 procedures, equipment and values used in the qualification tests. In addition to the
15 certification on each subsequent project, the Engineer may request copies of the approved
16 procedure specification.

17 (H) Oversize, Short-Slotted, and Long-Slotted Holes

18 Where shown in the plans or permitted in writing, use oversize, short-slotted and long-
19 slotted holes with high strength bolts 5/8 inch and larger in diameter. Do not allow the
20 distance between edges of adjacent holes or edges of holes and edges of members to be
21 less than permitted under the AASHTO specification. Oversize, short-slotted and long-
22 slotted holes are defined as follows:

- 23 (1) Oversize holes are 3/16 inch larger than bolts 7/8 inch and less in diameter, 1/4 inch
24 larger than bolts 1 inch in diameter, and 5/16 inch larger than bolts 1 1/8 inches and
25 greater in diameter. When oversized holes are permitted, they are allowed in any or
26 all plies of friction type connections. Install hardened washers over exposed oversize
27 holes.
- 28 (2) Short-slotted holes are 1/16 inch wider than the bolt diameter and have a length that
29 does not exceed the oversize diameter requirements of Subarticle 1072-16(H)(1) by
30 more than 1/16 inch. When short-slotted holes are permitted, they are allowed in any
31 or all plies of friction-type or bearing-type connection. Locate holes without regard
32 to direction of loading in friction-type connections, but orient normal to the direction
33 of the load in bearing-type connections. Install hardened washers over exposed
34 short-slotted holes.
- 35 (3) Long-slotted holes are 1/16 inch wider than the bolt diameter and have a length more
36 than allowed in Sub-paragraph 2 but not more than 2 1/2 times the bolt diameter.
37 Structural plate washers or a continuous bar not less than 5/16 inch in thickness are
38 required to cover long slots that are the outer plies of joints. Ensure that these
39 washers have a size sufficient to completely cover the slot after installation. When
40 long-slotted holes are permitted, they are allowed in only one of the connected parts
41 of either a friction-type or bearing-type connection at an individual faying surface.

42 When used in slip critical connections, locate holes without regard to direction of loading
43 if one-third more bolts are provided than needed to satisfy the allowable unit stresses
44 except as herein restricted.

45 When used in bearing-type connections, orient the long diameter of the slot normal to the
46 direction of loading. No increase in the number of bolts over those necessary for the
47 allowable unit stress is required.

48 (I) Misfits

49 When misfits occur for any reason, enlargement of the holes by reaming is limited to
50 1/16 inch over the nominal size hole called for unless otherwise permitted in writing.

(J) Erection Bolt Holes

At field welded connections where erection bolts are used, provide holes 3/16 inch larger than the nominal erection bolt diameter.

1072-17 INSTALLING BOLTS

Install high strength bolts in accordance with Article 440-8.

1072-18 WELDING**(A) Definition**

The Bridge Welding Code referred to herein is the edition of the ANSI/AWS/AASHTO Bridge Welding Code D 1.5 and any applicable interim that is current on the date of advertisement for the project, and as modified by the *Standard Specifications*.

(B) General

Commercially blast clean all steel used in girders, beams and connecting members to SSPC-SP 6 before welding. With the exception of rolled beams, the Contractor at their option may submit to the Department for review, an alternate cleaning method for main member material exposed to welding.

Weld all steel in the shop or in the field for bridges, whether permanent or temporary, and perform all other work related to welding including, but not limited to, testing and inspection of welds, preparation of material, oxygen cutting, electrodes, shielding and shear studs, meeting the Bridge Welding Code. Weld other steel items not covered under the Bridge Welding Code in accordance with the applicable AWS Welding Code. Some examples may include but not limited to; Structural Welding Code-Steel (AWS D1.1), Structural Welding Code- Aluminum (AWS D1.2), Structural Welding Code-Sheet Steel (AWS D1.3), Structural Welding Code- Reinforcing Steel (AWS D1.4) and Structural Welding Code-Stainless Steel (AWS D1.6).

Weld only where shown in the plans or where called for in the *Standard Specifications* unless requesting and receiving written approval from the Department for additional welding.

Show all permanent and all temporary welds on the shop drawings. For groove welds, indicate on the shop drawings the particular detail and process to be employed in production of the work. For prequalified joints, use of the Bridge Welding Code letter classification designation of the joint (B-L2b-S etc.) along with the appropriate symbol satisfies this requirement. Tack welds that become part of a permanent weld are not required on the shop drawings.

Provide fillet welds, including seal welds, at least the minimum size allowed by the Bridge Welding Code for the thickness of material welded or the size called for in the plans, whichever is larger. For exposed, bare, unpainted applications of steel, the basic requirements for weld filler metal with atmospheric corrosion resistance and coloring characteristics similar to that of the base metal are mandatory. The variations from these basic requirements listed in the Bridge Welding Code for single pass welds are not permitted.

All welds designated as Fracture Critical (FC) and subject to tension shall be so designated on the shop drawings. Unless otherwise directed by the Engineer, any flange to web (FC) complete joint penetration (CJP) groove weld subjected to calculated tensile stress normal to the weld axis, shall be so designated on the design and shop drawings.

Section 1072

1 (C) Qualification of Personnel

2 Ensure that each welder, welding operator and tacker is qualified in accordance with the
3 Bridge Welding Code or other applicable AWS Welding Code as determined by the
4 Engineer. For field applications, employ welders that are qualified by the Department.
5 Welders shall be requalified by the Department every 5 years. Contact the Materials and
6 Tests Unit to schedule qualification tests.

7 Permanent in-shop welders employed by a fabricator who passed the appropriate welding
8 tests and whose weldments are radiographically tested with regularly acceptable results
9 are exempt from additional testing when approved by the Engineer. Welder qualification
10 testing shall be administered and witnessed by a current AWS Certified Welding
11 Inspector (CWI). Ensure all welder qualification testing is witnessed by an independent
12 testing agency approved by the Department. As evidence of such qualification, furnish a
13 satisfactory certificate, or a copy thereof, issued by a fabricator or Department approved
14 testing agency as applicable. Submit certification for each welder, welding operator or
15 tacker, and for each project, stating the name and identification number of the welder,
16 welding operator or tacker; the name and title of the person who conducted the
17 examination; the kind of specimens; the position of welds; the AWS electrode
18 classification used; the results of the tests; the date of the examination and witness
19 thereof. Such certifications are required for all persons performing shop or field welds of
20 any kind on the work, whether permanent or temporary. Ensure each welder provides a
21 picture ID upon request or other form of positive identification as required by the
22 Engineer.

23 (D) Qualification of Welds and Procedures

24 For shop employed welded construction, submit to the Department all welding
25 procedures, prequalified or qualified by test 30 days in advance before performing any
26 welding. All welding shall comply with the applicable AWS designed code of
27 construction.

28 For field weld applications, submit prequalified Welding Procedure Specifications (WPS)
29 for each joint configuration for approval at least 30 days before performing any welding.
30 In lieu of the aforementioned,, use the WPS provided and preapproved by the
31 Department. Field welding operations are limited to using SMAW welding process.
32 These preapproved WPS are available from the Materials and Tests Unit. Use non-
33 prequalified welding procedures that have been submitted and approved by the Engineer.
34 At no cost to the Department, demonstrate their adequacy in accordance with the
35 applicable AWS Welding Code.

36 On all welding, include in the welding procedure continuous visual inspection by
37 welders, welding operator, tackers, welding supervisors and all personnel involved in
38 preparation of the material for welding.

39 Approval by the Engineer of the procedure specifications does not relieve the Contractor
40 of his responsibility to develop a welding procedure that produces weldments meeting the
41 required quality and dimensions.

42 If non-prequalified joints procedures are previously found acceptable to the Engineer on
43 another project, furnish the inspector with a copy of the joint details and procedure
44 specification approved at the time of qualification. Such documentation is required from
45 each fabricator employing a non-prequalified joint or procedure on the work. Failure to
46 produce such documentation results in the fabricator being required to requalify the joint
47 or procedure or to use prequalified joints, procedures, and procedure specifications.

48 On weldments where geometric shape prevents compliance with requirements to weld
49 a particular position, alternate procedures are considered for approval. Previously
50 qualified alternate procedures are considered for approval without further procedure
51 qualification tests. No separate payment is made for developing, demonstrating and

1 documenting for future use such alternate procedures, as such work is incidental to the
2 work of welding.

3 **(E) Requirements for Testing and Inspection**

4 Require the fabricator to make provisions for convenient access to the work for
5 inspection and cooperate with the inspector during the required inspection and testing.

6 Visual welding inspection shall be performed by an inspector qualified in accordance
7 with AWS QC-1. Inspect welds in the presence of the Department's inspector unless
8 otherwise approved by the Department's inspector, using visual inspection and the
9 nondestructive tests herein prescribed in addition to the test requirements of the Bridge
10 Welding Code and the contract. Employ quality control inspectors and NDT technicians
11 qualified in accordance with the Bridge Welding Code and preapproved by the Engineer
12 before the start of any fabrication. Supply the appropriate certifications as required by
13 the Bridge Welding Code to the Department's inspector for all inspectors. Individuals
14 assigned to production welding activities or processes and their supervisors are not
15 acceptable for performing quality control testing. Ensure a qualified quality control
16 welding inspector (CWI) is present any time welding is in progress. No separate
17 payment is made for inspection and testing.

18 Retest welds requiring repairs or replacement in the presence of the Department's
19 inspector after the repairs or replacements are made. Approval of the Engineer is
20 required for any repair exceeding three attempts to correct.

21 If the Engineer finds that acceptable repair to defective work is not feasible; the entire
22 piece is rejected.

23 Payment at the contract prices for the various items in the contract which include the
24 work of welding is full compensation for all costs resulting from the required
25 nondestructive testing of welds and from the required inspection of welds.

26 **(F) Nondestructive Test Required**

27 Personnel performing Nondestructive Testing (NDT) other than visual examination shall
28 be certified in conformance with the latest edition of the American Society for
29 Nondestructive Testing's (ASNT) recommended practice number (SNT-TC-1A). The
30 Employer's program shall meet all established guidelines of SNT-TC-1A for the
31 qualification of NDT personnel. In addition, all personnel performing NDT for final weld
32 acceptance shall be subject to the Department's practical proficiency test.

33 The extent of nondestructive testing required for main members is as prescribed in the
34 Bridge Welding Code and by the contract except that all flange splices shall be
35 radiographed for their full length. The term "main members" in this regard means
36 girders, diaphragms for curved girders, beams, floor beams, stringers, truss members,
37 high strength bolts, columns, bearing stiffeners, bearing shoes, high mount lighting
38 standards and components of main member carrying stress, including the end connections
39 for such members. Nondestructive testing of other complete welds or weld passes is
40 required when so noted in the plans or deemed necessary by the Engineer. For bridge
41 applications involving tubular structures that may be subject to the AWS D1.1 welding
42 code, the extent of NDT shall be as specified above for main members. Tests other than
43 those prescribed are also required when deemed necessary by the Engineer. Perform all
44 radiographic testing in accordance with procedures established by the Engineer. Copies
45 of these procedures are available from the State Materials Engineer.

46 High mount lighting standards shall be examined in accordance with Section 1401-2.
47 Other nondestructive test methods are sometimes deemed necessary by the Engineer to
48 determine the quality of the welds. No separate payment is made for inspection and
49 testing.

50 Any NDT not identified above shall be examined as directed by the Engineer.

Section 1072

1 The entire cost of this work is included in the unit contract price for the structural steel
2 items involved.

3 (G) Welded Structural Shapes

4 Produce butt welds of flanges and webs, and fillet welds of web to flanges of plate
5 girders and haunched beams using the submerged arc process. Produce other structural
6 shapes built up from plates and bars using the submerged arc process unless another
7 process is qualified for these joints in accordance with the Bridge Welding Code and is
8 subject to the approval of the Engineer.

9 After all shop welded splices in the flanges and webs for the full length of the field
10 section are made, tested and approved, fit the flange plates tight and square against the
11 web to leave no gap and to not bow the web. Brace one side of each flange against the
12 web with gussets or struts and tack weld securely to the web at the stiffener locations.
13 Upon removal of the welds, grind any nicks or gouges, preheat, weld and test or
14 incorporate into the stiffener fillet weld.

15 Connect the flanges to the web by starting the fillet weld at one end of the girder and
16 proceeding to the other ends.

17 As an option, make adjacent welds simultaneously.

18 The sequence for making the flange to web fillet welds is subject only to the provisions
19 for control of shrinkage and distortion and to the position requirements of the Bridge
20 Welding Code.

21 After flange to web welds are complete, shift bracing gussets or struts if necessary, then
22 remove all temporary gussets or struts. Remove tack welds by grinding flush with parent
23 metal.

24 Straighten any transverse warpage of the flanges if necessary by heating along the
25 centerline of the outside face.

26 Fit tight, square and tack weld stiffeners securely to the web. With the girder in the flat
27 position (web horizontal), weld the stiffeners to the web. Do not weld or tack weld
28 stiffeners to the flanges except where noted in the plans. Stiffeners are not to be used to
29 correct tilt of flange due to distortion associated to welding.

30 After all parts are welded into place, trim the girder to detail length with adjustments for
31 slope and end rotation exceeding 1/4 inch nett.

32 1072-19 SHOP ASSEMBLING

33 (A) General

34 Assemble the field connections of main members of continuous beam spans, plate girders
35 and rigid frames in the shop with milled ends of compressing members in full bearing,
36 and then ream their sub-size holes to specified size while the connections are assembled.
37 Assembly shall be either Full Girder Assembly or Progressive Girder Assembly unless
38 Full Girder Assembly or Special Complete Structure Assembly is required by the
39 contract.

40 Furnish a camber diagram to the Engineer showing the camber at each panel point of
41 each continuous beam line, plate girder or rigid frame. When the shop assembly is Full
42 Girder Assembly or Special Complete Structure Assembly, ensure the camber diagram
43 shows the camber measured in assembly. When any of the other methods of shop
44 assembly is used, show the calculated camber in the camber design.

45 Clean surfaces of metal in contact before assembling. Assemble the parts of a member,
46 pin well and firmly draw together with bolts before reaming. Take assembled pieces
47 apart, if necessary, for removal of burrs and shavings produced by the reaming operation.

48 Ensure that the member is free from twists, bends and other deformation.

1 Drift during assembling only to bring the parts into position, and not sufficient to enlarge
2 the holes or distort the metal. If any holes are enlarged to admit the fasteners, ream them.

3 Match-mark those connecting parts assembled in the shop for the purpose of reaming
4 holes in field connections and provide a diagram showing marks furnished by the
5 Engineer.

6 **(B) Full Girder Assembly**

7 Full Girder Assembly consists of assembling all members of each continuous beam line,
8 plate girder or rigid frame at one time.

9 **(C) Progressive Girder Assembly**

10 Progressive Girder Assembly consists of assembling initially for each continuous beam
11 line or plate girder at least two contiguous shop sections or all members in at least
12 two contiguous shop panels but not less than the number of panels associated with
13 three contiguous section lengths (i.e., length between field splices) and not less than
14 150 feet in the case of structures longer than 150 feet. Add at least one shop section at
15 the advancing end of the assembly before removing any member from the rearward end,
16 so the assembled portion of the structure is never less than the specified above.

17 **(D) Special Complete Structure Assembly**

18 Special Complete Structure Assembly consists of assembling the entire structure,
19 including the floor system.

20 Ensure each assembly, including camber, alignment, accuracy of holes and fit of milled
21 joints, is approved by the Engineer before reaming.

22 **1072-20 PAINTING AND OTHER PROTECTIVE COATINGS**

23 Shop paint in accordance with Section 442.

24 Repair galvanized surfaces that are abraded or damaged in accordance with Article 1076-7.

25 **1072-21 MARKING AND SHIPPING**

26 Paint or mark each member with an erection mark for identification and furnish an erection
27 diagram with erection marks shown thereon. Notification of shipping shall be provided to the
28 Department in writing as soon as practical but in no case less than 24 hours for in-state
29 producers and 72 hours for out of state producers. Hours are as defined in Subarticle 1072-
30 7(A).

31 Prior to loading, the Fabricator's quality control (QC) shall make certain (QC stamped
32 approved) that all material meets the Contract specifications and has been presented to the
33 Department for final inspection.

34 Furnish to the Engineer as many copies of material orders, shipping statements and erection
35 diagrams as the Engineer directs. Show the weights of the individual members on the
36 statement. Mark the weights on members weighing more than 3 tons. Load structural
37 members on trucks or cars in such a manner that they are transported, unloaded and stored at
38 their destination without being excessively stressed, deformed or otherwise damaged.

39 Load and ship steel beams and girders in accordance with the Figures 1072-2 and 1072-3 and
40 Table 1072-9 for all types of transportation. When the contractor wishes to place members on
41 trucks not in accordance with these limits, to ship by rail, to attach shipping restraints to the
42 members, to ship horizontally curved steel members, or to invert members, he shall submit
43 a shipping plan before shipping. Refer to Article 1072-9.

Section 1072

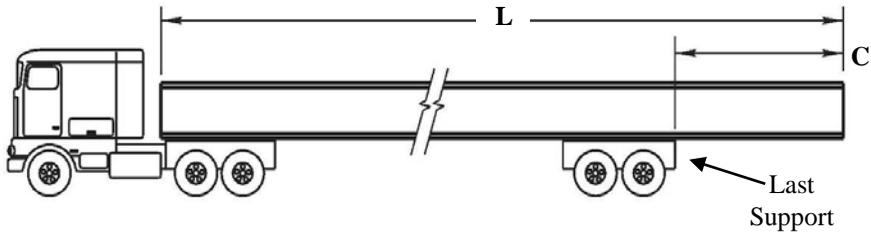

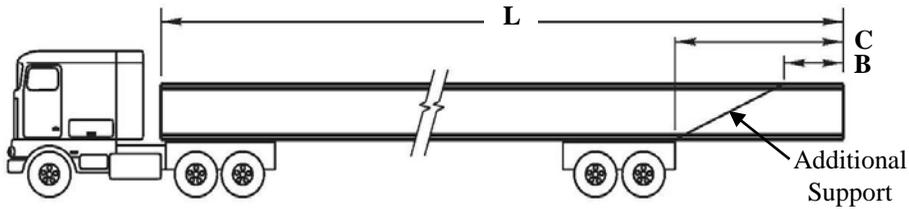

Figure 1072-2. Truck loading diagram for when the length past the last support, **C**, is 15 ft or less.

1 **Figure 1072-3.** Truck loading diagram for when the length past the last support, **C**, is
2 between 15 feet and 30 feet.

3 For truck loading with the length of the last support between 15 feet and 30 feet in Figure
4 1072-3, use the following formulas to calculate truck loading limits or use the values given in
5 Table 1072-9:

6
$$B = 0.4C$$

7
$$C = 0.2L \text{ to } 0.3L, \text{ up to } 30 \text{ ft}$$

8 Where **B** is the length of the member past a required additional restraint, **C** is the length of the
9 member extending past the last support and **L** is the length of the member.

Length of Member, feet	Minimum Length Past Last Support, feet	Maximum Length Past Last Support, feet	Maximum Length Past Additional Restraint, feet
<i>(L)</i>	<i>(C)</i>	<i>(C)</i>	<i>(B)</i>
75	15	22.5	9
80	16	24	9.6
85	17	25.5	10.2
90	18	27	10.8
95	19	28.5	11.4
100	20	30	12
105	21	30	12
110	22	30	12
115	23	30	12
120	24	30	12
125	25	30	12
130	26	30	12
135	27	30	12

1 Restrain overhanging ends of beams or girders both vertically and horizontally to prevent
2 excess movement. Chains are permitted to secure beams and girders during shipping only
3 when adequate measures are taken to prevent damage to the material by the use of approved
4 protective material. If necessary, use adequate bracing to prevent bending of the top flange.

5 Pack bolts of one length and diameter and loose nuts or washers of each size separately. Ship
6 pins, small parts and packages of bolts, washers and nuts in boxes, crates, kegs or barrels, but
7 do not allow the gross weight of any package to exceed 300 lbs. Plainly mark a list and
8 description of the contained material on the outside of each shipping container.

9 Steel die stamped fabricator's identity, station number, girder number and span number of
10 main members into an unpainted area (if available) near the end of the member. Die stamp
11 members with painted ends outside the painted area but as close to the end as possible.

12 Ship anchor bolts, washers and other anchorage or grillage materials, in time to be
13 incorporated into the masonry portion of the structure.

14 **SECTION 1074**
15 **MISCELLANEOUS METALS AND HARDWARE**

16 **1074-1 WELDING**

17 Any facility performing welding operations shall be approved by NCDOT Materials and Tests
18 Unit. Weld other steel items not covered under the Bridge Welding Code in accordance with
19 the applicable AWS Welding Code. Some examples may include but not limited to;
20 Structural Welding Code-Steel (AWS D1.1), Structural Welding Code- Aluminum (AWS
21 D1.2), Structural Welding Code-Sheet Steel (AWS D1.3), Structural Welding Code-
22 Reinforcing Steel (AWS D1.4) and Structural Welding Code-Stainless Steel (AWS D1.6).
23 Certify all welders performing any welding on any metals in accordance with the applicable
24 AWS welding code in the position and process required as approved by the Engineer.

25 **1074-2 EXPANSION ANCHORS**

26 Unless otherwise shown in the plans, provide expansion anchors consisting of two or more
27 units with a minimum of two hard metal conical ring wedges and two expandable lead sleeves
28 of an equally effective design that is approved by the Engineer. Use anchors providing
29 a minimum safe holding power of 3,000 lbs. for 3/4 inch bolts and 2,000 lbs. for
30 5/8 inch bolts, based upon 1/4 of the actual holding power of the anchor in 3,000 psi concrete.
31 Furnish satisfactory evidence, based upon actual tests performed by a commercial testing
32 laboratory, which indicate that the anchors develop the minimum required safe holding
33 power.

34 When it is proposed to use anchors that are previously accepted as meeting the above
35 requirements, the anchors are accepted on the basis of a certified statement indicating the
36 prior acceptance of the furnished anchors.

37 **1074-3 PLAIN STEEL BARS WITH THREADED ENDS**

38 Provide plain steel bars with threaded ends meeting ASTM A307, Grade A.

39 **1074-4 HARDWARE FOR TIMBER STRUCTURES**

40 Use machine bolts, drift-bolts and dowels that are either wrought iron or medium steel. Use
41 washers that are cast iron ogee, malleable iron castings or cut from medium steel or wrought
42 iron plate.

43 Use machine bolts with square heads and nuts. Use nails that are cut or round wire of
44 standard form. Use spikes that are cut, wire spikes or boat spikes.

45 Use black or galvanized nails, spikes, bolts, dowels, washers and lag screws for untreated
46 timber.

Section 1074

1 Galvanize or cadmium plate all hardware for treated timber bridges, except malleable iron
2 connectors.

3 **1074-5 METAL BRIDGE RAILING**

4 **(A) General**

5 As an option, use either aluminum or galvanized steel metal rail, provided that the same
6 material is used on all structures on the project.

7 Certified mill test reports are required for rails and posts.

8 Place a permanent identifying mark that identifies the fabricator on each post. Use
9 a method and location of the identifying mark such that it does not detract from the
10 appearance of the post.

11 Where it is necessary for rails to be curved, form the curvature in the shop or in the field.
12 Uniformly curve the rail without buckling or kinking. Perform all welding in accordance
13 with AWS D1.1 for steel railing and AWS D1.2 for aluminum railing.

14 Provide an anchor unit of sufficient strength to insure load anchoring capacity as
15 specified for rail loading in the *AASHTO LRFD Bridge Design Specifications*.

16 **(B) Aluminum Rail**

17 Supply material for posts, post bases, rails, expansion bars and clamp bars meeting
18 ASTM B221 for Alloy 6061 T6.

19 Use material for rivets meeting ASTM B316 for Alloy 6061 T6. Use rivets that are
20 standard button head and cone point cold driven.

21 Use material for nuts meeting ASTM B211 for Alloy 6061 T6.

22 Provide material for washers meeting ASTM B209 for Alloy Alclad 2024 T3.

23 Supply material for shims meeting ASTM B209 for Alloy 6061 T6.

24 Ensure that the handrails meet the dimensional tolerance requirements of ANSI H35.2.

25 **(C) Galvanized Steel Rail**

26 Use posts, post bases, rails, expansion bars and clamp bars meeting ASTM A36 and
27 galvanize in accordance with ASTM A123. Grind the cut ends of rail smooth and give
28 them 2 coats of organic zinc repair paint. Galvanize the posts and post bases after they
29 are riveted together.

30 Use rivets meeting ASTM A502 for Grade 1 rivets.

31 Use bolts meeting ASTM F593 Alloy 304.

32 Use nuts meeting ASTM F594 Alloy 304.

33 Use washers meeting ASTM F844 except made from Alloy 304 stainless steel.

34 Use materials for shims meeting ASTM A1011 for Grades 36, 40 or 45, or ASTM A1008
35 for Grade C, and galvanized in accordance with ASTM A123.

36 **1074-6 STEEL PIPE**

37 Steel pipe bent or welded in fabricating shall meet ASTM A53 for standard weight pipe. Use
38 galvanized pipe unless otherwise shown in the plans.

1 1074-7 IRON CASTINGS**2 (A) General**

3 Comply with the Department's Iron Casting QA/QC program. Producers and suppliers
4 furnishing iron castings for Department projects shall comply with this program. The
5 program details are available on the Materials and Tests website.

6 Boldly fillet castings at angles, and provide arises that are sharp and perfect. No sharp,
7 unfilleted angles or corners are permitted. Provide castings that are true to pattern in
8 form and dimensions, free from pouring faults, sponginess, cracks, blow holes, and other
9 defects affecting their strength and value for the service intended. Sand blast or otherwise
10 effectively clean of scale and sand all castings to present a smooth, clean, and uniform
11 surface. Welding is not allowed for the purpose of making a casting structurally sound.
12 Welding for cosmetic or other purposes is not allowed without approval of the Engineer.

13 (B) Gray Iron Castings

14 Supply gray iron castings meeting all facets of AASHTO M 306 excluding proof load.
15 Proof load testing will only be required for new casting designs during the design
16 process, and conformance to M306 loading (40,000 lbs.) will be required only when
17 noted on the design documents. Acceptance of production castings will be based on test
18 bars. Cast test bars, of size "B", attached to and integral with the castings. Instead of
19 this, cast test bars separate from the castings when approved in writing by the Engineer.
20 The Engineer reserves the right to require that a test bar be machined from an actual
21 casting if deemed necessary. Unless otherwise specified, do not coat gray iron castings.
22 Do not perform any welding on castings for any reason without prior approval from the
23 Engineer. Mark castings with the NCDOT Standard Number of the casting design, the
24 fabricator's ID and the day, month and year of production.

25 1074-8 STEPS

26 Fabricate steps for minor drainage structures from deformed reinforcing bars, use gray iron
27 castings meeting Subarticle 1074-7(B) or use composite plastic-steel construction as shown in
28 the plans.

29 The use of steps differing in dimension, configuration or materials from those shown in the
30 plans is allowed by furnishing the Engineer with details of the proposed steps and obtaining
31 written approval for the use of such steps.

32 1074-9 FABRICATED STEEL GRATES

33 Use fabricated steel grates made from bars that meet ASTM A36. Galvanize the grates after
34 fabrication in accordance with AASHTO M 111. Mark items with fabricators ID, month and
35 year of production.

36 1074-10 PINS

37 Supply pins for bearing assemblies meeting either ASTM A36 or ASTM A108 for
38 Grades 1016 through 1030, unless otherwise required by the plans or specifications.

39 1074-11 WASHERS

40 Provide washers for use with fasteners meeting ASTM F436. Provide washers for high
41 strength bolts meeting Article 1072-5.

42 Ensure that the size and finish (plain, weathering or galvanized) of washers is compatible with
43 the fastener.

Section 1076

1 1074-12 METAL STAY-IN-PLACE FORMS

2 Provide metal stay-in-place forms for concrete floor slabs of zinc-coated (galvanized) steel
3 sheet conforming to ASTM A653, Structural Steel (SS) Grades 33 through 80 and Coating
4 Class G165 meeting all requirements relevant to steel stay-in-place forms as noted on the
5 contract plans. Do not use material thinner than 20 gauge.

6 1074-13 STEEL GRID FLOORING

7 Steel grid flooring shall conform to the requirements of AASHTO LRFD Bridge Construction
8 Specifications, Section 12 and these Specifications.

9 SECTION 1076 **10 GALVANIZING**

11 1076-1 GALVANIZING

12 Wherever galvanizing is required, perform the galvanizing in accordance with this section
13 except where other requirements for galvanizing are included in other sections of the
14 *Standard Specifications*.

15 Allow the Engineer to obtain samples of molten zinc directly from the galvanizing vat upon
16 request.

17 1076-2 INSPECTION NOTIFICATION

18 Coordinate galvanizing inspection with the Materials and Tests Unit in accordance with
19 Subarticle 1072-7(A). Before inspection, the galvanizer/supplier shall provide the
20 Department's inspector with NCDOT approved drawing/purchase order, stating contract
21 number, location of project, quantity/type of material being galvanized and mill test report(s)
22 for respective material.

23 1076-3 FABRICATED PRODUCTS

24 Galvanize products fabricated from rolled, pressed and forged steel shapes, plates, bars and
25 strips 1/8 inch thick and heavier in accordance with AASHTO M 111. Fabricate products into
26 the largest unit that is practicable to galvanize before the galvanizing is done. Fabrication
27 includes all operations necessary to complete the unit such as shearing, cutting, punching,
28 forming, drilling, milling, bending, welding and riveting. Galvanize components of bolted or
29 riveted assemblies separately before assembly. When it is necessary to straighten any
30 sections after galvanizing, perform such work without damage to the zinc coating.

31 Completely seal all edges of tightly contacting surfaces by welding and commercial blast
32 clean to SSPC-SP 6 before galvanizing.

33 Commercial blast clean components with partial surface finishes in accordance with
34 Subarticle 442-7(A) before pickling.

35 1076-4 HARDWARE

36 Galvanize iron and steel hardware in accordance with AASHTO M 232.

37 1076-5 ASSEMBLED PRODUCTS

38 Completely seal all edges of tightly contacting surfaces by welding before galvanizing.
39 Galvanize assembled steel products in accordance with AASHTO M 111.

40 1076-6 SHEETS

41 Galvanize iron or steel sheets in accordance with ASTM A653.

42 1076-7 REPAIR OF GALVANIZING

43 Repair galvanized surfaces that are abraded or damaged at any time after the application of
44 zinc coating. Surfaces to be repaired shall be clean, dry and free of oil, grease, pre-existing

1 paint, corrosion and rust. Surface to be repaired shall be blast-cleaned to SSPC-SP 10 (near
2 white).

3 Where circumstances do not allow blast or power tool cleaning to be used, then hand tools
4 may be used. Cleaning shall meet SSPC-SP 2, the removal of loose rust, mil scale or paint to
5 the degree specified, by hand chipping, scrapping, sanding and wire-brushing. Surface
6 preparation shall extend into the undamaged galvanized coating. Spray using a non-aerosol
7 spray, or brush-apply the paint to the cleaned areas with 2 coats of organic zinc repair paint
8 meeting Article 1080-9. Ensure that the total thickness of the 2 coats is not less than 3 dry
9 mils. Allow adequate curing time before subjecting repaired items to service conditions in
10 accordance with the manufacturer's printed instructions.

11 Application conditions shall be 40°F Air/Steel temperature and rising, steel temperature shall
12 be 5°F above the dew point and relative humidity shall be 85% or less. Follow paint
13 manufacturers recommendation if more restrictive than above requirements.

14 Follow paint manufacturers written instructions on storage temperatures, mixing application,
15 continuous agitation and pot life. No thinners are to be used when applying organic zinc
16 repair paint by brush or roller.

17 Instead of repairing by painting with organic zinc repair paint, other methods of repairing
18 galvanized surfaces that are abraded or damaged are allowed provided the proposed method is
19 acceptable to the Engineer.

20 Excessive damage to galvanized surfaces as determined by the Engineer is cause for rejection.
21 Replace or re-galvanize rejected galvanized material.

22 **SECTION 1077**
23 **PRECAST CONCRETE UNITS**

24 **1077-1 GENERAL**

25 Use precast concrete units from sources participating in the Department's Precast Concrete
26 QC/QA Program. A list of participating sources is available from the Materials and Tests
27 Unit. The Department will remove a manufacturer of precast concrete units from this program
28 if the monitoring efforts indicated that non-specification material is being provided or test
29 procedures are not being followed.

30 This section covers the materials for and the production of precast reinforced concrete units
31 produced in accordance with the contract. Where precast reinforced concrete circular manhole
32 sections are used, they shall meet AASHTO M 199.

33 **1077-2 PLAN REQUIREMENTS**

34 The plans for precast units will be furnished by the Department in the *Roadway Standard*
35 *Drawings* or details shown in the project plans.

36 When the Department does not make precast plans available and the Contractor chooses to
37 precast, submit drawings to the Engineer for the items proposed to precast. Submit one
38 complete set of drawings for review, at least 40 calendar days before beginning production.
39 After acceptance, submit seven complete sets of drawings. Acceptance by the Engineer of
40 contractor drawings will not be considered as relieving the Contractor of any responsibility
41 for precast units. When precast units are load bearing and require structure design, have the
42 plans prepared and certified by an engineer licensed by the State of North Carolina.
43 Contractor furnished drawings shall show complete design, installation and construction
44 information in such detail as to enable the Engineer to determine the adequacy of the
45 proposed units for the intended use. Contractor drawings shall include details of steel
46 reinforcement size and placement and a schedule that lists the size and type of precast units at
47 each location where the precast units are to be used. Produce precast units in accordance with
48 the approved drawings.

Section 1077

1 1077-3 MATERIALS

2 Refer to Division 10.

Item	Section
Air Entraining Agent	1024-3
Chemical Admixtures	1024-3
Coarse Aggregate	1014-2
Curing Agents	1026
Fine Aggregate	1014-1
Fly Ash	1024-5
Ground Granulated Blast Furnace Slag	1024-6
Miscellaneous Metals	1074
Portland Cement	1024-1
Reinforcing Steel	1070
Silica Fume	1024-7
Type IP Blended Cement	1024-1
Type IS Blended Cement	1024-1
Water	1024-4

3 1077-4 INSPECTION

4 The Department reserves the right to place a duly authorized inspector in the plant at any time
5 work related to the production of units for the Department is being performed. Notify the
6 Engineer at least 7 days in advance when such work is scheduled to begin.

7 Provide an office area for the inspector of at least 50 sf with desk, chair, telephone, facilities
8 for proper heating and cooling, adequate lightning and electrical outlets.

9 Acceptance of precast units will be on the basis of tests of materials, compression tests on
10 concrete cylinders and inspection of the finished units, including amount and placement of
11 steel reinforcement, to determine their conformance with the approved dimensions and design
12 and their freedom from defect. The inspector will have the authority to reject any or all units
13 not manufactured in accordance with these specifications. Any unit found to be defective in
14 any manner at any time will be rejected and replaced by an acceptable unit or repaired in a
15 manner approved by the Engineer.

16 (A) Storage

17 Store all Department units in a separate area on the yard. Store all units on a solid,
18 unyielding foundation free of standing water or in a manner directed by the Engineer. Do
19 not stack units before inspection.

20 (B) Transporting

21 Do not transport units away from the casting yard until the concrete has reached the
22 minimum required 28 day compressive strength and a period of at least 5 days elapses
23 after casting, unless otherwise permitted by the Engineer.

24 Do not transport any unit from the plant to the job site before the approval of that unit by
25 the plant inspector. Such approval is stamped on the unit by the plant inspector.

26 1077-5 PORTLAND CEMENT CONCRETE

27 (A) Composition and Design

28 Portland cement concrete is composed of Portland cement, coarse aggregate (#67 or
29 78M), fine aggregate, water and unless otherwise permitted by the Engineer, an air
30 entraining agent. If other cementitious materials and/or chemical admixtures are used,
31 use these materials in the proper proportions to obtain the optimum effect. Do not use
32 calcium chloride or other admixtures containing calcium chloride.

Section 1077

1 Supply concrete that develops a minimum compressive strength as shown in
2 Table 1077-1 unless other strengths are designated on the approved drawings. When
3 required, air entrain concrete to provide an air content of $4.5\% \pm 1.5\%$. Supply concrete
4 with a maximum slump of 3.5 inches unless a high range water reducer (super plasticizer)
5 is approved by the Engineer. Do not use concrete with a slump exceeding 6 inches. As
6 an option, reduce the cement content of the mix design by up to 20% and replace with fly
7 ash at a rate of 1.2 lbs. of fly ash for each pound of cement replaced or reduce the cement
8 content up to 50% and replace with blast furnace slag on a pound for pound basis.

Section 1077

TABLE 1077-1 PRECAST CONCRETE STRENGTH REQUIREMENTS AT AN AGE OF 28 DAYS		
Precast Units	Requirement	Specification Reference
<u>BARRIER:</u>		
Portable	4,500 psi	Sect. 854, 1090 and 1170
Permanent	4,500 psi	Sect. 854, 857 and 1090
<u>CULVERTS:</u>		
Circular Pipe	4,000 psi	Sect. 310, 1032, 1034, 1520 and AASHTO M 170
Single Cell Box Sections	5,000 psi	Contract and AASHTO M 259
Pipe Tees	4,000 psi	Sect. 310, 1032 and AASHTO M 170
Pipe Elbows	4,000 psi	Sect. 310, 1032 and AASHTO M 170
Cross & Parallel Special End Sections	3,500 psi	Sect. 310 and 1032
<u>DRAINAGE STRUCTURES:</u>		
Boxes (Solid & Waffle)	4,000 psi	Sect. 840 and ASTM C913
<u>CIRCULAR MANHOLES:</u>		
Base	4,000 psi	Sect. 1525 and AASHTO M 199
Riser Section	4,000 psi	Sect. 1525 and AASHTO M 199
Top Section	4,000 psi	Sect. 1525 and AASHTO M 199
Grade Ring	4,000 psi	Sect. 858 and AASHTO M 199
<u>WALLS AND PANELS:</u>		
Wing, Head & End Walls	4,000 psi	AASHTO T 23
Precast Retaining Wall (PRW) Units	4,000 psi	Contract
Precast Retaining Wall Coping	3,000 psi	Contract
Retaining Wall Panels	4,000 psi	Contract
Sound Barrier Wall Panels	4,500 psi	Contract
<u>INCIDENTAL PRECAST ITEMS:</u>		
Concrete Pads For Outlet Pipe, Controller Base Cabinets	2,500 psi	Sect. 815, 816 and 825
Right-of-Way Markers	2,500 psi	Sect. 806 and 1054
Concrete Anchor For Cable Guardrail	3,000 psi	Sect. 1046
Picnic Tables	2,500 psi	Contract
Waste Containers	2,500 psi	Contract

1 Submit a proposed concrete mix design for the precast units. Determine quantities of fine
2 and coarse aggregates necessary to provide concrete in accordance with this section by
3 the method described in ACI 211 using the absolute volume method.

4 The Engineer will review the mix design only to ascertain general compliance with the
5 *Standard Specifications*. Do not use a mix until notified that the mix is acceptable.
6 Acceptance of the mix design does not relieve the Contractor of his responsibility to
7 furnish an end product meeting the *Standard Specifications*. Upon request from the
8 Contractor, a precast concrete unit mix design accepted and used satisfactorily on any
9 Department project may be accepted for use on other projects.

10 **(B) Testing**

11 Make all representative concrete test cylinders and all testing required herein in the
12 presence of the plant inspector for items with strength requirements greater than 2,500 psi
13 in Table 1077-1, unless otherwise approved by the Engineer. For items with strength
14 requirements of 2,500 psi, furnish a Type 3 material certification in accordance with
15 Article 106-3 certifying that the item meets this Specification.

16 Before the first load is placed, determine the air content by a calibrated Chace indicator in
17 accordance with AASHTO T 199. If the air content as determined by the Chace indicator
18 fails to meet the *Standard Specifications*, perform 2 more tests with the Chace indicator
19 on the same load and average all 3 tests. Acceptance or rejection of the load is based on
20 the average of the 3 Chace indicator tests. As an alternate method determine the air
21 content by AASHTO T 152, T196 or T121.

22 Perform temperature, air and slump tests whenever cylinders are cast.

23 Determine slump in accordance with AASHTO T 119 with no more than 3 1/2 inches
24 allowed.

25 For the purpose of testing for the required 28 day compressive strength, furnish, at no
26 cost to the Department, at least four concrete cylinders for each class of concrete, each
27 structure and each day that precast units are produced for the Department. If the
28 contractor anticipates an early break request, furnish the Department with two concrete
29 cylinders for each early break request. These cylinders are in addition to the four
30 concrete cylinders required for each day of production. Make and cure cylinders in
31 accordance with AASHTO T 23 unless, by permission of the Engineer, the units are
32 cured by one of the methods in Article 1077-9 for the full time required to meet the
33 specified compressive strength requirements. In such case, cure the cylinders with the
34 members and in the same manner as the members. Test cylinders in accordance with
35 AASHTO T 22. If the average of two cylinders tested to determine compressive strength
36 at the age of 28 days fails to indicate a compressive strength as shown in Table 1077-1, or
37 such compressive strength as is required by the approved drawings, such failure is cause
38 for the rejection of the members represented.

39 **(C) Temperature Requirements**

40 Maintain the concrete temperature at the time of placing in the forms not less than 50°F
41 nor more than 95°F unless otherwise directed by the Engineer.

42 Place concrete in cold weather in accordance with Article 420-7.

43 **(D) Use of Water Reducing Admixtures**

44 Use water reducing admixtures in accordance with Subarticle 1000-4(G). Use high range
45 water reducers (super plasticizers), if approved by the Engineer.

Section 1077

1 1077-6 FORMS

2 Use forms of sturdy construction and which are capable of consistently providing straight
3 lines and uniform dimensions in the finished product. Use metal forms except where other
4 materials are approved by the Engineer. Provide an identifying number on each form, and
5 mark each precast unit with the same identifying number as the form used to cast unit. Forms
6 not meeting these requirements are subject to rejection by the Engineer. Provide joints in
7 forms that are smooth and tight enough to prevent leakage of mortar. Provide inside surfaces
8 of forms that are accessible for cleaning. After each use, clean the forms thoroughly. Before
9 casting, free the inside surfaces of the forms from rust, grease or other foreign matter. Do not
10 allow coatings used for release of members to build up and in no case allow liquid or powder
11 from coating materials to come in contact with the reinforcement steel.

12 1077-7 REINFORCEMENT

13 (A) Steel Reinforcement

14 Furnish steel reinforcement and place as shown in the plans and in accordance with
15 Section 1070.

16 (B) Macro Synthetic Fiber Reinforcement

17 Substitute as an option, macro-synthetic fibers instead of 4 inches x 4 inches W1.4 x
18 W1.4 welded wire reinforcement for selected precast concrete products in accordance
19 with the following requirements.

20 (1) Materials

21 Refer to Division 10.

Item	Section
Portland Cement Concrete	1077-5

22 Substitute macro-synthetic fibers only for steel reinforcement with an area of steel of
23 0.12 sq.in./ft or less in the following items:

24 (a) Precast drainage structure units in accordance with *Roadway Standard*
25 *Drawings* No. 840.45.

26 (b) Precast manhole 4.0 feet riser sections in accordance with *Roadway Standard*
27 *Drawings* No. 840.52.

28 All other requirements, including reinforcement for these precast concrete items will
29 remain the same.

30 (2) Submittal

31 Submit to the Department for approval by the precast producer and fiber
32 manufacturer, independently performed test results certifying the macro-synthetic
33 fibers and the precast concrete products meet the requirements listed herein.

34 (3) Macro-Synthetic Fibers

35 Manufacture from virgin polyolefins (polypropylene and polyethylene) and comply
36 with ASTM D7508. Fibers manufactured from materials other than polyolefins.
37 Submit test results certifying resistance to long-term deterioration when in contact
38 with the moisture and alkalis present in cement paste and/or the substances present
39 in air-entraining and chemical admixtures.

40 Fiber length shall be no less than 1.5 inches. Use macro-synthetic fibers with an
41 aspect ratio (length divided by the equivalent diameter of the fiber) between 45 and
42 150, a minimum tensile strength of 40 ksi when tested in accordance with ASTM
43 D3822 and a minimum modulus of elasticity of 400 ksi when tested in accordance
44 with ASTM D3822.

1 (4) Fiber Reinforced Concrete

2 Approved structural fibers may be used as a replacement of steel reinforcement in
3 allowable structures of *Roadway Standard Drawings* Nos. 840.45 and 840.52. The
4 dosage rate, in pounds of fibers per cubic yard, shall be as recommended by the fiber
5 manufacturer to provide a minimum average residual strength of concrete, tested in
6 accordance with ASTM C1399, of no less than that of the concrete with the steel
7 reinforcement that is being replaced and no less than 5 lb/cy. Submit the
8 recommendations of the manufacturer that correlate the toughness of steel-reinforced
9 concrete with that of the recommended dosage rate for the fiber-reinforced concrete.

10 Use fiber reinforced concrete with a $4.5\% \pm 1.5\%$ air content and a compressive
11 strength of at least 4,000 psi in 28 days.

12 Determine workability of the concrete mix in accordance with ASTM C995. The
13 flow time shall at least 7 seconds and no greater than 25 seconds.

14 Assure the fibers are well dispersed and prevent fiber balling during production.
15 After introduction of all other ingredients, add the plastic concrete and mix the
16 plastic concrete for at least 4 minutes or for 50 revolutions at standard mixing speed.

17 **1077-8 PLACING CONCRETE**

18 Use the procedures and equipment for handling, placing and consolidating the concrete such
19 that a uniformly dense and high grade concrete is obtained in all parts of the unit under all
20 working and weather conditions. Do not mix, handle, deliver, place or finish concrete using
21 devices made of aluminum or containing aluminum.

22 Internal, external or a combination of internal and external vibration is required as necessary
23 to produce uniformly dense concrete without honeycomb.

24 **1077-9 CURING CONCRETE**

25 **(A) General**

26 Precast units are subjected to one of the methods of curing described below or to other
27 methods or combinations of methods approved by the Engineer. Cure the precast units
28 for a sufficient length of time so the concrete develops the specified compressive strength
29 at 28 days or less. Do not strip forms until at least 24 hours after the concrete attains
30 initial set. For this purpose, initial set is defined as at least 500 psi resistance to
31 a standard penetrometer. The option to strip forms earlier is available provided concrete
32 cylinders indicate a strength of at least 75% of the 28 day compressive strength is
33 attained before release for each day's production. Do not deface or injure the units.

34 **(B) Curing at Elevated Temperatures**

35 Cure at elevated temperatures in accordance with Subarticle 1078-10(B).

36 **(C) Water Curing**

37 Water curing of precast units is allowed as described in Subarticle 420-15(B), by
38 covering with water saturated material, or by a system of perforated pipes, mechanical
39 sprinklers, porous hoses or by any other method that keeps the units moist during the
40 specified curing period. Do not use methods that deface or injure the precast units.

41 **(D) Curing Compound**

42 Application of a curing compound is allowed provided it is left intact until the specified
43 compressive strength is met. Keep all surfaces moist before the application of the
44 compound and damp when the compound is applied. Seal the surface with a single
45 uniform coating at the rate of coverage recommended by the curing compound
46 manufacturer, or as directed by the Engineer, but not less than 1 gal per 150 sf of area.

Section 1077

1 1077-10 LIFT HOLES, HANDLING

2 Do not cast or drill more than 4 holes in each unit for the purpose of handling or placing
3 unless otherwise approved by the Engineer. Locate all lift holes and handling devices in
4 accordance with plan and design requirements. Units damaged while being handled or
5 transported are rejected or require repair in a manner approved by the Engineer.

6 1077-11 FINAL FINISH

7 Unless otherwise required by the contract, finish all concrete in accordance with
8 Subarticle 420-17(B).

9 Do not repair units with honeycomb, cracks, or spalls until inspected by the Engineer. Use
10 repair methods that are approved by the Engineer before their use. Any appreciable
11 impairment of structural adequacy is cause for rejection.

12 1077-12 EXPOSED AGGREGATE FINISH FOR PRECAST CONCRETE PANELS

13 When required, provide an exposed aggregate finish for front faces of panels with a depth of
14 exposure ranging from 0 to 1/4 inch. Before beginning production, furnish three 12 inch x 12
15 inch sample panels to establish acceptable variations in color, texture and uniformity of the
16 finish. After the sample panels are accepted and within 30 days of beginning production,
17 produce a reinforced test panel of the largest size that will be used for the project with the
18 accepted exposed aggregate finish. Acceptance of the appearance of panels during production
19 will be based on the test panel and accepted sample panels.

20 Use aggregate and cement from the same source as was used for the test panel and accepted
21 sample panels to produce panels with an exposed aggregate finish. Provide access to visually
22 inspect the entire finish of each completed panel and compare it to the test panel appearance
23 before stacking panels. Replace the test panel with a new test panel every three months
24 during production or when fly ash or cement source changes.

25 1077-13 STEPS FOR PRECAST DRAINAGE STRUCTURES

26 Supply steps meeting AASHTO M 199 for design, materials and dimensions. Incorporate
27 steps in all drainage structures over 3.5 feet in height. Do not detail the lowest step more than
28 16 inches from the bottom.

29 1077-14 MARKING

30 Clearly show the following information on each precast member:

31 (A) Date of manufacture,

32 (B) Name of the manufacturer,

33 (C) Piece mark designations where such designations are shown in the plans, and

34 (D) For precast culverts, match mark each precast member by a method approved by the
35 Engineer, before shipment.

36 Indent marking into the concrete or paint on with waterproof paint.

37 1077-15 DIMENSIONS

38 Ensure that all dimensions allow assembly of the units in place without objectionable
39 deviation from the lines shown in the plans. If requested by the Engineer, assemble the
40 precast members to ensure a quality fit before shipment of the precast members.

41 1077-16 INCIDENTAL PRECAST ITEMS

42 Furnish a Type 3 materials certification in accordance with Article 106-3 for incidental
43 precast items in Table 1077-1. Signal Cabinet Foundations shall meet the requirements herein
44 and in Section 1098.

Section 1078

1 1078-2 MATERIALS

2 Refer to Division 10.

Item	Section
Air Entraining Agent	1024-3
Chemical Admixtures	1024-3
Coarse Aggregate	1014-2
Epoxy Protective Coating	1081-1
Fine Aggregate	1014-1
Fly Ash	1024-5
Ground Granulated Blast Furnace Slag	1024-6
Miscellaneous Metals	1074
Portland Cement	1024-1
Prestressing Strand	1070-5
Reinforcing Steel	1070
Type IP Blended Cement	1024-1
Type IS Blended Cement	1024-1
Silica Fume	1024-7
Structural Steel	1072
Water	1024-4

3 Do not make changes in the source of aggregates, cements or admixtures during the casting of
4 members in any one span or substructure unit unless approved by the Engineer.

5 1078-3 INSPECTION

6 The Department reserves the right to place a duly authorized inspector in the plant at any or
7 all times work related to the production of members for the Department is performed. Notify
8 the Engineer at least 7 days in advance when such work is scheduled. Provide an office area
9 with an approximate floor space of 100 sf, a desk or drafting table, two chairs, telephone,
10 separate dial-up or faster internet access, facilities for proper heating and cooling and
11 adequate lighting at the plant for the exclusive use of the inspector. The inspector has the
12 authority to reject any or all members not manufactured in accordance with these *Standard*
13 *Specifications*. Approval of any member by the inspector at the plant is in no way final, and
14 further inspection is made at the structure site both before and after the member is placed in
15 the final position. Any member found to be defective in any manner at any time is rejected
16 and requires replacement by an acceptable member or repair in a manner approved by the
17 Engineer.

18 Do not transport any member from the plant to the job site before approval of that member by
19 the plant inspector. Provide access to all surfaces of the member so the plant inspector has the
20 opportunity to properly inspect the member before approval. This approval is stamped on the
21 member by the plant inspector.

22 1078-4 PORTLAND CEMENT CONCRETE

23 (A) Composition and Design

24 Supply Portland cement concrete composed of Portland cement, coarse aggregate, fine
25 aggregate, water and an approved air-entraining agent. Add other cementitious materials
26 and/or chemical admixtures if approved by the Engineer. When admixtures are used, use
27 them in the proper proportions to obtain the optimum effect. Do not use set accelerating
28 admixtures, calcium chloride or admixtures containing calcium chloride. If approved,
29 high range water reducer may be used at a rate not to exceed the manufacturer's
30 recommended dosage.

1 Supply concrete with a minimum compressive strength of 5,000 psi at the age of 28 days,
 2 unless otherwise required by the plans or Specifications. Ensure that all coarse aggregate
 3 used in prestressed concrete passes a 1 inch sieve. Maintain a cement content of at least
 4 564 lbs. per cubic yard but no more than 752 lbs/cy. As an option, reduce the cement
 5 content of the mix design and replace with fly ash or ground granulated blast furnace slag
 6 in accordance with Article 1024-1. For concrete with a 28 day design strength greater
 7 than 6,000 psi, if approved, substitute microsilica for cement, in conformance with
 8 Article 1024-1.

9 Supply concrete meeting Table 1078-1, unless otherwise approved by the Engineer.

TABLE 1078-1 REQUIREMENTS FOR CONCRETE		
Property	28 Day Design Compressive Strength 6,000 psi or less	28 Day Design Compressive Strength greater than 6,000 psi
Maximum Water/Cementitious Material Ratio	0.45	0.40
Maximum Slump without HRWR	3.5"	3.5"
Maximum Slump with HRWR	8"	8"
Air Content (upon discharge into forms)	5 ± 2%	5 ± 2%

10 Submit to the Engineer proposed concrete mix designs for each strength of concrete used
 11 in the work. Determine quantities of fine and coarse aggregates necessary to provide
 12 concrete in accordance with the *Standard Specifications* by the method described in
 13 ACI 211 using the absolute volume basis.

14 Submit mix designs, stated in terms of saturated surface dry weights, on
 15 M&T Form 312U at least 35 days before using the proposed mix. Adjust batch
 16 proportions to compensate for surface moisture contained in the aggregates at the time of
 17 batching. Changes in the saturated dry mix proportions are not permitted unless revised
 18 mix designs are submitted to the Engineer and are determined to be acceptable for use.

19 Provide with M&T Form 312U a listing of laboratory test results of aggregate gradation,
 20 air content, slump and compressive strength. List the compressive strength of at least
 21 three 6 inches x 12 inches or 4 inches x 8 inches cylinders. Show the age of the cylinders
 22 at the time of testing and a detailed description of the curing procedure. Perform
 23 laboratory tests in accordance with Table 1078-2.

TABLE 1078-2 CONCRETE LABORATORY TESTING	
Property	Test Method
Aggregate Gradation	AASHTO T 27
Air Content	AASHTO T 152
Slump	AASHTO T 119
Compressive Strength	AASHTO T 23 and T 22

24 If the design 28 day compressive strength is greater than 6,000 psi, submit the
 25 compressive strength of at least six cylinders. Ensure that the average strength of the
 26 six cylinders is at least 1,500 psi above the minimum 28 day compressive strength
 27 required by the plans.

28 When the combination of materials is such that the required strength and/or a workable
 29 slump is not obtained at the minimum specified cement content with the maximum
 30 allowable water-cement ratio, increase the cement content at no cost to the Department
 31 by whatever amount is required to produce the required strength and/or slump without
 32 exceeding the allowable water-cement ratio.

Section 1078

1 The Engineer reviews the mix design only to ascertain general compliance with the
2 *Standard Specifications*. The Engineer notifies the Contractor, in writing, that the mix
3 design is either acceptable or unacceptable. Do not use a mix until notified by the
4 Engineer that the mix design is acceptable. Acceptance of the mix design does not
5 relieve the Contractor of responsibility to furnish an end product meeting specification
6 requirements. Upon request, a mix design accepted and used satisfactorily on any
7 Department project may be accepted for use on other projects.

8 (B) Testing

9 Employ a certified concrete technician to perform all testing required by this subarticle at
10 the bed site in the presence of the plant inspector unless otherwise approved.
11 Certification of technicians is awarded upon satisfactory completion of examinations
12 prepared and administered by the Department or other approved agency.

13 (1) Air Content

14 Before allowing placement of the first load in a bed, determine the air content by
15 a calibrated Chace indicator. During the placement of the first load, determine the
16 air content by AASHTO T 152, T 196 or T 121. Determine the air content in each
17 subsequent 10 cubic yards by the Chace indicator before allowing placement.
18 Determine the air content by AASHTO T 152, T 196 or T 121 from all loads from
19 which cylinders are made. If the air content as determined by the Chace indicator,
20 fails to meet the specification requirements, a second test is run on material from the
21 same load and the results of the 2 tests averaged. If the average does not meet the
22 *Standard Specifications*, a test on the same load is conducted using AASHTO T 152,
23 T 196 or T 121. Acceptance or rejection of the load is based on the results of this
24 test.

25 (2) Slump

26 Determine slump in accordance with AASHTO T 119.

27 (3) Strength

28 For the purpose of testing for the required 28 day compressive strength and also for
29 the required compressive strength for the transfer of load, furnish, at no cost to the
30 Department, cylinders made from a sample of concrete placed near the live end of
31 the bed and additional cylinders made from a sample of concrete placed near the
32 dead end of the bed. Make cylinders in accordance with AASHTO T 23, except cure
33 the cylinders in the same manner as the members represented until the strands are
34 released. Place cylinders in clusters at random points along the casting bed. After
35 the strands are released, air cure the cylinders in an approved common area near the
36 testing apparatus for the remainder of the 28 day curing period. Test the cylinders in
37 accordance with AASHTO T 22. Provide approved apparatus for testing the transfer
38 strength of the cylinders. Maintain this apparatus to within 1.0% accuracy and
39 calibrate at intervals not to exceed 12 months by an approved testing company at no
40 cost to the Department. The Engineer reserves the right to require verification
41 immediately after a testing machine is relocated and whenever there is reason to
42 doubt the accuracy of the indicated load, regardless of the time interval since the last
43 verification.

1 The testing requirements vary according to the 28 day compressive strength required
2 by the plans as follows:

3 (a) Compressive Strength (28 day) of 6,000 psi or Less

4 Test a set of two cylinders, one from each end of the bed, for the purpose of
5 determining whether the concrete has reached the required strength for transfer
6 of load. Ensure that the average of the strength tests on the two cylinders meets
7 or exceeds the required strength and the lowest cylinder is not more than 200 psi
8 below the required strength.

9 Test a set of two cylinders to determine compressive strength at the age of 28
10 days. The strength from these two cylinders is averaged. Ensure that this average
11 is at least 5,000 psi or such 28 day compressive strength required by the plans or
12 *Standard Specifications*. Ensure that no cylinder indicates a compressive
13 strength less than 400 psi below the required 28 day compressive strength.
14 Failure to meet the above requirements is cause for rejection of the members
15 represented.

16 (b) Compressive Strength (28 day) of Greater Than 6,000 psi

17 Test four cylinders, two sets of two cylinders from each end of the bed, for the
18 purpose of determining whether the concrete has reached the required strength for
19 transfer of load. The strengths from the dead end cylinders are averaged and
20 the strengths from the live end cylinders are averaged. Ensure that both of these
21 averages meet or exceed the required release strength and the lowest cylinder is
22 not more than 200 psi below the required strength.

23 Test a set of three cylinders from each end to determine the 28 day compressive
24 strength. The strengths from the dead end cylinders are averaged and the
25 strengths from the live end cylinders are averaged. Ensure that both of these
26 averages meet or exceed the 28 day compressive strength. Ensure that no
27 cylinder indicates a compressive strength less than 400 psi less than the required
28 28 day compressive strength. Failure to meet the above requirements is cause
29 for rejection of the members represented.

30 **(C) Temperature Requirements**

31 Maintain a concrete temperature at the time of placing in the forms between 50°F
32 and 95°F.

33 Do not place concrete when the air temperature, measured at the location of the
34 concreting operation in the shade away from artificial heat, is below 35°F.

35 **(D) Elapsed Time for Placing Concrete**

36 Ensure that the elapsed time for placing concrete is in accordance with
37 Subarticle 1000-4(E). The requirements of Subarticle 1000-4(E) pertaining to
38 Class AA concrete apply to prestressed concrete.

39 **(E) Use of Set Retarding Admixtures**

40 By permission of the Engineer, use an approved set retarding admixture if choosing to
41 take advantage of the extended time interval between adding mixing water and placing
42 the concrete.

43 Use a quantity of set retarding admixture per 100 lbs. of cement within the range
44 recommended on the current list of approved set retarding admixtures issued by the
45 Materials and Tests Unit.

46 **(F) Use of Water Reducing Admixtures**

47 Use water-reducing admixtures in accordance with Subarticle 1000-4(G).

Section 1078

1 (G) Use of Calcium Nitrite Corrosion Inhibitor

2 Add an approved calcium nitrite corrosion inhibitor (30% solids) to the concrete mix at
3 the batch plant for the bridge elements identified by the plan notes. Clearly mark the
4 prestressed concrete members that contain calcium nitrite.

5 Use the inhibitor at a minimum rate of 3.0 gal/cy. Ensure that the hardened concrete
6 contains at least 5.8 lbs/cy Nitrite (NO₂) when tested in accordance with Materials and
7 Tests Method Chem. C-20.0 with the exception of concrete used in prestressed members.
8 Test prestressed members as follows:

9 The Department will perform the complete C-21.0 Field Test Procedure for the Nitrite
10 Ion in Plastic Concrete on plastic concrete samples obtained randomly from a truck used
11 to pour concrete near each end (live end and dead end) of a prestressed concrete casting.
12 Powder samples will be taken from hardened cylinders made at the time C-21.0 is run for
13 any concrete that fails the C-21.0 (plastic test) method. The Chemical Testing Laboratory
14 will test the powder using method C-20.0 Determination of Nitrite in Hardened Concrete.
15 Acceptance of the concrete is dependent in the results of method C-20.0 (hardened test)
16 when any sample fails the C-21.0 (plastic test method).

17 The Department will perform a qualitative nitrite ion check by method C-22.0 (Field Spot
18 Test) on each load of concrete batched for a prestressed concrete casting bed.
19 Acceptance of the concrete is dependent on the results of method C-20.0 (hardened test)
20 when any sample fails the C-22.0 (Field Spot Test). The producer may elect to not
21 incorporate concrete that fails Method C-22.0 (Field Spot Test) instead of waiting
22 for C-20.0 (hardened test) test results to determine the acceptability of the member. Once
23 per each week's production of prestressed concrete with corrosion inhibitor, random
24 samples of hardened concrete powder will be taken from cylinders used for
25 method C-21.0 (plastic test). These samples will be submitted to the Chemical Testing
26 Laboratory for analysis using method C-20.0 (hardened test).

27 Units with calcium nitrite in a quantity less than specified are subject to rejection.
28 Furnish powder drilled from concrete cylinders to the Engineer, in a quantity to be
29 specified, to verify the concentrations of calcium nitrite in hardened concrete. Concrete
30 failing to contain calcium nitrite at the required concentrations as tested is subject to
31 rejection.

32 Use only air-entraining, water-reducing and/or set-controlling admixtures in the
33 production of concrete mixtures that are compatible with calcium nitrite solutions.

34 Strictly adhere to the manufacturer's written recommendations regarding the use of
35 admixtures including storage, transportation and method of mixing. If preferred, use
36 calcium nitrite, which acts as an accelerator, in conjunction with a retarder to control the
37 set of concrete, as per the manufacturer's recommendation.

38 (H) Measuring Materials

39 Measure materials in accordance with Article 1000-8.

40 (I) Mixers and Agitators

41 Use mixers and agitators meeting Article 1000-10.

(J) Mixing and Delivery

(1) General

Mix and deliver concrete to the site of the work by one of the following methods, except where other methods are approved by the Engineer. The Engineer approves the mixing of concrete by methods other than those listed below provided the proposed method is capable of satisfying job requirements and there is adequate evidence that the proposed method produces concrete complying with the *Standard Specifications*. Assume responsibility for controlling the materials and operations so as to produce uniform concrete meeting the *Standard Specifications*.

Have present during all batching operations at the concrete plant a certified concrete technician employed by the Contractor, prestressed concrete producer or concrete supplier while concrete is batched and delivered to the site of the work. The sole duty of this employee is to have charge of and exercise close supervision of the production and control of the concrete. Ensure the technician performs moisture tests, adjusts mix proportions of aggregates for free moisture, completes batch tickets on M&T Form 903 or approved delivery tickets, signs batch tickets or approved delivery tickets and assures quality control of the batching operations. Delivery tickets are permitted instead of batch tickets on M&T Form 903 provided they are reviewed and approved by the Materials and Tests Unit. Certification of technicians is awarded upon satisfactory completion of examinations prepared and administered by the Department or other approved agency.

(a) Central Mixed Concrete

Mix completely in a stationary mixer and transport the mixed concrete to the point of delivery in a truck agitator or in a truck mixer operating at agitating speed or in non-agitating equipment approved by the Engineer. Mix within the capacity and at the mixing speeds recommended by the equipment manufacturer.

(b) Transit Mixed Concrete

Mix completely in a truck mixer while at the batching plant, in transit or at the work site.

(2) Mixing Time for Central Mixed Concrete

The mixing time starts when all the solid materials are in the mixing compartment and ends when any part of the concrete begins to discharge. Charge the ingredients into the mixer such that some of the water enters in advance of cement and aggregate, and substantially all the water is in the drum before 1/3 of the specified mixing time elapses. Transfer time in multiple drum mixers is counted as part of the mixing time.

Establish the minimum mixing time by one of the following:

(a) Mixer performance tests as described herein,

(b) The manufacturer of the equipment, or

(c) The requirement of one minute for mixers of 1.0 cy capacity or less with an increase of 15 seconds for each cubic yard or fraction thereof in increased capacity.

The Engineer reserves the right to require a mixer performance test at any time. The minimum mixing time as determined by the mixer performance test is that which produces concrete in accordance with Table 1078-2.

Section 1078

1 Sample and test for mixer performance as provided below. Charge the mixer to its
2 rated capacity with the materials and proportions used in the work and mix at the
3 recommended mixing speed to the target time. Stop mixing then and begin
4 discharging. Take two samples of sufficient size to make the required tests after
5 discharge of approximately 15% and 85% of the load by an appropriate method of
6 sampling which provides representative samples of the concrete.

7 Separately test each of the two samples of concrete for the properties listed in
8 Table 1078-2. Conduct tests in accordance with the standard methods shown in
9 Table 1078-2 or procedures established by the Materials and Tests Unit.

10 Perform the mixer performance test described above on at least two batches of
11 concrete. For the performance test to be acceptable, ensure that all tests in each
12 batch meet the requirements listed in Table 1078-3.

13 The Engineer rechecks mixer performance at any time when in his judgment
14 acceptable mixing is not accomplished.

15 Where acceptable mixing cannot be accomplished in the established mixing time, the
16 Engineer increases the mixing time or requires that the mixer be repaired or replaced
17 before any further mixing.

**TABLE 1078-3
REQUIREMENTS FOR UNIFORMITY OF CONCRETE WITHIN A BATCH**

Property	Requirement	Test Method
Difference in Test Samples Air Content, Percent by Volume of Concrete	1.0%	AASHTO T 152
Slump	1.0"	AASHTO T 119
Coarse aggregate content, portion by weight of each sample retained on the No. 4 sieve	6.0%	-
Weight per Cubic Foot (Density)	1.0 lb/cf	AASHTO T 121
Average Compressive Strength at 7 days, Percent of Average	7.5% ^A	AASHTO T 22 and T23

18 **A.** Obtain tentative approval pending 7 day compressive strength tests.

19 (3) Truck Mixers and Truck Agitators

20 Use truck mixers and truck agitators meeting Subarticle 1000-11(C). For concrete
21 with a design 28 day compressive strength greater than 6,000 psi, load trucks to
22 within 1 cy of rated capacity and mix at a speed of 16 to 18 rpm.

23 (4) Delivery

24 For central mixed concrete delivered in truck agitators, truck mixers, or transit mixed
25 concrete, use a ticket system for recording the transportation of batches from the
26 proportioning plant to the site of the work. Fill out the tickets on M&T Form 903 or
27 approved delivery tickets in accordance with the instructions issued by the Engineer.
28 Issue the tickets to the truck operator at the proportioning plant for each load and
29 have them signed by the certified concrete technician, which signifies that the
30 concrete in the truck is inspected before departure. Show on each ticket the time
31 batching is complete and if transit mixed, the number of revolutions at mixing speed,
32 if any, at the plant. Deliver the tickets to the inspector at the site of the work. For
33 central mixed concrete delivered in non-agitating equipment, alternate methods of
34 documenting batch proportions are considered by the Engineer. Loads that do not
35 arrive in satisfactory condition within the time limits specified are not acceptable for
36 use in the work.

1 (K) Ready Mixed Concrete Plant

2 Ensure ready mixed concrete plants are inspected and approved by the Department before
3 they are used to produce concrete for the project. Ensure that plants meet all applicable
4 requirements of the *Standard Specifications* and in addition have at least two acceptable
5 concrete delivery vehicles that are in working condition. Plants approved by the
6 Department are placed on a list of approved plants that is made available. All plants are
7 subject to reinspection at intervals selected by the Engineer. Reapproval after each
8 inspection is contingent on continuing compliance with the *Standard Specifications*

9 1078-5 CASTING BED AND FORMS

10 Use metal forms, including headers or end forms, except where other materials are approved
11 by the Engineer. Use forms of adequate thickness, braced, stiffened, anchored and aligned
12 adequately to consistently produce members within the limits of dimensional tolerances.
13 Design and align the forms so they do not restrict longitudinal movement of the casting when
14 the prestressing force is transferred. Provide corners and angles that are chamfered or
15 rounded. Provide joints in forms that are smooth and tight enough to prevent leakage of
16 mortar. Plug holes and slots in forms, pallets, headers and bulkheads neatly to prevent
17 leakage of mortar. Make the inside surfaces of forms accessible for cleaning. Thoroughly
18 clean the beds and forms after each use. Before casting, clean the inside surfaces of the forms
19 from rust, grease or other foreign matter. Remove all foreign substances from inside the
20 forms, including any standing water. Do not allow coatings used for release of members to
21 build up. Do not use forms that do not present a smooth surface.

22 When casting holes through the top flange of Bulb Tee Girders for overhang or interior bay
23 falsework hanger rods, use rigid PVC conduits with a wall thickness of approximately
24 1/8 inch. Do not use thin wall material. Secure conduits in the forms so they do not migrate
25 out of the proper location. Other methods of forming holes may be proposed but are subject
26 to the Engineer's approval.

27 When casting dowel rod holes in cored slab or box beam members, use material that creates
28 round, vertical holes of the specified diameter and in the correct location. Do not use material
29 that deforms, collapses or shifts position during casting of the member.

30 Apply form release agents to the forms either before or after stringing of strands. If applied
31 before stringing, provide a release agent of a type that dries to a degree so it cannot
32 contaminate any strand that comes in contact with it. If the release agent is applied after
33 stringing, exercise great care and provide a sheet metal or similar type shield for protection of
34 the strands.

35 1078-6 TENSIONING DEVICES

36 Use tensioning devices adequate to produce and maintain the required tension in all strands
37 until the concrete reaches the required transfer strength. Equip all jacks with accurate and
38 calibrated gauges for registering jacking loads. Calibrate gauges with the jacks with which
39 they are used. Calibrate all jacks and gauges by an approved testing company at no cost to the
40 Department at intervals not to exceed 12 months. During progress of the work, if gauge
41 readings and elongations indicate materially differing loads, recalibrate as required. Use
42 gauges with a full load capacity of 1 1/2 to 2 times their normal working load, unless
43 otherwise approved. Do not use loads less than one-fourth or more than 3/4 of the total
44 graduated gauge capacity unless calibration data clearly establishes consistent accuracy over
45 a wider range. Use gauges with indicating dials at least 6 inches in diameter and gauge
46 pointers that do not fluctuate, preventing an accurate reading, but remain steady until the
47 jacking load is released. Ensure that all gauges have an accuracy of reading within 2%.
48 Provide means for measuring the elongation of strands within 1/4 inch.

Section 1078

1 1078-7 PLACING STRANDS, TIES AND REINFORCING STEEL

2 Position strands, ties, supports, reinforcing bars of the sizes shown in the plans and bearing
3 plates in accordance with the detailed dimensions shown in the plans and effectively secure
4 against displacement from their correct positions. The use of previously tensioned strands is
5 not permitted. For prestressing strands, do not allow deflections or displacements of any kind
6 between the end anchorages unless shown in the plans. Place the steel reinforcing in final
7 position after tensioning of the strands. Bend all tie wires to the inside of the member so the
8 ends are farther from the edge than the material tied. Support bottom strands spacings not to
9 exceed 20 feet by supports meeting Article 1070-4 or by other approved means. Plastic
10 supports may be used when approved.

11 Strands with kinks, bends, nicks, scale, excessive rust or other defects are not permitted. No
12 more than one broken wire per casting bed is permitted. Slight rusting is not cause for
13 rejection, provided it is not sufficient to cause visible pits. Take precautions to prevent
14 contamination of strands and reinforcing steel. Clean the strands and reinforcing steel to an
15 acceptable condition before pouring concrete. Do not place concrete in the forms until the
16 strand and reinforcement condition and arrangement are inspected by the plant inspector.

17 Strand splices are only permitted at the end of a reel and when using a single strand jack.
18 Ensure that the strand lengths to be spliced together have the same lay of wire to avoid
19 unraveling and position the splice so it does not fall within a member. Do not torch cut the
20 ends of the spliced strand lengths. Cut by shears, abrasive grinders or other means approved
21 by the Engineer. No more than one strand splice per bed is allowed on an individual strand
22 and the use of previously tensioned strands for splicing is not permitted.

23 Where debonding of strands is required, accomplish by encasing the strand in a tubular
24 conduit capable of resisting the pressure exerted by the concrete. Do not use slit conduit. Use
25 a conduit of HDPE or polypropylene with a minimum wall thickness of 0.025 inch. Ensure
26 that the inside diameter of the conduit is of sufficient size to allow free movement of the
27 encased strand but not greater than the diameter of the strand plus 1/8 inch. Secure the
28 conduit so longitudinal movement along the strand is prevented, and bonding of the strand is
29 prevented at the required location ± 1 inch. Prevent concrete from entering the conduit by
30 taping. Use tape manufactured from a non-corrosive material compatible with the concrete,
31 conduit and steel.

32 1078-8 TENSIONING PROCEDURE

33 A producer quality control representative shall be present during strand tensioning. Tension
34 each strand to the load shown in the plans before placing the concrete.

35 Measure the load induced in the prestressing strand both by jacking gauges and strand
36 elongations on at least the first five strands and every third strand thereafter on each pour.
37 Measure loads on all other strands by either jacking gauges or strand elongations. When both
38 methods of measurement are used, if a discrepancy between gauge and elongation of more
39 than 5% is apparent, carefully check the entire operation and determine the source of error
40 before proceeding. Make appropriate allowances in the computed elongation and jacking
41 loads for load losses due to friction and all possible slippage or relaxation of the anchorage.
42 Establish references periodically at each strand anchorage to indicate any yielding or slippage
43 that may occur between the time of initial tensioning and final release of the strands.

44 In determining the applied load by measuring the elongation of the strand, use a modulus of
45 elasticity taken from the typical stress-strain curve for the brand, size and type of strand
46 tensioned. Submit stress-strain curve data for the actual heats of material used in the strands
47 to the plant inspector before using the strands. Identify each reel or strand by tagging in
48 accordance with AASHTO M 203. Mark the outer layer of each reel pack of strand with a
49 wide color band. In addition, attach a metal tag to each reel pack labeled in accordance with
50 AASHTO M 203.

1 Tension strands in a group or individually. Before full tensioning, bring each strand to
2 an initial tension of 2,000 lbs. for all beds under 150 feet in length, 3,000 lbs. for all beds
3 150 feet to 300 feet in length and 4,000 lbs. for all beds longer than 300 feet in length.
4 Measure this initial tension by a calibrated gauge or other approved means, and then compute
5 the elongation due to initial tensioning. Use the difference between the required final tension
6 and the initial tension to compute the expected additional elongation.

7 For precast prestressed deck panels, use a final prestressing force of 14,000 lbs. per strand for
8 Grade 250 strand and 16,100 lbs. per strand for Grade 270 strand.

9 After initial tensioning, tension the strands until the required elongation and jacking load are
10 attained and reconciled within the limits specified above. Keep a permanent record of the
11 initial jacking load, the final jacking load, and the elongation produced thereby.

12 In single strand tensioning, rotation of the jacking ram is not allowed.

13 When draped strands are used, submit the bed layout showing the method of draping and
14 tensioning the draped strands and also calculations determining the loads required for
15 tensioning the draped strands. Drape the strands for all members to be cast in any one
16 tensioning operation before casting any beam. Have end templates or bulkheads at ends of
17 beams remain vertical or as otherwise shown in the plans. Perform draping for all members
18 either simultaneously or in single or incremental lifts beginning at the center of the bed and
19 working outward toward each end of the bed. Complete tensioning in the fully draped
20 position is not allowed unless approved in writing.

21 Use round steel rollers of a type and dimensions approved by the Engineer for deflecting the
22 draped strands. Round the part in contact with the strand to a diameter of not less than
23 3/4 inch. Use support and hold-down devices of sufficient rigidity with adequate support so
24 the final position of the strands is as shown in the plans.

25 With strands tensioned in accordance with the above requirements and with other
26 reinforcement in place, cast the concrete members so as to achieve the required lengths.
27 Maintain strand load between anchorages until the concrete reaches the required compressive
28 strength for transfer of load from the anchorages to the members.

29 For personnel engaged in the tensioning operation, provide protection by effective shields
30 adequate to stop a flying strand. Provide shields produced from steel, reinforced concrete,
31 heavy timbers and other approved material at both ends of the bed.

32 **1078-9 PLACING CONCRETE**

33 Place concrete in accordance with Article 1077-8 and the additional requirements of this
34 article.

35 Upon completion of stressing strand, place concrete within a reasonable time to prevent
36 contamination of the strands and reinforcing steel.

37 Place concrete for girders 54 inches or less in height, and concrete for all cored slabs and box
38 beams, in two or more equal horizontal layers. Place concrete for girders over 54 inches in
39 height in three horizontal layers. When placing concrete in three layers locate the top of the
40 first layer approximately at the top of the bottom flange and locate the top of the second layer
41 approximately at the top of the web. To prevent separation of surfaces between layers, do not
42 allow the time between successive placements onto previously placed concrete to exceed
43 20 minutes, unless the previously placed concrete has not yet stiffened, as evidenced by the
44 continuous effective use of vibration. Should shrinkage or settlement cracks occur, the
45 Engineer reserves the right to require additional layers and/or vibration.

46 The requirement of the above paragraph may be waived with the permission of the Engineer if
47 self-consolidating concrete is used.

48 Internal or a combination of internal and external vibration is required as is necessary to
49 produce uniformly dense concrete without honeycomb.

Section 1078

- 1 Place concrete in cold weather in accordance with Article 420-7.
- 2 Place concrete in daylight unless an adequate lighting system meeting the approval of the
3 Engineer is provided.
- 4 Do not exceed a temperature of 95°F in the freshly mixed concrete when placed in the forms.
- 5 Place the concrete in the bed in one continuous operation, finishing each member before
6 proceeding to the next one. If the pour stops before the concrete in all the members in the bed
7 is placed, start curing immediately. Do not place concrete in any remaining members in that
8 bed setup once curing at elevated temperatures has begun.
- 9 When cored slabs and box beams are cast, employ an internal hold-down system to prevent
10 the voids from moving. At least 6 weeks before casting cored slabs or box beams, submit to
11 the Engineer for review and comment, detailed drawings of the proposed void material and
12 hold-down system. In addition to structural details, indicate the location and spacing of the
13 holds-downs. Submit the proposed method of concrete placement and of consolidating the
14 concrete under the void.

1078-10 CURING CONCRETE

(A) General

17 Cure concrete by steam curing, radiant heat curing or water curing, as set forth below.
18 As an option, cure concrete for prestressed piles with membrane curing compound as set
19 forth below. Use a method or methods that prevent the concrete from losing moisture at
20 any time before curing is complete. Use methods that do not deface or injure the
21 concrete. Use curing procedures that prevent cracks from occurring in the members.
22 Cure all members in any one bed by the same method.

23 Continue the curing period until the concrete reaches sufficient strength to permit transfer
24 of load from the anchorage to the members. As soon as the concrete attains release
25 strength, immediately release all forms in a continuous operation, without delay for other
26 activities such as the cleaning of forms. Immediately following the removal of the forms,
27 de-tension the members.

(B) Curing at Elevated Temperatures

29 Perform radiant heat curing under a suitable enclosure that contains the heat and prevent
30 moisture loss. Apply moisture by a cover of moist burlap, cotton matting, or similar
31 approved material. Retain moisture by covering the member with an approved waterproof
32 sheeting in combination with an insulating cover. Support the cover at a sufficient
33 distance above the member being cured to allow circulation of the heat.

34 Provide steam curing enclosures essentially free of steam leakage to minimize moisture
35 and heat losses. Do not allow the enclosure to come in contact with the members or
36 forms for the members. Do not direct steam jets on the forms so as to cause localized
37 high temperatures.

38 After placing and vibrating, allow the concrete to attain its initial set before the
39 application of heat or steam. The concrete is considered to obtain its initial set when it
40 has a penetration resistance of at least 500 psi when tested in accordance with
41 AASHTO T 197. Take the sample of concrete tested for penetration resistance from the
42 last load cast in the bed. Store the sample of concrete with the precast member and
43 maintain in the same condition and environment as the member except for the periods of
44 time necessary to prepare the test specimen and to perform the penetration resistance test.
45 Conduct the penetration resistance test.

1 As an option, submit data indicating that an approved concrete mix attains its initial set
2 after some particular time period. Different periods may be required for different weather
3 conditions. If such data is submitted, consideration is given to permitting heat or steam
4 introduced after the time indicated by such data instead of having to perform the
5 penetration resistance test. Consideration is given to determining the time of initial set by
6 methods other than AASHTO T 197 provided data supporting such other methods is
7 submitted.

8 When the ambient air temperature is below 50°F, cover the forms after the placement of
9 concrete and apply sufficient heat to maintain the temperature of the air surrounding the
10 unit between 50° and 70°F.

11 When the ambient air temperature is above 70°F, start a water cure as set forth below or
12 other approved method as soon as the concrete is able to receive the water without
13 physical damage to its surface. Discontinuation of the cure is allowed upon introduction
14 of steam, provided that a relative humidity of 100% is maintained.

15 The temperature within the curing enclosure shall not exceed 160°F.

16 Maintain a relatively uniform rate of increase of the temperature within the curing
17 enclosure of approximately 40°F per hour, not to exceed 15°F per 15 minutes. Ensure
18 that the temperature increase is relatively uniform throughout the length and on both
19 sides and top of the concrete unit. Place recording thermometers within 50 feet of each
20 end of the bed and at points not to exceed 100 feet between the end thermometers.
21 Provide at least two thermometers for bed lengths of 100 feet or less. Calibrate recording
22 thermometers at intervals not to exceed 6 months. Ensure that the temperature differential
23 within the curing enclosure does not exceed 15°F. Submit complete temperature records
24 for all cures before final approval of the members.

25 Continue steam curing until the concrete reaches the required transfer strength.

26 (C) Water Curing

27 Keep the concrete continuously wet by the application of water as soon as possible
28 without damage to the concrete surface, and before the concrete obtains an initial set of
29 500 psi. Apply the water using soaker hoses and wet burlap or other approved means for
30 the full length of each member. Apply water evenly along the entire length of the bed.

31 When the ambient air temperature is below 50°F cover the forms after the placement of
32 the concrete and apply sufficient heat in an approved manner to maintain the temperature
33 of the air surrounding the member between 50°F and 70°F. After the concrete obtains
34 an initial set of 500 psi, the air temperature surrounding the member is allowed to
35 increase to 100°F while continually maintaining moisture on the surface of the concrete.
36 Whenever heat is applied to the member, place temperature recording clocks on the bed
37 as required when curing at elevated temperatures. The requirements for rate of
38 temperature increase apply.

39 Maintain the application of heat (if used) and water until the concrete obtains release
40 strength.

41 (D) Curing with Membrane Curing Compound

42 As an option, cure prestressed concrete piles with a membrane curing compound. Spray
43 the entire surface of the concrete uniformly with a wax-free, resin-base curing compound
44 conforming to Article 1026-2. Use clear curing compound to which a fugitive dye is
45 added for color contrast.

Section 1078

1 Apply the membrane curing compound after the surface finishing is complete, and
2 immediately after the free surface moisture disappears. In the event the application of
3 curing compound is delayed, start another curing method immediately and continue until
4 the application of the curing compound is started or resumed or until the concrete reaches
5 the required detensioning strength.

6 Seal the surface with a single uniform coating of the specified type of curing compound
7 applied at the rate of coverage recommended by the manufacturer or as directed by the
8 Engineer, but not less than one gallon per 150 sf of area.

9 At the time of use, thoroughly mix the compound in a condition with the pigment
10 uniformly dispersed throughout the vehicle. If the application of the compound does not
11 result in satisfactory coverage, stop the method and apply water curing, as set out above,
12 until the cause of the defective work is corrected.

13 At locations where the coating shows discontinuities, pinholes, or other defects, or if rain
14 falls on the newly coated surface before the film dries sufficiently to resist damage, apply
15 an additional coat of the compound immediately after the rain stops at the same rate
16 specified herein.

17 When the ambient air temperature is below 50°F, cover the forms after the application of
18 the curing compound and apply sufficient heat in an approved manner to maintain the
19 temperature of the air surrounding the member between 50°F and 70°F. Whenever heat
20 is applied to the members, place recording thermometers on the bed as required when
21 curing at elevated temperatures. The requirements for rate of temperature increase also
22 apply.

23 Completely remove any curing compound adhering to a surface to which new concrete is
24 bonded by sandblasting, steel wire brushes, bush hammers or other approved means.

25 Protect the concrete surfaces to which the compound is applied from abrasion or other
26 damage that results in perforation of the membrane film until the concrete achieves
27 design strength and the members are de-tensioned.

28 **1078-11 TRANSFER OF LOAD**

29 A producer quality control representative or equivalent qualified personnel shall be present
30 during removal of forms and during transfer of load.

31 Transfer load from the anchorages to the members when the concrete reaches the required
32 compressive strength shown in the plans. Loosen and remove all formwork in one continuous
33 operation as quickly as possible as soon as release strength is obtained. As soon as the forms
34 are removed, and after the Department's Inspector has had a reasonable opportunity to inspect
35 the member, transfer the load from the anchorages to the members as quickly as possible in
36 one continuous operation using the approved detensioning sequence.

37 For any particular group of members cast in the same bed, do not transfer the load to any
38 concrete until the test cylinder breaks indicate that the concrete in all these members has
39 reached the required strength as outlined in Subarticle 1078-4(B)(3). If these conditions are
40 not met, delay the transfer of the prestressing load to the concrete until tests of additional
41 cylinders show that the required strength is reached.

42 When curing at elevated temperatures, begin the procedures for transferring prestressing load
43 immediately after curing is discontinued and the forms are released, and while the concrete is
44 still hot to prevent cooling shrinkage and cracking. If so directed by the Engineer, cover
45 members or otherwise protect so as to cool the concrete slowly after release to prevent
46 thermal shock and the evaporation of moisture in the members.

1 Transfer load to not cause cracks in members. Transfer load by gradual release of the strands
2 as a group, by gradual release of part of the group, or by burning the fully tensioned strands at
3 the ends of the members. If intending to release the strands by a method other than gradual
4 release of the entire group, submit six copies of the proposed method and pattern of release, if
5 not so shown in the plans, for approval. Rigidly follow the approved method and pattern of
6 release. When the fully tensioned strands are burned, burn each strand or group of strands
7 simultaneously at each end of the bed in its indicated order in the pattern and at each end of
8 each member before proceeding to the strands in the next group in the pattern at any point.
9 Because of the critical nature of the bond development length in prestressed concrete panel
10 construction, if transferring of stress by burning the fully tensioned strands at the ends of the
11 member, burn each strand first at the ends of the bed and then at each end of each member
12 before proceeding to the next strand in the burning pattern.

13 When detensioning all girders, box beams, cored slabs, piles, and panels do not burn strands
14 quickly but heat with a low oxygen flame played along the strand for at least 5 inches until the
15 metal gradually loses its strength. Apply heat at such a rate that failure of the first wire in
16 each strand does not occur until at least 5 seconds after heat is first applied. When
17 detensioning other members, follow the above procedure unless an alternate procedure is
18 approved. Detensioning by arc welder is not allowed.

19 Incorporate the following in the method for single strand detensioning of members having
20 draped strands:

21 (A) Release the pair of straight strands located in the uppermost position in the lower flange
22 first.

23 (B) Then release the tension in the draped strands at the ends and uplift points in accordance
24 with an approved pattern.

25 (C) Disengage all hold-down devices for draped strands and release the hold-downs.

26 (D) Then release the pair of straight strands located in the upper flange.

27 (E) Release the remaining straight strands of the pattern in accordance with an approved
28 sequence.

29 (F) Release all strands in a manner meeting the Engineer's approval that will cause
30 a minimum shock and lateral eccentricity of loading.

31 Failure to follow the above procedures for transfer of load is ground for rejection of the
32 members involved.

33 **1078-12 VERTICAL CRACKS IN PRESTRESSED CONCRETE GIRDERS BEFORE** 34 **DETENSIONING**

35 This section addresses prestressed concrete members that have vertical casting cracks before
36 strand detensioning. Certain types of these cracks have been determined by the Department to
37 render the girders unacceptable.

38 Unacceptable cracked members are those with two or more vertical cracks spaced at a
39 distance less than the member depth which extend into the bottom flange. Such members are
40 not serviceable and will be rejected. Members with two or more vertical cracks spaced at a
41 distance less than the member depth but do not extend into the bottom flange are subject to
42 an engineering assessment. Such members may not be serviceable and may be rejected.

43 Members with one or more vertical cracks that extend into the bottom flange and are spaced
44 at a distance greater than the member depth are subject to an engineering assessment to
45 determine their acceptability. If this engineering assessment is required, submit, at no
46 additional cost to the Department, a proposal for repairing the member and a structural
47 evaluation of the member prepared by an engineer licensed by the State of North Carolina.

Section 1078

1 In the structural evaluation, consider the stresses under full service loads had the member not
2 cracked and the effects of localized loss of prestress at the crack as determined by methods
3 acceptable to the Department.

4 All members, except those defined as unacceptable, which exhibit vertical cracks before
5 detensioning, shall receive a 7 day water cure as directed by the Engineer. The water cure
6 shall begin within 4 hours after detensioning the prestressing strands and shall be at least
7 3 feet beyond the region exhibiting vertical cracks.

8 The Department has the final determination regarding acceptability of any members in
9 question.

10 **1078-13 PRESTRESSED CONCRETE GIRDER WEB SPLITTING**

11 After detensioning of certain girders with draped strands, cracks occasionally occur in the
12 webs at the ends of the girders.

13 Repair all cracks located in the web of girders appearing after detensioning that are
14 0.010 inches (0.25 mm) or greater in width by means of epoxy injection in accordance with
15 the Standard Specifications and as approved by the Engineer.

16 Repair any web cracks that are less than 0.010 inches (0.25 mm) and greater than 0.005 inches
17 (0.15 mm) in width by coating them with an approved clear, water based alkylalkoxysilane
18 (silane) penetrating sealant having a minimum 40 percent solids. Use a sealant that meets the
19 requirement of NCHRP 244 and Federal AIM VOC emissions standards and has been
20 approved by the Engineer. Coat web cracks between 0.005 inches (0.15 mm) and 0.010 inches
21 (0.25 mm) in width with silane within 2 weeks after they appear or before shipment to the site
22 whichever occurs soonest.

23 Cracks located in the web less than or equal to 0.005 (0.15 mm) in width need not be coated.

24 Do not repair or coat any cracks without prior approval of the Engineer. No separate payment
25 will be made for the treatment of cracks, as payment is included in the contract unit price bid
26 for prestressed concrete girders.

27 Repair of web cracks shall not be a substitute for using an approved debonding pattern for
28 future girders as described below.

29 If such cracks occur, employ a method to remedy this condition on all subsequent girders of
30 the same type and strand pattern. If debonding of strands is used, satisfy the following
31 criteria:

32 (A) Do not debond the two straight strands in the top of the girder. Debond 1/2 of the straight
33 strands, as nearly as possible, in the bottom flange. As nearly as possible, debond 1/4 of
34 the straight strands in the bottom of girder 4 feet from each end of the girder and debond
35 1/4 of the straight strands 2 feet from each end of the girder.

36 (B) Use a debonding pattern that is symmetrical about the vertical axis of the girder.

37 (C) Debond strands so the center of gravity of the strands in the bottom of the girder remain
38 within 1 inch of their original location at the end of the girder.

39 (D) Debond strands in accordance with Article 1078-7.

40 No separate payment is made for debonding strands as payment is included in the contract
41 unit price bid for prestressed concrete girders.

1 1078-14 HANDLING, TRANSPORTING AND STORING

2 Members damaged while being handled or transported are rejected or require repair in
3 a manner approved by the Engineer. All members are allowed to be handled immediately
4 after transfer of load from the anchorages to the members is complete.

5 Store all prestressed members on solid, unyielding, storage blocks in a manner to prevent
6 torsion or objectionable bending. In handling prestressed concrete girders 54 inches or less in
7 height, including cored slabs and box beams, maintain them in an upright position at all times
8 and pick them up within 5 feet of the points of bearing and transport and store supported only
9 within 3 feet of points of bearing. In handling prestressed concrete girders greater than 54
10 inches in height, maintain them in an upright position at all times and submit for approval the
11 proposed method of lifting, transporting, and storing the girders. When requested, provide
12 calculations to confirm girders are not overstressed by such operations.

13 Prestressed concrete panels are weak in the direction perpendicular to the prestressing strands,
14 therefore, they are subject to breakage during handling, storing or transporting. Provide
15 adequate blocking during all of these construction phases.

16 In handling, transporting, and storing prestressed members, use the number and location of
17 supports in accordance with the plan requirements for the sizes, lengths and types of members
18 involved, or as approved.

19 When handling the prestressed concrete members, a temporary stress of $5\sqrt{f_{ci}}$ is permitted,
20 where f_{ci} is the strength of concrete at release, in pounds per square inch.

21 Do not transport members away from the casting yard until the concrete reaches the minimum
22 required 28 day compressive strength and a period of at least 5 days elapses since casting,
23 unless otherwise permitted.

24 Do not transfer any member from the plant to the job site before approval of that member by
25 the plant inspector. This approval is stamped on the member by the plant inspector.

26 1078-15 FINAL FINISH

27 Finish prestressed concrete members that are intended for composite action with subsequently
28 placed concrete or asphalt with a roughened surface for bonding. Make sure that no laitance
29 remains on the surfaces to be bonded.

30 Rough float the tops of girders. Broom finish the top surface of the cored slab and box beam
31 sections receiving an asphalt overlay. Rake the top surface of cored slab and box beam
32 sections receiving a concrete overlay to a depth of 3/8 inch. No surface finish is required for
33 sides and bottom of the slab and beam sections except the exposed side of the exterior unit as
34 noted below. Provide a resulting surface finish essentially the same color and surface finish
35 as the surrounding concrete.

36 Provide a 3/4 inch chamfer along the bottom edges on ends and sides of all box beam and
37 cored slab sections, top outside edges of exterior sections and acute corners of sections.
38 Round the top edges on ends of all sections with a 1/4 inch finishing tool. Provide square
39 corners along top edges on all sections along shear keys. Do not chamfer vertical edges at
40 ends of sections.

41 Fill all voids in the diagonal face of the bottom flange of prestressed concrete girders and the
42 outside face of exterior cored slabs and box beams with a sand-cement or other approved
43 grout. Fill all voids in piles greater than 1/2 inch in diameter or depth as above. Provide
44 a resulting surface finish essentially the same color and surface finish as the surrounding
45 concrete. Repair voids greater than 1/4 inch in diameter or depth in other faces of these and
46 other members except piles in a like manner. Where an excessive number of smaller voids
47 exist in any member, the Engineer requires a similar repair.

Section 1078

1 Repair honeycomb, excessively large fins, and other projections as directed. Submit, at no
2 additional cost to the Department, a proposal for repairing members with honeycomb, cracks
3 or spalls. Do not repair members containing honeycomb, cracks, or spalls until a repair
4 procedure is approved and the member is inspected by the Engineer. Any appreciable
5 impairment of structural adequacy that cannot be repaired to the satisfaction of the Engineer is
6 cause for rejection.

7 Clean and fill holes caused by strand hold downs upon removal from the casting bed. Use
8 patches of materials approved by the Engineer that develop strength at least equal to the
9 minimum 28 day strength requirement for the concrete before approval of the member.
10 Ensure that members are clean and surfaces have a uniform appearance.

11 Give the top surface of prestressed concrete panels a raked finish or other approved finish to
12 provide an adequate bond with the cast-in-place concrete. As soon as the condition of the
13 concrete permits, rake the top surface of the concrete making depressions of approximately
14 1/4 inch. Take care when raking not to catch and pull the coarse aggregate.

15 Clean reinforcing bars exposed on the tops of girders and exterior cored slabs or box beams of
16 mortar build up and excessive rust.

17 Apply epoxy protective coating to the ends of prestressed members as noted in the plans.

18 **1078-16 ALIGNMENT AND DIMENSIONAL TOLERANCES**

19 **(A) Piles**

20 Manufacture piles within the tolerances indicated in Table 1078-4 and Figure 1078-1.

21 **(B) Cored Slabs**

22 To ensure a good, neat field fit, assemble cored slab spans in the yard and have pieces
23 matchmarked. Ensure that pieces fit together neatly and in a workmanlike manner.

24 Manufacture cored slabs within the tolerances indicated in Table 1078-5 and
25 Figure 1078-2.

26 **(C) Girders**

27 Manufacture girders within the tolerances indicated in Table 1078-6 and Figure 1078-3.

28 **(D) Prestressed Concrete Panels**

29 Manufacture prestressed concrete panels within the tolerances indicated in Table 1078-7.

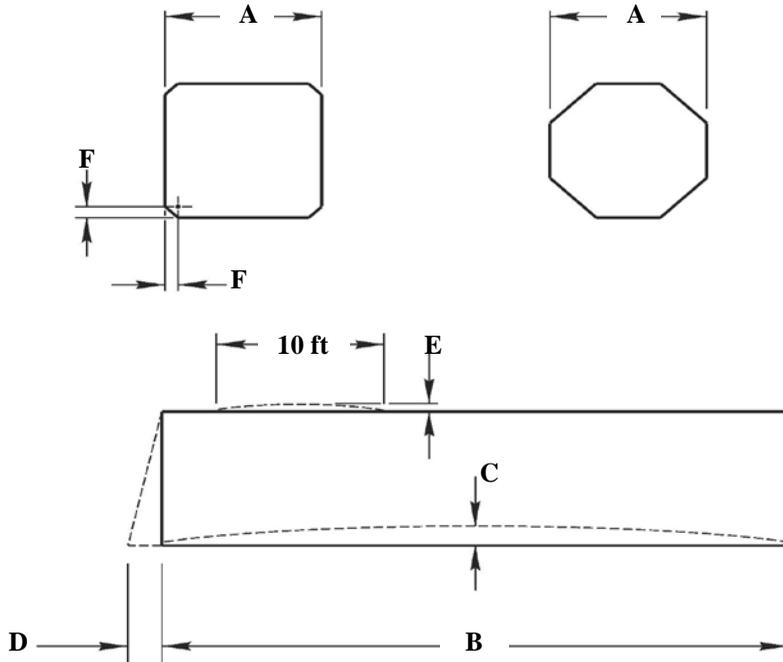

30 **(E) Box Beams**

31 To ensure a good, neat field fit, assemble box beam spans in the yard and have pieces
32 match-marked. Ensure that pieces fit together neatly and in a competent manner.

33 Manufacture box beams within the tolerances indicated in Table 1078-8 and
34 Figure 1078-4.

1 **1078-17 IDENTIFICATION OF MEMBERS**

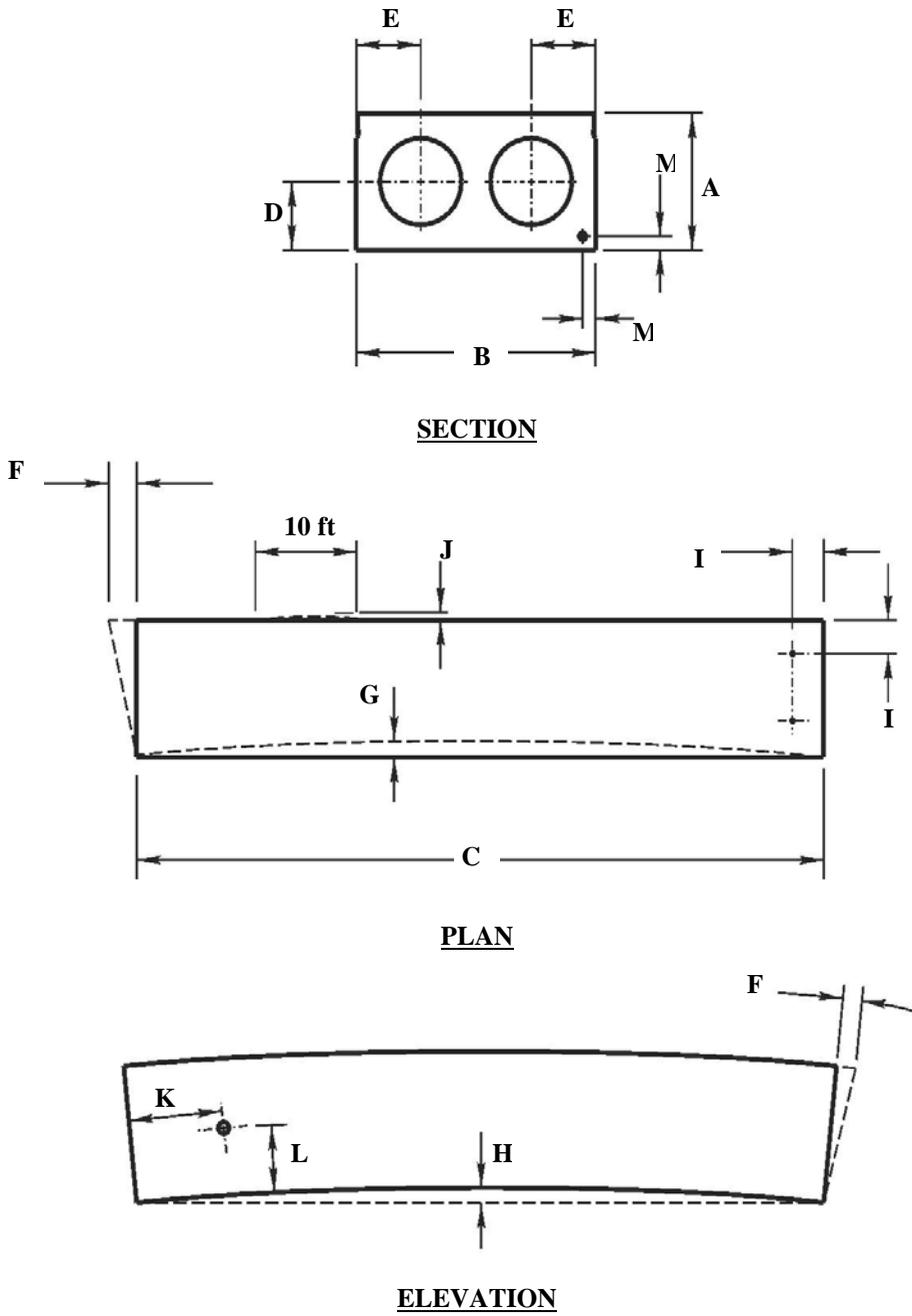

- 2 Permanently identify each prestressed member by number and date of manufacture, and paint
 3 this information, or otherwise mark as approved by the Engineer, on at least one end of the
 4 member as soon as practical after manufacture. In the case of girders or cored slabs, paint
 5 other identification as to station, span and position within the span on at least one end of the
 6 member.

- 7 **Figure 1078-4. Prestressed Piles.** Dimensions shown are in Table 1078-4.

TABLE 1078-4 TOLERANCES FOR PRESTRESSED PILES (Refer to Figure 1078-1)	
Dimension	Tolerance
Width (A)	-1/4" to +3/8"
Length (B)	± 1 1/2"
Horizontal alignment Deviation from a straight line parallel to the centerline of pile (C)	1/8" per 10 ft
Squareness of ends (D)	1/8" per 12" of width, 3/16" max.
Local smoothness (E)	1/4" in 10 ft
Position of strands (F)	1/4"
Position of mild reinforcing steel, including spiral pitch	1/2"

Section 1078

1 Figure 1078-5. Prestressed cored slabs. Dimensions shown are in Table 1078-5.

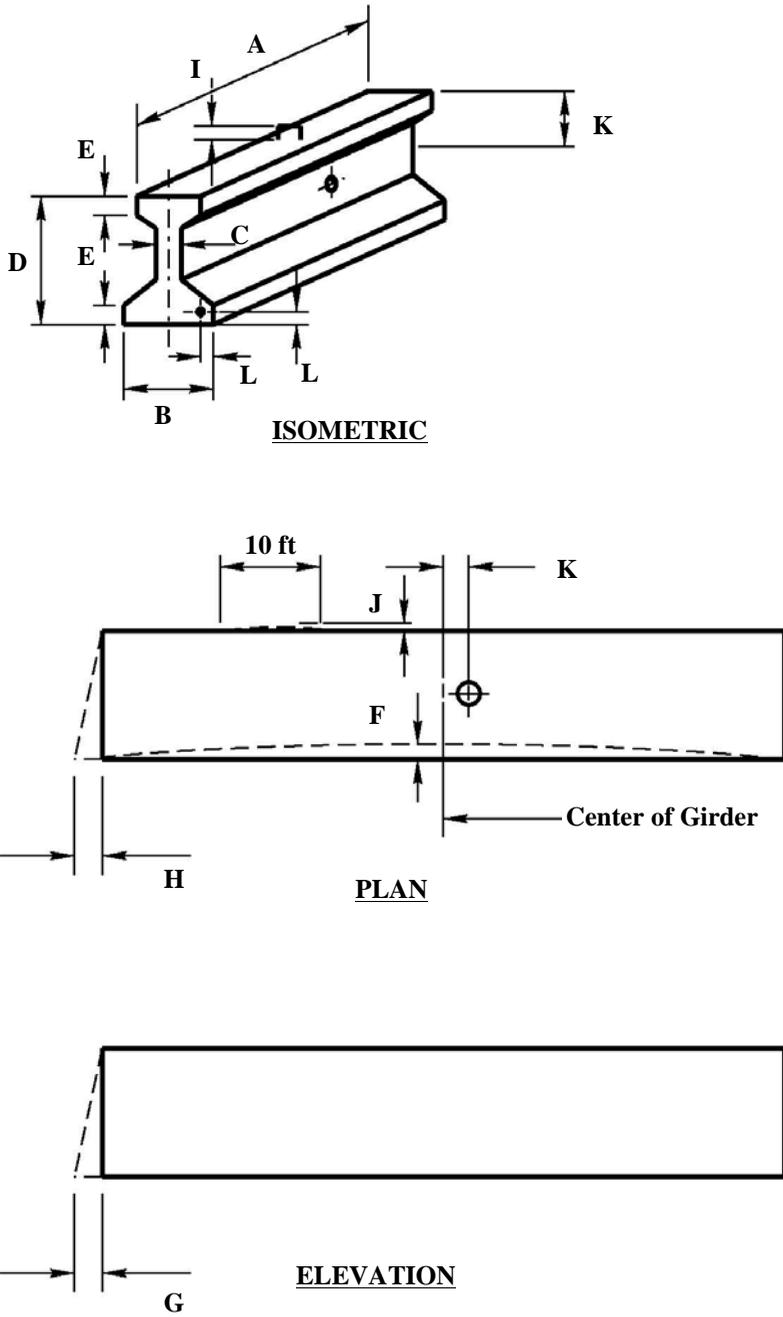

**TABLE 1078-5
TOLERANCES FOR PRESTRESSED CORED SLABS
(Refer to Figure 1078-2)**

Dimension	Tolerance
Depth (A)	+3/8" to -1/8"
Width (B)	± 1/4"
Length (C)	± 1/8" per 10 ft
Position of voids - Vertical (D)	± 3/8"
Position of voids - Horizontal (E)	± 3/8"
Position of void Ends – Longitudinal	+1", -3"
Square ends - Deviation from square (horizontal) or vertical) or designated skew (F)	±1/4"
Horizontal alignment - Deviation from a straight line parallel to the centerline of member (G)	0-30 ft long: 1/4" 30-50 ft long: 3/8" 50+ ft long: 1/2"
Camber - Differential between adjacent units (H)	1/4" per 10 ft, 3/4" max.
Camber - Differential between high and low members of same span (H)	3/4" max.
Position of dowel holes - Deviation from plan position (I)	1/4"
Width - Any one span	Plan width +1/8" per joint
Width - Differential of adjacent spans in the same structure	1/2"
Bearing area - Deviation from plane surface	1/16"
Local smoothness (J)	1/4" in 10 ft
Position of holes for transverse strands	Horizontal (K): ±1/2" Vertical (L): ±3/8"
Position of strands (M)	± 1/4"

1 1078-18 QUALITY CONTROL

- 2 Maintain a daily quality control record form approved by the Engineer including pertinent
- 3 information concerning tensioning, concrete quality and placement, curing and detensioning.
- 4 Have this form signed and dated by a certified concrete technician. Furnish a copy of the
- 5 completed or up-to-date form to the Materials and Tests Unit upon request and before any
- 6 members are approved. A sample form, indicating the minimum required information, is
- 7 available from the Materials and Tests Unit.

Section 1078

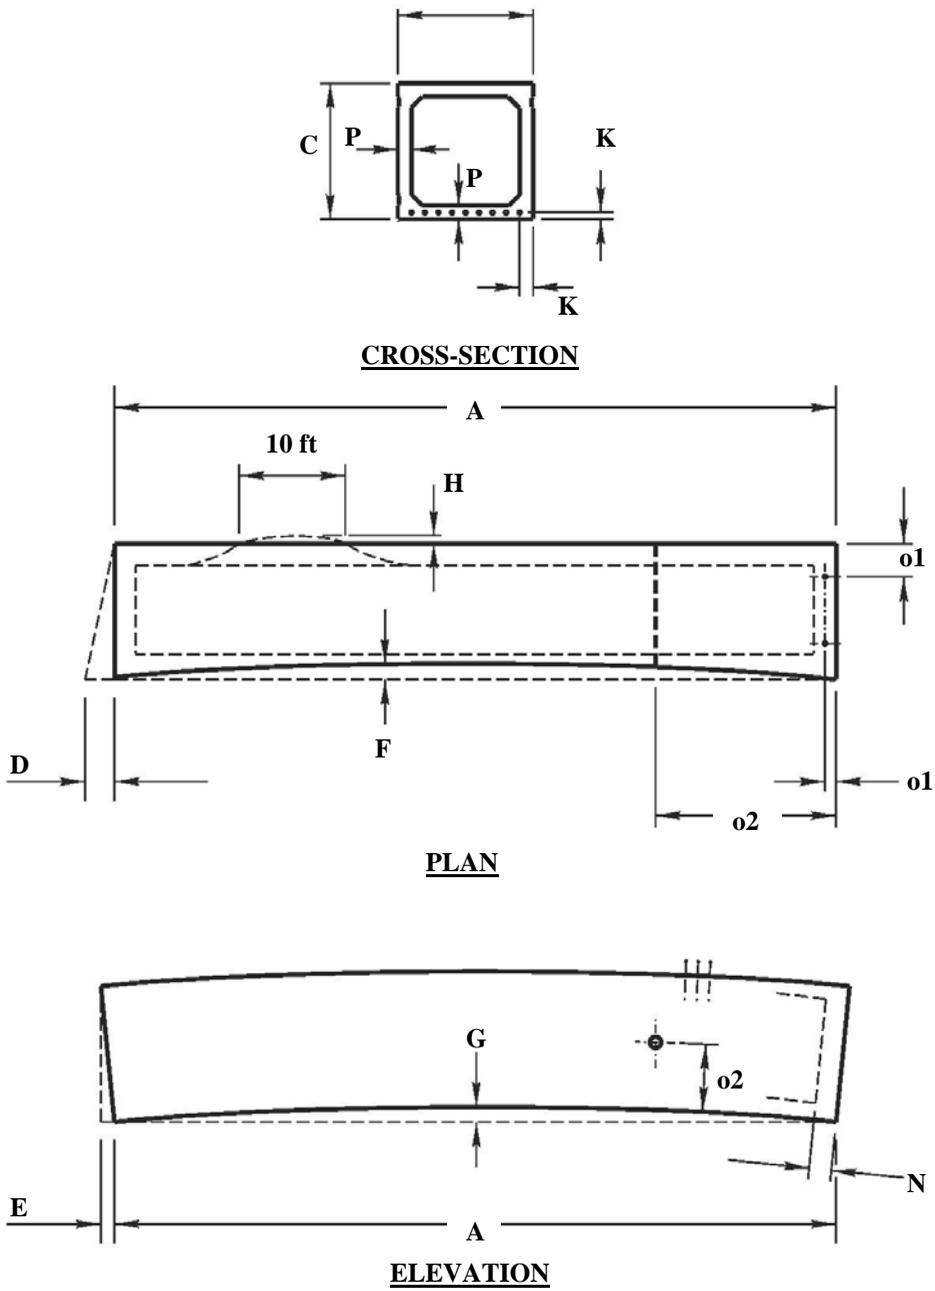

1 **Figure 1078-6. Prestressed Girders.** Dimensions shown are in Table 1078-6.

TABLE 1078-6 TOLERANCES FOR PRESTRESSED GIRDERS (Refer to Figure 1078-3)	
Dimension	Tolerance
Length (A) Girders 80 ft. or shorter	$\pm 1/8"$ per 10 ft
Length (A) Girders longer than 80 ft.	$\pm 1/8"$ per 10 ft Not to exceed 1 1/2"
Width - Flanges(B)	$+3/8"$ to $-1/8"$
Width - Web (C)	$+3/8"$ to $-1/8"$
Depth - Overall (D)	$+1/2"$ to $-1/4"$
Depth - Flanges (E)	$\pm 1/4"$
Horizontal alignment (top or bottom flange) Deviation from a straight line parallel to the centerline of beam (F)	$\pm 1/8"$ per 10 ft Not to exceed 1"
Bearing plate Deviation from plane surface	1/16"
Girder ends Deviation from square or designated skew (G and H)	Vertical (G): $\pm 1/8"$ per 12" of girder height Horizontal (H): $\pm 1/2"$
Position of stirrups - Projection above top of girder (I)	$\pm 1/2"$
Position of stirrups – Placement along girder length	$\pm 1"$
Local smoothness of any surface (J)	1/4" in 10 ft
Position of holes for diaphragm bolts (K)	$\pm 1/4"$
Position of strands (L)	$\pm 1/4"$

- 1 Dimensions followed by an alphabetical suffix are shown in Figure 1078-3. The length (A) is
- 2 measured along the top of the top flange. The tolerances at girder ends (G and H) are
- 3 increased to 1 inch if the girder end is to be encased in a full depth concrete diaphragm.

TABLE 1078-7 TOLERANCES FOR PRESTRESSED CONCRETE PANELS	
Dimension	Tolerance
Length (Transverse direction to girders)	$-1/4"$ to $+1/2"$
Width (Longitudinal direction to girders)	$-1/8"$ to $+1/4"$
Depth	0 to $+3/8"$
Position of Strand Horizontal Dimension	$\pm 1/8"$
Vertical Dimension	$\pm 1/2"$

Section 1078

1 Figure 1078-7. Prestressed Box Beams. Dimensions shown are in Table 1078-8.

TABLE 1078-8 TOLERANCES FOR BOX BEAMS (Refer to Figure 1078-4)	
Dimension	Tolerance
Length (A)	$\pm 1"$
Width (overall) (B)	$\pm 1/4"$
Depth (overall) (C)	$+ 1/4"$
Variation from specified plan end squareness or skew (D)	$\pm 1/8"$ per 12" width, $\pm 1/2"$ max
Variation from specified elevation end squareness or skew (E)	$\pm 1/8"$ per 12", $\pm 1/2"$ max
Sweep, for member length (F) up to 40 ft	$\pm 1/4"$
Sweep, for member length (F) 40 to 60 ft	$\pm 3/8"$
Sweep, for member length (F) greater than 60 ft	$\pm 1/2"$
Differential camber between adjacent members (G):	$1/4"$ per 10 ft., $3/4"$ max
Local smoothness of any surface (H)	$1/4"$ in 10 ft
Position of strands (K)	$\pm 1/4"$
Longitudinal Position of blockout (N)	$\pm 1"$
Position of dowel holes (o1)	$\pm 1/4"$
Position of sleeves cast in beams, in both horizontal and vertical plane (o2)	$\pm 1/2"$
Position of void (P)	$\pm 3/8"$
Bearing area – deviation from plane surface	$\pm 1/16"$
Width - Any one span	Plan width + $1/8"$ per joint
Width – Differential of adjacent spans in the same structure	$1/2"$

1

SECTION 1079

2

BEARINGS AND BEARING MATERIALS

3

1079-1 PREFORMED BEARING PADS

4 Provide preformed bearing pads composed of multiple layers of 8 oz/sy cotton duck
5 impregnated and bound with high quality natural rubber, or equally suitable materials
6 approved by the Engineer, that are compressed into pads of uniform thickness. Ensure that
7 the thickness of the preformed bearing pads is 3/16 inch with a tolerance of $\pm 1/16$ inch. Use
8 cotton duck that meets Military Specification MIL-C882-D for 8 oz/sy cotton army duck or
9 equivalent. Provide enough pads as to produce the required thickness after compressing and
10 vulcanizing. Ensure that the finished pads withstand compressive loads perpendicular to the
11 plane of the laminations of not less than 10,000 psi without detrimental extrusion or reduction
12 in thickness.

13 Furnish a Type 3 certification in accordance with Article 106-3 certifying that the preformed
14 bearing pads meet this Specification.

15 Internal holding pins are required for all shim plates when the contract plans indicate the
16 structure contains the necessary corrosion protection for a corrosive site.

17 Repair laminated (reinforced) bearing pads utilizing external holding pins via vulcanization.
18 Submit product data for repair material and a detailed application procedure to the Materials
19 and Tests Unit for approval before use and annually thereafter.

Section 1079

1 1079-2 ELASTOMERIC BEARINGS

2 (A) General

3 Provide elastomeric bearings that meet the requirements of AASHTO M251, except as
4 specified herein.

5 Manufacturers shall be pre-qualified by the Department and shall submit working
6 drawings for approval. Refer to Subarticles 1079-2(D) and 1079-2(E). Furnish a Type 3
7 certification in accordance with Article 106-3 certifying that elastomeric bearings satisfy
8 this Specification and all design criteria. Include the lot number, description and test
9 results in the certification.

10 (B) Elastomer Properties

11 The elastomer for all bearings shall be classified as Grade 3.

12 The shear modulus of the elastomer for laminated (reinforced) bearings shall be 160 psi,
13 unless otherwise noted in the plans.

14 Provide Grade 50 or Grade 60 durometer hardness elastomer in all (unreinforced)
15 bearings, unless otherwise noted in the plans.

16 (C) Testing

17 The optional test procedures of AASHTO M 251 are not required, except as specified
18 herein.

19 Determine the shear modulus of the elastomer for laminated (reinforced) bearings in
20 accordance with ASTM D4014.

21 At the Manufacturer's option, plain (unreinforced) bearings may be tested using the
22 methods of Appendices X1 and X2 of AASHTO M 251.

23 Test at least two bearings per lot or as directed by the Engineer. Define a "lot" as a group
24 of 100 or less bearings with or without holes or slots, which are:

25 (1) Manufactured in a reasonably continuous manner from the same batch of elastomer
26 and cured under the same conditions, and

27 (2) Of the same type (plain or laminated) and of similar size (no dimensions shall vary
28 by more than 40%).

29 A lot may include bearings from multiple projects and purchasers.

30 (D) Working Drawings

31 Submit six sets of detailed fabrication drawings of laminated (reinforced) bearings to the
32 Engineer for review, comments and acceptance. Show complete details and all material
33 specifications. Clearly identify any proposed deviations from details shown in the plans
34 or requirements of the Standard Specifications. Obtain drawing approval before
35 manufacturing of the bearings.

1080-1 GENERAL

All batches or lots of paint products shall be Department approved prior to use. Self-curing inorganic zinc paint shall also be pre-qualified as required in Section 1080-5. Deliver all Department approved paints to the point of application in sealed and original containers clearly marked with the type of paint and batch or lot numbers clearly labeled on the container. At the point of application all paints shall arrive ready to be mixed for use without additional oil or thinner. Mix all paints in accordance with the manufacturer's printed instructions. All paints or paint components that harden or curdle in the container and will not break up with a paddle to form a smooth, uniform consistency will be rejected. Any thinning necessitated by weather conditions shall be approved in writing and use only those thinners approved by the manufacturer. Thinning of any waterborne paints shall be prohibited. Upon receipt at the point of application, store all paint materials in a moisture free environment between 40°F and 110°F or at such temperatures within this range recommended by the manufacturer of which the more stringent shall apply. The storage areas shall be equipped with a device capable of recording daily high and low temperatures.

1080-2 PAINT VEHICLES, THINNERS AND DRIERS

Paint vehicles, thinners and dryers shall meet the requirements for these ingredients that are included in the *Standard Specifications* for the paint being used. Only ingredients recommended by the manufacturer which have a history of compatibility with each other and so recorded on the manufacturer product data sheet may be used.

1080-3 PACKING AND MARKING

Ship paint and paint materials in strong, substantial containers that are properly labeled and plainly marked with the weight, color and volume in gallons of the paint content; a true statement of the percentage composition of the pigment; the proportions of pigment to vehicle; and the name and address of the manufacturer. Any package or container not so marked as described above or exceeding 5 gallons total volume shall require prior approval by the Department. .

1080-4 INSPECTION AND SAMPLING

All paint components shall be sampled and approved by the Department or an approved representative, either at the point of manufacture or at the point of application. Inspection and sampling will be performed at the point of manufacture wherever possible. The Contractor shall not begin painting until the analysis of the paint has been performed, and the paint has been accepted by the Department. When sampling paint products, use the Department sampling procedure. In order for materials to be evaluated and accepted by the Department, coating manufacturers shall submit completed performance test data from the National Transportation Product Evaluation Program (NTPEP) or test results from ISO certified laboratories reporting requirements as required for each paint listed in Section 1080-5 through 1080-9.

1080-5 SELF-CURING INORGANIC ZINC PAINT

Use only Department approved and qualified inorganic zinc paint. These products shall be requalified every five years unless the formulation of the product or manufacturing process is changed in which case, the product shall be requalified before use. Samples for qualification shall be submitted six months in advance. Ensure the paint manufacturer submit the following at the same time to the State Materials Engineer.

(A) A minimum one quart sample of each component of paint including the manufacturer's name, location, product name, mixing instructions, batch number and SDS.

Section 1080

1 (B) At least three panels prepared as specified in 5.5.10 of AASHTO M 300, Bullet Hole
2 Immersion Test.

3 (C) At least six panels of 4 inch x 6 inch x 1/4 inch for the MEK Rub test, ASTM D4752 and
4 the Adhesion Pull Test, ASTM D4541.

5 For new qualifications or where product formulation has changed provide the Department the
6 following.

7 (A) A certified test report from an approved independent testing laboratory that the product
8 has been tested for slip coefficient and meets AASHTO M 252, Class B.

9 (B) A certified test report from an approved independent test laboratory for the Salt Fog
10 Resistance Test, Cyclic Weathering Resistance Test, and Bullet Hole Immersion Test as
11 specified in AASHTO M 300.

12 Use the same batch of paint for all samples and panels. The independent test laboratory report
13 may be for a typical batch of the same product. Submit samples and reports for qualification
14 at least six months in advance of anticipated need. The Materials and Tests Unit will conduct
15 all tests of paints in accordance with the latest ASTMs, Federal Test Method Standard
16 No. 141 and various other methods in use.

17 Use a self-curing inorganic zinc paint meeting the Type I Inorganic Zinc Primer paint
18 specified in AASHTO M 300 and the following:

19 (A) Use mixed paint with zinc content of not less than 72% by mass of the total solids.

20 (B) The slip coefficient meets AASHTO M 253, Class B.

21 (C) The adhesion shall be no less than 400 psi in accordance with ASTM D4541.

22 (D) Cure the paint to meet the solvent rub requirements in ASTM D4752.

23 (E) Formulate the paint to produce a distinct contrast in color with the blast cleaned metal
24 surfaces and with the finish paint.

25 **1080-6 COAL TAR EPOXY PAINT**

26 Use coal tar epoxy paint meeting SSPC-Paint 16.

27 **1080-7 ORGANIC-ZINC REPAIR PAINT**

28 Use organic-zinc repair paint meeting SSPC-Paint 20 Type II or Federal
29 Specification TT-P-641. Organic-zinc repair paint is not tinted and is applied 3 to 4 wet mils
30 of paint per coat. Do not use zinc paint in aerosol spray cans.

31 **1080-8 METALLIZATION SEALERS**

32 Use low-viscosity, clear or colored and pigmented as approved by the Engineer. Sealer
33 products are formulated to flow over and be absorbed into the natural pores of the thermal
34 sprayed coating (TSC). The pigment particle size for colored sealer must be small enough to
35 flow easily into the pore of the TSC, nominally a 5-fineness of grind per ASTM D1210.

36 **1080-9 WATERBORNE PAINTS**

37 Paint manufacturers must have a Department approved and qualified self-curing inorganic
38 zinc product to submit a waterborne paint product for approval.

39 **(A) Composition**

40 Use ingredients and proportions as specified in Tables 1080-7 through 1080-14. Do not
41 use Chrome Green.

42 Provide raw materials based on the specified ingredients that are uniform, stable in
43 storage, and free from grit and coarse particles. Do not use rosin or rosin derivatives.

1 Beneficial additives such as anti-skinning agents, suspending agents or wetting aids are
2 allowed.

3 **(B) Properties**

4 (1) General

5 Use both Type I and II paints that meet Tables 1080-7 through 1080-14.

6 (2) Odor

7 Normal for the materials permitted in accordance with ASTM D1296.

8 (3) Color

9 The colors before and after weathering when compared with Federal Test
10 Method Standard No. 595B are Brown #30045, Green #24108 and Gray #26622.
11 There are no color requirements for white waterborne paint. The Engineer may
12 approve the use of semi-gloss or gloss products for the above Department
13 colors.

14 (4) Working Properties

15 Use a paint that is easily applied by brush, roller or spray when tested in accordance
16 with Federal Test Method Standard No. 141, Methods 4321, 4331 and 4541. Ensure
17 that the paint shows no streaking, running or sagging during application or while
18 drying.

19 (5) Storage Conditions

20 Prior to application, ensure that the paint shows no thickening, curdling, gelling or
21 hard caking when tested as specified in Federal Test Method Standard No. 141,
22 Method 3011, after storage for 6 months from the date of delivery, in a full, tightly
23 covered container, at a temperature of 50°F to 110°F.

24 (6) Skinning

25 No skinning is allowed in a 3-quarters filled closed container after 48 hours when
26 tested in the standard manner specified in Federal Test Method Standard No. 141,
27 Method 3021.

28 (7) Salt Contamination

29 Minimize the content of salt contamination by the incorporation of only high purity
30 materials. Ensure that the specific resistance of the aqueous leachate of the
31 composite of the pigments in required proportions is at least 5,000 ohm-cm when
32 tested in accordance with ASTM D2448.

33 (8) Early Rust Resistance

34 Provide each type of paint that meets the early rust requirements specified in
35 Materials and Tests Standards CLS-P-1.0.

36 **(C) Inspection**

37 All materials supplied under this Specification are subject to random inspection by the
38 Department.

39 Supply samples of any or all ingredients used in the manufacture of this paint, along with
40 the supplier's name and identification for the material when requested.

41 **(D) Volatile Organic Compound (VOC) Content**

42 Ensure that the VOC content after formulation, but before thinning, complies with the
43 VOC limit for the applicable coatings category per Federal regulations. Notify the

Section 1080

1 coating specifier if State or local regulations reduce the maximum VOC content
2 permitted for coatings applied in a specific locality.

3 **(E) Color Variation**

4 A color variation of 5 Δe units from the specified color will be acceptable. After
5 3 months weathering, the color shall not vary more than 5 Δe units from the original color
6 value.

Table 1080-1
Composition of Pigments for Waterborne Paints, % By Weight

Property	Brown		White		Gray		Test Method

- A.** Consistency 48 hours or more after manufacture.
- B.** Prepare the specimen for adhesion by applying 2 dry mils of coating to a 3 inch X 5 inch X 0.25 steel panel cleaned to a minimum SSPC-SP-6 finish with a 1.7 +0.5 mil profile.

Section 1080

1 **1080-10 PAINT FOR VERTICAL MARKERS**

2 For vertical markers, use a waterborne acrylic or alkyd type material meeting Table 1080-15.
3 Apply sufficient paint to completely cover the color of the underlying substrate along with
4 any surface imperfections.

TABLE 1080-4		
PROPERTIES OF PAINT FOR VERTICAL MARKERS		
Property	Requirement	Test Method
Color	# 27040 Black or # 13538	Federal Color Std. 595
Adhesion to Substrate	3A Min.	ASTM D3359

5 **1080-11 EPOXY RESIN FOR REINFORCING STEEL**

6 Submit prequalified products other than those now approved for use to the State Materials
7 Engineer for approval. Requalify each product every 5 years and any time a change is made
8 in the manufacturing process or chemical composition of the epoxy resin.

9 Use powdered resin of any color that provides contrast to the corroded or uncorroded surface
10 of the steel. Provide material of the same quality as that used for prequalification tests and as
11 represented by test reports forwarded to the State Materials Engineer.

12 Ensure the manufacturer of the epoxy resin supplies to the coating applicator information on the
13 resin that is essential to the proper use and performance of the resin as a coating. Ensure the
14 manufacturer of the resin furnish the coating applicator a written certification signed by a
15 responsible officer of the company that the material furnished for coating the reinforced steel
16 is the same formulation as that for which test reports were previously submitted to the State
17 Materials Engineer.

18 With each batch of coating material, furnish a written certification by the coating applicator to
19 the Engineer which properly identifies the batch number, material, quantity represented, date
20 of manufacture, name and address of manufacturer and includes a statement that the supplied
21 coating material is the same composition as that prequalified.

22 **1080-12 ABRASIVE MATERIALS FOR BLAST CLEANING STEEL**

23 Select the gradation of the abrasive to impart the anchor profile specified.

24 **(A) Mineral and Slag Abrasives**

25 Use blasting abrasives with suitable steel or mineral abrasives containing no more than
26 100 ppm of any corrosive compound such as sulfate or chloride or 100 ppm of any
27 EPA characteristic waste compound such as lead, chromium or arsenic. Mineral and slag
28 abrasives as defined by SSPC AB-1 are not to be recycled without written permission
29 from the Department. The end user of the abrasive (e.g. shop or contractor), shall
30 provide the Department with the abrasive conformance testing certificate as required in
31 SSPC AB-1 and perform field quality control testing immediately prior to use at the
32 minimum frequency specified in SSPC AB-1.

33 **(B) Ferrous Metallic Abrasives**

34 Ferrous metallic abrasives are new and previously unused material. The end user
35 (e.g. shot or contractor) of the abrasive shall provide the Department with the abrasive
36 conformance testing certificate as required by SSPC AB-3 and perform the abrasive
37 cleanliness testing and conductivity testing immediately prior to use when not recorded
38 on the manufacturer's certification. The frequency for this testing is once per 55 gallon
39 barrel of abrasive.

(C) Cleanliness of Recyclable Ferrous Metallic Abrasives

Shop facilities shall annually acquire a composite sample of their recycled abrasive (work mix) in the Department's presence. A composite sample is a mixture of individual samples taken from a minimum of three separate areas of the work mix. The composite sample is to be tested at an accredited laboratory and provide the Department with a TCLP analysis and sulfate and chloride testing. The shop shall provide annually, the Department with a notarized Type 3 certification certifying the plant location has not used their facilities or equipment for the removal of lead based coatings. Prior to starting work, field contractors recycled work mix used shall meet the requirements of SSPC AB-2 prior to first use for each Department project.

Shop and Field Contractors cleaned work mix shall meet the requirements of SSPC AB-2 and maintain the size and shape of the abrasive to impart the specified profile. The quality control inspector shall document and test the cleaned work mix prior to starting work once every 12 hours or once every work shift whichever period is shorter. Abrasive testing shall meet and be performed in accordance with SSPC AB-2, ASTM D4940 (Water Soluble Contaminants), ASTM D7393 (Oil Content), SSPC PA-17 (Particle Size Distribution) and the Contract documents.

Nonconforming work mix shall not be used, shall be removed from equipment and shall be disposed of in accordance with federal, state, and local regulations and project specification requirements. If non-compliant work mix is detected during continuous recycling following three failing testing attempts blasting and handling equipment shall be checked for residual contamination after removal of the contaminated media. Following cleaning, new compliant media should be fed through the equipment and shall be tested for compliance with requirements of SSPC-AB 2 before production work resumes.

1080-13 FIELD PERFORMANCE AND SERVICE

Do not use paint products inspected by the Engineer and found to exhibit poor performance in similar North Carolina environments. Poor performance is defined as any coating failing to meet ASTM D610, Grade 5, or having greater than 3% rusting or disbonding before attaining 5 years of service.

**SECTION 1081
EPOXY AND ADHESIVES****1081-1 EPOXY RESIN SYSTEMS****(A) Classification**

The types of epoxies and their uses are as shown below:

Type 1 - A low-modulus, non-sag gel adhesive used to bond or repair damp, vertical or overhead surfaces. Typical applications include walls, concrete foundations, concrete pipe, conduit and ceilings.

Type 2 - A low-modulus, general-purpose adhesive used in epoxy mortar repairs. It may be used to patch spalled, cracked or broken concrete where vibration, shock or expansion and contraction are expected. Feather-edged patching is not recommended with this material; instead, the adjacent concrete perimeter should be sawed at least 1/4 inch to 1/2 inch deep and any remaining concrete chipped away to provide a vertical interface between the epoxy mortar and concrete.

Type 3 - A high-modulus general-purpose adhesive used to bond plastic concrete or hardened concrete to hardened concrete or other structural materials. It may be used to produce a high-strength epoxy mortar grout bed for equipment or to patch interior spalls, cracks or broken concrete. It is not recommended for exterior patching because its rate of thermal expansion and contraction differs too greatly from concrete. It may be used for anchoring bolts where a flowable adhesive is required.

Section 1081

1 **Type 3A** - A gel-like version of Type 3, used specifically for embedding dowel bars,
2 threaded rods, rebars and other fixtures in hardened concrete.

3 **Type 4A** - A gray protective coating for concrete, wood, steel and other structural
4 materials. It is typically used as a topcoat in waterproofing concrete exposed to splash
5 zones and tidal water.

6 **Type 4B** - A red primer coating used with Type 4A.

7 **Type 5** - A high modulus, low viscosity adhesive suitable for pressure injection into
8 cracks in concrete. For some non-structural crack repairs, Type 5 epoxy may be poured
9 on the surface to penetrate cracks by gravity. This may be beneficial before
10 waterproofing and skid proofing.

11 **(B) Requirements**

12 Epoxies shall conform to the requirements shown in Table 1081-1 using the test methods
13 described in Article 1081-3.

14 For epoxy resin systems used for embedding dowel bars, threaded rods, rebar, anchor
15 bolts and other fixtures in hardened concrete, the manufacturer shall submit test results
16 showing that the bonding system will obtain 125% of the specified required yield
17 strength of the fixture. Furnish certification that, for the particular bolt grade, diameter
18 and embedment depth required, the anchor system will not fail by adhesive failure and
19 that there is no movement of the anchor bolt. For certification and anchorage, use
20 3,000 psi as a minimum Portland cement concrete compressive strength used in this test.
21 Use adhesives that meet Section 1081.

22 List the properties of the adhesive on the container and include density, minimum and
23 maximum temperature application, setting time, shelf life, pot life, shear strength and
24 compressive strength.

25 **(C) Properties of Epoxy Resin Systems**

26 (1) All integral fillers, pigments and thixotropic agents shall be fine enough to not
27 separate, settle or cause skinning during storage of the epoxy components. Do not
28 use abrasive fillers such as alumina and silica flour. Do not use solvents. When
29 mineral fillers are to be added during mixing, they shall be inert, readily dispersible
30 and except for sand, have fineness such that 99% of the material will pass
31 a No. 325 sieve.

32 (2) The coefficient of expansion of cured epoxy is 6 times greater than that of concrete.
33 Therefore, to reduce spalling and peeling during temperature changes, avoid thick
34 layers of pure epoxy. A 4:1 by weight sand-epoxy mortar has approximately the
35 same coefficient of expansion as concrete.

36 (3) The shelf life of parts A and B shall be at least one year from the date of
37 manufacture.

38 (4) Types 1 through 5 epoxy resin systems are moisture insensitive and can be applied
39 on clean, dry or damp surfaces free of standing water.

Table 1081-1
Properties of Mixed Epoxy Resin Systems

Property	Type 1	Type 2	Type 3	Type 3A	Type 4A	Type 4B	Type 5
Viscosity-Poises at 77°F ± 2°F	Gel	10-30	25-75	Gel	40-150	40-150	1-6

Minimum Tensile Strength at 7 days (psi)	1,500	2,000	4,000	4,000	1,500	1,500	4,000
Tensile Elongation at 7 days (%)	30 min.	30 min.	2-5	2-5	5-15	5-15	2-5
Min. Compressive Strength of 2" mortar cubes at 24 hours	3,000 (Neat)	4,000-	6,000-	6,000 (Neat)	3,000	3,000	6,000
Min. Compressive Strength of 2" mortar cubes at 7 days	5,000 (Neat)	-	-	-	-	5,000	-
Maximum Water Absorption (%)	1.5	1.0	1.0	1.5	1.0	1.0	1.0
Min. Bond Strength Slant Shear Test at 14 days (psi)	1,500	1,500	2,000	2,000	1,500	1,500	1,500

(D) Test Methods for Epoxies

(1) Viscosity

Determine the viscosity of the mixture in accordance with AASHTO T 237 using Brookfield viscometer model RVT. Use the spindle number and speed shown in Table 1081-1.

(2) Pot Life

Determine the pot life of the mixture in accordance with AASHTO T 237 except use a mass of 60 ± 0.4g.

Section 1081

1 (3) Compressive Strength of Epoxy Mortar

2 Determine the compressive strength of epoxy mortar in accordance with
3 ASTM C109 except as follows:

4 Use mortar consisting of one part epoxy and 3 parts standard graded Ottawa sand
5 except for Types 1 and 3A, which shall be tested neat. Mix epoxy
6 components A and B at the recommended proportions for 2 minutes, add the sand,
7 and mix for 3 minutes. Pour the mortar into the cube molds in two layers, and tamp
8 each layer 50 times with a spatula and 25 times with a hammer handle. Make
9 six specimens, and cure all in air at $77^{\circ}\text{F} \pm 2^{\circ}\text{F}$ for 24 hours. Test three specimens
10 for compressive strength at the end of this curing period. Immerse the remaining
11 three specimens in water at $+ 77^{\circ}\text{F}$ for 6 days, after which immediately test them for
12 compressive strength in the wet condition.

13 (4) Tensile Strength and Tensile Elongation

14 Determine the tensile strength and tensile elongation of the mixture in accordance
15 with ASTM D638.

16 (5) Absorption

17 Determine the water absorption of the mixture in accordance with ASTM D570.

18 (6) Bond Strength

19 Determine the bond strength of the moist-cured mixture at 14 days by the slant shear
20 test in accordance with ASTM C882.

21 (E) Prequalification

22 All epoxy resin systems shall be on the NCDOT Approved Products List before use.
23 Manufacturers choosing to supply material for Department jobs must submit an
24 application through the Value Management Unit with the following information for each
25 type and brand name:

26 (1) Contact information, including name, address and telephone number of the
27 manufacturer,

28 (2) Brand/Trade name of the material,

29 (3) Type of the material in accordance with Article 1081-1 and 1081-4,

30 (4) Technical data sheet stating at a minimum product description, yield, technical
31 information, mixing directions, finishing directions, curing, clean-up and
32 precautions/limitations,

33 (5) Material Safety Data Sheets,

34 (6) Certified test data showing the product meets the specifications, including evidence
35 that the testing laboratory is regularly inspected by the Cement and Concrete
36 Reference Laboratory (CCRL) of the National Institute of Standards Technology or
37 other approved reference laboratory, and

38 (7) A sample of the product for testing (four injection tubes or 1/2 gallon of each
39 component is required for testing).

40 Products will remain on the NCDOT Approved Products List as long as the formulation
41 and manufacturing process remain unchanged, and the product performs as intended in
42 the field.

(F) Acceptance

When materials on the NCDOT Approved Products List are furnished to a project, submit to the Engineer a Type 3 material certification in accordance with Article 106-3 for each lot or batch delivered.

When materials are furnished to the Bridge Maintenance Unit, the terms of acceptance will be listed in the bid solicitation. The Engineer reserves the right to reject any epoxy that does not perform adequately in the field.

(G) Supply

Supply epoxy resin in two components, labeled as “Component A - Contains Epoxy Resin” and “Component B - Contains Curing Agent”, for combining immediately before use in accordance with the manufacturer’s instructions. Mark each container with the manufacturer’s name, NCDOT type, lot or batch number, quantity, date of manufacture, shelf life or expiration date, color, mixing instructions, usable temperature range and hazards or safety precautions.

Furnish the two components in separate non-reactive containers. Provide containers of such size that the proportions of the final mix can be obtained by combining a single container of one component with one or more whole containers of the other component.

(H) Notes on Use of Epoxies**(1) Safety**

Epoxies can irritate the eyes, skin and respiratory tract. Therefore, wear chemical splash goggles, chemically-resistant gloves and protective clothing and boots when handling epoxies. Respiratory protection is usually not needed if epoxies are mixed and applied in well-ventilated areas, but avoid prolonged breathing of vapors. Follow all MSDS instructions for proper use of these materials.

(2) Mixing

Stir parts A and B individually until each component is homogeneous. Use a separate stirrer for each component.

Combine parts A and B, either by weight or volume, as specified in the manufacturer’s instructions. Stir the mixture vigorously, periodically scraping the sides and bottom of the container. Small quantities of epoxy usually require 2 to 3 minutes to mix homogeneously; 5-gallon quantities can take up to 10 minutes of mixing.

Temperature affects the viscosity and pot life of epoxies. Most laboratory tests are conducted at 77°F. Higher temperatures render epoxies thinner and faster setting; lower temperatures induce higher viscosities and longer pot lives.

Add sand or other fillers to liquid epoxies only after parts A and B have been thoroughly mixed. Stir in the sand or filler until all particles are completely coated.

(3) Storage and Substrate Temperature

Store epoxies at temperatures between 50°F and 90°F. Epoxy components exposed to the extremes of this range or outside this range should be conditioned to 77°F before mixing and blending. If heat is necessary, always use indirect methods such as hot water, a heated room or a microwave oven to condition components.

When applying epoxy to a cold substrate, preheat the components approximately 1°F above 77°F for every 2°F of substrate temperature below 77°F.

Seal previously opened containers to be airtight. Unsealed containers can absorb moisture from the atmosphere, which can alter the chemical reaction of the mixture.

Section 1081

1 1081-2 POLYESTER RESIN EPOXY ADHESIVE

2 (A) General

3 Polyester resin is used specifically for embedding dowel bars, threaded rods, rebars and
4 other fixtures in hardened concrete.

5 Have the manufacturer submit test results showing that the bonding system will obtain
6 125% of the specified yield strength of the anchor fixture in concrete with a minimum
7 compressive strength of 3,000 psi. Field testing may be required for adhesively anchored
8 fixtures.

9 (B) Materials

10 Package components of the adhesive in containers of such size that one whole container
11 of each component is used in mixing one batch of adhesive. Use containers of such
12 design that all of the contents may be readily removed, and are well sealed to prevent
13 leakage. Furnish adhesive material that requires hand mixing in two separate containers
14 designated as Component A and Component B. A self-contained cartridge or capsule
15 will consist of two components which will be automatically mixed as they are dispensed,
16 as in the case of a cartridge, or drilled into, as in the case of a capsule.

17 Clearly label each container with the manufacturer's name; date of manufacture; batch
18 number; batch expiration date; all directions for use and such warning of precautions
19 concerning the contents as may be required by Federal or State laws and regulations.

20 (C) Mixing of Adhesive

21 Mix adhesive in conformance with the manufacturer's instructions.

22 1081-3 HOT BITUMEN

23 Mix the adhesive asphaltic material with the filler homogeneously.

24 (A) Physical Requirements

25 Supply materials meeting Tables 1081-2 or 1081-3 and 1081-4.

TABLE 1081-2			
ADHESIVE PROPERTIES OF ASPHALTIC MATERIAL WITH FILLER			
Property	Min.	Max.	Test Method
Softening point, °F.	200	-	ASTM D36
Penetration, 100 g, 5 sec., 77°F	10	18	ASTM D5
Flow, inch, as modified in Subarticle 1081-4(B)	-	0.2	ASTM D5329
Viscosity, 400°F, poises or ASTM D4402 as modified in Subarticle 1081-4(B)	30	75	ASTM D2669
Flash Point, C.O.C., °F.	550	-	ASTM D92

TABLE 1081-3			
ASPHALT PROPERTIES OF ASPHALTIC MATERIAL WITHOUT FILLER			
Property	Min.	Max.	Test Method
Penetration, 100 g, 5 sec., 77°F	25	-	ASTM D5
Viscosity, 275°F poises	12	100	ASTM D2171
Viscosity Ratio, 275°F	-	2.2	See Subarticle 1081-3(B)

TABLE 1081-4 FILLER PROPERTIES			
Property	Min.	Max.	Test Method
Filler Content, % by Weight	65%	75%	See Subarticle 1081-3(B)
Filler Fineness, % Passing No. 325	75%	-	ASTM C430 as modified in Subarticle 1081-3(B)
Filler Fineness, % Passing No. 200	95%	-	
Filler Fineness, % Passing No. 100	100%	-	

1 **(B) Test Methods**

2 (1) Flow

3 Determine flow according to Section 6 of ASTM D5329 with the exception that the
4 oven temperature shall be 158°F ± 2°F and sample preparation done according to
5 Section 7.1 of ASTM D5.

6 (2) Viscosity

7 Viscosity is to be determined according to ASTM D2669 or ASTM D4402 using
8 a spindle speed of 10 rpm. Heat the adhesive to approximately 410°F and allowed to
9 cool. Determine viscosity at 400°F ± 1°F.

10 (3) Asphalt Properties

11 Properties of the base asphalt are to be determined on the material obtained from the
12 following extraction and Abson recovery methods. Extract the asphalt by heating the
13 adhesive just to the point where it will easily flow and then transfer 125 to 150 g into
14 400 ml of trichloroethylene with a temperature of 125°F to 150°F. Thoroughly stir
15 this mixture to dissolve the asphalt. Decant the trichloroethylene-asphalt mixture
16 decanted and the asphalt recovered using the Abson recovery method, ASTM D1856
17 as modified by the following. The extraction methods of ASTM D2172 do not apply
18 and there will be no filtration of the solvent asphalt mixture. The extraction solution
19 of trichloroethylene and asphalt shall be centrifuged for at least 30 minutes at
20 770 times gravity in a batch centrifuge. Decant this solution in the distillation flask,
21 taking care not to include any filler sediment. Apply heat and bubble carbon dioxide
22 solution slowly to bring the solution temperature to 300°F. At this point the carbon
23 dioxide flow is increased to 800 ml to 900 ml per minute. The solution temperature
24 is maintained at 320°F to 335°F with this carbon dioxide flow for at least 20 minutes
25 and until the trichloroethylene vapors have been completely removed from the
26 distillation flask. Repeat the above extraction-recovery method as necessary to
27 obtain the desired quantity of asphalt. Use the asphalt recovered to determine
28 penetration, 275°F viscosity, and 275°F viscosity ratio.

29 (4) Viscosity Ratio

30 Determine the 275°F viscosity ratio by comparing the 275°F viscosity on the base
31 asphalt before and after the thin-film oven test. Perform the thin-film oven test in
32 accordance with ASTM D1754. Determine the specific gravity by pycnometer as in
33 ASTM D70 for use in the thin-film oven test. Calculate the 275°F viscosity ratio by
34 dividing the viscosity after the thin-film oven test by the original 275°F viscosity.

35 (5) Filler Material

36 Separate the filler material from the asphalt to determine Filler Content and Filler
37 Fineness. Determine the portion by weight of the adhesive insoluble in
38 1,1,1 trichloroethane by weighing 10.00 ± 0.01 grams of solid adhesive into

Section 1081

1 a centrifuge flask with approximately 100 ml volume such as that specified in
2 ASTM D1796. Add 50 ml of 1,1,1-trichloroethane to the adhesive, which should be
3 broken up in small pieces to speed up the dissolution solids. Place the sample flask
4 in a balanced centrifuge and spin using a minimum relative centrifugal force of
5 150 in accordance with ASTM D1796 for 10 minutes. Remove the sample flask and
6 decant the solid, taking care not to lose any solids. Repeat the application of solvent
7 and centrifuging until the solvent becomes clear and the filler is visually free of
8 asphalt. Dry the filler at 160°F ± 5°F to remove solvent and weigh the resulting
9 filler. Filtration of the decanted solvent may be performed to verify there is no loss
10 of filler. Percent filler content is calculated as follows:

$$\text{Filter Content, \% by Weight} = \frac{\text{Filler Weight, grams} \times 100}{\text{Original Adhesive Weight, grams}}$$

11 Determine Filler Fineness according to ASTM C430 using number 325, 200 and
12 100 sieves. This method is to be modified by using a water soluble non-ionic
13 wetting agent, such as Triton X-100, to aid the wetting action. Concentration of the
14 surfactant solution shall be approximately 1% by weight. Thoroughly wet the one-
15 gram dry sample in the surfactant solution and allowed to soak for 30 minutes.
16 Transfer the filler completely into the sieve cup and apply water spray for 2 minutes.
17 Surfactant solution may be added as needed and physical means used to disperse any
18 clumped particles. Dry the sample and handle as described in ASTM C430.

19 (C) Prequalification

20 Bituminous adhesives are required to be pre-qualified by the Department's
21 Transportation-Traffic Engineering Branch. Interested parties shall submit a sample to
22 a qualified independent testing laboratory for testing in accordance with
23 Subarticle 1081-3(A) at no cost to the Department. Submit a Type 2 materials
24 certification in accordance with Article 106-3 with the results and the name of the testing
25 laboratory along with a qualification sample(s) of the same lot to the Department for
26 evaluation. For more information on the pre-qualification process, contact the
27 Work Zone Traffic Control Unit.

28 (D) Packaging and Labeling

29 Pack the adhesive in self-releasing cardboard containers which will stack properly.
30 Containers shall have a net weight of 50 lbs. to 60 lbs. and contain two to four
31 subcompartments. Ensure the label shows the manufacturer, quantity and batch number.
32 Print "Bituminous Adhesive for Pavement Markers" or similar wording on the label.

33 (E) Certification

34 A certification from the manufacturer showing the physical properties of the bituminous
35 adhesive and conformance with the Specifications shall be required before use.

36 (F) Application

37 Apply the adhesive according to the manufacturer's requirements and the following
38 requirements.

39 Apply the adhesive when the road surface, ambient air and pavement marker
40 temperatures are in the range of 50°F to 160°F on dry pavement.

41 The composition of the adhesive shall be such that its properties will not deteriorate when
42 heated to and applied at temperatures up to 425°F using either air or oil-jacketed melters.

43 Melt and heat the bituminous adhesive in either thermostatically controlled double boiler
44 type units using heat transfer oil or thermostatically controlled electric heating pots. Do
45 not use direct flame units.

1 Heat the adhesive to between 375°F and 425°F and applied directly to the pavement
2 surface from the melter/applicator by either pumping or pouring. Maintain the
3 application temperature between 375°F and 425°F as lower temperatures may result in
4 decreased adhesion while higher temperatures may damage the adhesive.

5 Use sufficient adhesive to insure total contact with the entire bottom of the pavement
6 marker. Apply pavement markers to the adhesive immediately (within 5 seconds) to
7 assure bonding. Place the pavement marker in position by applying downward pressure
8 until the marker is firmly seated with the required adhesive thickness and squeeze-out.
9 Remove excessive adhesive squeeze-out from the pavement and immediately remove
10 adhesive on the exposed surfaces of pavement markers. Soft rags with mineral spirits
11 conforming to Federal Specifications TT-T-291 or kerosene may be used if necessary, to
12 remove adhesive from exposed faces of pavement markers. No other solvent may be
13 used.

14 Do not waste or spill any excess adhesive on Department right of way. Remove and
15 properly dispose of any adhesive spilled or dumped at such location. The Contractor, at
16 no cost to the Department, shall correct any damage incurred to the Department, highway
17 or appurtenances as a result of misplaced adhesive.

18 The adhesive may be reheated and reused. However, the pot life at application
19 temperatures shall not exceed the manufacturer's recommendations.

20 Clean out of equipment and tanks may be performed using petroleum solvents such as
21 diesel fuel or similar materials. All solvents shall be removed from the equipment tanks
22 and lines before the next use of the melter.

23 **1081-4 EPOXY RESIN ADHESIVE FOR BONDING TRAFFIC MARKERS**

24 **(A) General**

25 This section covers epoxy resin adhesive for bonding traffic markers to pavement
26 surfaces.

27 **(B) Classification**

28 The types of epoxies and their uses are as shown below:

29 **Type I**

30 Rapid Setting, High Viscosity, Epoxy Adhesive. This type of adhesive provides rapid
31 adherence to traffic markers to the surface of pavement.

32 **Type II**

33 Standard Setting, High Viscosity, Epoxy Adhesive. This type of adhesive is
34 recommended for adherence of traffic markers to pavement surfaces when rapid set is not
35 required.

36 **Type III**

37 Rapid Setting, Low Viscosity, Water Resistant, Epoxy Adhesive. This type of rapid
38 setting adhesive, due to its low viscosity, is appropriate only for use with embedded
39 traffic markers.

40 **Type IV**

41 Standard Set Epoxy for Blade Deflecting-Type Plowable Markers.

42 **(C) Requirements**

43 Epoxies shall conform to the requirements set for in AASHTO M237.

Section 1082

1 (D) Prequalification

2 Refer to Subarticle 1081-1(E)

3 (E) Acceptance

4 Refer to Subarticle 1081-1(F)

5 SECTION 1082 6 STRUCTURAL TIMBER AND LUMBER

7 1082-1 GENERAL

8 Use Southern Pine timber and lumber graded in accordance with the current grading rules of
9 the Southern Pine Inspection Bureau unless otherwise specified or approved by the Engineer.
10 Use stress rated grades equal to or higher than the grades specified. For temporary crossings,
11 the use of stress rated lumber having stress ratings below those specified may be used if
12 approved by the Engineer.

13 Have all timber and lumber, including any preservative treatment, inspected and/or tested at
14 no cost to the Department by an NCDOT approved commercial inspection company before it
15 is delivered to the project. Provide industry standard commercial inspection reports for each
16 shipment of untreated timber or lumber before its use on the project. Provide industry
17 standard commercial inspection reports and treatment test reports for each shipment of treated
18 timber or lumber before its use on the project. Perform all timber and lumber treatment
19 inspections in accordance with Standard M2 (Part A) of the AWWA Specifications. In
20 addition, brand, hammer mark, ink stamp or tag each piece of timber or lumber with the
21 approved commercial inspection company's unique mark to indicate it has been inspected.

22 1082-2 UNTREATED TIMBER AND LUMBER

23 Lumber that is 2 to 4 inches thick and 2 inches to 4 inches wide shall conform to Structural
24 Light Framing, Grade No. 1 Dense MC19. Lumber that is 2 inches to 4 inches thick and
25 6 inches wide or wider shall conform to Structural Joists and Planks, Grade No. 1 Dense
26 MC19. Lumber that is 5 inches and thicker along the least dimension shall conform to, #1
27 Dense or Dense Select Structural (DSS). Rough lumber will be acceptable except where
28 surfacing is called for by the contract. Rough lumber may vary $\pm 1/4$ inch from the
29 dimensions shown on the contract or bill of material.

30 1082-3 TREATED TIMBER AND LUMBER

31 (A) General

32 Grade marked lumber will not be required. Brand or ink stamp each piece of treated
33 lumber in accordance with the AWWA Standard M6.

34 (B) Bridges, Fender Systems and Piles

35 Lumber for bridges that is 2 inches to 4 inches thick and 2 inches to 4 inches wide shall
36 conform to Structural Light Framing, Grade No. 1 Dense. Lumber for bridges that is
37 2 inches to 4 inches thick and 6 inches wide and wider shall conform to Structural Joists
38 and Planks, Grade No. 1 Dense. Lumber for bridges that is 5 inches and thicker along the
39 least dimension shall conform to Structural Lumber, #1 Dense or Dense Select Structural
40 (DSS). Lumber for fender systems shall conform to Structural Lumber, #1 Dense or
41 Dense Select Structural (DSS).

42 Timber for piles shall meet ASTM D25 except that the timber shall be Southern Pine, and
43 have at least a 2 inches sap ring or a 3 inches sap ring where called for by the contract or
44 where the preservative is creosote and the retention is greater than 18 lbs/cf.

45 Rough lumber will be acceptable except where surfacing is called for by the contract or
46 bills of material. Rough lumber may vary $\pm 1/4$ inch from the dimensions shown in the

1 plans or bill of material. Dressed lumber may be 1/8 inch scant from the dimensions
2 shown in the plans or bill of material. A 1/4 inch tolerance in length will be permitted.

3 (C) Guardrail Posts

4 Lumber for guardrail posts shall conform to Timbers, Grade No.1. Rough lumber will be
5 acceptable. An allowable tolerance of 3/8 inch scant will be permitted from nominal
6 dimensions.

7 (D) Fence Posts and Braces

8 Sawn fence posts and braces no larger than 4 inches x 4 inches shall conform to
9 Structural Light Framing, Grade No. 2. Sawn fence posts and braces larger than
10 4 inches x 4 inches shall conform to Timbers, Grade No. 1.

11 Round lumber shall meet Subarticle 1050-2(A).

12 Use fully dressed S4S lumber for fence posts.

13 An allowable tolerance of 1/2 inch scant will be permitted from nominal dimensions of
14 sawed and dressed lumber.

15 (E) Sign Posts and Battens

16 Lumber for sign posts no larger than 4 inches x 4 inches shall conform to Structural Light
17 Framing, Grade No. 1 MC19. Lumber for sign posts larger than 4 inches x 4 inches and
18 lumber for sign battens shall conform to Timbers, Grade No. 1. Use fully dressed S4S
19 lumber for sign posts and battens.

20 An allowable tolerance of 1/2 inch scant will be permitted from nominal dimensions of
21 sign posts. A tolerance of 1 inch under and 3 inches over will be permitted in the length
22 of the post.

23 (F) Poles

24 Timber for poles shall meet ANSI O5.1 except the timber shall be treated Southern Pine
25 or treated Douglas Fir. Use 40 feet Class 3 poles unless otherwise specified in the
26 contract.

27 1082-4 PRESERVATIVE TREATMENT

28 (A) General

29 Give all timber and lumber required to be treated a preservative treatment in accordance
30 with AWWA Standards. The required retention of chromated copper arsenate is specified
31 on the oxide basis. Preservative retention will be determined by the assay method.

32 After treatment, handle the timber and lumber carefully with rope slings, without sudden
33 dropping, breaking of the fibers, bruising or penetrating the surface with tools or hooks.

34 Treated timber and lumber will not be accepted for use unless it has been inspected and
35 found satisfactory, both before and after treatment, and shall be delivered to the project
36 site in a condition acceptable to the Engineer.

37 Use treating plants that have laboratory facilities at the plant site for use of the inspector
38 in accordance with AWWA Standard T1.

39 (B) Timber Preservatives

40 Use timber preservatives conforming to AWWA Standard U1 and T1.

41 (C) Bridges, Fender Systems and Piles

42 Treat timber and lumber for bridges and fender systems in accordance with
43 AWWA Standard U1, except the type of preservative and the retention of preservative will
44 be as required by the contract.

Section 1082

1 Treat piles in accordance to AWPA Standard U1 and T1, except the type of preservative
2 and the retention of preservative will be as required by the contract.

3 **(D) Guardrail Posts**

4 Treat guardrail posts in accordance to AWPA Standard U1 and T1, except require
5 retention of preservative as below.

6 Give all guardrail posts a preservative treatment of creosote, pentachlorophenol or
7 chromated copper arsenate. The same type of preservative is to be used throughout the
8 entire length of the project.

9 Minimum retention for creosoted timber will be 12 lbs. of preservative per cubic foot of
10 wood. Minimum retention for timber treated with pentachlorophenol will be 0.6 pound
11 of dry chemical per cubic foot of wood. Minimum retention for timber treated with
12 chromated copper arsenate will be 0.6 lb. of dry chemical per cubic foot of wood.

13 **(E) Fence Posts and Braces**

14 Treat sawed posts and braces in accordance with AWPA Standard U1 and T1, except
15 require retention of preservative as below.

16 Treat round posts and braces in accordance with AWPA Standard U1 and T1, except
17 require retention of preservative as below.

18 Before treatment, peel round posts and braces cleanly for their full length, remove all
19 bark and innerskin, and trim all knots and projections flush with the surface of the
20 surrounding wood. Machine peeling will be permitted. Cut the ends to the proper length
21 before treatment.

22 Give all fence posts and braces a preservative treatment of either creosote,
23 pentachlorophenol, or chromated copper arsenate. The same type of preservative shall be
24 used throughout the entire length of the project.

25 Minimum retention for creosoted sawed timber will be 10 lbs. of preservative per cubic
26 foot of wood. Minimum retention for sawed timber treated with pentachlorophenol will
27 be 0.5 lb. of dry chemical per cubic foot of wood. Minimum retention for sawed timber
28 treated with chromated copper arsenate will be 0.5 lb. of dry chemical per cubic foot of
29 wood.

30 Minimum retention for creosoted round timber will be 8 lbs. of preservative per cubic
31 foot of wood. Minimum retention for round timber treated with pentachlorophenol will
32 be 0.4 lb. of dry chemical per cubic foot of wood. Minimum retention for round timber
33 treated with chromated copper arsenate will be 0.4 lb. of dry chemical per cubic foot of
34 wood.

35 **(F) Sign Posts and Battens**

36 Treat sign posts and battens in accordance with AWPA Standard U1 and T1, except
37 require retention of preservative as below.

38 Give all sign posts and battens a preservative treatment of either pentachlorophenol or
39 chromated copper arsenate. The same type of preservative shall be used throughout the
40 entire length of the project.

41 Minimum retention for timber treated with pentachlorophenol will be 0.6 lb. of dry
42 chemical per cubic foot of wood. Minimum retention for timber treated with chromated
43 copper arsenate will be 0.6 lb. of dry chemical per cubic foot of wood.

44 All timber shall have moisture content of not greater than 19% before treatment. Redry
45 timber treated with chromated copper arsenate after treatment until it has moisture
46 content of not greater than 25%.

1 **(G) Poles**

2 Treat poles in accordance with AWWA Standard U1 and T1, except require retention of
3 preservative as below.

4 Give all poles a preservative treatment of either pentachlorophenol, or chromated copper
5 arsenate. The same type of preservative shall be used throughout the entire length of the
6 project.

7 Minimum retention for poles treated with pentachlorophenol will be 0.45 lb. by assay of
8 dry chemical per cubic foot of wood. Minimum retention for poles treated with
9 chromated copper arsenate will be 0.6 lb. by assay of dry chemical per cubic foot of
10 wood.

11 **SECTION 1084**
12 **PILES**

13 **1084-1 PILES**14 **(A) Treated Timber Piles**

15 Timber for treated timber piles shall meet Article 1082-3. Give treated timber piles
16 a preservative treatment in accordance with Article 1082-4.

17 **(B) Steel Piles**

18 See Section 1076 for galvanized steel piles. Before incorporating steel piles into the
19 work, obtain all applicable certified mill test reports clearly identifiable to the lot of
20 material by heat numbers, submit these reports to the Engineer for review and analysis
21 and receive approval of such test reports from the Engineer. These requirements apply to
22 both domestic. Transfer the heat number of each painted pile to the newly painted
23 surface with a permanent marker of a color contrasting to the paint once the paint has
24 fully cured.

25 **(1) Steel H-Piles**

26 Steel H-piles shall meet ASTM A572 Grade 50 or ASTM A588.

27 **(2) Steel Pipe Piles**

28 Steel pipe piles shall be of uniform diameter and conform to ASTM A252 Grade 3
29 modified (50,000 psi). Make all joints and seams in the pipe pile watertight. Unless
30 otherwise indicated by the contract, the ends of pipe pile may be flame cut. Square
31 flame cut ends with axis of the pile to provide a full uniform bearing over the entire
32 end area when the pile is being driven. Welding procedure qualification for AWS
33 D1.1 is required for pipe piles requiring splicing. The welding shall be performed by
34 a Department certified welder.

35 **(C) Prestressed Concrete Piles**

36 Prestressed concrete piles shall meet Section 1078.

37 **1084-2 STEEL SHEET PILES**

38 Steel sheet piles detailed for permanent applications shall be hot rolled and meet ASTM A572
39 or ASTM A690 unless otherwise required by the plans. Steel sheet piles shall be coated as
40 required by the plans. Galvanized sheet piles shall be coated in accordance with Section
41 1076. Metallized sheet piles shall be metallized in accordance with the Thermal Sprayed
42 Coatings (Metallization) Program. Any portion of the metallized sheet piling encased in
43 concrete shall receive a barrier coat. The barrier coat shall be an approved waterborne coating
44 with a low-viscosity which readily absorbs into the pores of the aluminum thermal sprayed
45 coating. The waterborne coating shall be applied at the spreading rate that results in a
46 theoretical 1.5 mil dry film thickness. The manufacturer shall issue a letter of certification

Section 1086

1 that the resin chemistry of the waterborne coating is compatible with the 99.9% aluminum
2 thermal sprayed alloy and suitable for tidal water applications.

3 Steel sheet piles detailed for temporary applications shall be hot rolled and meet ASTM A328.

SECTION 1086 PAVEMENT MARKERS

1086-1 TEMPORARY RAISED PAVEMENT MARKERS

7 (A) General

8 Use raised pavement markers evaluated by NTPEP.

9 Use raised pavement markers of the prismatic reflector type, or better as approved. The
10 markers shall be constructed either of an injection molded plastic body and base or
11 consist of a plastic shell filled with a mixture of inert thermosetting compound and filler
12 material. Either construction type shall contain one or more integrated prismatic
13 reflective lenses to provide the required color designation.

14 The minimum reflective area of the lens face is 2.0 sq.in.

15 The color of the reflective pavement marker housing shall match the pavement marking
16 color, which it supplements.

17 All raised pavement marker reflective lenses shall be in close conformance with the
18 Federal Standard No. 595 colors as listed below when viewed at night.

Crystal: Color No. 17886 (White)

Yellow: Color No. 13538

Red: Color No. 11302

19 (B) Adhesives

20 (1) Epoxy

21 The epoxy shall meet Section 1081-4.

22 Review 1081-4(B) for description of epoxy types suitable for markers to be
23 installed. Use an epoxy adhesive type that is appropriate for the pavement and
24 ambient temperature per the manufacture's recommendations. It is recommended
25 that the ambient temperature during application of Types II and IV epoxy shall be at
26 least 50°F and preferably higher than 60°F. These adhesives harden relatively
27 slowly at 50°F, but the hardening rate rapidly accelerates as temperature increases.

28 (2) Hot Bitumen

29 The hot bitumen shall meet Article 1081-3.

30 (3) Pressure Sensitive

31 As supplied by the manufacturer.

32 (C) Material Certification

33 Furnish a Type 2 material certification in accordance with Article 106-3 for all raised
34 pavement markers before use.

35 1086-2 PERMANENT RAISED PAVEMENT MARKERS

36 (A) General

37 Use raised pavement markers evaluated by NTPEP. The markers shall be constructed
38 either of an injection molded plastic body and base or consist of a plastic shell filled with
39 a mixture of inert thermosetting compound and filler material. Either construction type
40 shall contain one or more integrated prismatic reflective lenses to provide the required

1 color designation. Raised pavement markers (permanent) shall be of the glass or plastic
2 face lens type and meet Subarticle 1086-1(A). Plastic lenses shall have an abrasion
3 resistant coating.

4 (1) Potted Markers

5 Potted marker shells shall be made of molded methyl methacrylate conforming to
6 Federal Specification L P 380C, Type I, Class 3. Filling material shall be an inert
7 thermosetting compound selected for strength, resilience, and adhesion adequate to
8 meet physical requirements of the *Standard Specifications*. Sand or other inert
9 granulars shall be embedded in the surface of the inert thermosetting compound and
10 filler material before its curing to provide a surface, which will readily bond to the
11 adhesive.

12 (2) Injection-molded Markers

13 Injection-molded markers shall consist of polymer materials selected for strength and
14 resilience adequate to meet the physical requirements of the *Standard Specifications*.
15 The bottom surface of the marker shall contain grooves or nonsmooth structure
16 designed to increase bonding with the adhesive.

17 **(B) Optical Requirements**

18 All optical performance for permanent raised pavement markers shall conform to
19 ASTM D4280.

20 **(C) Physical Properties**

21 All physical properties for permanent raised pavement markers shall conform to
22 ASTM D4280.

23 **(D) Hot Bitumen Adhesives**

24 Use hot bitumen adhesive for mounting the pavement markers to asphalt concrete
25 roadways. The hot bitumen adhesive shall meet the requirements of Article 1081-3.
26 Other adhesives such as epoxy or cold bituminous adhesive pads are not acceptable on
27 asphalt concrete roadways for permanent applications.

28 **(E) Epoxy Adhesives**

29 Use epoxy adhesive for mounting the pavement markers to concrete roadways. The
30 epoxy adhesive shall comply with Section 1081-4. Other adhesives such as hot and cold
31 bituminous or adhesive pads are not acceptable on concrete roadways for permanent
32 applications.

33 **(F) Material Certification**

34 Furnish a Type 2 material certification in accordance with Article 106-3 for all raised
35 pavement markers before use.

36 **1086-3 SNOWPLOWABLE PAVEMENT MARKERS**

37 **(A) General**

38 Use snowplowable pavement markers evaluated by NTPEP. The snowplowable
39 pavement marker shall consist of a cast iron housing with one or more glass or plastic
40 face lens type reflective lenses to provide the required color designation. Shape the
41 casting to deflect a snowplow blade upward in both directions without being damaged.
42 Incorporate into the casting two parallel keels and a connecting web designed to fit into
43 slots cut into the road surface. Plastic lens faces shall use an abrasion resistant coating.

44 Use recycled snowplowable pavement markers that meet all the requirements of
45 new snowplowable pavement markers except Subarticle 1086-3(B)(1). Recycled
46 snowplowable pavement markers with minimal variation in dimensions are acceptable

Section 1086

1 only when the reflector fits in the casting of the recycled snowplowable pavement marker
2 as originally designed.

3 (B) Castings

4 (1) Dimensions

5 The dimension, slope and minimum area of reflecting surface shall conform to
6 dimensions as shown in the plans. The minimum area of each reflecting surface
7 shall be 1.44 sq.in.

8 (2) Materials

9 Use nodular iron in accordance with ASTM A536.

10 (3) Surface

11 The surface of the keel and web shall be free of scale, dirt, rust, oil, grease or any
12 other contaminant which might reduce its bond to the epoxy adhesive.

13 (4) Identification

14 Mark the casting with the manufacturer's name and model number of marker.

15 (C) Reflectors

16 (1) General

17 Laminate the reflector to an elastomeric pad and attach with adhesive to the casting.
18 The thickness of the elastomeric pad shall be 0.04 inch.

19 (2) Reflector Type

- 20 (a) One-direction, one color (crystal)
- 21 (b) Bidirectional, one color (yellow and yellow)
- 22 (c) Bidirectional, two colors (red and crystal)
- 23 (d) Bidirectional, two colors (red and yellow)

24 All pavement marker reflective lenses shall be in close conformance with the Federal
25 Standard No. 595 colors as listed below when viewed during night situations.

Crystal: Color No. 17886 (White)

Yellow: Color No. 13538

Red: Color No. 11302

26 (3) Reflector Optical Requirements

27 (a) Definitions

28 Define "horizontal entrance angle" as the angle in the horizontal plane between
29 the direction of incident light and the normal to the leading edge of the marker.

30 Define "observation angle" as the angle, at the reflector, between observer's line
31 of sight and the direction of the light incident on the reflector.

1 Define “specific intensity (S.I.)” as candlepower of the returned light at the
 2 chosen observation and entrance angles for each footcandle of illumination at
 3 the reflector.

$$\text{S.I.} = RL \times (D \times D) \times IL$$

Where:

S.I. = Specific Intensity

RL = Reflected Light

IL = Incident Light

D = Test Distance

4 (b) Optical Performance

5 Test the reflector for specific intensity as described below:

6 Form a 1 inch diameter flat pad using #3 coarse steel wool per Federal
 7 Specification FF-W-1825. Place the steel wool pad on the reflector lens. Apply
 8 a load of 50 lbs. and rub the entire lens surface 100 times. Do not abrade the red
 9 lens of the Type 3 and Type 4 bi-directional units.

10 Locate the reflector to be tested with the center of the reflecting face at
 11 a distance of 5 feet from a uniformly bright light source having an effective
 12 diameter of 0.2 inch.

13 The photocell must be an angular ring 0.37 inch I.D. x 0.47 inch O.D. Shield it
 14 to eliminate stray light. The distance from light source center to the center of
 15 the photoactive area shall be 0.2 inch. If a test distance of other than 5 feet is
 16 used, modify the source and receiver in the same proportion as the test distance.

17 After abrading the lens surface using the above steel wool abrasion procedure,
 18 the specific intensity of each crystal reflecting surface at 0.2 degrees observation
 19 angle must not be less than the following when the incident light is parallel to
 20 the base of the reflector.

TABLE 1086-1		
MINIMUM SPECIFIC INTENSITY		
(candle/footcandle/unit marker)		
Color	Horizontal Entrance Angle	
	0 Degrees	20 Degrees
Crystal	3.00	1.20
Yellow	1.80	0.72
Red	0.75	0.30

21 **(D) Properties**

22 All optical and physical properties for snowplowable pavement markers shall conform to
 23 ASTM D4383.

24 **(E) Epoxy Adhesive**

25 The epoxy adhesive shall meet the requirements of Section 1081-4. Mix the epoxy
 26 adhesive rapidly by a two component type automatic metering, mixing and extrusion
 27 apparatus.

28 **(F) Material Certification**

29 Furnish a Type 2 material certification in accordance with Article 106-3 for all raised
 30 snowplowable markers before use.

Section 1087

**SECTION 1087
PAVEMENT MARKINGS**

1087-1 GENERAL

Yellow and white pavement markings shall be retroreflective. Black pavement markings shall be matte, non-retroreflective.

The material manufacturer has the option of formulating the pavement marking material according to his own specifications; however, the manufacturer shall meet all the minimum requirements specified herein.

All pavement marking materials, pigments, beads, highly reflective media and resins shall be free from all skins, dirt and foreign objects.

Use pavement marking materials capable of being fabricated into pavement markings of specified dimensions and adhering to asphalt and Portland cement concrete pavements when applied in accordance with their manufacturer’s recommendation.

Pavement marking materials upon heating shall not exude fumes, which are toxic, or injurious to persons or property.

Homogeneously mix all pavement marking materials.

1087-2 COMPOSITION

(A) Paint Composition

Pavement marking paint shall be a ready mixed type paint product conforming to Federal Specification TTP 1952F with spraying consistency suitable for use as a retroreflective pavement marking. Glass beads are dropped by suitable pressurized means into the wet paint as it is applied to the pavement.

(B) Removable Tape Composition

Removable tape pavement marking shall be composed of materials as specified by their manufacturer.

Use removable tape markings capable of conforming to pavement contours, breaks, faults, etc. through the action of traffic at normal pavement temperatures. The tape shall have resealing characteristics such that it is capable of fusing with itself and previously applied marking tape of the same composition under normal conditions of use. The removable tape markings shall be patchable.

Use removable tape markings capable of adhering to the pavement by a pressure-sensitive pre-coated adhesive or as directed by the manufacturer.

(C) Thermoplastic Composition

Use thermoplastic alkyd/maleic pavement markings composed of the materials in Table 1087-1.

TABLE 1087-1 PHYSICAL PROPERTIES OF THERMOPLASTIC ALKYD/MALEIC PAVEMENT MARKINGS	
Component	By Weight
Alkyd/Maleic Binder	18.0% Min
Glass Beads (Premixed)	30.0% Min
Titanium Dioxide Pigment (ASTM D476 Type 2)	10.0% Min.
Yellow Pigment (For Yellow Marking Only) Silica Encapsulated Lead Chromate Pigment	4.0% Min.

Use white thermoplastic that does not contain anatase titanium dioxide pigment.

1 Provide yellow thermoplastic that contains only heat resistant silica encapsulated lead
2 chromate pigment. The lead chromate pigment shall contain at least 60% lead chromate.

3 Calcium carbonate and inert fillers may be as opted by the manufacturer, providing all
4 other qualifications are met.

5 The total silica content used in the formulation of the thermoplastic shall be the premixed
6 glass beads and/or highly reflective media. Uniformly disperse the pigment, beads,
7 media and filler in the binder.

8 The Alkyd/maleic binder shall consist of a mixture of synthetic resins (at least one
9 synthetic resin shall be solid at room temperature) and a high boiling point plasticizers.
10 At least 1/2 of the binder composition shall be 100% maleic-modified glycerol of resin
11 and be no less than 15% by weight of the entire material formulation. The binder shall
12 contain no petroleum hydrocarbon resins. Use resins/rosins that are maleic-modified
13 glycerol esters.

14 The thermoplastic material shall be free of contaminates and be homogeneously dry-
15 blended or hot mixed from 100% virgin stock using no reprocessed materials, (excluding
16 the requirement to use reprocessed glass).

17 The thermoplastic material shall not deteriorate or discolor when held at the application
18 temperatures for at least 4 hours or upon repeated reheating (at least 4 times).

19 The color, viscosity and chemical properties versus temperature characteristics of the
20 thermoplastic material shall remain constant for up to 4 hours at the application
21 temperature and be the same from batch to batch.

22 The thermoplastic material shall be readily applicable at temperatures between 400°F and
23 440°F from the approved equipment to produce lines and symbols of the required above
24 the pavement thickness.

25 **(D) Cold Applied Plastic Composition**

26 The cold applied plastic pavement marking shall consist of a mixture of high quality
27 polymeric materials, pigments and glass beads distributed throughout its base cross-
28 sectional area, with a reflective layer of beads bonded to the top surface.

29 The cold applied plastic markings shall adhere to the pavement by a pressure-sensitive
30 pre-coated adhesive.

31 The cold applied plastic shall conform to pavement contours, breaks, faults, etc. through
32 the action of traffic at normal pavement temperatures. The film shall have resealing
33 characteristics such that it is capable of fusing with itself and previously applied marking
34 tape of the same composition under normal conditions of use. The cold applied plastic
35 pavement marking shall be patchable.

36 **1087-3 COLOR**

37 All pavement markings, without drop-on beads and/or media, shall visually match the color
38 chips that correspond to the Federal Standard Number 595b for the following colors:

Crystal: Color No. 17886 (White)

Yellow: Color No. 13538

Black: Color No. 37038

39 **1087-4 GLASS BEADS**

40 **(A) Composition**

41 The silica content of the glass beads shall be at least 60%.

42 Manufacture the beads from 100% recycled non-pigmented glass from a composition
43 designed to be highly resistant to traffic wear and to the effects of weathering. All

Section 1087

1 standard intermix and drop-on glass beads shall be manufactured using 100% North
2 American recycled glass cullet.

3 All intermixed and drop-on glass beads shall not contain more than 75 ppm arsenic or
4 200 ppm lead.

5 (B) Physical Characteristics

6 Use glass beads that are colorless, clean, transparent and free from milkiness, excessive
7 air bubbles, skins and foreign objects. Use glass beads with a minimum refractive index
8 of 1.50 when tested by the liquid immersion method at $77^{\circ}\text{F} \pm 9^{\circ}\text{F}$ in accordance with
9 ASTM D1214 using the Becke Line Method or an equivalent method. Use glass beads
10 that are spherical in shape and essentially free of sharp angular particles or particles
11 showing surface scarring or scratching.

12 All intermixed and drop-on glass beads shall comply with NCGS § 136-30.2 and 23 USC
13 § 109(r).

14 (C) Gradation & Roundness

15 Use drop-on and intermixed glass beads in all pavement markings with at least 80% true
16 spheres when tested in accordance with ASTM D1155. Drop-on and intermixed glass
17 beads used on any pavement markings shall meet Table 1087-2.

Sieve Size	Gradation Requirements	
	Minimum	Maximum
Passing #20	100%	--
Retained on #30	5%	10%
Retained on #50	40%	80%
Retained on #80	15%	40%
Passing #80	0%	5%
Retained on #200	0%	5%

18 (D) Chemical Resistance

19 Conduct the following chemical resistance test on all glass beads:

20 Place 3 to 5 g portions of the same glass bead batch to be tested in three separate glass
21 beakers or three porcelain dishes. Cover one sample with distilled water, cover the
22 second sample with 3N solution of sulfuric acid and cover the third sample with 50%
23 solution of sodium sulfides. After one hour of immersion, examine the glass bead
24 samples microscopically for evidence of darkening or frosting. All three samples shall
25 show no evidence of darkening or frosting.

26 (E) Moisture Resistance

27 Conduct the following moisture resistance test on drop-on glass beads:

28 Place a 2 lb. minimum sample of glass beads in a clean, washed cotton bag with a thread
29 count of 50 warp, 50 woof. Immerse the bag containing the sample in a container of
30 water for 30 seconds or until the water covers the spheres, whichever is longer. Remove
31 the bag from water and force excess water from the sample by squeezing the bag.
32 Suspend the bag and allow to drain for 2 hours at room temperature 70°F to 72°F . Then
33 mix the sample in the bag by shaking thoroughly. Transfer the sample slowly to a clean
34 dry glass funnel having a stem of 4 inches in length with 1/4 inch inside diameter. The
35 entire sample shall flow freely through the funnel without stoppage. When first
36 introduced in the funnel, if the spheres clog, it is permissible to lightly tap the funnel to
37 start the flow.

1 1087-5 PACKAGING FOR SHIPMENT

2 Deliver all pavement marking and glass bead materials to the project in suitable containers
3 packaged by the manufacturer. Clearly and adequately mark each material container to
4 indicate the material, color, date of manufacture, process, batch or lot number, manufacturer's
5 name and location, temperature application range, shelf life and include the MSDS.

6 Thermoplastic pavement marking materials shall be in block or granular form packaged in
7 either suitable corrugated containers or thermal degradable plastic bags to which it will not
8 adhere during shipment or storage.

9 Package glass beads in moisture resistant packaging.

10 1087-6 STORAGE LIFE

11 All pavement marking materials shall meet this Specification for one year from the date of
12 shipment from the manufacturer to the Contractor, or the project when stored properly by the
13 manufacturer's recommendation. Replace any pavement marking materials not meeting these
14 Specifications.

15 1087-7 TESTS TO BE PERFORMED

16 When independent test laboratory tests are required, perform them on samples taken by
17 an agency certified by the Department from the same process, batch or lot number as the
18 material shipped to the project. The test reports shall contain the lot number. Use Department
19 approved independent test laboratories.

20 Perform the following tests on thermoplastic pavement marking materials, intermixed glass
21 beads and drop-on glass beads unless prescribed otherwise by the Engineer:

22 (A) Intermixed and Drop-on Glass Beads

23 Use X-ray Fluorescence for the normal sampling procedure for intermixed and drop-on
24 beads, without crushing, to check for any levels of arsenic and lead. If any arsenic or
25 lead is detected, the sample shall be crushed and repeat the testing using X-ray
26 Fluorescence. If the X-ray Fluorescence test shows more than LOD of 5 ppm, test the
27 beads using United States Environmental Protection Agency Method 6010B, 6010C or
28 3052 for no more than 75 ppm arsenic or 200 ppm lead.

29 (B) Thermoplastic Pavement Marking Material Composition

30 (1) % Binder tested in accordance with ASTM D4797.

31 (2) % Titanium Dioxide Pigment tested in accordance with ASTM D3720 or D4764.

32 (3) % Lead Chromate Pigment tested in accordance with D4797.

33 (4) % Glass Beads tested in accordance with ASTM D4797.

34 Except ash, use a 100 gram sample rather than a 10 gram sample to allow for testing of
35 gradation and percent of rounds. Provide the results of sieve analysis and % rounds.

36 (C) Flash Point

37 The thermoplastic shall have a flashpoint of no less than 500°F when tested in
38 accordance with ASTM D92 COC.

39 (D) Requirements

40 The thermoplastic material after heating for 240 ± 5 minutes at $425 \pm 3^\circ\text{F}$ and cooled to
41 $77 \pm 3^\circ\text{F}$ shall meet the following:

Section 1087

- 1 (1) Color
- 2 (a) White
- 3 Daylight reflectance 2° Standard observer and CIE illuminant
- 4 Using XYZ scale D65/10° - 80% minimum
- 5 ASTM E1349
- 6 Yellowness Index - The white thermoplastic shall not exceed a yellowness index
- 7 of 0.12
- 8 (b) Yellow
- 9 Daylight reflectance at 2° Standard observer and CIE illuminant
- 10 Using XYZ scale D65/10° - 45% minimum =Y
- 11 ASTM E1349
- 12 (2) Bond Strength
- 13 The bond strength shall be 200 psi or greater in accordance with ASTM D4796.
- 14 (3) Cracking Resistance at Low Temperatures
- 15 After applying a 4 inches, 125 mil draw-down to concrete blocks and cooling to 15 ±
- 16 3°F, the material shall show no cracks at an observation distance of 12 inches.
- 17 (4) Specific Gravity
- 18 The specific gravity shall be 1.95-2.20 in accordance with ASTM D792.
- 19 (5) Softening Point
- 20 The softening point shall be 215 ± 15°F in accordance with ASTM D36.
- 21 (6) Drying Time
- 22 When applied at a thickness of 125 mils, the material shall set to bear traffic in no
- 23 more than 2 minutes when air and substrate temperature is 50°F ± 3°F (and no more
- 24 than 10 minutes when the air and substrate temperature is 90°F ± 3°F when applied
- 25 at temperature of 412.5 ± 12.5°F in accordance with AASHTO T 250.
- 26 (7) Alkyd Binder Determination
- 27 The thermoplastic material shall immediately dissolve in diacetone alcohol. Slow
- 28 dissolution is evidence of the presence of hydrocarbon binder components.
- 29 (8) Indentation Resistance
- 30 The Shore Type A2 Durometer with a 4.41 lb. load applied shall be between 40 and
- 31 75 units after 15 seconds at 115°F in accordance with ASTM D2240.

1087-8 MATERIAL CERTIFICATION

33 Furnish the following pavement marking material certifications in accordance with

34 Article 106-3:

Glass Beads	Type 3 Material Certification and Type 4 Material Certification
Paint	Type 3 Material Certification
Removable Tape	Type 3 Material Certification
Thermoplastic	Type 3 Material Certification and Type 4 Material Certification
Cold Applied Plastic	Type 2 Material Certification and Type 3 Material Certification
Polyurea	Type 3 Material Certification

SECTION 1088 DELINEATORS

1088-1 REFLECTIVE UNIT REQUIREMENTS FOR DELINEATORS

(A) Definition

Refer to ASTM D4956.

Define “entrance angle” as the angle at the reflector between direction of light incident on it and direction of reflector axis.

Define “observation angle” and “specific intensity” in accordance with Subarticle 1086-3(C)(3)(a).

(B) Reflective Elements

(1) Prismatic Plastic Type

(a) General

Use an acrylic plastic prismatic reflector hermetically sealed to an acrylic plastic back. The reflector shall consist of a clear and transparent face, herein referred to as a lens, with an acrylic plastic back fused to the lens under heat pressure around the entire perimeter of the lens. Where a central mounting hole is required, permanently seal the unit against dust, water and water vapor.

The lens shall consist of a smooth front surface free from projections or indentations except a central mounting hole and identification markings. Mold the manufacturer’s trademark legibly into the face of the lens.

(b) Specific Intensity

Refer to ASTM D4956.

The specific intensity of each prismatic plastic type reflector shall meet Table 1088-1 measurements made with reflectors spinning. Failure to meet the specific intensity minimum will constitute failure of the lot.

**TABLE 1088-1
OPTICAL PROPERTIES OF PRISMATIC
PLASTIC TYPE REFLECTORS**

Observation Angle (Degrees)	Entrance Angle (Degrees)	Minimum Specific Intensity (Candlepower per Footcandle)		
		<i>Crystal</i>	<i>Yellow</i>	<i>Red</i>
0.1°	0°	119	71	29
0.1°	15°	119	28	--
0.1°	20°	47	28	11
0.1°	35°	50	30	--

Locate the prismatic plastic type reflector to be tested at a distance of 100 feet from a single light source having an effective diameter of 2 inches operate the light source at approximately normal efficiency. Measure the return light from the reflector by a photoelectric photometer having a minimum sensitivity of 1 x 10 footcandles per mm scale division. The photometer shall have a receiver aperture of 0.5 inch diameter, shielded to eliminate stray light. The distance from light source center to aperture center shall be 2.1 inches for 0.1 degree observation angle. During testing, spin the reflectors to average the orientation effect.

Section 1088

1 If a test distance other than 100 feet is used, modify the source and aperture
2 dimensions, and the distance between source and aperture, in the same
3 proportion as the test distance.

4 (c) Durability

5 (i) Seal Test

6 Use the following test to determine if a reflector is adequately sealed
7 against dust and water:

8 Submerge 50 samples in water at room temperature. Subject the submerged
9 samples to a vacuum of 5 inches gauge for 5 minutes. Restore atmospheric
10 pressure and leave the samples submerged for 5 minutes, then examine the
11 samples for water intake. Evidence of any water is a failure. Failure of
12 more than 2% of the number tested will be cause for rejection.

13 (ii) Heat Resistance Test

14 Test three reflectors for 4 hours in a circulating air oven at 175°+5°F. Place
15 the test specimens in a horizontal position on a grid or perforated shelf,
16 permitting free air circulation. At the conclusion of the test, remove the
17 samples from the oven and permit them to cool in air to room temperature.
18 The samples, after exposure to heat, shall show no change in shape and
19 general appearance when compared with unexposed control standards. Any
20 failures will be cause for rejection.

21 (2) High Performance Sheeting Grade

22 The reflective sheeting shall be Grade C retroreflective sheeting that conforms to
23 Article 1092-2.

24 **1088-2 GUARDRAIL AND BARRIER DELINEATORS**

25 **(A) Brackets and Casings for Delineators**

26 Make brackets for guardrail and barrier delineators out of 12 gauge galvanized steel,
27 0.063 inch thick aluminum alloy, or .080 inch thick polycarbonate. Use molded plastic
28 type guardrail and barrier delineators that consist of a plastic casing and a reflective
29 element.

30 **(B) Reflective Element Requirements**

31 The reflective element shall meet Article 1088-1. In addition, guardrail delineators and
32 side mounted barrier delineators shall have a minimum reflective area of 7 sq.in. Top
33 mounted barrier delineators shall have a minimum reflective area of 28 sq.in.

34 **(C) Material Certification**

35 Furnish a Type 2 material certification in accordance with Article 106-3 for all guardrail
36 and barrier (permanent) delineators and a Type 7 material certification for all guardrail
37 and barrier delineators (temporary) before use.

38 **(D) Approval**

39 All materials are subject to the approval of the Engineer.

40 **1088-3 GUARDRAIL END DELINEATION**

41 **(A) General**

42 Use guardrail end delineation that is adhesive coated yellow reflective sheeting applied
43 with a pressure sensitive adhesive backing.

(B) Reflective Sheeting Requirements

Use Grade C yellow retroreflective sheeting which conforms to Article 1092-2 for all guardrail end delineation. In addition, guardrail end delineation shall have a minimum reflective area of 2 sf for curved end sections or cover the entire portion of square end sections. See *Roadway Standard Drawings*.

(C) Material Certification

Furnish a Type 2 material certification in accordance with Article 106-3 for all guardrail end delineation before use.

(D) Approval

All materials are subject to the approval of the Engineer.

1088-4 OBJECT MARKERS**(A) General**

Use 7 feet galvanized steel U-shaped channel posts as supports for delineators that are fabricated from steel conforming to ASTM A36 or ASTM A409. Use 7 feet posts, which weigh at least 1.12 lbs/lf after fabrication and application of protective finish. Punch or drill all posts with 3/8 inch diameter holes on the centerline, spaced on 1 inch centers, starting 1 inch from the top and extending at least 24 inches down the posts. Make sure that the holes are clean and the posts are free of burrs. Hot dip galvanize the posts after fabrication for the full length and total area in accordance with ASTM A123.

(B) Reflectors

Use 3 inches diameter prismatic plastic reflectors on object markers that meet Subarticle 1088-1(B)(1).

(C) Reflective Sheeting Requirements

Use Grade C retroreflective sheeting on object markers that meet Article 1092-2.

(D) Panel Requirements

Use panels that meet Article 1092-1.

(E) Fasteners

Use fasteners that meet Article 1092-1.

(F) Material Certification

Furnish a Type 5 material certification in accordance with Article 106-3 for sheeting, a Type 2 material certification for delineators and a Type 1 material certification for U-channel posts before use.

(G) Approval

All materials are subject to the approval of the Engineer.

1088-5 TUBULAR MARKERS**(A) General**

Provide tubular markers that are made of ultraviolet stabilized plastic impact resistant material and have been evaluated by NTPEP. Provide orange, yellow or white tubular markers as shown in the plans.

Provide tubular markers that are flexible or have a flexible joint at the base, such that it will return to its original shape and position if struck by a 5,000 lb vehicle at a velocity of 55 mph. When struck the tubular markers shall not permanently distort to a degree that would prevent reuse.

Section 1088

1 Use tubular markers that are circular in shape and have a minimum height of 36 inches
2 with a broadened base. Use tubular markers that have a minimum height of 42 inches on
3 roadways with posted speed limits greater than 50 mph.

4 Design tubular markers that have white retroreflective collars or as shown in the contract.

5 Where retroreflective collars are required, provide Grade C retroreflective sheeting or
6 better that meets Article 1092-2. Use retroreflective sheeting bands with a minimum
7 width of 4 inches with 6 inches between the bands. Apply a continuous strip of sheeting
8 completely around the tubular marker to ensure 360° retroreflectivity.

9 **(B) Material Certification**

10 Furnish a Type 3 material certification in accordance with Article 106-3 for all new
11 tubular markers and retroreflective collars and a Type 7 material certification for all used
12 tubular markers and retroreflective collars before use.

13 **(C) Approval**

14 All materials are subject to the approval of the Engineer.

15 **1088-6 FLEXIBLE DELINEATOR**

16 **(A) General**

17 Provide flexible delineators evaluated by NTPEP.

18 **(B) Retroreflective Sheeting**

19 Use retroreflective sheeting that is a minimum area of 16 sq.in., with a minimum width
20 of 3 inches. The reflective sheeting shall be Grade C retroreflective sheeting or better
21 and shall conform to Article 1092-2.

22 Use retroreflective sheeting which is yellow, red or crystal, as shown in the plans. Attach
23 the retroreflective sheeting on the front and back of the delineator post as required by the
24 contract.

25 **(C) Post**

26 Design a delineator post that is flexible and made of recycled material. Provide
27 a delineator post that is resistant to impact, ultraviolet light, ozone, hydrocarbons and
28 stiffening with age.

29 Provide a post that is not seriously affected by exhaust fumes, asphalt or road oils, dirt,
30 vegetation, soil, deicing salts or any other types of air contamination or materials likely to
31 be encountered. Upon weathering, the post shall not exhibit serious discoloration,
32 checking or cracking, peeling or blistering, swelling, shrinking or distortion, or any other
33 detrimental effects. Weathering shall not cause appreciable strength or flexibility loss.

34 Design a post with a smooth surface that is free from irregularities or defects. The
35 surface of the post shall not soil excessively. If soiling does occur, it shall be easily
36 cleaned using detergent and water, or solvent.

37 Use posts that have a convex shaped cross-section. The cord distance for the cross-
38 section shall be from 3.5 inches to 4.5 inches in length.

39 Design a post such that it can maintain straightness throughout its entire life. Straight is
40 defined as no point along its length any more than 1 inch away from a perfectly straight
41 edge placed longitudinally along any side of the post.

42 Provide a post in which both sides of the top of the post accepts, and holds securely,
43 retroreflectorized sheeting.

44 Design posts that are gray in color.

1 **(D) Base Support**

2 Provide a base support that is hot rolled rail steel or new billet steel meeting
3 Article 1088-5, the physical requirements of ASTM A499 and the chemical requirements
4 of ASTM A1.

5 Use a base support that is a uniform flanged U-channel post with a nominal weight of
6 3 lb./ft. before holes are punched. Use base support posts that are 18 inches in length and
7 have sufficient number of 3/8 inch diameter holes on 1 inch centers to facilitate
8 attachment of the flexible post.

9 **(E) Anchoring**

10 Design a delineator post for a permanent installation to resist overturning, twisting and
11 displacement from wind and impact forces.

12 **(F) Temperature**

13 Design flexible delineators that do not bend, warp or distort and remain straight, when
14 stored or installed at temperatures up to + 120°F. Design all components of the flexible
15 delineator, post and reflective sheeting to remain stable and remain fully functional
16 within a temperature range of - 20°F to + 120°F.

17 **(G) Impact Resistance, Wind Resistance**

18 Design flexible delineators that meet the impact and wind resistance of the current
19 evaluation criteria of the NTPEP.

20 **(H) Product Identification**

21 Provide flexible delineator post that are permanently identified, on the rear side, with the
22 manufacturer's name and the month and year of fabrication in order to provide a tracking
23 method for ongoing outdoor evaluation, and specification quality control. The letters
24 shall be at least 1/4 inch in height and permanently affixed to the rear of the marker.

25 **(I) Material Certification**

26 Furnish a Type 2 and Type 3 material certification in accordance with Article 106-3 for
27 all flexible delineators before use.

28 **(J) Approval**

29 All materials are subject to the approval of the Engineer.

30 **SECTION 1089**
31 **TRAFFIC CONTROL**

32 **1089-1 WORK ZONE SIGNS**33 **(A) General**

34 Use Grade B fluorescent orange retroreflective sheeting on rigid work zone sign
35 substrates. All sheeting shall conform to Article 1092-2. Cover the entire sign face of
36 the sign substrate with Department approved sheeting. No bubbles or wrinkles will be
37 permitted in the material.

38 (1) Work Zones Signs (Stationary)

39 Use approved composite or aluminum substrate for sign backing. Signs and sign
40 supports shall meet NCHRP 350 crash requirements for breakaway devices.

41 (2) Work Zones Signs (Barricade Mounted)

42 Use approved composite or roll-up signs for barricade mounted sign substrates. No
43 other type of sign substrate is allowed on barricades. Approved composite barricade

Section 1089

1 mounted warning signs (black on orange) shall be Grade B retroreflective sheeting
2 that meets the requirements of Article 1092-2. Sign and barricade assembly shall
3 meet NCHRP 350 crash requirements for Work Zone Category II devices.

4 (3) Work Zones Signs (Portable)

5 Use approved composite or roll-up sign substrates on portable sign stands. No other
6 type of sign substrate is allowed on portable sign stands.

7 (a) Composite

8 Use Grade B fluorescent orange retroreflective sheeting that meets the
9 requirements of Article 1092-2. Signs and sign supports shall meet NCHRP 350
10 crash requirements for breakaway devices.

11 (b) Roll-up Signs

12 Use Grade B fluorescent orange retroreflective sheeting for roll-up signs that
13 meet the requirements of Article 1092-2.

14 Use roll up signs that have a minimum 3/16 inch x 1 1/4 inches horizontal rib
15 and 3/8 inch x 1 1/4 inches vertical rib. Signs shall meet NCHRP 350 crash
16 requirements and be Traffic Control qualified by the Work Zone Traffic Control
17 Unit.

18 (B) Material Certification

19 Furnish a Type 3 material certification in accordance with Article 106-3 for all new
20 reflective sheeting used on work zone signs meeting the retroreflective requirements of
21 Article 1092-2. Furnish a Type 7 material certification for all used signs meeting the
22 minimum retroreflective requirements of Article 1092-2.

23 (C) Approval

24 All materials are subject to the approval of the Engineer.

25 (D) Warranty

26 Refer to Subarticle 1092-2(B) for warranty requirements of rigid sign retroreflective
27 sheeting.

28 Roll-up fluorescent orange retroreflective signs will maintain 80% of its retroreflectivity as
29 described in Article 1092-2 for years 1 and 2 and 50% for year 3.

30 Rigid and rollup fluorescent orange signs shall maintain a fluorescence luminance factor
31 of 13% for 3 years and conform to Article 1092-2.

32 Rigid and roll up fluorescent orange signs shall maintain a total luminance factor of 25
33 for 3 years and conform to Article 1092-2.

34 1089-2 WORK ZONE SIGNS SUPPORTS

35 (A) General

36 (1) Work Zone Signs (Stationary)

37 Provide work zone sign supports for work zone signs (stationary) that are sturdy,
38 durable and crashworthy. Work zone signs (stationary) and their supports shall meet
39 NCHRP 350 crash requirements for Category II work zone devices.

40 Use 3 lb U-channel steel posts, 4 inches x 4 inches wood posts or perforated square
41 steel tubing posts for all work zone signs with surface areas greater than 16 sf. Dual
42 mount signs with surface areas greater than 10 sf on either 3 lb U-channel steel posts,
43 4 inches x 4 inches wood posts or perforated square steel tubing posts having the
44 equivalent or greater strength of 3 lb U-Channel Steel posts. Perforated square steel
45 tubing breakaway posts certified by the manufacturer for single mounting purposes

1 may be used for the single mounting of stationary work zone signs for signs greater
2 than 10 sf.

3 3 lb. steel U-channel posts shall comply with Subarticle 1094-1(B) and may be
4 galvanized steel or painted green by the post manufacturer.

5 (2) Work Zone Signs (Portable)

6 Use work zone signs and portable work zone sign stands that are sturdy, durable and
7 crashworthy.

8 **(B) Material Certification**

9 Provide portable work zone signs and stands that are listed on the NCDOT Approved
10 Product List. Furnish a Type 3 material certification in accordance with Article 106-3 for
11 all new work zone sign (stationary) posts and a Type 7 material certification for all used
12 work zone sign (stationary) posts before use.

13 Furnish a Type 3 material certification in accordance with Article 106-3 for all new
14 portable work zone sign stand assemblies and a Type 7 material certification for all used
15 portable work zone sign stand assemblies before use.

16 **(C) Approval**

17 All materials are subject to the approval of the Engineer.

18 **1089-3 BARRICADES**

19 **(A) General**

20 Construct barricades out of perforated square steel tubing, angle iron or other Department
21 approved materials that meet or exceed NCHRP 350 crash requirements for Category II
22 work zone devices.

23 Use barricade rails constructed of approved composite, hollow/corrugated extruded rigid
24 polyolefin, HDPE or other Department approved material that have a smooth face and
25 alternating orange and white retroreflective stripes that slope at an angle of 45°.
26 Barricade rails shall meet or exceed NCHRP 350 crash requirements for Category II
27 work zone devices.

28 **(B) Supports**

29 Support barricade rails in a manner that shall be visible to the motorist and provide
30 a stable support not easily blown over by wind or traffic.

31 **(C) Retroreflective Sheeting**

32 Use Grade B retroreflective sheeting that meets Article 1092-2. Flame treat rails before
33 applying the sheeting if required by the sign sheeting manufacturer. Apply the reflective
34 sheeting with a pressure sensitive adhesive to both sides of the rails.

35 Use the same color sheeting on each rail of any individual barricade.

36 **(D) Material Certification**

37 Furnish a Type 3 material certification in accordance with Article 106-3 for all new
38 barricades and a Type 7 material certification for all used barricades before use.

39 **(E) Approval**

40 All materials are subject to the approval of the Engineer.

Section 1089

1 1089-4 CONES

2 (A) General

3 Use cones made of ultraviolet stabilized plastic impact resistant material meeting
4 MUTCD and this article. Orange will be the predominant color on cones.

5 Use cones conical in shape with a minimum height of 28 inches or 36 inches. The
6 28 inch cones shall have a minimum base dimension of 13.75 inches, and the 36 inch
7 cones shall have a minimum base dimension of 14.5 inches as shown in the *Roadway*
8 *Standard Drawings*. The 28 inch and 36 inch cones (excluding ballast) shall have a
9 minimum weight of 7 lbs. and 10 lbs. respectively. When in an upright position, have the
10 cones display the same dimensions regardless of their orientation to oncoming traffic.

11 (B) Ballast

12 Provide wind resistant cones that do not blow over under normal roadway conditions,
13 including high speed truck traffic in close proximity to the cones when properly ballasted.
14 Provide cones that do not permanently distort to a degree that would prevent reuse when
15 struck.

16 Achieve ballasting of the cones by using any of the following methods:

17 (1) Cones with bases that may be filled with ballast,

18 (2) Doubling the cones or using heavier weighted cones, or

19 (3) Cones with special weighted bases or weights such as rubber rings that can be
20 dropped over the cones and onto the base to provide increased stability.

21 Provide cones with 70% of the weight of the cone in the base. These added weights shall
22 not present a hazard if the devices are inadvertently struck.

23 (C) Retroreflective Sheeting

24 Where retroreflective cones are required, provide a cone with flexible, prismatic cone
25 sheeting having impact resistance and attached with precoated pressure sensitive
26 adhesive. The retroreflective sheeting shall meet or exceed the retroreflectivity
27 requirements of Grade B sheeting in Section 1092. Use two retroreflective bands, the top
28 one is 6 inches wide and the bottom one is 4 inches wide; see *Roadway Standard*
29 *Drawings*.

30 (D) Material Certification

31 Furnish a Type 3 material certification in accordance with Article 106-3 for all new cones
32 with or without retroreflective sheeting and a Type 7 material certification for all used
33 cones with or without retroreflective sheeting before use.

34 (E) Approval

35 All materials are subject to the approval of the Engineer.

36 1089-5 CHANNELIZING DEVICES

37 (A) Drums

38 (1) General

39 Provide drums composed of a body, alternating orange and white 4-band pattern of
40 Type III-High Intensity or higher prismatic retroreflective sheeting and ballasts
41 evaluated by NTPEP.

42 (2) Body

43 Provide a drum made of orange, impact resistant, ultraviolet plastic material capable
44 of maintaining its integrity upon impact throughout a temperature range of -20°F to

1 125°F. When struck, the drum shall not permanently distort to a degree that would
2 prevent reuse, nor roll excessively after impact. Design the drum to prevent water
3 from accumulating and freezing in the top or bottom.

4 Provide a drum that is cylindrical in shape with the following dimensions;
5 a minimum height of 36 inches, a minimum top outer diameter of 18 inches, a
6 bottom outer diameter of 21 inches to 24 inches, and a minimum weight of 7 lbs.
7 The top outer diameter shall not exceed the bottom outside diameter. Provide closed
8 tops on drums to prevent accumulation of debris.

9 (3) Retroreflective Stripes

10 Provide at least four retroreflective bands with two orange and two white alternating
11 horizontal circumferential bands. The top band shall always be orange. Use a 6 inch
12 to 8 inch wide band Type III–High Intensity or higher prismatic retroreflective
13 sheeting meeting the requirements of Article 1092-2 for each band. Do not exceed
14 2 inches for any non-retroreflective spaces between orange and white stripes. Do not
15 splice the retroreflective sheeting to create the 6 inch band. Apply the retroreflective
16 sheeting directly to the drum surface. Do not apply the retroreflective sheeting over
17 a pre-existing layer of retroreflective sheeting. Do not place bands over any
18 protruding corrugations areas. No damage to the retroreflective sheeting should
19 result from stacking and unstacking the drums, or vehicle impact.

20 (4) Ballast

21 Ballast drums using the sandbag ballast method, the tire sidewall ballast method or
22 the preformed weighted base ballast method. When properly ballasted, the drums
23 shall be wind resistant to the extent of withstanding wind created by traffic under
24 normal roadway conditions, including high speed truck traffic in close proximity to
25 the drums. Do not place ballast on top of the drum.

26 (a) Sandbag Ballast Method

27 Supply a sandbag with 50 lb. of sand with each drum. Place the sandbag inside
28 the body on top of the detachable base. Upon impact the main body of the drum
29 shall deform and become detached from the base, allowing vehicles to easily
30 pass over the remaining base.

31 (b) Tire Sidewall Ballast Method

32 Design the base of the drums to accommodate no more than two tire sidewalls
33 that when combined will have a weight of at least 30 lb and no more than 50 lb.
34 Use the manufacturer’s required tire sidewall ballast. Upon impact the main
35 body of the drum shall deform and become detached from the tire sidewalls,
36 allowing vehicles to easily pass over the tire sidewall ballasts.

37 (c) Preformed Weighted Base Ballast Method

38 Supply a preformed base specifically designed for the model drum. The weight
39 of each drum’s preformed base will be self-certified by the manufacturers. Each
40 drum with preformed bases shall be approved by the Work Zone Traffic Control
41 Unit. Upon impact, the main body of the drum shall deform and become
42 detached from the base allowing vehicles to easily pass over the remaining base.

43 (5) Material Certification

44 Furnish a Type 3 material certification in accordance with Article 106-3 for all new
45 drums and a Type 7 material certification for all used drums before use.

46 (6) Approval

47 All materials are subject to the approval of the Engineer.

Section 1089

1 (B) Skinny Drums

2 (1) General

3 Provide skinny drums composed of a body, alternating orange and white stripes of
4 Type III-High Intensity or higher prismatic retroreflective sheeting and ballasts
5 evaluated by NTPEP.

6 (2) Body

7 Provide a skinny drum made of orange, impact resistant, ultraviolet plastic material
8 capable of maintaining its integrity upon impact throughout a temperature range of
9 - 20°F to 125°F. When struck, the skinny drum shall not permanently distort to
10 a degree that would prevent reuse, nor roll excessively after impact. Design the
11 skinny drum to prevent water from accumulating and freezing in the top or bottom.

12 Provide a skinny drum that is cylindrical in shape with the following dimensions;
13 a minimum height of 42 inches, a minimum top outer diameter of 4 inches and a
14 bottom outer diameter of 7.5 inches. The top outer diameter shall not exceed the
15 bottom outside diameter. Provide closed tops on drums to prevent accumulation of
16 debris.

17 (3) Retroreflective Stripes

18 Provide at least four retroreflective bands with two orange and two white alternating
19 horizontal circumferential bands for each skinny drum. The top band shall always be
20 orange. Use a 6 inch to 8 inch wide band Type III-High Intensity or higher
21 prismatic retroreflective sheeting that meets Article 1092-2 for each band. Do not
22 exceed 2 inches for any non-retroreflective spaces between orange and white stripes.
23 Do not splice the retroreflective sheeting to create the 6 inch band. Apply the
24 retroreflective sheeting directly to the skinny drum surface. Do not apply the
25 retroreflective sheeting over a pre-existing layer of retroreflective sheeting. Do not
26 place bands over any protruding corrugation areas. No damage to the reflective
27 sheeting should result from stacking and unstacking the skinny drums, or vehicle
28 impact.

29 (4) Ballast

30 Ballast skinny drums using a preformed base specifically designed for the model
31 skinny drum. Each base shall be at least 15 lb and circular or polygonal with equal
32 sides. When properly ballasted, the skinny drums shall be wind resistant to the
33 extent of withstanding wind created by traffic under normal roadway conditions,
34 including high speed truck traffic in close proximity to the skinny drums. Do not
35 place ballast on top of the drum. Upon impact, the main body of the drum shall
36 deform and become detached from the base allowing vehicles to easily pass over the
37 remaining base.

38 (5) Material Certification

39 Furnish a Type 3 material certification in accordance with Article 106-3 for all new
40 skinny drums and a Type 7 material certification for all used skinny drums before
41 use.

42 (6) Approval

43 All materials are subject to the approval of the Engineer.

44 1089-6 FLASHING ARROW BOARDS

45 (A) General

46 Provide a trailer mounted arrow board that meets or exceeds the physical and operational
47 requirements of the MUTCD and which has been evaluated by NTPEP. The following

1 specifications supplement those basic requirements. Provide a totally mobile complete
2 unit capable of being located as traffic conditions demand.

3 The display housing shall meet the minimum size requirements of a Type C panel with
4 a 15 or 25 lamp configuration.

5 The display housing shall have a hand-crank mechanism to allow raising and lowering
6 the display with a locking device to ensure the display housing will remain secured in
7 either position

8 The display housing will have a minimum height of 7 feet from the bottom of the sign to
9 the ground when raised in the upright position.

10 The display housing assembly shall be of weather resistant construction.

11 The lamps shall be controlled to provide the following modes as a minimum: Flashing
12 Right or Left Arrow, Flashing Double Arrow and Caution Mode (four outermost corner
13 lamps).

14 **(B) Power System**

15 Provide a unit that is solar powered and supplemented with a battery backup system that
16 includes a 110/120 VAC powered on-board charging system.

17 The unit shall also be capable of being powered by standard 110/120 VAC power source.

18 The batteries, when fully charged, shall be capable of powering the display for
19 20 continuous days with no solar power.

20 Store the battery bank and charging system in a lockable, weather and vandal resistant
21 box.

22 **(C) Controller**

23 Provide automatic brightness/dimming of the display and a manual override dimming
24 switch.

25 The controller shall provide a battery-charge status indicator.

26 Mobile radio or any other radio transmissions shall not affect the controller.

27 Store the controller in a lockable, weather and vandal resistant box.

28 **(D) Trailer**

29 Finish all exterior metal surfaces with Federal orange enamel per Federal Standard 595a,
30 color chip ID# 13538 or 12473 respectively. The trailer shall be able to support
31 a 100 mph wind load with the display fully extended.

32 The trailer shall be equipped with leveling jacks capable of stabilizing the unit in
33 a horizontal position when located on slopes 6:1 or flatter.

34 The trailer shall be properly equipped in compliance with North Carolina Law governing
35 motor vehicles.

36 Provide a minimum 4 inch wide strip of fluorescent orange retroreflective sheeting to the
37 frame of the trailer. Apply the sheeting to all sides of the trailer. The retroreflective
38 sheeting shall be Grade C that conforms to Article 1092-2. Drums may be supplemented
39 around the unit in place of the sheeting.

40 **(E) Reliability**

41 Provide a sign unit that all components are rated to operate at temperatures ranging from
42 -30°F to 165°F.

Section 1089

1 The sign manufacturer shall notify the Work Zone Traffic Control Unit whenever
2 modifications are made to a prequalified sign on the NCDOT APL.

3 The Work Zone Traffic Control Unit will review changes and per its discretion either
4 make no change to the sign's status or remove it from the list until the sign can be
5 reevaluated.

6 (F) Material Certification

7 Furnish a Type 3 material certification in accordance with Article 106-3 for all new
8 flashing arrow boards, a Type 7 material certification for all used flashing arrow boards,
9 and wind load certifications required in Subarticle 1089-6(D) for all new and used
10 flashing arrow boards before use.

11 (G) Approval

12 The sign shall be on the NCDOT APL before use on construction projects in North
13 Carolina. A sign may be removed from the NCDOT APL due to unsatisfactory field
14 performance and shall not return to the list until the manufacturer identifies the reason for
15 the failure and the problem has been corrected to the satisfaction of the Department.

16 The sign manufacturer shall notify the Department whenever modifications are made to
17 their sign that was prequalified on the NCDOT APL. The Department will review
18 changes and per its discretion, either make no change to the sign's status on the NCDOT
19 APL or remove the sign from the list until the sign can be reevaluated.

20 1089-7 PORTABLE CHANGEABLE MESSAGE SIGNS

21 (A) General

22 Provide trailer or truck mounted portable changeable message signs that meet MUTCD
23 and have been evaluated by NTPEP.

24 A trailer mounted portable changeable message sign shall be a totally mobile complete
25 sign unit capable of being located as traffic conditions demand.

26 (B) Display Panel

27 Provide sign capable of sequentially displaying at least 2 phases of 3 lines of a
28 programmable message with at least 8 characters per line and a character height of at
29 least 18 inches.

30 The display characters will be composed of LED elements. The display panel may be of
31 the following types- Full Matrix, Continuous Line Matrix, and Character Matrix.

32 Messages are to be automatically centered and proportionally spaced on each line of
33 a Full Matrix and Continuous Line Matrix displays. Character Matrix displays shall
34 display odd number character messages one character left of the centerline.

35 The display characters shall be protected with a polycarbonate lens that shall not decrease
36 the daytime visibility of the sign.

37 The display panel shall have an electro-hydraulic system to allow raising and lowering
38 the display with 360° rotation capability. The distance from the bottom of the sign to the
39 ground shall be at least 7 feet. A locking device(s) shall be provided to ensure the display
40 will remain secure in the raised, lowered and rotated positions. The sign shall have the
41 capability to be raised and rotated to its operating position by one person.

42 A manual backup mechanism for the raising and lowering the display panel shall be
43 provided in the event the electro-hydraulic system fails.

44 The display panel assembly shall be of weather resistant construction

1 **(C) Power System**

2 The unit shall be Solar powered and supplemented with a battery backup system which
3 includes a 110/120 VAC powered on-board charging system.

4 The batteries, when fully charged, shall be capable of powering the display for
5 20 continuous days with no solar power. The unit shall be capable of being powered by
6 standard 110/120 VAC power source.

7 Store the battery bank and charging system in a lockable, weather and vandal resistant
8 box.

9 **(D) Controller**

10 The controller shall be capable of being equipped with the necessary hardware and
11 software to allow wireless communication with other portable changeable message signs
12 or other components of an intelligent transportation system. The controller shall also
13 provide at a minimum; a keyboard, a display for message review and editing, a light
14 source for nighttime operations, an event time clock and all other required controls for
15 the operation of the display. Program each controller with password protection that will
16 deter unauthorized programming of the controller. The password system is recommended
17 to include at last two levels of security such that operators at one level may only change
18 message sequences displayed using preprogrammed sequences and operators at a higher
19 level may create and store messages or message sequences.

20 The controller shall include the following capabilities; manually dimming the display,
21 storing at least 99 user generated messages, adjusting the flash rate of display and display
22 phasing and monitoring battery-charge status.

23 Mobile radio or any other radio transmissions shall not affect the controller.

24 The controller shall be stored in a lockable, weather and vandal resistant box.

25 The controller shall be pre-programmed with messages shown below and stored in
26 memory:

MAX SAFE SPEED 25 MPH	MAX SAFE SPEED 30 MPH
STOP AHEAD	YIELD AHEAD
MAX SAFE SPEED 35 MPH	MAX SAFE SPEED 40 MPH
MAX SAFE SPEED 45 MPH	MAX SAFE SPEED 50 MPH
ONE LANE BRIDGE	SURVEY CREW
MAX SAFE SPEED 55 MPH	DETOUR AHEAD
CAUTION DETOUR AHEAD	LANE CLOSED AHEAD
RIGHT LANE CLOSED	LEFT LANE CLOSED
CENTER LANE CLOSED	SINGLE LANE AHEAD
MERGE LEFT	MERGE RIGHT

CAUTION FLAGGER AHEAD	RUNAWAY TRUCK RAMP
MEDIAN WORK AHEAD	
LEFT LANE NARROWS	RIGHT LANE NARROWS
TEST PATTERN A ^A	TEST PATTERN B ^B

- 1 **A.** Test Pattern A is 1/2 of the LEDs on at a time.
2 **B.** Test Pattern B is for the remaining 1/2 of the LEDs on at a time.

3 **(E) Trailer**

4 Finish all exterior metal surfaces with Federal orange enamel per Federal Standard 595a;
5 color chip ID# 13538 or 12473 respectively except for the sign face assembly that shall
6 be flat black.

7 Provide a minimum 4 inches wide strip of fluorescent orange retroreflective sheeting to
8 the frame of the trailer. Apply the sheeting to all sides of the trailer. The retroreflective
9 sheeting shall be Grade C that conforms to Article 1092-2. Drums may be supplemented
10 around the unit in place of the sheeting.

11 The trailer shall be able to support a 100 mph wind load with the display fully extended.

12 The trailer shall be equipped with leveling jacks capable of stabilizing the unit in
13 a horizontal position when located on slopes 6:1 or flatter.

14 The trailer shall be properly equipped in compliance with North Carolina Law governing
15 motor vehicles.

16 **(F) Reliability**

17 Provide a sign unit that all components are rated to operate at temperatures ranging from
18 -30°F to 165°F.

19 **(G) Material Certification**

20 Furnish a Type 3 material certification in accordance with Article 106-3 for all new
21 changeable message signs, a Type 7 material certification for all used changeable
22 message signs and wind load certifications required in Subarticle 1089-7(E) for all new
23 and used changeable message signs before use.

24 **(H) Approval**

25 The sign shall be listed on the NCDOT APL before use on construction projects in North
26 Carolina. A sign may be removed from the NCDOT APL due to unsatisfactory field
27 performance and shall not return to the list until the manufacturer identifies the reason for
28 the failure and the problem has been corrected to the satisfaction of the NCDOT.

29 The sign manufacturer shall notify NCDOT whenever modifications are made to their
30 sign that was prequalified on the NCDOT APL. The Department will review changes
31 and per its discretion will either make no change to the sign's status on the NCDOT APL
32 or remove the sign from the list until the sign can be reevaluated.

33 **1089-8 TEMPORARY CRASH CUSHIONS**

34 **(A) General**

35 Provide temporary crash cushions that meet NCHRP 350 for Work Zone Test Level II for
36 work zones that have a posted speed limit of 45 mph or less. Provide temporary crash
37 cushions that meet NCHRP 350 for Work Zone Test Level III devices for work zones
38 that have a posted speed limit of 50 mph or greater. Provide redirective temporary crash
39 cushions or non-directive temporary crash cushions that capture errant vehicles without
40 complete penetration through the device.

1 The temporary crash cushion shall contain the debris resulting from impact within the
2 structure of the temporary crash cushion.

3 Include in the temporary crash cushion package any required rear transition panels to
4 connect the back of the temporary crash cushion to rigid or flexible barrier systems.
5 Include any required portable base, as recommended by the manufacturer of the
6 temporary crash cushion, to connect the bottom of the temporary crash cushion to a
7 paved surface. Temporary crash cushion shall not be placed on an unpaved surface.

8 **(B) Retroreflective End Treatments**

9 Provide a yellow nose wrap that visually matches the color chip that corresponds to the
10 Federal Standard No. 595a for Yellow (Color No. 13538) for all temporary crash
11 cushions.

12 The retroreflective end treatment shall meet the requirement for retroreflectivity in
13 Article 1088-1 and *Roadway Standard Drawings*.

14 **(C) Material Certification**

15 Furnish a Type 3 material certification in accordance with Article 106-3 for all new
16 temporary crash cushions and a Type 7 material certification for all used temporary crash
17 cushions before use.

18 **(D) Approval**

19 Use temporary crash cushions listed on the NCDOT APL.

20 **1089-9 ATTENUATORS**

21 **(A) General**

22 Provide truck mounted attenuators that meet NCHRP 350 Test Level II for work zones
23 that have a posted speed limit of 45 mph or less. Provide truck mounted attenuators that
24 meet NCHRP 350 Test Level III for work zones that have a posted speed limit of 50 mph
25 or greater.

26 Use trucks with gross vehicle tare weight as described in the NCHRP 350 crash test for
27 the impact attenuator provided. Provide truck in accordance with the manufacturer's
28 specifications. Ballasting methods are not permitted.

29 Use the attenuator in accordance with the manufacturer's specifications. Provide truck
30 mounted attenuators with standard trailer lighting systems, including brake lights, tail
31 lights and turn signals.

32 **(B) Retroreflective End Treatment**

33 The retroreflective end treatment shall meet Article 1088-1 and *Roadway Standard*
34 *Drawings*.

35 **(C) Material Certification**

36 Furnish a Type 3 material certification in accordance with Article 106-3 for all new truck
37 mounted attenuators and a Type 7 material certification for all used truck mounted
38 attenuators before use.

39 **(D) Approval**

40 Use only truck mounted attenuators listed on the NCDOT APL.

Section 1090

1 1089-10 FLAGGER

2 (A) 24 Inch Stop and Slow Paddle

3 (1) Retroreflective Sheeting

4 Use retroreflective sheeting with a smooth, sealed outer surface that will display the
5 same color both day and night. Cover the entire sign face with Grade B
6 retroreflective sheeting. Retroreflective sheeting shall meet Article 1092-2. The
7 distance from the bottom of the sign to the ground shall be at least 6 feet.

8 (2) Material Certification

9 Furnish a Type 3 material certification in accordance with Sections 106-3 for all new
10 reflective sheeting used on flagger paddles and a Type 7 material certification for all
11 used sheeting before use.

12 (3) Approval

13 All materials are subject to the approval of the Engineer.

14 (B) Vest

15 (1) Apparel Materials

16 Use highly-visibility safety apparel that meets the Performance Class 2 or higher
17 requirements of the ANSI/ISEA 107-2010 or the equivalent revision. For nighttime
18 flagging operations, Performance Class 3 safety apparel is required.

19 (2) Apparel Verification

20 (3) All safety apparel shall have the original tag or label indicating that it meets the
21 requirements of the ANSI/ISEA 107-2010 or the equivalent revision. Approval

22 All safety apparel is subject to the approval of the Engineer.

SECTION 1090

PORTABLE CONCRETE BARRIER

25 1090-1 PORTABLE CONCRETE BARRIER

26 (A) General

27 Use portable concrete barrier that meets Section 854, Section 1077 and the plans. The
28 requirement for approved galvanized connectors will be waived if the barrier remains the
29 property of the Contractor.

30 (B) Used Portable Concrete Barrier

31 Used barrier will be acceptable provided the following conditions have been met:

32 (1) The Contractor has furnished a Type 7 material certification in accordance with
33 Article 106-3.

34 (2) The strength of the concrete in each barrier unit is at least 4,500 psi as evidenced by
35 nondestructive tests made in place by a rebound hammer in accordance with
36 ASTM C805.

37 (C) Anchor Bolts

38 Use anchor bolts that meet ASTM A325.

39 (D) Approval

40 All materials are subject to the approval of the Engineer.

SECTION 1091
ELECTRICAL MATERIALS

1091-1 GENERAL REQUIREMENTS

(A) New Materials

Furnish new equipment, materials and hardware unless otherwise specified.

(B) Electrical Industry Standards

Provide electrical materials in accordance with the appropriate UL standard when identified and shall be listed with a Nationally Recognized Testing Laboratory (NRTL) such as UL, ETL, CSA or one acceptable to the Engineer. The NRTL shall maintain periodic inspection of the production of materials and shall, by the labeling or listing procedure, verify that the materials comply with appropriate standards of performance or are suitable for use in a specified manner.

(C) Certification

Furnish a Type 3 material certification in accordance with Article 106-3.

1091-2 Wire and Cable

Use only stranded copper conductors, unless otherwise shown in the contract or *Standard Specifications*. Provide wire and cable with identification labels or tags on either the wire or cable itself or on the coil, reel or smallest container in which the product is packaged when delivered to the project. Show the manufacturer's name, gauge, UL symbol and type of wire or cable on the identification label or tag. When requested by the Department, furnish samples of wire and cable to the Department at no additional cost.

Use wire and cable of the type and size shown in the contract meeting the following applicable UL standards: 44, 83, 493, 719, 854, 1063 and 1581.

Where required by the plans, use soft or annealed solid bare copper wire conforming to ASTM B3.

1091-3 CONDUIT

(A) Conduit Bodies, Boxes and Fittings

Use conduit bodies, boxes, and fittings that meet UL Standard 514A or 514B for electrical and communications installations.

(B) Rigid Metallic Conduit

Provide rigid hot dipped galvanized steel conduit that meets UL Standard 6 with rigid full weight sherardized or galvanized threaded fittings.

(C) PVC Conduit

Provide non-metallic conduit and duct including associated couplings, approved for above and below ground use with or without concrete encasement in accordance with UL Standard 651A. Provide Schedule 40 conduit unless otherwise specified.

(D) Liquid-Tight Flexible Metal Conduit

Provide conduit that meets UL Standard 360 that is acceptable for equipment grounding in accordance with the NEC. Ensure conduit has insulated throat and malleable iron watertight fittings.

(E) Liquid-Tight Flexible Nonmetallic Conduit

Provide conduit that meets UL Standard 1660.

Section 1091

1 (F) Solid Wall HDPE Conduit

2 Use HDPE conduit that conforms to UL Standard 651A. Provide conduit meeting
3 Table 1091-1 with minimum wall thickness ratios corresponding to EPEC-40
4 (Schedule 40), EPEC-80 (Schedule 80) or EPEC-B (SDR 13.5) as listed in
5 UL Standard 651A, Table 1091-1, 1091-2 and 1091-3.

Conduit Trade Size	Furnish
1"	EPEC-40
1 1/4"	EPEC-40
1 1/2"	EPEC-B (SDR 13.5)
2"	EPEC-B (SDR 13.5)
2 1/2"	EPEC-B (SDR 13.5)
3"	EPEC-B (SDR 13.5)
4"	EPEC-B (SDR 13.5)
5"	EPEC-80
6"	EPEC-80

6 Ensure the PE resin compounds used in manufacturing the conduit meet or exceed the
7 cell classification PE 334480C (black with 2% minimum carbon black) or
8 PE 334480E (colored conduit with UV inhibitors) in ASTM D3350 and Table 1091-2.

Property	Requirement	Test Method
Density	0.940 - 0.947g/cm ³	ASTM D1505 ASTM D792 ASTM D4883
Melt Index (condition 190/2.16 is acceptable)	< 0.4 grams/10 minutes	ASTM D1238
Flexural Modulus	80,000 psi, min.	ASTM D790
Tensile Strength	Tensile Strength 3,000 psi, min.	ASTM D638
Elongation	Elongation 400%, min.	ASTM D638
Slow Crack Growth Resistance	An ESCR as per condition B, 10% IGEPAL requirement of F ₁₀ >96 hrs is allowable	ASTM D1693
Hydrostatic Design Basis	"0" for Non-Pressure Rated Pipe	ASTM D2837
UV Resistance (Outdoor Conduit Only)	Stabilize with at least 2% by weight carbon black or colored with UV Inhibitor	ASTM D4218

9 Furnish conduits in the colors for the applications shown in Table 1091-3. For conduits
10 manufactured with stripes, ensure that a minimum of three stripes are uniformly spaced
11 around the conduit with 120 degrees of separation. Do not use "Solid Yellow" or "Black
12 with Yellow Stripes" conduit.

**TABLE 1091-3
CONDUIT COLORS**

Conduit Contents	Preferred Solid Color	Alternate
Signal Cable	Black	None
Loop Lead-in Cable	White	Black with White Stripes
Communication Cable (Copper, Fiber Optic, Coaxial)	Orange	Black with Orange Stripes
Electrical Power Cable	Red	Black with Red Stripes

1 Ensure the HDPE conduit is resistant to benzene, calcium chloride, ethyl alcohol, fuel oil,
2 gasoline, lubricating oil, potassium chloride, sodium chloride, sodium nitrate and
3 transformer oil and is protected against degradation due to oxidation and general
4 corrosion.

5 Furnish factory lubricated, low friction, conduit with a coefficient of friction of 0.10 or
6 less in accordance with Telcordia GR-356.

7 Ensure the supplied conduit is identified and certified as meeting, UL Standard 651A.
8 Ensure the conduit is marked at least with the following information on 5 feet or less
9 intervals:

10 (1) Material: HDPE

11 (2) Trade Size: i.e., 2 inches

12 (3) Conduit Type: SDR 13.5 or EPEC-B

13 (4) Manufacturer's name or trademark

14 (5) Manufacturer's production code to identify manufacturing date, facility, etc.

15 (6) NRTL symbol or listing number

16 Furnish coilable conduit that is supplied on reels in continuous lengths for transportation
17 and storage outside. Ensure that the process of installing the coilable conduit on the reel
18 does not alter the properties or performance of the conduit for its intended purpose.

19 **(G) Conduit Plugs, Pull Line and Tracer Wire**

20 Furnish conduit plugs that provide a watertight barrier when installed in conduit. Furnish
21 conduit plugs sized in accordance with conduit. Ensure conduit plug provides a means to
22 secure a pull line to the end of the plug. Provide removable and re-usable conduit plugs.
23 Conduit plugs are not required to be listed electrical devices.

24 For all spare conduits, furnish woven polyester pull tape with a minimum rated tensile
25 strength of 2,500 lbs. Pull lines are not required to be listed electrical devices.

26 Provide green insulated number 14 AWG, THWN, stranded copper wire to serve as
27 tracer wire.

28 **1091-4 DUCT AND CONDUIT SEALER**

29 Use duct and conduit sealer or mastic which is a putty-like compound and:

30 **(A)** Is permanently non-hardening, non-oxidizing, and non-corrosive to metals, rubber,
31 plastic, lacquer and paints;

32 **(B)** Is readily workable for thumbing into openings and forming into seals around wires
33 inside conduits and openings around conduits;

34 **(C)** Has a service temperature range of minus 30°F to 200°F;

35 **(D)** Is clean, non-poisonous and non-injurious to human skin;

Section 1091

1 (E) Seals against water, dust and air and shall adhere to wood, glass, plastics, metal, rubber
2 and painted surfaces; and

3 (F) Is non-conductive.

4 **1091-5 ELECTRICAL JUNCTION BOXES**

5 **(A) General**

6 Provide electrical junction boxes with covers of the type and size indicated by the
7 contract or plans for the termination of conduits.

8 **(B) Polymer Concrete (PC) Junction Boxes**

9 Provide polymer concrete (PC) boxes which have bolted covers and open bottoms.
10 Provide vertical extensions of 6 inches to 12 inches as required by project provisions.

11 Use polymer concrete material made of an aggregate consisting of sand and gravel bound
12 together with a polymer and reinforced with glass strands to fabricate box and cover
13 components which are exposed to sunlight. Other thermoplastic materials may be used
14 for components which are not normally exposed to sunlight.

15 Provide certification that the polymer concrete boxes and covers meet
16 Tier 15 requirements of ANSI/SCTE 77. Provide certification that testing methods are
17 compliant with ANSI/SCTE 77.

18 Provide the required logo on the cover. Provide at least two size 3/8 inch diameter hex
19 head stainless steel cover bolts to match inserts in the box. Provide pull slot(s) with
20 stainless steel pin(s). Polymer concrete junction boxes are not required to be listed
21 electrical devices.

22 **(C) Cast Metal (BR/SW) Junction Boxes**

23 Provide three-piece cast-metal barrier rail (BR) box with replaceable flange, or two-piece
24 cast metal side walk (SW) box with non-replaceable flange, as shown in the plans. The
25 box shall be hot dipped galvanized with factory or field drilled conduit entrances.
26 Provide a hot dipped galvanized cover with checkered imprint, pry bar slots, and
27 reinforcing ribs for heavy loading, neoprene gasket, and brass or stainless steel bolts.
28 Provide a blind tapped (1/4 inch NC thread minimum) boss on interior of box for
29 grounding.

30 **1091-6 GROUNDING ELECTRODES**

31 Provide grounding electrodes of the following types as indicated in the specifications and
32 plans.

33 **(A) Ground Rods**

34 Provide 5/8 inch diameter, 10 feet long, copper-clad steel ground rods with 10 mil thick
35 copper cladding.

36 **(B) Sectional Ground Rods**

37 Provide sectional ground rods comprised of 5/8 inch diameter, 10 feet long, steel ground
38 rods with 10 mil thick copper cladding, welded together in a butt configuration with
39 an exothermic weld. As an alternative, provide UL listed bronze couplers designed to
40 connect 5/8 inch diameter copper-clad steel rods. Do not use threaded ground rods or
41 threaded couplers. Provide minimum lengths required by plans.

SECTION 1092
SIGNING MATERIALS

1092-1 SIGNS AND HARDWARE

Fabricate signs from aluminum alloy sheets. Use supporting frames and accessories made of aluminum. Use galvanized steel backing plates and mounting bolts. Use materials that conform to Tables 1092-1 and 1092-2.

Filler metal shall conform to Section 10(3) of the *Standard Specifications for Structural Supports for Highway Signs, Luminaires and Traffic Signals*.

Aluminum sign studs, welded to the sign panels in accordance with Article 901-3, shall be capable of withstanding a direct pull-out load of 400 lb. Furnish a Type 3 material certification in accordance with Article 106-3 demonstrating conformance to this requirement. The Materials and Tests Unit will take samples of the studs and make random field tests of the welded studs to verify the statement of certification. Failure of more than 10% of the studs tested on any one sign will be sufficient evidence for rejection of stud welding on the entire sign. When tested in tension, the studs shall not fail in the weld area, but fail in the threaded portion of the stud.

Drill bolt holes and slots to finished size or they may be punched to finished size, provided the diameter of the punched holes is at least twice the thickness of the metal being punched. Flame cutting of bolt holes and slots will not be permitted. No galvanizing of any steel part will be allowed until all welding, cutting, milling, punching, and drilling of the part has been completed.

TABLE 1092-1
ALUMINUM SIGN MATERIALS

Aluminum Materials	Alloy Specification	Test Method
Extruded Bars	6061-T6	ASTM B221
Sheets and Plates	6061-T6, 5052-H38 or 3004-H38	ASTM B209
Structural Shapes	6061-T6	ASTM B308
Standard Weight Pipe	6061-T6	ASTM B241
Castings	356-T7	ASTM B26
Bolts	6061-T6, 2024-T4 ^A	ASTM B211
Nuts (1/4" Tap and under)	2024-T4 ^A , 6061-T6 or 6262-T9	ASTM B211
Nuts (5/16" Tap and over)	2024-T4 ^A , 6061-T6 or 6262-T9	ASTM B211
Nuts (3/8" Self-locking)	2017-T4, 6061-T6	ASTM B211
Washers (std. flat) Alclad	2024-T4 ^A or 6061-T6	ASTM B209
Washers (std. lock)	7075-T6	ASTM B211
Welded Studs (1/4")	5356-H12 or 5356-H32	ASTM B211

A. The alloy shall have anodic coating of 0.0002 inch minimum thickness with dichromate or boiling water seal

TABLE 1092-2
STEEL SIGN MATERIALS

Galvanized Steel Materials	Test Method for Base Metal	Test Method for Galvanizing
Structural Shapes and Plates	ASTM A36	ASTM A123
Standard Weight Black Pipe	ASTM A53	ASTM A123
Bolts and Nuts	ASTM A307	ASTM F2329
Washers (std. flat and lock)	ASTM A307	ASTM F2329
High Strength Bolts, Nuts and Washers	ASTM A325	ASTM B695 Class 55

Section 1092

1 1092-2 RETROREFLECTIVE SHEETING

2 Reflectorize all signs. Use colors and sheeting grades of the sign backgrounds and messages
3 as shown in the contract. After preparation of the sign panels, in accordance with
4 Subarticle 901-3(D), apply retroreflective sheeting as required herein. The retroreflective
5 sheeting shall consist of white or colored sheeting having a smooth outer surface and the
6 property of a retroreflector over its entire surface.

7 Retroreflective sheeting shall meet ASTM D4956 and are listed on the NCDOT APL.

8 The reflective material specified herein is intended for use on surfaces of various traffic
9 control devices, including drums, barricades, traffic cones and highway signs, to assure their
10 adequate visibility at all times upon exposure to a light source when totally dry or wet.
11 Provide reflectorization that produces a wide-angle retroreflectivity, enhancing nighttime
12 visibility. This retroreflective sheeting shall consist of encapsulated, enclosed lens or
13 prismatic with a transparent plastic having a smooth, flat outer surface. Provide material that
14 is flexible, of good appearance, free from ragged edges, cracks and extraneous materials, and
15 exhibits good quality workmanship.

16 (A) Performance and Test Requirements

Observation Angle, degrees	Entrance Angle, degrees	White	Yellow	Green	Red	Blue	Fluorescent Yellow Green	Fluorescent Yellow
0.2	-4.0	525	395	52	95	30	420	315
0.2	30.0	215	162	22	43	10	170	130
0.5	-4.0	310	230	31	56	18	245	185
0.5	30.0	135	100	14	27	6	110	81
1.0	-4.0	80	60	8	16	3.6	64	48
1.0	30.0	45	34	4.5	9	2	36	27

Observation Angle, degrees	Entrance Angle, degrees	White	Yellow	Green	Red	Blue	Fluorescent Yellow Green	Fluorescent Yellow	Fluorescent Orange
0.2	-4.0	380	285	38	76	17	300	230	115
0.2	30.0	215	162	22	43	10	170	130	65
0.5	-4.0	240	180	24	48	11	190	145	60
0.5	30.0	135	100	14	27	6	110	81	30
1.0	-4.0	80	60	8	16	3.6	64	48	7.5
1.0	30.0	45	34	4.5	9	2	36	27	5.6

TABLE 1092-5
MINIMUM COEFFICIENT OF RETROREFLECTION FOR NC GRADE C
(Candelas Per Lux Per Square Meter)

Observation Angle, degrees	Entrance Angle, degrees	White	Yellow	Green	Red	Blue	Brown
0.2	-4.0	250	170	45	45	20	12
0.2	30.0	150	100	25	25	11	8.5
0.5	-4.0	95	62	15	15	7.5	5
0.5	30.0	65	45	10	10	5	3.5

1 For areas printed with transparent colors, the coefficient of retroreflection shall not
2 be less than 70% of the values for the corresponding color.

3 (1) Adhesive

4 Meet ASTM D4956.

5 (2) Field Performance

6 The fabricating agency will date all signs (month, year) at the completion of
7 fabrication. That date constitutes the start of the field performance obligation period.

8 **(B) Manufacturer's Warranty and Obligations**

9 (1) Warranty

10 The sheeting manufacturer warrants to the Department that all materials furnished
11 under this Specification will be new, of good components and workmanship and
12 agrees to the following conditions.

13 Retroreflective sheeting processed and applied to sign blank materials in accordance
14 with the manufacturer's manuals shall be warranted by the manufacturer to perform
15 effectively as stated in this section. The manufacturer's manuals shall contain
16 a complete descriptive explanation of all the requirements necessary of the sign
17 fabricator.

18 (2) Obligation Grades A, B and C

19 (a) Years 1 through 7 (Years 1 Through 2 for Fluorescent Orange)

20 Cover the cost of restoring the sign face in its field location to its original
21 effectiveness at no cost to the Department for materials, labor and equipment.
22 In addition to the reflective requirements for Grade B fluorescent orange, the
23 sheeting shall at least maintain a total Luminance Factor (Y) of 25
24 (ASTM D4956) and a Fluorescence Luminance Factor (YF) of 13%
25 (ASTM E2301) for 3 years. Maintain at least 80% of fluorescent orange
26 sheeting reflectivity for years 1 and 2.

27 (b) Years 8 through 10 (Year 3 for Fluorescent Orange)

28 Replace the sheeting required to restore the sign face to its original
29 effectiveness. Maintain 50% of fluorescent orange sheeting reflectivity for
30 year 3.

31 (c) Years 11 through 12

32 Replace 50% of the sheeting required to restore the sign face to its original
33 effectiveness.

Section 1094

1 1092-3 CERTIFICATION

2 Provide a Type 6 material certification in accordance with Article 106-3 for all retroreflective
3 sheeting used in the manufacture of signs certifying that the sheeting meets Section 1092.

4 SECTION 1094 5 GROUND MOUNTED SIGNS

6 1094-1 GROUND-MOUNTED SIGN SUPPORTS

7 (A) Breakaway or Simple Steel Beam Sign Supports

8 Fabricators of breakaway or simple steel beam sign supports shall be AISC Category I
9 certified.

10 Steel supports for Type A and B ground mounted signs shall be galvanized rolled steel
11 sections, either breakaway or simple design, as required by the contract. Fabricate
12 supports from plates, W shapes, and S shapes, as required by the contract, and they shall
13 conform to ASTM A36. Splices in the supports will not be permitted. Perform
14 galvanizing before assembly that conforms to ASTM A123. Cutting steel supports to
15 length after they have been galvanized will not be permitted in new construction. The
16 support(s) shall be uniformly straight to within 1/8 inch tolerance for pieces less than
17 20 feet in length, and 1/4 inch tolerance for pieces over 20 feet in length.

18 Fabricate high strength bolts, nuts and washers required for breakaway supports from
19 steel in accordance with ASTM A325 and galvanize in accordance with ASTM B695,
20 Class 55.

21 (B) 3 lb Steel U-Channel Posts

22 Make 3 lb steel U-channel posts out of rerolled rail steel or new billet steel, conforming
23 to the mechanical requirements of ASTM A499, Grade 60, and the chemical
24 requirements of ASTM A1, for rails having nominal weights of 91 lbs. per yard or
25 greater. Proportion the cross section so a moment of 1,450 ft-lb, applied to the cross
26 section normal to the flanges, will produce an extreme fiber stress no greater than
27 39,500 psi. Use posts that weight 3 lbs/lf. Punch or drill all posts with 3/8 inch diameter
28 holes on the centerline, spaced 1 inch on centers, starting 1 inch from the top and
29 extending to the bottom of the posts. Galvanize these posts after fabrication for the full
30 length and total area in accordance with ASTM A123. The zinc coating inside of the
31 3/8 inch diameter holes shall not exceed Specification requirements enough to prevent a
32 5/16 inch diameter bolt from freely passing through.

33 Use U-channel post sections of the same general configuration as that shown in the
34 contract, however minor variations may be considered acceptable by the Engineer
35 provided all other requirements are met.

36 (C) 2 lb Steel U-Channel Posts

37 Use 2 lb steel U-channel posts that are variable length galvanized steel, U-shaped channel
38 posts.

39 Fabricate the U-channel posts from steel meeting ASTM A1008 or ASTM A499, or
40 an approved alternate. The posts shall weigh 2 lbs/lf, and be of the length necessary to
41 meet the erection requirements of the contract. Before galvanizing, punch or drill
42 3/8 inch diameter holes on 1 inch centers, beginning 1 inch from the top of the post, for a
43 minimum distance equal to the vertical dimension of the respective sign or mile marker.
44 Galvanize these posts after fabrication in accordance with ASTM A123. The zinc coating
45 inside of the 3/8 inch diameter holes shall not exceed Specification requirements enough
46 to prevent a 5/16 inch diameter bolt from freely passing through.

1 U-channel post sections shall be of the same general configuration as that shown in the
2 contract, however, minor variations may be considered acceptable by the Engineer,
3 provided all other requirements are met.

4 **(D) Steel Square Tube Posts**

5 Use steel square tube posts of variable length galvanized steel. The post shall be
6 a minimum 14 gauge steel square tube. Before galvanizing punch or drill all posts with
7 3/8 inch diameter holes on the centerline, spaced 1 inch on centers, starting 1 inch from
8 the top and extending to the bottom of the posts.

9 Galvanize these posts after fabrication for the full length and total area in accordance
10 with ASTM A123. G90 zinc coating shall not be accepted. The zinc coating inside of
11 the 3/8 inch diameter holes shall not exceed Specification requirements enough to prevent
12 a 5/16 inch diameter bolt from freely passing through.

13 Steel square tube sections shall be of the same general configuration as that shown in the
14 contract, however, minor variations may be considered acceptable by the Engineer,
15 provided all other requirements are met.

16 **(E) Wood Supports**

17 Wood supports shall conform to Articles 1082-2 and 1082-3.

18 **1094-2 RIVETS FOR SIGN OVERLAYS**

19 Rivets for sign overlays shall be 1/8 inch diameter aluminum rivets of the pull through type,
20 and be approved by the Engineer. Submit for approval several samples of rivets, along with
21 adequate descriptive catalog literature.

22 **SECTION 1096**
23 **OVERHEAD SIGN STRUCTURES**

24 **1096-1 ALUMINUM OVERHEAD SIGN STRUCTURES**

25 Materials for aluminum overhead sign structures shall conform to Article 1092-1 and
26 *AASHTO Standard Specifications for Structural Supports for Highway Signs, Luminaires and*
27 *Traffic Signals*. Where the Contractor proposes to use materials that are not covered by these
28 references, such use will be contingent on the Engineer's approval of these materials.

29 **1096-2 STEEL OVERHEAD SIGN STRUCTURES**

30 Use Category I certified by the American Institute of Steel Construction Fabricators for steel
31 overhead sign structures as required by Subarticle 1072-1(A). Use either structural carbon
32 steel or structural low-alloy steel for steel overhead sign structures meeting *AASHTO LRFD*
33 *Bridge Design Specifications*. Other steel may be used, subject to the approval of the
34 Engineer. Structural steel that has been cold-rolled to increase the yield strength will be
35 permitted. Mechanically galvanize all fasteners. Hot-dip galvanize all other components of
36 the structural assembly after fabrication has been completed. The galvanizing shall meet
37 ASTM B695, Class 55, for fasteners and ASTM A123 for other structural steel.

38 **1096-3 WELDING**

39 Perform all welding in the fabrication of the supports by AWS certified welders. Furnish
40 a copy of the AWS certification for each welder used for fabrication. All welds shall be free
41 of cracks, blow holes, slag, and other irregularities, and be wire brushed, sandblasted or
42 otherwise cleaned. Refer to Article 1076-3 for additional requirements for galvanizing.

43 Aluminum welding processes and procedures, shielding gases, preparation, weld quality,
44 inspection and correction of welds, and the qualification of welding procedures, welders and
45 welding operators will be governed by the AWS Structural Welding Code, D1.2.

Section 1098

1 The welding of steel components, including structural details, filler metal, workmanship and
2 technique, qualification and inspection will be based on the applicable requirements of the
3 AWS Structural Welding Code, D1.1.

4 **SECTION 1098** 5 **SIGNALS AND INTELLIGENT TRANSPORTATION SYSTEM** 6 **MATERIALS**

7 **1098-1 GENERAL REQUIREMENTS**

8 **(A) Qualified Products**

9 Furnish new equipment, materials, and hardware unless otherwise required. Inscribe
10 manufacturer's name, model number, serial number and any additional information
11 needed for proper identification on each piece of equipment housed in a case or housing.

12 ITS and Signals Qualified Products List (QPL) is available on the Department's website.

13 Certain signal and communications equipment, material and hardware shall be
14 pre-approved on the QPL by the date of installation. Equipment, material and hardware
15 not pre-approved when required will not be allowed for use on the project. Consult the
16 QPL web site to obtain pre-approval procedures.

17 **(B) Submittal Requirements**

18 Furnish a Type 3 material certification in accordance with Article 106-3. When
19 requested by the Department, provide additional certifications from independent testing
20 laboratories and sufficient data to verify item meets applicable Specifications. Ensure
21 additional certification states the testing laboratory is independent of the material
22 manufacturer and neither the laboratory nor the manufacturer has a vested interest in the
23 other.

24 Identify all proprietary parts in Contractor-furnished material. The Department reserves
25 the right to reject material that uses proprietary components not commercially available
26 through electronic supply houses.

27 For Contractor-furnished material listed on the QPL, furnish submittals in the format
28 defined by the QPL.

29 For Contractor-furnished material not on the QPL, furnish three copies of the equipment
30 list including three copies of catalog cuts. Identify proposed material on catalog cuts by
31 a reproducible means (highlighter pen does not transfer to copies). Ensure material lists
32 contain material description, brand name, manufacturer's address and telephone number,
33 stock number, size, identifying trademark or symbol and other appropriate ratings.

34 Submit for approval catalog cuts and/or shop drawings for materials proposed for use on
35 the project. Allow 40 days for review of each submittal. Do not fabricate or order
36 material until receipt of Engineer's approval.

37 Submit four copies of each catalog cut and/or drawing and show for each component the
38 material description, brand name, stock-number, size, rating, manufacturing specification
39 and the intended use (identified by labeling all components with the corresponding
40 contract line item number). Present the submittals neatly arranged in the same order as
41 the contract bid items. Electronic submittals of catalog cuts and drawings may be
42 accepted in lieu of hard copies.

43 One hard copy and an electronic (PDF) copy of reviewed submittals will be returned to
44 the Engineer from the ITS and Signals Unit.

(C) Observation Period

Warrant workmanship and Contractor-furnished equipment for a 30 day observation period under the payment and performance bond from date of acceptance.

If workmanship or equipment fails during the 30 day observation period, repair or replace with new equipment and begin a new 30 day observation period.

The observation period for this work is not part of the work to be completed by the project completion date.

(D) Warranties

Unless otherwise required herein, provide manufacturer's warranties on Contractor-furnished equipment for material and workmanship that are customarily issued by the equipment manufacturer and that are at least 2 years in length from successful completion of the 30 day observation period. Include unconditional coverage for all parts and labor necessary or incidental to repair of defective equipment or workmanship and malfunctions that arise during warranty period.

Ensure all contractor-furnished equipment, including pieces and components of equipment, hardware, firmware, software, middleware, internal components and subroutines, which perform any date or time data recognition function, calculation or sequencing will support a four digit year format for at least 50 years.

Upon successful completion of the 30 day observation period, transfer manufacturer's warranties with proper validation by the manufacturer to the Department or its designated maintaining agency.

(E) Firmware Licensing and Upgrades

Provide the Department with a license to duplicate all programmable devices in equipment for maintenance and software upgrades. Provide binary or hexadecimal format files for each device that may be programmed by the Department. Ensure files are provided on PC compatible compact discs or other approved media.

Ensure firmware performance upgrades that occur during the contract period are available to the Department at no additional cost.

Make firmware upgrades that are developed to correct operating characteristics available to the Department at no additional cost until the warranty period expires.

(F) Plan of Record Documentation

Before final acceptance, furnish plan of record documentation of all fieldwork. Plan of record documentation will be subject to approval before final acceptance. Store documentation in a manila envelope placed in a weatherproof holder mounted within each cabinet or housing for easy access.

Except for standard bound manuals, bind all 8 1/2 inches x 11 inches documentation, including 11 inches x 17 inches drawings folded to 8 1/2 inches x 11 inches, in logical groupings in either 3-ring or plastic slide-ring loose-leaf binders. Permanently label each grouping of documentation.

Provide manual, electrical schematic diagram, and cabinet wiring diagram for each control equipment cabinet and piece of equipment in cabinet. Place manuals and prints in weatherproof holder. For wiring diagrams and electrical schematic diagrams not bound into printed manuals, provide copies at least 22 inches x 34 inches.

Provide Operator's Manuals containing detailed operating instructions for each different type or model of equipment. Ensure manuals contain instructions for possible modification to equipment.

Section 1098

1 Provide maintenance procedures manuals containing detailed preventive and corrective
2 maintenance procedures for each different type or model of equipment.

3 Provide detailed wiring diagrams that include interconnection of equipment with pin-out
4 configurations, pin functions, and cable part numbers. For communications systems,
5 camera systems, video imaging loop emulator detection systems, intelligent
6 transportation systems, closed loop signal systems and other computerized systems,
7 provide two copies of system connection diagrams showing system interconnection
8 cables and associated terminations.

9 **(G) Wire and Cable**

10 Furnish wire and cable on reels. When requested by the Department, furnish samples of
11 wire and cable to the Department at no additional cost.

12 **(H) Electrical Service**

13 Furnish external electrical service disconnects with single pole 50 A inverse time circuit
14 breaker with at least 10,000 RMS symmetrical amperes short circuit current rating in
15 a lockable NEMA 3R enclosure. Ensure service disconnects are listed as meeting
16 UL Standard UL-489 and marked as being suitable for use as service equipment.
17 Fabricate enclosure from galvanized steel and electrostatically apply dry powder paint
18 finish, light gray in color, to yield a minimum thickness of 2.4 mils. Provide ground bus
19 and neutral bus with at least 4 terminals with minimum wire capacity range of number 14
20 through number 4.

21 Furnish NEMA Type 3R meter base rated 100 A minimum that meets the requirements of
22 the local utility. Provide meter base with ampere rating of meter sockets based on
23 sockets being wired with insulated wire rated at least 167°F.

24 Furnish four terminal, 600 volt, single phase, 3 wire meter base with the following:

- 25 (1) Line, Load and Neutral Terminals accept #8 to 2/0 AWG Copper/Aluminum wire,
26 (2) Ringed or Ringless Type, with or without bypass,
27 (3) Made of galvanized steel,
28 (4) Listed as meeting UL Standard UL-414, and
29 (5) Overhead or underground service entrance as specified.

30 Ensure meter bases have electrostatically applied dry powder paint finish, light gray in
31 color, with minimum thickness of 2.4 mils.

32 Furnish 1 inch watertight hub for threaded rigid conduit with meter base.

33 If meter base and electrical service disconnect are supplied in the same enclosure, ensure
34 assembly is marked as being suitable for use as service equipment. Ensure combination
35 meter and disconnect mounted in a pedestal for underground service is listed as meeting
36 UL Standard 231. Otherwise, ensure combination meter and disconnect is listed as
37 meeting UL Standard 67.

38 **(I) Painting**

39 Where painting of signal equipment cabinets, signal heads, signal poles, and pedestals is
40 required, apply paint at the factory. No field painting will be allowed except when paint
41 has been scratched or marred. In such cases, apply two field coats of the same color and
42 grade enamel as the original paint to the scratched or marred portions.

43 **(J) Performance of Warranty Repair and Maintenance**

44 Provide authorization to the Traffic Electronics Center of the NCDOT to perform all
45 warranty repairs after project acceptance. The decision to perform warranty work at the
46 Traffic Electronics Center by NCDOT electronics technicians or to have warranty work

1 performed by the vendor shall be at the discretion of the State. Provide any training
2 required by the manufacturer to authorize the Traffic Electronics Center to perform
3 warranty work and ensure manufacturer will furnish parts to the Traffic Electronics
4 Center for all warranty repairs at no cost to the State. In addition, ensure the
5 manufacturer agrees to provide prompt technical support to the NCDOT electronics
6 technicians for a period of one year after the end of the warranty period at no cost to the
7 State. Defective parts replaced under warranty by the Traffic Electronics Center will be
8 returned to the vendor at the vendor's request. Provide schematics, part lists, and other
9 documentation to perform bench repair to the Traffic Electronics Center within 2 weeks
10 upon request. The Department agrees not to divulge any proprietary information in the
11 schematics, part lists and other documentation upon request from the vendor. After
12 project acceptance and at the request of the State, manufacturer shall perform warranty
13 repairs to equipment which fails during the warranty period at no cost to the State
14 including freight costs to ship repaired equipment back to the Traffic Electronics Center.
15 Ensure all equipment is repaired and returned to the Traffic Electronics Center within
16 21 calendar days of receipt by the manufacturer.

17 **1098-2 BACKPLATES**

18 Comply with ITE standard *Vehicle Traffic Control Signal Heads*. Provide backplates specific
19 to the manufacturer of the vehicle signal heads. Provide stainless steel fasteners and hardware
20 for attachment to signal head. Provide backplates that extend at least 5 inches from the
21 vehicle signal head outline. Ensure the backplate fills in the gaps between cluster-mounted
22 vehicle signal sections (5-section vehicle signal heads). A 1/4 inch maximum gap between
23 vehicle signal head and backplate, as viewed from the front, will be allowed.

24 Fabricate metallic backplates for vehicle signal heads from sheet aluminum at least
25 0.05 inch thick. Provide backplates painted an alkyd urea black synthetic baking enamel with
26 minimum gloss reflectance that meets Federal Specification MIL-E-10169, Instrument Black.

27 Provide polycarbonate or vacuum formed ABS plastic backplates that are black on both the
28 front and back sides with a consistent color throughout the entire piece for each backplate.
29 Provide backplates that contain UV inhibitors and stabilizers for protection against
30 UV degradation. Provide backplates that have a minimum tensile stress at yield of 5,300 psi
31 at 73°F and meet UL Standard 94. Ensure polycarbonate backplates have a minimum
32 thickness of 0.100 inch with one side dull black and the other side semi-gloss black. Ensure
33 vacuum formed ABS plastic backplates have a minimum thickness of 0.125 inch with a hair
34 cell finish on the front side and a smooth finish on the back side.

35 **1098-3 MESSENGER CABLE**

36 Comply with ASTM A475 for extra high strength grade wire strand, Class A zinc coating.
37 Fabricate messenger cable from seven steel wires twisted into a single concentric strand.

38 **1098-4 RISER SEALING DEVICES**

39 Furnish appropriately sized clamp-on aluminum weatherheads for electrical control and
40 power cables.

41 Furnish heat shrink tubing for the installation of fiber-optic or coaxial cable in a new riser.
42 Ensure the heat shrink tubing is made of modified polyolefin and includes a hot-melt
43 adhesive. Provide tubing that has a length of at least 5 inches before heating. Ensure the heat
44 shrink tubing will provide a watertight fit around individual cables and outer wall of the riser
45 after heat is applied in accordance with the manufacturer's instructions.

46 Furnish heat shrink tubing retrofit kits for the installation of fiber optic cable or coaxial cables
47 to an existing riser with existing cables. Ensure the heat shrink material is made of modified
48 polyolefin and is supplied in a flat sheet design. Ensure the kit contains an apparatus to
49 secure both ends of the flat sheet together to form a tube shaped cylinder. Ensure the securing
50 apparatus is flexible to the point that it will allow the heat shrink material to conform to the

Section 1098

1 shape and dimensions of the riser and cables once heat is applied and will not separate during
2 the heating process. Provide heat shrink tubing retrofit kits with a hot-melt adhesive. Provide
3 the flat sheet heat shrink material that has a minimum length of 5 inches prior to heating.
4 Ensure the heat shrink tubing retrofit kit provides a watertight fit around individual cables and
5 outer wall of the riser after heat is applied in accordance with the manufacturer's instructions.

6 **1098-5 JUNCTION BOXES**

7 **(A) General**

8 Comply with Article 1091-5.

9 **(B) Standard Size Junction Boxes**

10 Provide standard size junction boxes and covers with minimum inside dimensions of
11 16" (l) x 10" (w) x 10" (d).

12 **(C) Oversized Junction Boxes**

13 Provide oversized junction boxes and covers with minimum inside dimensions
14 of 28" (l) x 15" (w) x 22" (d).

15 **1098-6 POLE LINE HARDWARE**

16 Provide universal grade strandvises used for extra high strength steel messenger cable.

17 Provide other pole line hardware constructed of hot-dipped galvanized steel conforming to
18 ASTM A153.

19 Provide machine bolts, eyebolts and thimble eye bolts with minimum tensile strength of
20 12,400 lb. Provide hot-dipped galvanized nuts, 3 inches x 3 inches curved square washers
21 and thimbleyelets.

22 Provide suspension clamp fabricated from hot-dipped galvanized steel with minimum length
23 of 5 3/4 inches. Ensure clamp has a groove rated for the messenger cable size it is intended to
24 secure. Provide J-hook fabricated from 3/8 inch thick hot-dipped galvanized steel flat or oval
25 stock with sufficient hook radius to cradle 11/16 inch diameter cable. Provide two 1/2 inch
26 diameter hot-dipped galvanized bolts and nuts to tighten the clamp around the messenger
27 cable. Provide one 5/8 inch diameter hot-dipped galvanized bolt of sufficient length to attach
28 J-hook and clamp to the wood pole with a 3 inch x 3 inch curved square washer and double
29 nuts.

30 Provide 3-bolt clamp fabricated from hot-dipped galvanized steel with minimum length
31 of 5 3/4 inches. Ensure clamp has two parallel grooves rated for the messenger cable size it is
32 intended to secure. Provide three 5/8 inch diameter hot-dipped galvanized bolts and nuts to
33 tighten the clamp around the messenger cable.

34 Provide parallel groove clamp consisting of high strength, high conductivity non-copper
35 bearing aluminum alloy clamp halves with interlocking fingers to prevent mismatch. Ensure
36 clamp halves have molded grooves to secure #8-1/0 AWG stranded copper wires. Provide
37 clamps with grooves prefilled with antioxidant joint compound. Provide 3/8 inch hex head,
38 square shank, galvanized steel bolt with galvanized steel lock washer and nut.

39 Provide 1/2 inch and 3/4 inch wide, .030 inch thick Type 316 stainless steel straps with
40 Type 316 stainless steel buckles.

41 Provide either 0.05 inch x 0.30 inch aluminum wrapping tape or 0.06 inch diameter Type 316
42 stainless steel lashing wire for lashing cables to messenger cable. Ensure aluminum wrapping
43 tape is 1350 alloy, O-temper, with 12,800 psi tensile strength. Use 0.045 inch diameter Type
44 316 stainless steel lashing wire to lash fiber-optic communications cable to messenger cable.

45 Provide hot-dipped galvanized steel clamp with groove sized for 1/4 inch to 3/8 inch
46 messenger cable for securing lashing wire(s) to messenger cables at ends of each spiraled run.
47 Ensure clamp hardware is hot-dipped galvanized steel.

1 1098-7 GUY ASSEMBLIES

2 Furnish guy assemblies with anchor assemblies, guy cable and guy cable guard.

3 Provide anchor assemblies with all miscellaneous hardware consisting of either expanding
4 anchor with rod and triple-eye attachment, screw anchor with extension rod and triple-eye
5 attachment, or expanding rock anchor with triple-eye attachment. Ensure anchor assembly
6 size is adequate for site conditions. Provide rods constructed of hot-dipped galvanized steel
7 sized according to the soil bearing conditions in the area. Provide triple-eye guy attachments
8 constructed of hot-dipped galvanized steel. Anchor assemblies with double-strand eyes may
9 be used instead of those with the triple-eye feature when only one guy cable is to be attached.
10 Ensure anchor assemblies are 7 feet minimum in length.

11 For type of anchor assembly furnished, ensure the following:

12 (A) Expanding Anchor

13 Provide steel construction with protective paint or heat shrink of 6 mil plastic to protect
14 metal during shipping and storage.

15 (B) Screw Anchor

16 Provide hot-dipped galvanized steel construction.

17 (C) Expanding Rock Anchors

18 Provide malleable iron and rust-resisting paint construction.

19 Provide 3-bolt clamp to match messenger cable size.

20 Provide full round guy cable guards that are 8 feet in length and constructed of UV stabilized,
21 high impact, bright yellow HDPE.

22 Provide guy cables consisting of messenger cable of the same size as the largest sized
23 messenger cable to be guyed. Comply with Article 1098-3.

24 1098-8 INDUCTIVE DETECTION LOOPS**25 (A) Loop Sealant**

26 Provide loop slot sealant that completely encapsulates loop wire when installed according
27 to manufacturer's instructions. Provide loop sealant that does not generate temperatures
28 greater than 220°F. Ensure sealant bonds with asphalt and concrete pavement saw slots
29 so sealant and encapsulated loop wire do not come out of slot. Ensure sealant is self-
30 leveling, but with sufficient viscosity to prevent exit from saw slot when installed along
31 a 10% grade.

32 Provide sealant that protects loop wire by preventing the entrance of dirt, water, rocks,
33 sticks, and other debris into saw slot, and is resistant to traffic, water, gasoline, chemical
34 and chemical fumes, mild alkalis, oils and mild acids. Ensure sealant will not be affected
35 by water and sealant does not chemically interact with pavement and loop wire
36 insulation.

37 Ensure loop sealant has sufficient flexibility to permit expected pavement expansion and
38 contraction due to weather and to permit pavement movement due to traffic without
39 cracking for a temperature range of -40 to 160°F.

40 Provide sealant with a usable life of at least ten minutes once mixed, when the ambient
41 temperature is 75°F. Ensure sealant dries to tack free state in less than 2 hours, and does
42 not flow within or out of saw slot after exposed surface has become tack free. Tack free
43 time will be determined by testing with a cotton ball until no sealant adheres to cotton
44 ball and no cotton adheres to sealant.

Section 1098

1 Ensure 2 part sealant cures within 48 hours to attain 95% of published properties for the
2 cured material.

3 Ensure one part sealant cures within 30 days to attain 95% of published properties for the
4 cured material.

5 (B) Loop Wire

6 Provide loop wire composed of 19-strand conductor insulated by a cross-linked
7 polyethylene compound. Ensure insulated conductors are completely encased in tubes of
8 low density polyethylene compound. Print manufacturer's name, manufacture year and
9 any applicable part number on encasing tube at intervals of 2 feet or less.

10 Provide number 14 AWG copper conductors fabricated from 19 strands that comply with
11 ASTM B3 before insulating. Ensure stranded conductors use either concentric or bunch
12 stranding and comply with circular mil area and physical requirements of ASTM B8 or
13 ASTM B174 for bunch stranding.

14 Provide insulating compound that is cross-linked thermosetting black polyethylene in
15 accordance with ASTM D2655. Ensure insulation is applied concentrically about
16 conductor. Provide insulation thickness not less than 0.026 inch at any point and
17 minimum average thickness of 0.030 inch as measured by UL Standard 62.

18 Ensure insulation of finished conductor will withstand application of a 60 Hertz or
19 3,000 Hertz, 7,500 volt (RMS) essentially sinusoidal spark test potential as specified in
20 UL Standard 83.

21 Provide insulated conductors that are factory-installed in a protective encasing tube that
22 complies with the following:

23 Encasing tube fabricated of polyethylene compound conforming to ASTM D1248 for
24 Type I, Class C, Grade E5. Provide a minimum inside diameter of 0.150 inch. Provide
25 a wall thickness of 0.040 inch \pm 0.010 inch. Provide an outside diameter of 0.240 inch
26 \pm 0.010 inch.

27 (C) Conduit

28 Comply with Subarticle 1091-3(C) for PVC conduit.

29 1098-9 LEAD-IN CABLE

30 Furnish lead-in cable with two conductors of number 14 AWG fabricated from stranded
31 tinned copper that complies with IMSA Specification 50-2 except as follows:

32 (A) Ensure conductor is twisted with a maximum lay of 2.0 inches resulting in at least six
33 turns per foot.

34 (B) Provide a ripcord to allow cable jacket to be opened without using a cutter.

35 Provide length markings in a contrasting color showing sequential feet and within 1% of
36 actual cable length. Ensure character height of the markings is approximately 0.10 inch.

37 1098-10 FIBER-OPTIC CABLE

38 (A) SMFO Communications Cable

39 Furnish single mode fiber-optic cable manufactured into a loose buffer tube design,
40 installed around a central strength member where the cable complies with
41 RUS CFR 1755.900 and ICEA 640 requirements. Ensure the Manufacture is ISO 9001
42 and TL9000 registered and that the manufacturer's cable is RUS listed. The operating
43 temperature range of the cable shall be -40°F to +158°F.

44 Furnish individual fibers manufactured from silica and dopant materials with each fiber
45 having a color coated finish that is compatible with local injection detection (LID)
46 devices. Distinguish each fiber from others by color coding that meets EIA/TIA-598.

1 Furnish single mode fiber that does not exceed attenuation ratings of 0.25 dB/km at
2 1550 nm and 0.35 dB/km at 1310 nm and complies with ITU G.652D and
3 IEC 60793-2-50 Type B.1.3 industry standards for low water peak, single mode fiber.
4 Provide fibers that are useable and with a surface, sufficiently free of imperfections and
5 inclusions to meet optical, mechanical and environmental requirements.

6 Ensure the core central strength member is a dielectric glass reinforced rod and that the
7 completed cable assembly has a maximum pulling rating of 600 lbf during installation
8 (short term) and 180 lbf long term installed.

9 Construct buffer tubes (nominal size of 2.5 mm) manufactured from a polypropylene
10 copolymer material to provide good kink resistance and allows the buffer tube to
11 maintain flexibility in cold temperature over the expected lifetime of the cable. Ensure
12 that buffers tubes contain no more than 12 fibers per buffer tube unless specified
13 otherwise, and that all buffer tubes are filled with a water blocking gel or water swellable
14 material. Construct the cable such that the buffer tubes are stranded around the central
15 strength member in a reverse oscillating arrangement to allow for mid-span entry.
16 Distinguish each buffer tube from others by color coding that meets EIA/TIA-598. Use
17 filler tubes to maintain a circular cross-section of the cable. Ensure the filler tubes are the
18 same nominal size as the buffer tubes of 2.5 mm. Apply binders (water swellable yarn,
19 kevlar, etc.) with sufficient tension to secure buffer tubes and filler tubes to the central
20 member without crushing the buffer tubes. Ensure that binding material is
21 non-hygroscopic, non-wicking and dielectric with low shrinkage. Ensure the binders are
22 of a high tensile strength that is helically stranded evenly around cable core.

23 Ensure the cable core is protected from the ingress of moisture by a water swellable
24 material or that is filled with a water blocking compound that is non-conductive. Ensure
25 the water swellable material (when activated) or the water blocking compound is free
26 from dirt and foreign matter and is removable with conventional nontoxic solvents.
27 Furnish at least one ripcord to aid in the process of removing the outer jacket. Furnish
28 the outer jacket constructed of a medium-density polyethylene material to provide
29 reduced friction and enhanced durability. Ensure the polyethylene material contains
30 carbon black to provide UV protection and does not promote the growth of fungus.
31 Ensure the cable jacket is free of slits, holes or blisters and the nominal outer jacket
32 thickness is ≥ 0.050 ".

33 Ensure the completed cable assembly contains identification markings printed along the
34 outside cover of the jacket every 2 feet. Ensure the character height of the markings is
35 approximately 0.10 inch. Provide length markings in sequential feet and within 1% of
36 actual cable length.

37 Mark each cable with the following:

- 38 (1) Sequential length marks in feet as specified
- 39 (2) The name of the manufacturer
- 40 (3) "OPTICAL CABLE"
- 41 (4) Month/year of manufacture
- 42 (5) Number(s) of and type(s) of fibers
- 43 (6) Cable ID Number for product traceability

44 (B) Drop Cable

45 Furnish drop cable meeting the material requirements listed in Subarticle 1098-10(A)
46 with the exceptions herein to provide communications links between splice enclosures
47 and through interconnect centers. Furnish drop cable containing at least 6 individual
48 fibers.

49 Furnish drop cable that complies with RUS-CFR 1755.900 and is RUS listed. Ensure
50 each drop cables has the same operating characteristics as the SMFO cable it is to be
51 coupled with.

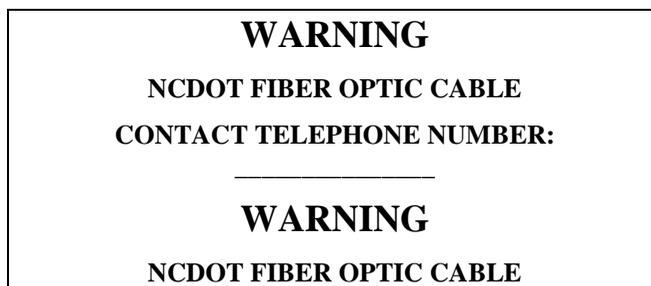

Section 1098

1 On one end of cable furnish six ST-PC connectors for termination on connector panel in
2 equipment cabinet. Provide either factory assembled drop cables with ST-PC connectors
3 or field installed connectors. No connectors are required for drop cables running from
4 one splice enclosure directly to another splice enclosure.

5 Ensure attenuation of drop cable at 1310 nm does not exceed 0.4 dB/km and the
6 attenuation at 1550 nm does not exceed 0.3 dB/km. Ensure attenuation loss for complete
7 drop cable assembly does not exceed a mean value of 1.5 dB.

8 (C) Communications Cable Identification Markers

9 Furnish yellow communications cable identification markers that are resistant to fading
10 when exposed to UV sources and changes in weather. Use markers designed to coil
11 around fiber-optic cable that do not slide or move along the surface of the cable once
12 installed. Ensure exposure to UV light and weather does not affect the markers natural
13 coiling effect or deteriorate performance. Provide communications cable wraps that
14 permit writing with an indelible marking pen and contain the following text in black:

15 **Figure 1098-1. Communication Cable Identification Marker.**

16 Overall Marker Dimensions: 7 inches (l) x 4 inches (w)

17 Lettering Height: 3/8 inch for WARNING, 1/4 inch for all other lettering

18 Submit a sample of proposed communications cable identification markers to the
19 Engineer for approval before installation.

20 (D) Fiber-Optic Cable Storage Guides

21 Furnish fiber-optic storage guides (snowshoes) that are non-conductive and resistant to
22 fading when exposed to UV sources and changes in weather. Ensure snowshoes have
23 a captive design such that fiber-optic cable will be supported when installed in the rack
24 and the minimum bending radius will not be violated. Provide stainless steel attachment
25 hardware for securing snowshoes to messenger cable and black UV resistant tie-wraps for
26 securing fiber-optic cable to snowshoe. Ensure snowshoes are stackable so multiple
27 cable configurations are possible.

28 **1098-11 FIBER-OPTIC SPLICE CENTERS**

29 (A) Interconnect Center

30 Furnish compact, modular interconnect centers designed to mount inside equipment
31 cabinets. Design and size interconnect centers to accommodate all fibers entering
32 cabinets.

33 Provide splice trays that hold, protect, and organize optical fibers, and secure fibers inside
34 splice tray. Design and size splice trays to be dielectric, to accommodate all fibers
35 entering splice tray, and to provide sufficient space to prevent microbending of optical
36 fibers. Provide connector panels with ST-type connectors.

37 Furnish SMFO pigtails with each interconnect center. Provide pigtails containing
38 connector panels that are no more than 6 feet in length with a factory assembled PC-ST

1 connector on one end. Ensure SMFO pigtailed meet the operating characteristics of the
2 SMFO cable with which it is to be coupled.

3 Furnish SMFO jumpers that are at least 3 feet in length with factory assembled PC-ST
4 connectors on each end. Ensure SMFO jumpers meet the operating characteristics of the
5 SMFO cable with which it is to be coupled.

6 (B) Splice Enclosure

7 Furnish splice enclosures that are re-enterable using a mechanical dome-to-base seal with
8 a flash test valve, and are impervious to the entry of foreign material (water, dust, etc.).
9 Ensure enclosures are manufactured so as to be suitable for aerial, pedestal, buried,
10 junction box and manhole installation.

11 Provide enclosures with at least one over-sized oval port that will accept two cables and
12 with at least four round ports (for single cables) that will accommodate all cables entering
13 enclosure. Provide heat shrink cable shields with enclosure to ensure weather tight seal
14 where each cable enters enclosure.

15 Within enclosures, provide enough hinged mountable splice trays to store the number of
16 splices required, plus the capacity to house six additional splices. Provide a fiber
17 containment basket for storage of loose buffer tubes expressed through the enclosure.
18 Ensure enclosures allow sufficient space to prevent microbending of buffer tubes when
19 coiled.

20 Provide splice trays that hold, protect, and organize optical fibers, and secure fibers inside
21 splice tray. Provide splice trays that are dielectric.

22 1098-12 FIBER-OPTIC TRANSCEIVERS

23 Furnish shelf-mounted, modular, single mode fiber-optic transceivers that transmit and
24 receive optical signals over a fiber-optic communications medium of two fibers and interface
25 with equipment cabinets (signal controller, dynamic message signs, etc.). Ensure transceivers
26 are asynchronous in operation. Ensure transceivers are capable of operating up to 5 miles
27 without boosting signal and without distortion. Ensure transceivers are switch selectable for
28 either local or master operation.

29 Do not provide transceivers internal to system equipment. Provide identical transceivers at all
30 locations capable of being interchanged throughout system.

31 Provide LEDs on the front panel of transceivers for power, and transmitting and receiving
32 indications. Comply with the following:

TABLE 1098-1	
PROPERTIES OF FIBER OPTIC TRANSCEIVER	
Property	Requirement
Input Power	115 VAC
Minimum Loss Budget	12 dB with corresponding receiver
Operating Wavelength	1310 or 1550 nm
Optical Connector	ST
Signal Connector	Female Plug Type DB9 or DB25
Temperature Range	0 to 150°F

Section 1098

1 Ensure modems operate in one of the following topologies:

2 Drop and Repeat Transceivers: Furnish transceivers that transmit and receive data in drop-
3 and-repeat poll-response data network mode with EIA/TIA-232, EIA/TIA-422 and
4 EIA/TIA-485 protocols.

5 Self-Healing Ring Transceivers: Furnish transceivers that transmit and receive data in a drop-
6 and-insert poll-response data network mode with EIA/TIA-232, EIA/TIA-422 and
7 EIA/TIA-485 protocols. Ensure transceiver operates in a Self-Healing Ring Network
8 Architecture.

9 **1098-13 DELINEATOR MARKERS**

10 Furnish tubular delineator markers, approximately 6 feet long, and constructed of
11 Type III HDPE material. Provide delineator assemblies that are ultraviolet stabilized to help
12 prevent components from color fading, warping, absorbing water, and deterioration with
13 prolonged exposure to the elements. Provide delineators designed to self-erect after being
14 knocked down or pushed over. Provide orange delineator posts.

15 Provide text, including division contact number, hot stamped in black on a yellow reflective
16 background material that will not fade or deteriorate over time. Provide delineator markers
17 with nominal message height of 15 inches that contain the text in Figure 1098-2 visible from
18 all directions approaching the assembly.

W A R N I N G	F I B E R	O P T I C	C A B L E S
BEFORE EXCAVATING OR IN AN EMERGENCY CALL (____) ____-____			
NORTH CAROLINA DEPARTMENT OF TRANSPORTATION			

19 **Figure 1098-2. Delineator Marker.**

20 **1098-14 PEDESTALS**

21 Furnish pedestal assemblies with foundations that conform to the latest edition of the
22 *AASHTO Standard Specifications for Structural Supports for Highway Signs, Luminaires, and*
23 *Traffic Signals* in effect on the date of project advertisement. Refer to *Roadway Standard*
24 *Drawings* No. 1743 for structural design specifications for each type of pedestal.

25 **(A) Pedestal Shaft**

26 Furnish one piece pedestal shafts fabricated from either aluminum or galvanized steel
27 pipe with a uniform pipe outer diameter of 4.5 inches and of the lengths specified for the
28 type of pedestal shown on *Roadway Standard Drawing No. 1743*. Refer to Article
29 1743-2 for pedestal type descriptions.

30 For Type I (pedestrian pushbutton pedestals) and Type II (normal-duty pedestals), furnish
31 shafts constructed from schedule 40 extruded aluminum pipe that conforms to Aluminum

1 Association Alloy 6061-T6 with a tensile strength of 30 KSI and a minimum wall
2 thickness of 0.237 inch. Aluminum conduit will not develop the necessary strength
3 required and is not allowed. Thread and deburr in accordance with American National
4 Standard Pipe Threads, NPT (ANSI B2.1). Finish the exterior with a rough surface
5 texture consisting of a uniform grain pattern that is perpendicular to the axis of the pipe
6 along the full pipe length. Unless otherwise specified, do not use galvanized steel pipe for
7 Type I and Type II pedestal shafts.

8 For Type III (heavy-duty pedestals), furnish schedule 120 galvanized steel pipe that
9 conforms to ASTM A53. Provide an 11 inches square by 1 inch thick steel base plate
10 with minimum yield strength of 36 ksi that conforms to ASTM A36. Fabricate the base
11 plate with four equally spaced bolt holes on an 11 inches bolt circle. Orient the bolt holes
12 in the corners of the plate. Size the holes to accommodate 1 inch diameter machine bolts.
13 Weld the pedestal shaft to the center of the base plate using a socket connection. Provide
14 circumferential fillet welds at the top and bottom of the base plate. Perform all welding
15 in accordance with the latest AWS Code. Hot-dip galvanize the pedestal shaft and base
16 plate assembly after fabrication in accordance with ASTM A123. Unless otherwise
17 specified, do not use aluminum pipe for Type III pedestal shafts.

18 (B) Transformer Bases

19 Furnish transformer bases for each type of pedestal shown on *Roadway Standard*
20 *Drawings* No. 1743 fabricated from aluminum that meets Aluminum Association
21 Alloy 356 or equivalent, and that are designed to break upon impact in accordance with
22 AASHTO requirements. Submit FHWA certification for each type of transformer base
23 that reflects compliance with NCHRP 350. For use in grounding and bonding, provide
24 a 0.5 inch minimum diameter, coarse thread hole cast into transformer base located inside
25 base and oriented for easy access.

26 Provide a minimum access opening for all transformer bases of 8 inches x 8 inches with
27 an access door that is attached with a 1/4 inch x 3/4 inch long stainless steel vandal proof
28 screw to secure access door.

29 For Type I (pedestrian pushbutton pedestals) and Type II (normal-duty pedestals),
30 provide overall base dimensions of 15" (l) x 13 3/4" (w) x 13 3/4" (d) for square bases
31 and 14" (l) x 16 1/2" (w) x 16 1/2" (d) for octagonal bases. Provide a threaded opening at
32 the top of the base to receive a 4 inch NPT pipe shaft. Include a set screw prep and
33 3/8 inch-16 x 1 inch stainless steel set screw to secure the pedestal post to the pedestal
34 base. Fabricate the bottom of the transformer base with four equally spaced holes or
35 slots for a 12 inches bolt circle to secure the entire assembly to the concrete foundation.

36 For Type III (heavy-duty pedestals), provide square bases with overall dimensions of
37 17" (l) x 13" (w) x 13" (d). Fabricate the top of the transformer base with four equally
38 spaced holes or slots for an 11 inches bolt circle to attach the pedestal shaft. Size the
39 holes or slots to accommodate 1 inch diameter machine bolts. Fabricate the bottom of the
40 transformer base with four equally spaced holes or slots for a 12 inch bolt circle to secure
41 the entire assembly to the concrete foundation. Size the holes or slots to accommodate
42 1 inch diameter anchor bolts. Provide the following mounting hardware for heavy-duty
43 pedestals:

- 44 (1) Four 1 inch diameter by 3 1/2 inches long machine bolts (ASTM F593), with heavy
45 hex nuts (ASTM A563 Grade DH, or A 194 Grade 2H), and thick flat washers, and
46 lock washers (ASTM F436) per pedestal assembly. Galvanize in accordance with
47 ASTM A153.
- 48 (2) Three heavy hex nuts (ASTM A563 Grade DH, or A194 Grade 2H), 2 thick flat
49 washers, and one lock washer (ASTM F436) for each anchor bolt. Galvanize in
50 accordance with ASTM A153.

Section 1098

- 1 (3) Six minimum slotted stainless steel shims of necessary thickness for leveling per
2 pedestal assembly.

3 (C) Anchor Bolts

4 For each pedestal, provide four anchor bolts in accordance with ASTM F1554, Grade 55,
5 of the size and length specified in *Roadway Standard Drawings* No. 1743. Provide
6 anchor bolts with coarse threads meeting the bolt/thread criteria specified by AISC.
7 Provide threads for a minimum length of 4 inches on each end of the bolt. All thread
8 anchor rods may be used. Ensure anchor bolts are hot-dipped galvanized in accordance
9 with ASTM A153.

10 For each anchor bolt:

- 11 (1) Provide three heavy hex nuts; one at the top, and two at the bottom (embedded end)
12 of the anchor bolt. Provide hex nuts with coarse threads that match the anchor bolt
13 thread requirements above. Provide hex nuts that meet the requirements of
14 ASTM A563 Grade DH, ASTM A194, Grade 2H or equivalent. Galvanize all heavy
15 hex nuts in accordance with ASTM A153.
16
17 (2) Provide one standard size washer that meets the requirements of ASTM F436 for use
18 between the two heavy hex nuts on the embedded end of the anchor bolt. Galvanize
19 in accordance with ASTM A153.
20
21 (3) Provide one extra thick, oversized washer for use over the slotted opening of the
22 pedestal base. Fabricate washer to meet the chemical, physical, and heat treating
23 requirements of ASTM F436. Fabricate the washer to the diameter and thickness
24 needed. Galvanize fabricated washer in accordance with ASTM A153. Heat treat to
25 the same requirements as F436 (i.e. 26 to 45 HRC).

26 For a 3/4 inch diameter anchor bolt mounted in a 1 1/2 inch slotted opening, the
27 dimensional requirements for an extra thick, oversized washer are as follows:

- 28 (a) The minimum Outside Diameter (OD) required is 2 3/4 inch.
29 (b) The hole Inside Diameter (ID) = Nominal Bolt Diameter + 1/16 inch = 0.812
30 inch.
31 (c) The minimum washer thickness required is 3/8 inch.

32 If anchor bolts less than 3/4 inch in diameter are proposed for use to anchor pedestal
33 bases, provide a washer calculation to ensure the washer thickness is adequate. To
34 account for any pedestal manufacturing differences, verify the actual slotted opening
35 width of the pedestal base anchoring points, and include it in the calculation. Anchor
36 bolts that are less than 1/2 inch in diameter may not be used as they are not
37 structurally adequate to support the pedestal and may inhibit the performance of the
38 breakaway base.

39 The fabrication process for thick washers makes the washer slightly tapered (i.e. the
40 top OD and the bottom OD are not the same). Install thick washers with the larger
41 diameter face down against the pedestal base casting.

42 Do not use standard washers over the slotted opening of the pedestal base. Do not
43 substitute or stack thin washers to achieve the required thickness specified or
44 required.

45 In addition to the submittal requirements of Section 1098-1(B), provide Mill
46 Certifications, Galvanization Certifications, and Heat Treating Certifications for all
47 anchor bolts, fabricated washers, and structural hardware

1 (D) Pedestal Cap

2 Furnish a 4 1/2 inch outside diameter slip fit domed pedestal top cap for each pedestal
 3 assembly designed to fit over the outside of the pedestal shaft. Fabricate the cap from
 4 aluminum that meets Aluminum Association Alloy 356. Ensure the cap provides
 5 3 equally spaced stainless steel set screw fasteners to secure the cap to the pedestal shaft.

6 (E) Pole Flange Base for 4 1/2 Inches Pipe

7 Furnish a flange base with cover for use with Type I (pedestrian pushbutton pedestals)
 8 and Type II (normal-duty pedestals) only. Flange bases are non-breakaway supports that
 9 are to be used with a breakaway bolt system for AASHTO compliance for breakaway
 10 structures. Provide aluminum or steel flange bases with a minimum 7.5 inches diameter
 11 bolt circle. Ensure bases are either continuously welded to shafts or threaded to receive
 12 shafts. Each base should be designed to accommodate either three or four 1/2 inch bolts
 13 equally spaced on the bolt circle to receive breakaway anchors. Provide NPT threads on
 14 the internal opening of the flange base through the full length of the flange base with
 15 locking set screws at the top of the base to receive a 4 inch NPT pipe shaft.

16 Fabricate aluminum flange bases that meet Aluminum Association Alloy 356
 17 requirements for architectural bases. Fabricate steel flange bases that meet ASTM A36.

18 Do not use flange bases for Type III pedestals.

19 (F) Breakaway Anchors

20 Furnish single or double neck omni-directional breakaway anchor bolt coupling systems
 21 for use with Type I (pedestrian pushbutton pedestals) and Type II (normal-duty pedestals)
 22 only. Use breakaway anchors that are FHWA certified to be compliant with NCHRP
 23 Report 350 as an alternative to transformer bases. Use with non-breakaway pole flange
 24 bases. Use 1/2 inch diameter bolts for pushbutton posts and 3/4 inch bolts for normal-
 25 duty pedestals. Fabricate from steel with a minimum yield strength of 55 KSI.
 26 Galvanize in accordance with ASTM A153. Do not use breakaway anchors with Type III
 27 pedestals, or in conjunction with breakaway transformer bases.

28 (G) Foundation

29 Install pedestal foundations of the type and size shown on *Roadway Standard Drawings*
 30 No. 1743.04 Furnish Class A minimum concrete that conforms to Article 1000-4.

31 Provide reinforcing steel that conforms to the applicable parts of Section 1070.

32 (H) Screw-In Helical Foundation Anchor Assembly

33 Furnish and install screw-in helical foundation as an alternative to the standard reinforced
 34 concrete foundation specified in Article 1743 "Pedestals" of the Standard Specifications,
 35 for supporting Type I and Type II Pedestals. Do not use for Type III Pedestals.

36 (1) Type I – Pedestrian Pushbutton Post:

37 Fabricate pipe assembly consisting of a 4 inch diameter x 56 inch long pipe, single
 38 helical blade and square fixed attachment plate. Furnish pipe in accordance with
 39 ASTM A-53 ERW Grade B and include a 2 inch x 3 inch cable opening in the pipe
 40 at 18 inches below the attachment plate. Furnish steel attachment plate and helical
 41 blade in accordance with ASTM A-36. Include four slotted mounting holes in the
 42 attachment plate to fit bolt circles ranging from 7 3/4 inches to 14 3/4 inches
 43 diameter. Furnish additional 3/4 inch keyholes at slotted holes to permit anchor bolt
 44 installation and replacement from top surface. Include combination bolt-head
 45 retainer and dirt scrapers at the attachment plate underside to allow for a level or
 46 flush-mount plate installation with respect to the finished grade. Galvanize pipe
 47 assembly components in accordance with AASHTO M 111 or an approved
 48 equivalent.

Section 1098

1
2 Furnish four 3/4 inch 10NC x 3 inch square head anchor bolts to meet the
3 requirements of ASTM 325. Provide four 3/4 inch plain flat galvanized washers,
4 four 3/16 inch thick galvanized plate washers and four 3/4 inch galvanized hex nuts.
5 Galvanize in accordance with AASHTO M 111 or an approved equivalent.

6 (2) Type II – Normal-Duty Pedestal:

7 Fabricate pipe assembly consisting of a 6 inch diameter x 60 inch long, single helical
8 blade, 1 1/4 inch diameter stinger rod and square fixed attachment plate. Furnish
9 pipe in accordance with ASTM A-53 ERW Grade B using schedule 40 wall
10 thickness and include a 2 inch x 3 inch cable opening in the pipe at 18 inches below
11 the attachment plate. Furnish steel attachment plate, helical blade and stinger rod in
12 accordance with ASTM A-36. Include four slotted mounting holes in the attachment
13 plate to fit bolt circles ranging from 10 inches to 15 inches in diameter. Furnish
14 additional 1 1/4 inch keyholes at slotted holes to permit anchor bolt installation and
15 replacement from top surface. Include combination bolt-head retainer and dirt
16 scrapers at the attachment plate underside to allow for a level or flush-mount plate
17 installation with respect to the finished grade. Galvanize pipe assembly components
18 in accordance with AASHTO M 111 or an approved equivalent.

19 Furnish four 1 inch 8NC x 4 inch galvanized Grade 5 square head anchor bolts.
20 Provide four 1 inch plain flat galvanized washers and four 1 inch galvanized hex
21 nuts. Galvanize in accordance with AASHTO M 111 or an approved equivalent.

22 **1098-15 SIGNAL CABINET FOUNDATIONS**

23 Provide foundations with a minimum pad area that extends 24 inches from front and back of
24 cabinet and 3 inches from sides of cabinet.

25 Furnish cabinet foundations with chamfered top edges. Provide minimum Class B concrete.

26 Provide preformed cabinet pad foundations with 7" (l) x 18" (w) minimum opening for the
27 entrance of conduits. For precast signal cabinet foundations, include steel reinforcement to
28 ensure structural integrity during shipment and placing of item. Include four 3/4 inch coil
29 thread inserts for lifting. Comply with Article 1077-16.

30 **1098-16 CABINET BASE ADAPTER/EXTENDER**

31 Fabricate base adapters and extenders from the same materials and with the same finish as
32 cabinet housing. Fabricate base adapter and extender in the same manner as controller
33 cabinets, meeting all applicable specifications called for in Section 6.7 of CALTRANS TEES.
34 Provide base adapters and extenders a height of at least 12 inches.

35 **1098-17 BEACON CONTROLLER ASSEMBLIES**

36 **(A) General**

37 Furnish all cabinets with a solid state flasher that meets NEMA TS-2-2003. Encapsulate
38 flasher components as necessary. Connect flasher to provide beacon operation as
39 specified.

40 Submit drawings showing dimensions, location of required equipment and mechanisms,
41 cabinet electrical diagrams, part numbers and descriptions of required equipment and
42 accessories to the Engineer. Provide certification to the Engineer that materials used in
43 cabinet construction meet these Specifications.

44 Furnish unpainted, natural, aluminum cabinet shells that comply with Section 7 of
45 NEMA TS-2-2003. Ensure all non-aluminum hardware on cabinet is stainless steel or
46 Department approved non-corrosive alternate. Provide roof with slope from front to back
47 at a minimum ratio of 1 inch drop per 2 feet. Ensure each exterior cabinet plane surface
48 is constructed of a single sheet of seamless aluminum. Ensure all components are

1 arranged for easy access during servicing. When modular in construction, provide guides
2 and positive connection devices to ensure proper pin alignment and connection.

3 Provide 20 mm diameter radial lead UL-recognized metal oxide varistors (MOV)
4 between each field terminal and ground bus. Electrical performance is outlined in
5 Table 1098-2.

TABLE 1098-2	
PROPERTIES OF SURGE PROTECTOR	
Property	Requirement
Maximum Continuous Applied Voltage at 85°C	150 VAC (RMS) 200 VDC
Maximum Peak 8x20µs Current at 85°C	6500 A
Maximum Energy Rating at 85°C	80 J
Voltage Range 1 mA DC Test at 25°C	212 - 268 V
Max. Clamping Voltage 8x20µs, 100A at 25°C	395 V
Typical Capacitance (1 MHz) at 25°C	1,600 pF

6 Provide beacon controller assemblies equipped with terminal blocks (strips) for
7 termination of all field conductors and all internal wires and harness conductors.
8 Terminate all wires at terminals. Ensure all field terminals are readily accessible without
9 removing equipment and located conveniently to wires, cables, and harnesses to be
10 connected. Ensure terminals are not located on underside of shelves or at other places
11 where they are not readily visible or where they may present a hazard to personnel who
12 might inadvertently touch them. Provide terminal blocks made of electrical grade
13 thermoplastic or thermosetting plastic. Ensure each terminal block is of closed back
14 design and has recessed-screw terminals with molded barriers between terminals. Ensure
15 each terminal consists of two terminal screws with removable shorting bar between them.
16 Ensure each terminal block is labeled with a block designation and each terminal is
17 labeled with a number. Ensure all terminal functions are labeled on terminal blocks.
18 Provide labels that are visible when terminal block is fully wired. Show labels on cabinet
19 wiring diagrams. Ensure terminals serving similar functions are grouped together.

20 Connect each conductor, including unused conductors, within or entering cabinet to
21 a terminal using crimped spade lugs. Place no more than two conductors on any single
22 terminal screw. Terminations to back panel may be soldered. Do not use quick
23 connectors or barrel connectors. Make all connections at terminals. Do not make in-line
24 splices.

25 Ensure outgoing circuits have same polarity as line side of power supply. Ensure
26 common return has same polarity as grounded conductor (neutral) of power supply.

27 Neatly package all wiring. Dress harnesses by lacing, braiding, or tying with nylon tie
28 wraps at closely spaced intervals. Attach wires, cables, or harnesses to cabinet walls for
29 support or to prevent undue wear or flexing. Use nylon tie straps or metal clamps with
30 rubber or neoprene insulators. Screw these attachment devices to cabinet. Do not use
31 stick-on clamps or straps.

32 Tag AC+, AC-, chassis ground, and flasher circuit conductors with non-fading,
33 permanent sleeve labels at conductor ends at terminals or use color-coded wire. Ensure
34 sleeve labels tightly grip conductors. Alternatively, use hot stamped labels on internal
35 conductor insulation at intervals of no greater than 4 inches. Ensure label legends are
36 permanent.

37 Ensure all jumpers are wire conductors or metal plates. Do not use printed circuit back
38 panels or back panels using wire tracks as jumpers.

39 Lay out all equipment and components for ease of use and servicing. Ensure equipment
40 controls can be viewed and operated without moving or removing any equipment.

Section 1098

1 Ensure there is access to equipment or components for servicing without removing any
2 other equipment or components. Removal of equipment is acceptable to access fan or
3 thermostat. Ensure equipment can be removed using only simple hand tools. Ensure
4 layout of equipment and terminals within the various cabinets furnished is identical from
5 cabinet to cabinet, unless otherwise approved.

6 Mount equipment using harnesses with suitable multipin (or similar) connectors. Design
7 or key all equipment to make it physically impossible to connect unit to wrong connector.
8 Ensure that functionally equivalent equipment is electrically and mechanically
9 interchangeable.

10 Equip vents with standard-size, replaceable filters or, if located where they can easily be
11 cleaned, permanent filters.

12 (B) Type F1 Cabinet

13 Provide dual-circuit flasher and 20-amp inverse time circuit breaker with at least
14 10,000 RMS symmetrical amperes short circuit current rating. Install one insect-resistant
15 vent on bottom and one on top on opposite wall to facilitate airflow.

16 (C) Type F2 Cabinet

17 Provide 20 inches high x 16 inches wide x 12 inches deep cabinet, dual-circuit flasher,
18 20-amp inverse time circuit breaker with at least 10,000 RMS symmetrical amperes short
19 circuit current rating, and solid state time switch. Provide filtered power to time switch.
20 Install one insect-resistant vent on each side of cabinet at the bottom to facilitate airflow.

21 (D) Type F2 and F3 Cabinet – Surge Protection and Documentation

22 Furnish and install a power line surge protector in the service power. Provide a 2-stage
23 power line surge protector that allows connection of the radio frequency interference
24 filter between stages of the device. Ensure device has a maximum continuous current
25 rating of at least 10 A at 120 V. Ensure device can withstand at least 20 peak surge
26 current occurrences at 20,000 A for an 8x20 microsecond waveform. Provide maximum
27 clamp voltage of 395 V at 20,000 A with a nominal series inductance of 200 μ h. Ensure
28 voltage does not exceed 395 V. Provide devices that comply with Table 1098-3.

Frequency (Hz)	Minimum Insertion Loss (dB)
60	0
10,000	30
50,000	55
100,000	50
500,000	50
2,000,000	60
5,000,000	40
10,000,000	20
20,000,000	25

29 Install surge protector in circuit breaker enclosure in a manner that will permit easy
30 servicing. Ground and electrically bond surge protector to cabinet within 2 inches of
31 surge protector.

32 Furnish and install a suitably sized plastic envelope or container in cabinet for holding
33 cabinet wiring diagrams and equipment manuals. Locate envelope or container so it is
34 convenient for service personnel. Furnish two sets of non-fading cabinet wiring diagrams
35 in a paper envelope or container and place them in the plastic envelope or container.

1 (E) Type F3 Cabinet

2 Provide 25 inches high x 22 inches wide x 15 inches deep cabinet, dual-circuit flasher,
3 fan, thermostat and switch-controlled cabinet light (15 watt minimum, incandescent).

4 Install a vent or vents at or near the cabinet bottom to permit the intake of air sized for the
5 rated flow of air from the fan, but no smaller than 20 square inches. Install fan with a
6 minimum 100 CFM rating.

7 Equip cabinet with two inverse time circuit breakers (20A & 15A) with at least 10,000
8 RMS symmetrical amperes short circuit current rating installed to ensure personnel
9 servicing the cabinet, including rear of back panel, cannot inadvertently be exposed to a
10 hazard. Install a terminal block that will accommodate service wire as large as number 4
11 AWG, and connect it to the circuit breaker. Install circuit breakers in addition to any
12 fuses that are a part of the individual control equipment components. Wire switch-
13 controlled cabinet light and thermostatically-controlled fan to the 15A circuit breaker.
14 Provide thermostat with a minimum range of 90° F to 130° F and with a rating sufficient
15 for fan load.

16 Equip cabinet with a duplex receptacle that is connected to the AC out and neutral out
17 terminals of the surge protector.

18 1098-18 SPREAD SPECTRUM RADIO**19 (A) General**

20 Furnish 900 MHz Serial and 900 MHz Serial/Ethernet spread spectrum radio systems
21 with field set-up software and all necessary hardware and signage in accordance with the
22 plans and specifications to provide a data link between field devices (i.e. Traffic Signal
23 Controllers, Dynamic Message Signs, etc.).

24 Provide a radio system with license free 902 – 928 MHz Serial Spread Spectrum
25 transceivers that are capable of Bi-Directional, Full Duplex communications. Furnish
26 material conforming to the National Electrical Code (NEC), the National Electrical
27 Safety Code (NESC), Underwriter’s Laboratories (UL) or a third-party listing agency
28 accredited by the North Carolina Department of Insurance, and all local safety codes in
29 effect on the date of advertisement. Comply with all regulations and codes imposed by
30 the owner of affected utility poles.

31 (B) 900 MHz Radio

32 Furnish license free 902 - 928 MHz Serial Spread Spectrum Radios that comply with
33 Table 1098-4.

Section 1098

TABLE 1098-4 SERIAL SPREAD SPECTRUM RADIO REQUIREMENTS	
Frequency Range	902 – 928 MHz
Technology	Frequency Hopping Spread Spectrum
Operational Modes	master; repeater; repeater/slave; slave; point-to-point; point-to-multipoint; peer-to-peer
Operating Voltage	Power Cube: 6 – 30 VDC
Operating Temperature/Humidity	-40°C to +75°C; 0 to 95% non-condensing
Transmitter	
Output Power	1 Watt (Max)
Modulation	Frequency Shift Keying
Hopping Patterns/Channels	Minimum of 50/minimum of 110
Data Rate(over the air)	1,200 to 115,200 bps
Receiver	
Sensitivity	-108 dBm @ 10 ⁻⁶ BER
Data Transmission	
Error Detection	32 Bit CRC, Automatic Repeat Request (ARQ)
Data Encryption	128 bit
System Gain	140 dB
LED's	
Signal Strength Indicators	Data Port Indicators consisting of a minimum of 3 LED's grouped together representing a Low, Medium or High Signal Strength with regards to the communications link with another targeted radio. Units must be supplied with external labels to identify how to interpret the Signal Strength. OR Combinations of the Front Panel LED indications with flashing rates and LED Colors can be used to identify the signal strength. Units must be supplied with external labels to identify how to interpret the Signal Strength.
Front Panel Indicators	Power (Optional) Transmit Data Receive Data OR Carrier Detect Transmit Clear to Send
Data Interface	
Interface Cable	Type 1 or Type 2 or Type 3 (If not specified in the Plans, furnish a Type 1 Data Interface Cable)
Antenna Connectors	Threaded Connector (Nickel and/or Silver Plated Brass)
Port to connected device	Serial - DB 9 Female Port; RS232 Asynchronous
Programming Port	DB9 Female or USB/Mini B
Radio Frequency Signal Jumper	RG-58 coaxial cable (6' long) with one end supplied with RF Threaded Connector that is compatible with the supplied radio. The other end furnished with a Standard N-Type Male Connector to mate with the lightning arrestor.
Mounting Style	Shelf
Certification	FCC

1 (C) 900 MHz Serial/Ethernet Spread Spectrum Radio

2 Furnish 902 – 928 MHz Serial/Ethernet Spread Spectrum Radios that comply with Table
3 1098-5.

TABLE 1098-5 SERIAL/ETHERNET SPREAD SPECTRUM RADIO REQUIREMENTS	
Frequency Range	902 – 928 MHz
Technology	Frequency Hopping Spread Spectrum
Operational Modes	master; repeater; repeater/slave; slave; point-to-point; point-to-multipoint; peer-to-peer
Operating Voltage	Power Cube: 6 – 30 VDC
Operating Temperature/Humidity	-40°C to +75°C; 0 to 95% non-condensing
Transmitter	
Output Power	1Watt (Max)
Modulation	Frequency Shift Keying
Hopping Patterns /Channels	Minimum of 15/Minimum of 25
Occupied Bandwidth	402.8 kHz
Data Rate(over the air)	867Kbps
Receiver	
Sensitivity	-100 dBm @ 10 ⁶ BER @ 614Kbps OR -100 dBm @ 10 ⁴ BER @ 1.1 Mbps
Data Transmission	
Error Detection	32 Bit CRC, retransmit on error
Data Encryption	128-bit
Authentication	Radius Compliant
System Gain	130 dB
LED's	
Signal Strength Indicators	Data Port Indicators consisting of a minimum of 3 LED's grouped together representing a Low, Medium or High Signal Strength with regards to the communications link with another targeted radio. Units must be supplied with external labels to identify how to interpret the Signal Strength. OR Combinations of the Front Panel LED indications with flashing rates and LED Colors can be used to identify the signal strength. Units must be supplied with external labels to identify how to interpret the Signal Strength.
Front Panel Indicators	Power COM 1 COM 2 OR Carrier Detect Transmit Clear to Send
Management & Network Protocols	HTTP, SNMP, Local Console, IP Auto Discover

Section 1098

Data Interface	
Interface Cable	Type 1 or Type 2 or Type 3 (If not specified in the Plans, furnish a Type 1 Data Interface Cable)
Antenna	Threaded Connector (Nickel and/or Silver Plated Brass)
Port to Connected Devices	Serial - Dual - DB 9 Female Ports: RS232/422/485 Ethernet: RJ-45 (10/100 BaseT, auto crossover)
Network Protocols	IEEE 802.3; HTTP, TCP, UDP, ARP, ICMP, FTP
Radio Frequency Signal Jumper	RG-58 coaxial cable (6' long) with one end supplied with RF Threaded Connector that is compatible with the supplied radio. The other end furnished with a Standard N-Type Male Connector to mate with the lightning arrester.
Certification	FCC

1 (D) Software

2 Furnish units with a Field Set-up Software. The Field Set-up Software shall be a
3 Window Based™ software program that uses a GUI (Graphical User Interface) to provide
4 the following features at a minimum: remote programming, remote radio configuration,
5 remote maintenance, remote diagnostics and a spectrum analyzer.

6 Furnish software supplied with drivers to allow easy set-up with all industry standard
7 traffic signal controllers, including 2070L/2070E controllers containing custom software
8 written specifically for the North Carolina Department of Transportation. Manufacturer
9 is required to develop additional drivers (at no charge) for other equipment not supported
10 by their existing pre-written Driver Package when needed. Drivers may be needed for
11 other equipment such as industry standard radar and video detection packages, and
12 Dynamic Message Sign controllers.

13 (E) 900 MHz Data Interface Cables

14 Furnish "Data Interface Cables" for installation with 2070L/2070E Type Controllers for
15 the following applications:

16 *900 MHz Data Interface Cable (Type 1)*

17 Application: Standard RS-232 data interface cable to be installed between the
18 Controller's RS-232 interface and the radio modem. Radio Modem can be
19 programmed as either a Master of Local Radio.

21 *900 MHz Data Interface Cable (Type 2)*

22 Application: Master Controller's RS-232 data interface connected to a fiber system
23 modem and Radio Modem with master programming.

25 *900 MHz Data Interface Cable (Type 3)*

26 Application: Local Controller's RS-232 data interface connected to a fiber system
27 modem and Radio Modem with master programming.

29 Ensure that the Data Interface Cables are compatible with all 1999 and 2002 and greater
30 Transportation Electrical Equipment Specifications "TEES", and 2070L/2070E compliant
31 controllers. Ensure cable is a minimum of 6 feet long.

32 (F) Directional Antenna (Yagi)

33 Furnish a directional antenna of welded construction that allows for vertical and
34 horizontal polarization.

35 Furnish mounting hardware with the antenna that will secure the antenna to a mounting
36 pipe that has a 1 1/2 inch Nominal Pipe Size (approximately 2 inches OD pipe diameter),
37 as recommended by the manufacturer of the antenna and as approved by the Engineer.

- 1 Furnish an 8.5 dBd. (11 dBi) Gain or 13 dBd (15.1 dBi) Gain antenna that complies with
 2 Table 1098-6 and Table 1098-7:

TABLE 1098-6	
900 MHz - YAGI ANTENNA - (8.5 dBd / 11 dBi Gain)	
Property	Requirement
Frequency Range	896 - 940 MHz
Nominal Gain	8.5 dBd / 11 dBi
Front to Back Ratio	18 dB
Horizontal Beamwidth (at half power points)	65 degree
Vertical Beamwidth (at half power points)	55 degree
Power Rating, UHF Frequency	200 Watts
Lightning Protection	DC Ground
Termination	Coaxial pigtail with a Standard N-Type Female Connector
Impedance	50 Ω
Rated Wind Velocity	125 mph
Rated Wind Velocity (with 0.5" radial ice)	100 mph
Projected Wind Surface Area (flat plane equivalent)	0.26 ft/sq
Number of Elements	6
Allows for vertical or Horizontal polarization	Yes
Welded construction	Yes

TABLE 1098-7	
900 MHz - YAGI ANTENNA – (13 dBd / 15.1 dBi Gain)	
Property	Requirement
Frequency Range	902 - 928 MHz
Nominal Gain	13 dBd / 15.1dBi
Front to Back Ratio	20 dB
Horizontal Beam width (at half power points)	40 degree
Vertical Beam width (at half power points)	35 degree
Power Rating, UHF Frequency	200 Watts
Lightning Protection	DC Ground
Termination	Coaxial pigtail with a Standard N-Type Female Connector
Impedance	50 Ω
Length (approx..)	53"
Rated Wind Velocity	125 mph
Rated Wind Velocity (with 0.5" radial ice)	100 mph
Projected Wind Surface Area (flat plane equivalent)	0.46 ft/sq
Number Elements	13
Allows for Vertical or Horizontal polarization	Yes
Welded construction	Yes

3 **(G) Omnidirectional Antenna**

- 4 Furnish an omnidirectional antenna of a solid, single piece construction.
- 5 Furnish mounting hardware with the antenna that will secure the antenna to a mounting
 6 pipe that has a 1 1/2 inch Nominal Pipe Size (approximately 2 inches OD pipe diameter),
 7 as recommended by the manufacturer of the antenna and as approved by the Engineer.

Section 1098

- 1 Furnish a 3 dBd (5 dBi) Gain or 6 dBd (8.1 dBi) Gain antenna that complies with Table
2 1098-8 and Table 1098-9:

Property	Requirement
Frequency Range	902 - 928 MHz
Nominal Gain	Typical gains of 3 or 6 dBd (dependent upon gain needed for application)
Termination	Standard N-Type Female Connector
Impedance	50 ohms
VSWR	1.5:1
Vertical Beam Width	33 degrees (3dBd Gain), 17 degrees (6dBd Gain)
Lightning Protection	DC Ground
Power Rating, UHF Frequency	100 Watts
Length	25" (3dBd Gain), 65" (6dBd Gain)
Rated Wind Velocity	125 mph

Property	Requirement
Frequency Range	902 - 928 MHz
Nominal Gain	6 dBd / 8.1dBi
Termination	Standard N-Type Female Connector
Impedance	50 Ω
VSWR	1.5:1
Vertical Beam Width	17 degrees
Lightning Protection	DC Ground
Power Rating, UHF Frequency	100 Watts
Rated Wind Velocity	125 mph
Solid, single piece construction	Yes
Mount in a vertical direction and limit to vertically polarized RF systems	Yes

3 **(H) Antenna Mounting Hardware Kit**

- 4 Furnish an antenna mounting kit to support the antenna when attached to a metal pole,
5 mast arm or wood pole.

- 6 Ensure the Antenna Mounting Hardware Kit includes at least one 96 inch galvanized
7 steel cable with a stainless steel bolt, nut and lock washer assembly on each end. Ensure
8 the pole base plate accepts a 1 1/2 inch NPT aluminum pipe, and provides a surface that
9 is at least 6 3/4 inches long x 4 1/4 inches to provide contact with the pole. Ensure the
10 pole base plate is designed to allow both ends of the 96 inch galvanized cables to be
11 secured and tightened to the base plate. Provide a 90 degree elbow with internal threads
12 on both ends to accommodate 1 1/2 inch NPT aluminum pipes. Provide a 1 1/2 inch x
13 18 inch long aluminum pipe threaded on both ends and a 1 1/2 inch x 24 inch aluminum
14 pipe threaded on one end with an end cap.

1 **(I) Coaxial Cable**

2 Furnish 400 Series coaxial cable to provide a link between the antenna and the lightning
3 arrestor that comply with Table 1098-10.

TABLE 1098-10 PROPERTIES AND REQUIREMENTS OF COAXIAL CABLE	
Property	Requirement
Attenuation (dB per 100 ft) @ 900 MHz	3.9 dB
Power Rating @ 900 Mhz	0.58 kW
Center Conductor	0.108" Copper Clad Aluminum
Dielectric: Cellular PE	0.285"
Shield (approx.)	Aluminum Tape - 0.291" Tinned Copper Braid - 0.320"
Jacket	Black UV protected polyethylene
Bend Radius	1"
Impedance	50 Ω
Capacitance	23.9 pf/ft
Water Blocking	Yes
Supply Coaxial Cable on 500 ft Reel	Yes

4 **(J) Standard N-Type Male Connector**

5 Furnish Standard N-Type Male Connector(s) of proper sizing to mate with the 400 series
6 coaxial cable and use a crimping method to secure the connector to the coaxial cable.
7 Furnish a connector that complies with Table 1098-11.

TABLE 1098-11 REQUIREMENTS OF STANDARD N-TYPE MALE CONNECTOR	
Description	Requirement
Center Contact	Gold Plated Beryllium Copper (spring loaded – Non-solder)
Outer Contact	Silver Plated Brass
Body	Silver Plated Brass
Crimp Sleeve	Silver Plated Copper
Dielectric	Teflon PTFE
Water Proofing Sleeve	Adhesive Lined Polyolefin – Heat Shrink
Attachment Size	Crimp Size 0.429" (minimum) hex
Electrical Property	Requirement
Impedance	50 Ω
Working Voltage	Yes
Insertion loss	Yes
VSWR	

8 **(K) Coaxial Cable Shield Grounding and Weatherproofing Kits**

9 (1) Furnish a Coaxial Cable Shield Grounding Kit containing components that will
10 adequately bond and ground the cable shield to the pole ground. Ensure the
11 grounding kit complies with MIL-STD-188-124A for coaxial cable and protects the
12 cable from lightning currents of at least 200kA. Ensure each kit is supplied, as
13 a minimum, with the following:

Section 1098

- 1 (a) Preformed Strap: 24 Gauge copper strap that is at least 1 5/8 inch long and is
- 2 sized to mate with the 400 series coaxial cable
- 3 (b) Tensioning Hardware: Copper nuts and lock washers
- 4 (c) Grounding Lead Cable: #6 AWG, stranded, insulated copper wire
- 5 (2) Furnish a Weatherproofing Kit containing components that will protect the coaxial
- 6 cable shield grounding system against the ingress of moisture and prevent vibrations
- 7 from loosening the connections. Ensure the weatherproofing kit is supplied, as
- 8 a minimum, with the following:
- 9 (a) Butyl Mastic Tape: 3 3/4 inches wide by 24 inches long (approximately)
- 10 (b) Electrical Tape: 2 inches wide by 20 inches long (approximately)

(L) Lightning Arrestor

12 Furnish a lightning arrestor installed in line between each antenna and its designated
13 radio modem inside the equipment cabinet in accordance with Table 1098-12. Furnish
14 lightning arrestor with multistrike capability, low strike throughput energy, flange mount
15 and bulkhead mount options and a standard N-Type female connector on both the
16 surge-side and protected-side connectors.

**TABLE 1098-12
PROPERTIES OF LIGHTNING ARRESTOR**

Property	Requirement
Surge (8/20 μ s Waveform) Maximum Strike Multiple Strike	40kA Max 20kA Multiple
Frequency Range	698MHz to 2.7GHz
Return Loss/VSWR	\leq -26dB (VSWR \leq 1.11:1)
Insertion Loss	\leq 0.1 dB over frequency range
Continuous Power	500 w @ 920MHz (750 W at 122° F)
Let Through Voltage	\leq \pm 200m Volts for 3kA @ 8/20 μ s Waveform
Throughput Energy	\leq 0.5 nJ for 3kA @ 8/20 μ s Waveform
Temperature	-40 to 185° F Storage/Operating 122° F
Vibration	1G at 5 Hz up to 100Hz
Unit Impedance	50 Ω
Standard N-Type Female Connector	On both the surge side and protected side connectors
Installation	Bi-Directional
Mounting	Bulkhead bracket with O-Ring, Lock Washer and Nut

(M) Coaxial cable – Power Divider (Splitter)

18 Furnish a coaxial cable power divider for repeater radio sites in accordance with
19 Table 1098-13. Ensure the power divider accommodates a single primary input RF
20 source and divides/splits the signal (power) equally between two output ports.

TABLE 1098-13 PROPERTIES OF COAXIAL CABLE - POWER DIVIDER	
Property	Requirement
Power Division	2 - Way
Frequency	900 - 1100 MHz
Insertion Loss	0.22 dB
Impedance	50 Ω
VSWR ref. to 50 Ohm (max)	1.3:1
Max. Input Power	500 Watts
Connectors	Standard N-Type Female

1 **(N) Disconnect Switch**

2 Furnish a double pole, single throw snap switch in a weatherproof outlet box with cover,
 3 suitable for use in wet locations. Ensure outlet box and cover supports a lockout tag
 4 device. Ensure outlet box includes one 1/2 inch diameter hole in back of box. Furnish
 5 mounting hardware, sealing gaskets and lockout tag.

6 **(O) Warning Signs and Decal**

7 Furnish "RF Warning Sign" and "Decal" at locations called for in the plans. Furnish
 8 mounting hardware to secure the sign to either metal or wood poles."

DIVISION 11

WORK ZONE TRAFFIC CONTROL

SECTION 1101

WORK ZONE TRAFFIC CONTROL GENERAL REQUIREMENTS

1101-1 TRANSPORTATION MANAGEMENT PLAN (TMP)

Maintain traffic through work zones in accordance with these Specifications, the MUTCD, *Roadway Standard Drawings*, 23 CFR 630 Subparts J and K and the Transportation Management Plan (TMP).

Below is a list of the possible TMP components:

- (A) Temporary Traffic Control Plan (TTC),
- (B) Transportation Operations Plan (TO), and
- (C) Public Information Plan (PI).

A TMP will always have a TTC component. The TTC will contain the project notes, phasing, detail sheets and other supporting information typically found in a TMP, per *TMP Guidelines* found on the Department's web site.

1101-2 TEMPORARY TRAFFIC CONTROL PLAN (TTC)

(A) General

Typically, phasing and drawings govern over project notes, and local notes govern over general notes. If a conflict arises in the TTC, refer to Article 105-4.

(B) Phasing

Complete the requirements of each phase before proceeding to the next phase and the requirements of each step before proceeding to the next step, unless the plans permit work to be performed concurrently.

If a TTC phasing is broken into areas, work may be performed in more than one area simultaneously as described in the plan.

(C) Project Notes

Two types of project notes may be included in the TTC:

- (1) General Notes apply at all times during the project, and
- (2) Local Notes apply only for the specific times and locations that they are referred to in the phasing and detail sheets.

(D) Alternate to Transportation Management Plan

If desired, submit an alternate TMP a minimum of 30 calendar days in advance of the anticipated implementation to allow for adequate review time. Do not implement alternate plans for traffic control until approved in writing and properly sealed. No adjustment in compensation or extension of the completion date(s) will be allowed due to the review time of the alternate. If an alternate TMP is implemented, the Contractor shall be responsible for any unanticipated changes to subsequent phases and steps.

Section 1101

1 (E) Temporary Traffic Control Plan Not Fully Covered in the Contract

2 When the TTC does not cover a particular work function, notify the Engineer to allow for
3 the development or modification of a sealed set of the Temporary Traffic Control Plans.

4 1101-3 BLASTING ZONE

5 When blasting operations are within 1,000 feet of a travelway, provide the appropriate traffic
6 control as shown in the plans and/or the *Roadway Standard Drawings*.

7 1101-4 CONSTRUCTION VEHICLE CROSSINGS

8 Do not cross the median, ramps or loops with vehicles or equipment unless a specific location
9 for crossing is approved and required traffic control devices are used as shown in the
10 *Roadway Standard Drawings*.

11 1101-5 ON-ROAD CONSTRUCTION VEHICLES

12 When operating outside of a closed lane or haul road crossing in a work zone, on-road
13 construction vehicles are subject to the Department's Division of Motor Vehicle weight and
14 safety regulations as commercial vehicles. Work vehicles must always use warning lights
15 with at least 50% being amber in color attached to the vehicle as high as possible and in a
16 manner such that they are not obscured by equipment or supplies. Vehicle hazard signals or
17 lights may be used to supplement this requirement. This requirement applies to all work
18 vehicles and equipment not inside lane closures or behind barriers. This requirement does not
19 apply to dump trucks but it is encouraged.

20 1101-6 EXCAVATIONS WITHIN TRAVELWAY

21 During the process of excavating in a travelway where traffic is to be later maintained, make
22 provisions to backfill and repair any excavated or damaged pavement before allowing traffic
23 to proceed over the affected lanes. In low speed areas (35 mph or less), metal plates may be
24 used to cover excavated areas.

25 1101-7 HAULING OPERATIONS

26 Comply with the multiple and single vehicle hauling restrictions as shown in the TMP when
27 performing hauling of equipment or materials to or from the project.

28 Define "Multiple Vehicle Hauling" as the hauling of equipment or materials to or from the
29 project with delivery at intervals of less than 5 minutes or results in more than one vehicle at
30 a particular work site at a time.

31 Define "Single Vehicle Hauling" as the hauling of equipment or materials to or from the
32 project with delivery at intervals of more than 5 minutes and results in no more than one
33 vehicle at a particular work site at a time.

34 1101-8 MATERIAL AND EQUIPMENT STORAGE

35 When work is not in progress, keep all personnel, equipment, machinery, tools, construction
36 debris, materials and supplies at least 40 feet away from active travel lanes. When vehicles,
37 equipment and materials are protected by concrete barrier or guardrail, they shall be offset at
38 least 5 feet from the barrier or guardrail.

39 1101-9 PARKING OF PERSONAL VEHICLES

40 Provide staging areas for personal vehicle parking a safe distance, at least 40 feet, from open
41 travel lanes or as directed by the Engineer before use..

42 1101-10 PROTECTION OF HAZARDS

43 Mark all hazards with signs, barricades, drums or other warning devices.

44 At each location where work is started which creates a safety hazard, continue the work until
45 completed to the extent that the safety hazard is eliminated. If the work is not pursued in

1 a continuous manner the Engineer will not allow any other work on the project to be
2 performed until the existing safety hazard is eliminated.

3 **1101-11 TEMPORARY LANE CLOSURES**

4 **(A) General**

5 Operate all equipment and personnel within the designated work area during lane
6 closures. Do not impede or stop traffic for the purpose of performing construction related
7 work on the traffic side of the lane closure, except when called for in the TMP.

8 Install lane closures with the traffic flow, beginning with devices on the upstream side of
9 traffic. Remove lane closures against the traffic flow, beginning with devices on the
10 downstream side of traffic.

11 Vehicles used to install or remove lane closures shall have vehicle warning lights as
12 described in 1101-5.

13 **(B) Intersections**

14 When construction proceeds through an intersection, provide flaggers and all other
15 necessary traffic control as required by the TMP to direct the traffic through the
16 intersection. When an intersection is signalized, place the signal in flash mode and
17 provide law enforcement or other adequate traffic control measure to direct traffic
18 through the intersection before beginning work in the intersection.

19 **1101-12 TEMPORARY ROAD CLOSURES**

20 **(A) Traffic Pattern Alterations**

21 Notify the Engineer 30 calendar days before altering the existing traffic pattern, unless
22 otherwise stated in the TMP.

23 Plan all traffic pattern alterations and meet with the Engineer to discuss the
24 implementation strategy before altering traffic. The Engineer will notify the proper
25 authorities and other affected parties as necessary.

26 **(B) Detour**

27 Ensure that all required detour signing and delineation, including work done by others,
28 are in place before placing traffic onto a detour.

29 **(C) Traffic Stoppage**

30 Limit the stoppage of traffic to times specified in the TMP. Provide time between
31 consecutive stoppages to allow the traffic queue to deplete.

32 **1101-13 TRAFFIC CONTROL SUPERVISION**

33 Provide the service of at least one qualified work zone supervisor. The work zone supervisor
34 shall have the overall responsibility for the proper implementation of the TMP and ensure all
35 employees working inside the NCDOT right of way have received the proper training
36 appropriate to the job decisions each individual is required to make.

37 The work zone supervisor is not required to be on site at all times but shall be available to
38 address concerns of the Engineer. The name and contact information of the work zone
39 supervisor shall be provided to the Engineer prior to or at the preconstruction conference.

40 Qualification of work zone supervisors shall be done by an NCDOT approved training agency
41 or other approved training provider. For a complete listing of these, see the Work Zone
42 Traffic Control's webpage.

43 Coordinate with and cooperate with work zone supervisors of adjacent or overlapping
44 construction projects to ensure safe and adequate traffic control is maintained throughout the

Section 1105

1 projects at all times including periods of construction inactivity in accordance with
2 Article 105-7.

3 1101-14 VEHICULAR ACCESS

4 Maintain continuous and safe vehicular access, including but not limited to, all residences,
5 businesses, schools, police and fire stations, hydrants, other emergency services, hospitals and
6 mailboxes. Conduct operations so as to limit the inconvenience to property owners.

7 1101-15 PEDESTRIAN ACCESS

8 Maintain pedestrian access at all times as shown in the TMP. When existing pedestrian
9 facilities are disrupted, closed or relocated, provide temporary facilities that are detectable and
10 include accessibility features consistent with the features present in the existing pedestrian
11 facility. The work zone supervisor is responsible for the implementation of the TMP, and
12 installation and maintenance of the pedestrian devices. The work zone shall be inspected
13 weekly or as directed by the Engineer. When pedestrian movement through or around a work
14 zone is necessary, provide a separate usable footpath. If the previous pedestrian facility was
15 accessible to pedestrians with disabilities, provide a footpath during temporary traffic control
16 that is comparable. Do not have any abrupt changes in grade or terrain that could cause a
17 tripping hazard or could be a barrier to wheelchair use. Provide channelizing devices that are
18 detectable to pedestrians who have visual disabilities. Provide temporary pedestrian facilities
19 that are made of concrete, asphalt or other suitable material as approved by the Engineer, at
20 all locations where the existing sidewalks have been removed for construction operations.

21 Do not sever or move pedestrian facilities for non-construction activities such as parking for
22 vehicles and equipment. Separate pedestrian movements from both work zone activity and
23 vehicular traffic.

SECTION 1105 TEMPORARY TRAFFIC CONTROL DEVICES

26 1105-1 DESCRIPTION

27 Furnish, install, maintain, relocate and remove temporary traffic control devices. All
28 temporary traffic control devices furnished by the Contractor shall remain the property of the
29 Contractor, unless otherwise specified in the contract.

30 1105-2 MATERIALS

31 Refer to Division 10.

32 Provide temporary traffic control devices that are listed on the NCDOT Approved Product
33 List.

34 1105-3 CONSTRUCTION METHODS

35 Ensure all temporary traffic control devices are inspected and approved before using them on
36 the project. Install temporary traffic control devices before construction operations begin and
37 during the proper phase of construction. Maintain and relocate temporary traffic control
38 devices during the time they are in use. Keep these devices in place as long as they are
39 needed and immediately remove thereafter. When operations are performed in stages, install
40 only those devices that apply to the present conditions.

1105-4 MAINTENANCE AND INSPECTION

Submit a proposed traffic control device maintenance schedule and checklist for approval before construction. Perform continuous maintenance and daily scheduled inspections of temporary traffic control devices. Review and maintain all traffic handling measures to ensure that adequate provisions are in place for public and workers' safety.

Maintenance activities include cleaning, repair, or replacement, and prompt disposal of temporary traffic control devices that are damaged, torn, crushed, discolored, displaced or deteriorated beyond effectiveness.

Replace work zone traffic control devices deemed unacceptable according to the guidelines set forth in the American Traffic Safety Service Association's (ATSSA) Quality Guidelines for Work Zone Traffic Control Devices.

If the name and telephone number of the agency, Contractor or supplier is shown on the non-retroreflective surface of all channelizing devices, use letters and numbers that are non-reflective and not over 2 inches in height.

1105-5 FAILURE TO MAINTAIN TRAFFIC CONTROL

Failure to maintain acceptable traffic control measures or temporary traffic control devices may result in formal notification of noncompliance. Implement remedial action immediately for imminent danger situations as directed by the Engineer. Implement remedial action within 48 hours after notification of a safety issue that is not an imminent danger. See Articles 107-21 and 108-7.

Failure to comply may result in having the work performed with available forces and equipment. In cases of willful disregard for the safety of the public, the Engineer may proceed immediately to implement the measures necessary to provide the appropriate level of traffic control to ensure that the safety of all concerned parties is maintained.

1105-6 MEASUREMENT AND PAYMENT

Payment at the contract unit prices for the various items in the contract will be full compensation for all work covered by this specification.

If the Contractor fails to maintain acceptable traffic control measures or temporary traffic control devices and the Engineer implements measures necessary to provide the appropriate level of traffic control, the actual cost of performing said work will be deducted from the monies due the Contractor on the contract.

SECTION 1110 WORK ZONE SIGNS

1110-1 DESCRIPTION

Furnish, install, maintain, temporarily cover and uncover, relocate and remove stationary and barricade mounted work zone signs in accordance with the contract.

Furnish, install, maintain and relocate portable work zone signs and portable work zone sign stands in accordance with the plans and the *Standard Specifications*. When portable work zone signs and portable work zone sign stands are not in use for periods longer than 30 minutes, collapse or remove sign stands and reinstall once work begins again.

1110-2 MATERIALS

Refer to Division 10.

Item	Section
Barricade Mounted Signs	1089-3
Work Zone Signs	1089-1
Work Zone Sign Supports	1089-2

Section 1110

1 Portable work zone signs shall be roll up or approved composite substrates. Use portable
2 work zone signs only with portable work zone sign stands specifically designed for one
3 another.

4 Provide portable work zone sign stands, portable signs and sheeting that meet NCHRP 350 for
5 Category II temporary traffic control devices and are listed on the NCDOT APL.

6 Provide portable work zone signs and stands that are crash tested together as a system by the
7 manufacturer. Poor performance of portable work zone signs or portable work zone sign
8 stands at any site, whether or not related to a specific contract, will be grounds for
9 non-acceptance of a product on any project under contract.

10 **1110-3 CONSTRUCTION METHODS**

11 **(A) Work Zone Signs (Stationary)**

12 All stationary Advance/General warning work zone signs require notification to existing
13 utility owners per Article 105-8 within 3 to 12 working days prior to installation.

14 Install work zone signs (stationary) to stand within 2° of plumb in all directions and
15 under all conditions. Erect signs per *Roadway Standard Drawings*.

16 Splicing of work zone sign (stationary) posts is acceptable. Splice work zone sign
17 (stationary) posts according to *Roadway Standard Drawings*. Remove entire post when
18 removing signs with spliced posts.

19 When required, cover work zone signs with an opaque material that prevents reading of
20 the sign at night by a driver using high beam headlights. Use material that does not
21 damage the sign sheeting.

22 Any damage incurred from the covering of work zone signs will be determined using
23 Article 901-5. Replace or repair any damaged signs due to the covering.

24 **(B) Work Zone Signs (Barricade Mounted)**

25 Mount approved composite or roll up signs to barricade rails so the signs do not cover
26 more than 50% of the top 2 rails or 33% of the total area of the 3 rails. Mount signs at
27 least one foot from the ground to the bottom of the sign.

28 **(C) Work Zone Signs (Portable)**

29 Install the portable work zone sign and sign stand to stand plumb within 10° left and
30 right, within 20° front and back and be capable of standing erect in windy conditions.

31 Install roll up or approved composite signs at least one foot from the bottom of the sign to
32 the edge of pavement elevation on two-lane two-way roadways. Install roll up or
33 approved composite signs at least 5 feet from the bottom of the sign to the edge of
34 pavement elevation on multi-lane roadways.

35 Clean the sign face before use.

36 When not in use for periods longer than 30 minutes, lay the portable work zone sign flat
37 on the ground and collapse the sign stand and lay it flat on the ground.

38 **1110-4 MEASUREMENT AND PAYMENT**

39 Nominal dimensions will be used to compute the sign panel areas.

40 *Work Zone Signs (Stationary)* will be measured and paid as the actual number of square feet
41 satisfactorily installed at each location and accepted by the Engineer. Where a particular sign
42 is used at more than one location, measurement will be made at each location.

43 *Work Zone Signs (Barricade Mounted)* will be measured and paid as the actual number of
44 square feet satisfactorily installed on barricades and accepted by the Engineer. Payment will

1 be made for the initial installation only. Relocation of signs will be incidental to the
 2 measurement of the quantity of signs.

3 *Work Zone Signs (Portable)* will be measured and paid as the actual number of square feet
 4 satisfactorily installed and accepted by the Engineer. Payment will be made for the initial
 5 installation only. Relocation of signs will be incidental to the measurement of the quantity of
 6 signs.

7 No direct payment will be made for stationary work zone sign supports or portable work zone
 8 sign stands. All stationary work zone sign supports or portable work zone sign stands will be
 9 incidental to the work of providing work zone signs.

10 Payment will be made under:

Pay Item	Pay Unit
Work Zones Signs (Stationary)	Square Foot
Work Zones Signs (Barricade Mounted)	Square Foot
Work Zones Signs (Portable)	Square Foot

11 **SECTION 1115**
 12 **FLASHING ARROW BOARDS**

13 **1115-1 DESCRIPTION**

14 Furnish, install, operate, maintain, relocate and remove arrow boards.

15 **1115-2 MATERIALS**

16 Refer to Division 10.

Item	Section
Flashing Arrow Boards	1089-6

17 Use arrow boards listed on the NCDOT APL.

18 Poor performance of arrow boards at any site, whether or not related to a specific contract,
 19 will be grounds for non-acceptance of a product on any project under contract.

20 **1115-3 CONSTRUCTION METHODS**

21 Use arrow boards that have the capability to display mode selections.

22 Do not use straight-line caution or chevron displays.

23 Mount flashing arrow boards on trucks, trailers or other mobile units.

24 Expedite repairs due to failure, malfunction or damage to an arrow board. Furnish another
 25 arrow board approved by the Engineer during the repair time. Repair or replace arrow boards
 26 immediately; otherwise, suspend all construction activities requiring the use of the arrow
 27 board until the arrow board is restored to operation.

28 Perform all maintenance operations recommended by the manufacturer of the arrow board.

29 **1115-4 MEASUREMENT AND PAYMENT**

30 *Flashing Arrow Board* will be measured and paid as the maximum number of arrow boards
 31 satisfactorily placed and accepted by the Engineer in use at any one time during the life of the
 32 project as required by the contract.

33 Flashing arrow boards installed on truck mounted attenuators (TMAs) will not be paid for
 34 separately as they are incidental to the cost of the TMA.

35 Replacement, repair and maintenance of arrow boards will be incidental to the work of this
 36 section.

Section 1120

1 Payment will be made under:

Pay Item

Flashing Arrow Board

Pay Unit

SECTION 1120

PORTABLE CHANGEABLE MESSAGE SIGNS

1120-1 DESCRIPTION

Furnish, install, operate, maintain, relocate and remove portable changeable message signs.

1120-2 MATERIALS

Refer to Division 10.

Item

Portable Changeable Message Signs

Section

1089-7

Use portable changeable message signs listed on the NCDOT APL.

Poor performance of portable changeable message signs at any site, whether or not related to a specific contract, may be grounds for non-acceptance of a product on any project under contract.

1120-3 CONSTRUCTION METHODS

Mount all portable changeable message signs on a trailer or truck so as to support the message board in a level position and in accordance with the plans. Align and sight the portable changeable message sign to provide optimal driver visibility. Messages on a portable changeable message sign shall consist of no more than 2 phases, and a phase shall consist of no more than 3 lines of text. Each phase shall be capable of being understood by itself, regardless of the order in which it is read. Messages shall be centered and uppercase within each line of the legend. If more than one portable changeable message sign is simultaneously legible to road users, then only one of the signs shall display a sequential message at any given time. As guidance, the display time for each phase shall be at least 2 seconds, and the sum of the display times for both of the phases shall be no more than 8 seconds. Sign operator will adjust the display rate so the 2 phase message can be understood by the motorist twice when approaching the sign at the posted speed limit. Relocate the units for the various stages of construction as shown in the plans or as needed to inform the motorists.

Provide an experienced operator for the portable changeable message sign during periods of operation to ensure that the messages displayed on the sign panel are in accordance with the plans and Article 1089-7(D). Periodically change the controller password to deter unauthorized programming. Using two levels of password security is recommended such that operators at one level may only change message sequences displayed using preprogrammed sequences and operators at a higher level may create and store messages or message sequences.

Ensure that the message sign is illuminated properly to meet the existing light conditions, and that all adjustments for operation of the sign are made as needed to properly guide motorists.

Expedite repairs due to failure, malfunction or damage to a portable changeable message sign. Furnish another changeable message sign during the repair time. Repair or replace portable changeable message sign immediately; otherwise, suspend all construction activities requiring the use of the sign until the sign is restored to operation.

1 Perform all maintenance operations recommended by the manufacturer of the sign.
 2 Periodically clean or replace the sign face panels and associated solar panels.

3 **1120-4 MEASUREMENT AND PAYMENT**

4 *Portable Changeable Message Signs* will be measured and paid as the maximum number of
 5 portable changeable message signs acceptably placed and in operation, at any one time during
 6 the life of the project. Payment for *Portable Changeable Message Signs* will be made on the
 7 following schedule:

- 8 (A) 70% of the unit bid upon placing the unit in service,
- 9 (B) 20% of the unit bid when the project is 50% complete, and
- 10 (C) 10% of the unit bid when the project is 100% complete.

11 *Portable Changeable Message Signs (Short Term)* will be measured and paid as the actual
 12 number of days the portable changeable message sign (short term) is used on a project for
 13 a specific work operation, removed from the project after the specific operation is complete
 14 and remains in use on the project no longer than 30 days.

15 Replacement, repair and maintenance of changeable message signs will be incidental to the
 16 work of this section.

17 Payment will be made under:

Pay Item	Pay Unit
Portable Changeable Message Sign	Each
Portable Changeable Message Sign (Short Term)	Day

18 **SECTION 1130**
 19 **DRUMS**

20 **1130-1 DESCRIPTION**

21 Furnish, install, maintain, relocate and remove drums with ballast.

22 **1130-2 MATERIALS**

23 Refer to Division 10.

Item	Section
Drums	1089-5

24 Provide drums listed on the NCDOT APL.

25 **1130-3 CONSTRUCTION METHODS**

26 Use the same type of retroreflective sheeting on all drums installed at any one time during the
 27 life of the project. Spacing of these devices is equal in feet to the speed limit in the taper and
 28 twice the speed limit in the tangent sections.

29 Use a ballasting method in accordance with manufacturer’s specification. When using a tire
 30 ballasting method, use approved manufacturer’s tires and place the tires flush with the ground.

31 Immediately replace and dispose of any drum, ballast or reflective sheeting that are torn,
 32 crushed, discolored or otherwise damaged.

33 **1130-4 MEASUREMENT AND PAYMENT**

34 *Drums* will be measured and paid as the maximum number of drums acceptably placed and in
 35 use at any one time during the life of the project.

36 Relocation, replacement, repair or disposal of drums, ballasts or reflective sheeting will be
 37 incidental to the work of this section.

Section 1135

1 Payment will be made under:

Pay Item	Pay Unit
Drums	Each

**SECTION 1135
CONES**

4 **1135-1 DESCRIPTION**

5 Furnish, install, relocate, maintain and remove cones and reflective cone collars.

6 **1135-2 MATERIALS**

7 Refer to Division 10.

Item	Section
Cones	1089-4

8 Provide cones listed on the NCDOT APL.

9 **1135-3 CONSTRUCTION METHODS**

10 Use retroreflective adhesive sheeting on all cones used between dusk and dawn. Use the
11 same type of retroreflective sheeting on all cone collars installed at any one time during the
12 life of the project. Do not use cones in the upstream taper of lane or shoulder closures for
13 multi-lane roadways. Do not use cones for longer than 3 consecutive days.

14 Use ballasting methods in accordance with manufacturer’s specification.

15 Cones may be used on all facilities for daytime and nighttime work with speed limits at or
16 below 55 mph. If used at night, the cones shall have adhesive retroreflective sheeting and
17 shall meet the height requirements in the *Roadway Standard Drawings*.

18 Cones may be used instead of drums, where allowed in the TMP or by the Engineer, on
19 facilities with speed limits above 55 mph, if both the work is performed during daylight
20 conditions and the devices are removed after each work period. Drums shall be used in the
21 tapers.

22 The maximum spacing for cones on multi-lane roadways is equal in feet to the posted speed
23 limit.

24 Immediately replace and dispose of any cone that is torn, crushed, discolored or otherwise
25 damaged.

26 **1135-4 MEASUREMENT AND PAYMENT**

27 *Cones* will be measured and paid as the maximum number of cones acceptably placed and in
28 use at any one time during the life of the project.

29 Relocation, replacement, repair, maintenance or disposal of cones will be incidental to the
30 work of this section.

31 Payment will be made under:

1145-1 DESCRIPTION

Furnish, install, maintain, relocate, ballast and remove barricades.

1145-2 MATERIALS

Refer to Division 10.

Item	Section
Barricades	1089-3

Provide barricades that meet NCHRP 350 for Category II traffic control devices and listed on the NCDOT APL.

1145-3 CONSTRUCTION METHODS

Install Type III barricades of sufficient length to close the entire roadway. Reposition the devices as necessary to completely close the roadway to traffic at the end of the workday.

Use sandbags or other approved ballasting methods to prevent overturning of barricades by the wind. If needed, place sandbags or other acceptable ballasting on the feet of the frame. Do not ballast barricades with objects such as rocks or chunks of concrete.

Do not anchor barricades to any pavement surfaces unless such anchoring method has passed the crash test requirement of NCHRP 350 for work zone category II devices.

Point the striped diagonals on the barricade rails in the direction of traffic flow.

1145-4 MAINTENANCE

Periodically inspect barricades and ballast. Replace any ballast as needed, including sandbags that have loose sand outside the bag.

1145-5 MEASUREMENT AND PAYMENT

Barricades (Type III) will be measured and paid as the maximum number of linear feet of barricades acceptably placed and in use at any one time during the life of the project. Measurement will be made of the total length of each barricade along one rail.

Relocation, replacement, repair, maintenance or disposal of barricade will be incidental to the work of this section.

Payment will be made under:

Pay Item	Pay Unit
Barricades (Type III)	Linear Foot

**SECTION 1150
FLAGGERS**

1150-1 DESCRIPTION

Furnish, relocate and maintain the flaggers, hats, vests, STOP/SLOW paddles and any other incidentals necessary to control traffic.

1150-2 MATERIALS

Refer to Division 10.

Item	Section
Flagger	1089-10

Refer to *Roadway Standard Drawings*.

Section 1160

1150-3 CONSTRUCTION METHODS

Provide the service of properly equipped and qualified flaggers (see *Roadway Standard Drawings*) at locations and times for such period as necessary for the control and protection of vehicular and pedestrian traffic. All flaggers shall be qualified by an NCDOT approved training agency in the set-up and techniques of safely and competently performing a flagging operation. For a complete listing of approved training agencies, see the Work Zone Traffic Control’s webpage.

Prior to beginning work on the project, a Qualification Statement that all flaggers used on the project have been properly trained through an NCDOT approved training resource shall be provided to the Engineer.

Use flagging methods that comply with the guidelines in the MUTCD.

1150-4 MEASUREMENT AND PAYMENT

Flagging conducted for the convenience of the Contractor’s operations is not compensated. The Department will pay for flaggers, including those used at Y-lines that are used in conjunction with a lane closure. Flaggers used for operations not involving a lane closure will be incidental to that operation and no payment will be made. Flaggers used for hauling operations, where the only need for a lane closure is due to the hauling operation, will be incidental to that operation and no payment will be made.

Any flagger used for less than one hour will be incidental to that operation.

Flagger (Day) will be measured and paid as a half day or full day. To constitute a full day, the flagger must work 4 consecutive hours during a shift. Any shift less than 4 consecutive hours will be paid as a half day. On any calendar day that more than one flagger is used, the quantity to be paid on that calendar day will be the maximum number of flaggers used at one time in that calendar day.

Payment will be made under:

Pay Item	Pay Unit
Flagger	Day

**SECTION 1160
TEMPORARY CRASH CUSHIONS**

1160-1 DESCRIPTION

Furnish, install, maintain, reset and remove temporary crash cushions.

1160-2 MATERIALS

Refer to Division 10.

Item	Section
Temporary Crash Cushions	1089-8

Use temporary crash cushions that meet NCHRP 350 Test Level II or III for transportation management devices and are listed on the NCDOT APL. Provide redirective temporary crash cushions or non-redirective temporary crash cushions that capture errant vehicles without complete penetration through the device. Use a redirective temporary crash cushion when adequate space for the lateral displacement of the crash cushion is not available.

Historical performance of the temporary crash cushions will help determine the future use of the material by the Department, even if the temporary crash cushion has been approved. Poor performance of temporary crash cushions at any site, whether or not related to a specific contract, may be grounds for non-acceptance of a product on any project under contract.

Section 1170

1 Historical performance of the TMA will help determine the future use of the material by the
2 Department, even if the TMA has been approved. Poor performance of TMA at any site,
3 whether or not related to a specific contract, may be grounds for non-acceptance of a product
4 on any project under contract.

5 **1165-3 CONSTRUCTION METHODS**

6 Before use, furnish the Engineer detailed brochures, specifications and other manufacturer’s
7 data that completely describes the performance criteria, installation and instructions for the
8 TMA.

9 Use TMAs that meet the crash test requirements of Subarticle 1089-9(A).

10 Do not park TMAs against rigid objects (i.e. bridge piers or portable concrete barrier) except
11 as a temporary safety measure and in no case for longer than 72 hours. Install the TMA on
12 a truck that is fully operational, in good running order and in accordance with the
13 manufacturer’s specifications.

14 Use the appropriate lighting and delineation on the truck and TMAs as shown in the *Roadway*
15 *Standard Drawings*. TMA trailer lighting systems shall be activated in the flash mode while
16 deployed.

17 Repair or replace within 24 hours any attenuator that becomes crushed or otherwise damaged
18 so that it will perform its intended purpose. Suspend all construction activities until the
19 attenuator is repaired or replaced. Provide safe control of traffic until the attenuator has been
20 repaired or replaced using approved methods.

21 **1165-4 MEASUREMENT AND PAYMENT**

22 TMA will be measured and paid as the maximum number of TMAs acceptably placed and in
23 use at any one time during the life of the project for all operations other than Moving and
24 Mobile Operations. TMAs will be incidental to all moving and mobile operations. In the
25 case of emergency situations, TMAs will not be paid when payment has already been made
26 for a stationary unit.

27 Relocation of TMAs will be incidental to the measurement of the quantities of TMAs and no
28 separate payment will be made.

29 Payment will be made under:

Pay Item	Pay Unit
TMA	Each

30 **SECTION 1170**
31 **POSITIVE PROTECTION**

32 **1170-1 DESCRIPTION**

33 Furnish, install, secure, maintain, remove and reset portable concrete barrier or water filled
34 barrier.

35 **1170-2 MATERIALS**

36 Refer to Division 10.

Item	Section
Anchor Bolts	1072-4
Anchor Bolt Adhesive	1081
Grout, Type 3	1003
Guardrail and Barrier Delineators	1088-2
Portable Concrete Barrier	1090

1 Provide portable concrete barrier that meets NCHRP 350 Test Level III. Refer to Section 854
2 for strength requirements of concrete barrier and grout.

3 Alternatively, for work zones on facilities with a posted speed limit of 45 mph or less, provide
4 water filled barrier that meets NCHRP 350 Test Level II. For work zones with a posted speed
5 limit greater than 45 mph, water filled barrier that meets NCHRP 350 Test Level III may be
6 used only if there is adequate space for the lateral displacement of the barrier according to the
7 manufacturer's specifications.

8 Provide water-filled barrier that acts as its own free standing, non-redirective end treatment or
9 has an attached end treatment that completely captures the impacting vehicle without full
10 penetration of the device. If water-filled barrier is provided, use environmentally safe anti-
11 freezing agent in the water per manufacturer specifications and recover agent when the barrier
12 is drained. Dispose of water and agent properly. Do not drain water filled barrier into or
13 across an existing travel lane. Provide barrier units that are capable of being lifted and moved
14 when filled, if draining is not possible.

15 Use barrier and delineators listed on the NCDOT APL.

16 Historical performance of the barrier will help determine future use of the material by the
17 Department, even if the barrier has been approved. Poor performance of the barrier at any
18 site, whether or not related to a specific contract, may be grounds for non-acceptance of
19 a product on any project under contract.

20 **1170-3 CONSTRUCTION METHODS**

21 **(A) General**

22 Place all types of portable concrete barrier or water filled barrier as shown in the contract.
23 When required by the plans, anchor portable concrete barrier by an approved method as
24 shown in the *Roadway Standard Drawings*.

25 Use one type of barrier on any continuous run of barrier within the project.

26 Barrier shall be placed on an asphalt or concrete surface. Barrier should not be placed on
27 cross slopes steeper than 6:1.

28 Use portable concrete barrier that avoids trapping water in sags, vertical curves, areas of
29 wedging and paving where super-elevations have been changed and other low spots as
30 directed. Provide adequate drainage behind the portable concrete barrier.

31 Lift, place and reset portable concrete barrier units using a two-point pick up, or other
32 acceptable method, which does not over-stress, damage or mar the surface of the
33 roadway. Do not use connection points for lifting purposes.

34 Do not use any barrier units that are cracked, damaged, chipped or otherwise
35 nonfunctional.

36 Place and install water filled barrier units as shown in the plans and per manufacturer
37 specifications.

38 In work zones with speed limits of 45 mph and less, use Test Level II barrier units.
39 Water filled barrier at a 36 inch height is preferred to limit sight distance impairment. If
40 devices taller than 36 inches are used in this situation, transition down to 36 inches or
41 shorter on the intersection approaches to provide proper sight distance.

42 In work zones with speed limits over 45 mph, use Test Level III barrier units. The units
43 shall be evaluated on a case by case basis to ensure ample space is available for device
44 deflection. Follow the manufacturer's specifications and recommendations.

45 Furnish barrier delineators for portable concrete and water filled barrier.

46 Furnish delineators for barrier in accordance with the *Roadway Standard Drawings*.

Section 1170

1 Once temporary barrier is installed at any location and no work is performed behind the
2 temporary barrier for a period longer than 2 months, remove or reset temporary barrier at
3 no cost to the Department unless otherwise stated in the TMP, temporary barrier is
4 protecting a hazard, or as directed by the Engineer.

5 **(B) Securing Barrier On Concrete and Asphalt Pavement Surfaces**

6 Use anchoring methods shown in *Roadway Standard Drawings*.

7 (1) Anchoring Method for Asphalt Pavements

8 Drill anchor holes normal to the surface of installation using a pneumatic drill with
9 a depth indicator, unless another drilling method is allowed. Make sure that the
10 diameter of the hole is in strict conformance with the *Roadway Standard Drawings*
11 or the manufacturer's recommendations. When directed, use a jig or fixture to ensure
12 correct positioning of the holes and proper alignment during the drilling process.
13 Adjust hole locations, as necessary, to avoid encountering reinforcing steel.
14 Immediately after drilling, brush the holes with a stiff-bristled brush of a sufficient
15 size to effectively remove dust from the sides of the hole, and blow all holes free of
16 all dust and debris using oil free compressed air. Repeat this procedure until the hole
17 is completely clean.

18 Inspect each hole immediately before placement of the anchor. Rework any hole
19 found to deviate from these requirements to ensure that an acceptable hole is
20 achieved.

21 Check each hole with a depth gauge to ensure proper embedment depth, if required.

22 Satisfactorily repair all spalled or damaged pavement.

23 Once the barrier and anchors are removed, fill the holes with grout. These
24 requirements may be waived if the bridge or roadway will no longer be used by
25 traffic.

26 (2) Adhesive Anchoring Method for Concrete Surfaces

27 Comply with Subarticle 1170-3(B)(1).

28 Mix adhesives in strict conformance with the manufacturer's instructions.

29 Pour the mixed adhesive into the hole. Agitate or rotate anchors to ensure complete
30 wetting and encapsulation. Insert the anchors to the specified depth. Completely fill
31 the anchor hole with adhesive and remove any excess adhesive flush with the
32 pavement. Do not disturb any anchors while the adhesive is hardening.

33 Coat all anchors to be adhesively bonded with a debonding agent to ease removal.
34 Formulate the debonding agent such that it does not reduce the strength of the anchor
35 system.

36 (3) Through the Deck Anchoring Method

37 Comply with Subarticle 1170-3(B)(1).

38 Anchor barrier to bridge decks as shown in *Roadway Standard Drawings*. Do not
39 use this method on prestressed concrete bridge deck panels.

40 **(C) Resetting Barrier**

41 Reset portable concrete barrier as defined by the TMP.

42 **(D) Stockpiling**

43 Stockpile the portable concrete barrier when the barrier is not used on the project or it
44 becomes necessary to stockpile units between 2 separate installations. Stockpile the

barrier at a location off the project of your choosing, unless otherwise noted in the TMP, or to a location within the project limits, if provided.

(E) Barrier Delineators

Use top mounted delineators for barrier throughout the project. Side mounted delineators may be used to supplement the top mounted delineators.

The delineators consist of a reflector and base or casing. Attach the delineator to the barrier as shown in the *Roadway Standard Drawings*.

Position delineators perpendicular to the centerline of the road. Use yellow delineators in the median and on the left side of one-way ramps, loops or other one-way facilities. Use crystal delineators on the right side of divided highways, ramps, loops and all other one-way or two-way facilities. In all cases, the color of the delineator shall supplement the color of the adjacent edgelines.

Barrier delineators shall be spaced according to the chart as shown in the *Roadway Standard Drawings*.

1170-4 MEASUREMENT AND PAYMENT

Portable Concrete Barrier (____) will be measured and paid as the maximum number of linear feet furnished, satisfactorily installed, accepted by the Engineer, maintained and removed, at any one time during the life of the project. Measurement will be made by counting the number of barrier units used and multiplying by the length of a unit.

Water Filled Barrier will be measured and paid as the maximum number of linear feet furnished, satisfactorily installed, accepted by the Engineer, maintained and removed, at any one time during the life of the project. Measurement will be made by counting the number of barrier units used and multiplying by the length of a unit.

Remove and Reset Portable Concrete Barrier (____) will be measured and paid as the number of linear feet of barrier moved from one location on the project to another location on the project. Measurement will be made by counting the number of barrier units moved during any one move and multiplying by the length of a unit. Where barrier units are moved more than once, each move will be measured separately. Whenever the Engineer directs the Contractor to move barrier units from an installed location to a stockpile either on or off the project and then back to another installed location, the complete move from the first installed location to the next installed location will be measured as 2 moves.

Reset Water Filled Barrier will be measured and paid as the actual number of linear feet furnished, satisfactorily installed, accepted by the Engineer, maintained and removed. Measurement will be made by counting the number of barrier units used and multiplying by the length of a unit.

Provide barrier stockpile areas at no cost to the Department. Barrier delineators will be incidental to these pay items.

Payment will be made under:

Pay Item	Pay Unit
Portable Concrete Barrier	Linear Foot
Portable Concrete Barrier (Anchored)	Linear Foot
Water Filled Barrier	Linear Foot
Remove and Reset Portable Concrete Barrier	Linear Foot
Remove and Reset Portable Concrete Barrier (Anchored)	Linear Foot
Reset Water Filled Barrier	Linear Foot

1180-1 DESCRIPTION

Furnish, install, maintain, relocate and remove skinny drums with ballast.

1180-2 MATERIALS.

Refer to Division 10.

Item	Section
Skinny Drums	1089-5

Provide skinny drums listed on the NCDOT APL.

1180-3 CONSTRUCTION METHODS

Use the same type of retroreflective sheeting (Type III High Intensity Prismatic or greater) on all skinny drums installed at any one time during the life of the project. Use ballasting methods in accordance with manufacturer’s specification.

Immediately replace and dispose of any skinny drum, ballast or retroreflective sheeting that are torn, crushed, discolored or otherwise damaged.

Skinny drums may be used instead of cones on all facilities with speed limits of 55 mph and below. Spacing of these devices is equal in feet to the speed limit in the taper and twice the speed limit or every other skip in the tangent sections.

Skinny drums may be used instead of cones and drums where allowed in the TMP or by the Engineer on facilities with speed limits above 55 mph, if all the following apply:

- (A) The work is performed during daylight conditions,
- (B) The devices are removed after each work period and
- (C) Drums are used in the tapers.

Do not use skinny drums on control-of-access facilities for night work operations or allow to remain in place overnight. Do not use skinny drums for tapers on multilane or control-of-access roadways with speed limits above 55 mph.

Do not intermix with drums or cones unless directed by the Engineer or the TMP.

1180-4 MEASUREMENT AND PAYMENT

Skinny Drums will be measured and paid as the maximum number of skinny drums satisfactorily placed, accepted by the Engineer and in use at any one time during the life of the project.

Relocation, replacement, repair, disposal and maintenance of skinny drums will be incidental to the work of this section.

Payment will be made under:

Pay Item	Pay Unit
Skinny Drum	Each

1190-1 DESCRIPTION

Furnish Law Enforcement and marked Law Enforcement vehicles to direct traffic in accordance with the contract.

1190-2 CONSTRUCTION METHODS

Use off duty uniformed Law Enforcement Officers and marked Law Enforcement vehicles equipped with blue lights mounted on top of the vehicle, and Law Enforcement vehicle emblems to direct or control traffic as required by the plans or by the Engineer.

Law Enforcement vehicles shall not be parked within the buffer space.

1190-3 MEASUREMENT AND PAYMENT

Law Enforcement will be measured and paid for in the actual number of hours that each Law Enforcement Officer provides during the life of the project as approved by the Engineer. There will be no direct payment for marked Law Enforcement vehicles as they are considered incidental to the pay item.

Payment will be made under:

Pay Item	Pay Unit
Law Enforcement	Hour

DIVISION 12

PAVEMENT MARKINGS, MARKERS AND DELINEATION

SECTION 1205

PAVEMENT MARKING GENERAL REQUIREMENTS

1205-1 DESCRIPTION

Furnish, install and remove pavement markings in accordance with the contract.

1205-2 MATERIALS

(A) General

Refer to Division 10.

Item	Section
Pavement Markings	1087

(B) Material Qualifications

Use pavement marking materials that are on the NCDOT APL.

(C) Performance

Poor performance of pavement marking materials at any site, whether or not related to a specific contract may be grounds for nonacceptance of a product on any project under contract.

1205-3 CONSTRUCTION METHODS

Do not use handliners or any other non-truck mounted pavement marking machine to install pavement markings for long line applications of any one line longer than 1,000 feet.

Use heated in place thermoplastic with skid resistant media for bike lane symbols.

(A) Testing Procedures

All pavement marking materials and placement will be tested by the Department. Install pavement markings in order to meet the retroreflectivity requirements as measured by a Department approved 30 m mobile or handheld retroreflectometer.

(B) Application Equipment

(1) General for all Application Equipment

Use pavement marking application equipment such that all parts that come in contact with pavement marking material are constructed for easy accessibility during cleaning and maintenance.

Keep the marking guns of the application device in full view of the operators at all times. Use applicators that are mobile and maneuverable to the extent that straight lines can be followed and all standard curves can be made in true arcs.

(2) Glass Bead and Highly Reflective Media Dispensing Equipment

Apply glass beads and highly reflective media to the surface of pavement long line markings using an automatic high pressurized bead and media dispenser or a pressurized mechanical feed, attached to the marking equipment. Hand liner type equipment is exempt from this requirement. Locate the bead and media applicator at the proper distance behind the application of pavement marking material to provide the proper amount of retroreflectivity. Equip the bead and media applicator with an

Section 1205

1 automatic cut-off control synchronized with the cut-off control of the marking
2 material.

3 Spread the beads and reflective media uniformly over the entire surface of the
4 pavement marking material such that they are partially embedded in the pavement
5 marking. A 60% bead and media embedment depth provides optimum
6 retroreflectivity.

7 (C) Weather Limitations and Seasonal Limitations for All Markings

8 Do not place pavement markings when moisture tests conducted on the pavement show
9 signs of moisture presence on the pavement or when it is anticipated that damage caused
10 by moisture may occur during the installation and drying periods.

11 (D) Time Limitations for Replacement

TABLE 1205-1 TIME LIMITATIONS FOR REPLACEMENT		
Facility Type	Marking Type	Replacement Deadline
Full-control-of-access multi-lane roadway (4 or more total lanes) and ramps, including Interstates	All markings	By the end of each workday's operation if the lane is opened to traffic
Multi-lane roadways (3 or more lanes) and ramps	Center Line, Lane Line, Railroad symbols, Stop bars, and school symbols	By the end of each workday's operation if the lane is opened to traffic (temporary paint with beads may be used)
	Edge Lines, gore lines and all other symbols	By the end of the 3rd calendar day after obliteration
Two-lane, two-way roadways	All centerline markings, railroad, Stop bars and school symbols	By the end of the 5th calendar day after obliteration
	Edge Lines and all other symbols	By the end of the 15th calendar day after obliteration

12 A multilane facility is defined as any roadway having more than two lanes to include
13 a two-lane / two-way roadway with a center two-way left turn lane.

14 (E) Premarking/Interim/Temporary Markings

15 Premarking (or layout markings) are small paint spots used by striping contractors to
16 establish locations of pavement markings. Premark each installation of the final
17 pavement marking materials before application on new pavement and when required to
18 replace existing pavement marking, except when existing markings are visible. Get the
19 premarking inspected and approved by the Engineer before placing the pavement
20 marking materials.

21 Interim paint is a thin layer of pavement marking paint applied at the striping contractor's
22 option to maintain traffic, instead of durable pavement markings. Apply interim paint to
23 comply with time limitations for placement if final pavement markings cannot be placed.
24 Interim markings shall be no more than 1/4 inch less than the specified line width of the
25 existing markings.

26 Place temporary paint markings for detours, lane shifts, milled surfaces and lifts of
27 asphalt other than the final pavement surface.

1 Review and record the existing pavement markings before resurfacing and reestablish the
 2 new pavement markings using the record of existing markings in conjunction with the
 3 *Roadway Standard Drawings*, unless otherwise directed. Submit the record of the
 4 existing pavement markings 7 calendar days before the obliteration of any pavement
 5 markings.

6 (F) Surface Preparation and Curing Compound Removal

7 Prepare the pavement to accept pavement markings to insure maximum possible
 8 adhesion. Clean, seal and remove curing compound as necessary to insure that the
 9 markings adhere to the pavement. Obtain approval for all surface preparation methods
 10 before implementing.

11 Pavements shall be free of grease, oil, mud, dust, dirt, grass, loose gravel, winter surface
 12 treatments and other deleterious material, before applying pavement markings.

13 Prepare the pavement surface, including removal of curing compound, at least 2 inches
 14 wider than the pavement markings to be placed, such that, an additional 1 inch of
 15 prepared area is on all sides of the pavement markings after they are applied.

16 Remove the groves caused by concrete grinders before installing the polyurea pavement
 17 marking.

18 Remove all curing compound and surface laitance on Portland cement concrete
 19 pavements where long-life pavement markings will be placed. Perform curing compound
 20 removal by high-pressure water blasting or grinding methods. Ensure that the surface is
 21 free of all residue, laitance and debris before applying the pavement marking. When
 22 surface preparation and curing compound removal operations are completed, blow the
 23 pavement surface clean by compressed air immediately before installing the pavement
 24 markings.

25 If required, apply a primer sealer to pavement surfaces before applying pavement
 26 marking material as recommended by the manufacturer. Apply primer sealer in
 27 a continuous film at least 2 inches wider than the pavement markings in such a way as
 28 not to cause any noticeable change in the appearance of the pavement markings.

29 Conduct all pavement surface preparation including curing compound removal in such
 30 a manner that the pavement or joint material is not damaged or left in a condition that
 31 will mislead or misdirect the motorist. Repair any damage caused to the pavement, or
 32 joint materials caused by surface preparation or the removal of curing compound by
 33 acceptable methods and at no additional cost to the Department.

34 Surface preparation and removal of bridge laitance shall be considered incidental to the
 35 installation of pavement marking with the exception of curing compound removal.

36 Where pavement surface preparation results in obscuring existing pavement markings of
 37 a lane occupied by traffic, immediately remove the residue, including dust, by approved
 38 methods.

39 (G) Application of Pavement Markings

40 (1) General for all types of Pavement Markings

41 Install pavement marking material that has a uniform thickness, smooth surfaced
 42 cross section throughout its entire length, width and length not less than the
 43 dimensions specified in the plans and that does not exceed the dimension by more
 44 than 1/2 inch.

45 Do not apply pavement marking materials over a longitudinal joint. Mask all bridge
 46 joints for removal of surface laitance, existing markings and application of new
 47 markings as directed by the Engineer. This work will be incidental to the installation
 48 of the pavement markings.

Section 1205

1 Install pavement marking lines that are straight or have uniform curvature and
2 conform to the tangents, curves and transitions as specified in the plans.

3 Produce finished lines that have well defined edges and are free of horizontal
4 fluctuations. Do not exceed 1/2 inch in lateral deviation from the proposed location
5 alignment at any point. Any greater deviations may be cause for requiring the
6 material to be removed and replaced at no additional cost.

7 Apply all longitudinal pavement marking lines 8 inches or less in width with one
8 pass of the pavement marking equipment. Pavement marking lines greater than 8
9 inches in width and pavement marking symbols may be applied with multiple passes
10 of the pavement marking equipment.

11 Install all pavement marking lines, stop bars, characters and symbols that require
12 multiple passes of the application equipment such that there are no gaps separating
13 the application passes.

14 Install characters and symbols so that they conform to the sizes and shapes shown in
15 the plans.

16 Protect the pavement markings until they are track free. Repair any markings
17 tracked by a vehicle by acceptable methods.

18 Remove all pavement marking materials spilled on the road surface by acceptable
19 methods.

20 Use yellow, white and black pavement markings, without glass beads and reflective
21 media that visually match the color chips that correspond to the Federal Test
22 Standard No. 595a for the following colors. Use markings that when subjected to
23 accelerated weathering as described in U.S. Federal Specification No. TTP-1952F
24 are within the tolerance limits of the color chips listed below:

White: Color No. 17886

Yellow: Color No. 13538

Black: Color No. 37038

25 (2) Highly Reflective Media Application

26 "Drop-on" is the method where glass beads and highly reflective media are
27 dispensed by a pressurized mechanical feed or high pressure means onto the
28 pavement marking as it is applied to the pavement. Drop-on bead and media
29 dispensing for symbols stop bars and characters may be accomplished by
30 gravitational methods.

31 (H) Observation Period

32 Maintain responsibility for debonding and color of the pavement markings during
33 a 12 month observation period beginning upon final acceptance of the project as defined
34 under Article 105-17. Guarantee the markings under the payment and performance bond
35 in accordance with Article 105-17.

36 During the 12 month observation period, provide pavement marking material that shows
37 no signs of failure due to blistering, chipping, bleeding, discoloration, smearing or
38 spreading under heat or poor adhesion to the pavement materials. Pavement markings
39 that bonded during application and were approved, but debond due to snowplowing will
40 not be considered a failed marking. Replace, at no additional expense to the Department,
41 any pavement markings that do not perform satisfactorily under traffic during the
42 12 month observation period.

(I) Removal of Pavement Markings

This work includes the removal of all types of pavement marking lines, symbols and characters including removal for long life marking preparation. This work does not include removal of removable tape pavement markings.

Remove pavement marking lines, characters and symbols by acceptable methods to the Engineer that will not materially or structurally damage the surface or the texture of the pavement. Leave the pavement surface in a condition that will not mislead or misdirect the motorist.

Where existing pavement markings are to be removed and replaced by other pavement markings, do not begin removal until adequate provisions have been made to complete the installation of the replacement markings. Remove pavement markings such that the surface is in proper condition for adequate bonding of the new markings. Promptly remove any material deposited on the pavement as a result of removing pavement markings as the work progresses by acceptable methods. Provide the equipment necessary to control dust and the accumulation of debris resulting from the removal process. The removal equipment shall provide dust control and the capture of the removed material shall be done using a separate vacuum equipped vehicle or other approved system. Perform the recovery process within the same operation as the removal. Do not let traffic use the lane where the removal is taking place until the recovery system is finished. Should the recovery system fail, cease removal operations until the recovery system is properly operating. The Contractor is responsible for all cleanup and proper disposal of all removed debris from the project site.

When using a grinding method for pavement marking removal, the equipment shall have multiple heads working in tandem or have a removal head with operator dialed controls to result in a planed surface and provide adequate preparation of the surface to accept the new marking material.

Do not use high pressure water blasting on asphalt.

Application of polyurea over existing pavement marking materials will require at least 95% of the existing pavement marking material to be removed; however, if one 15 mil application of paint was placed on asphalt pavement less than 6 months old, do not remove the existing paint pavement markings.

Thermoplastic may be installed over existing thermoplastic on asphalt. Application over existing pavement marking materials other than thermoplastic will require the existing pavement marking material to be removed so that at least 85% of the existing pavement marking surface is removed. Before applying thermoplastic pavement markings over the existing thermoplastic pavement markings, remove at least 25% of the oxidized existing thermoplastic. On newly installed failed thermoplastic that is to be removed and replaced, remove a minimum of 85% of the existing thermoplastic. However, if one 15 mil application of paint was placed on asphalt pavement less than 6 months old, do not remove the existing paint pavement markings.

Use black color #37038 in paint or tape, as determined by Contractor, to cover any remaining conflicting pavement marking after removal from asphalt pavement surfaces. Do not use black paint or tape on concrete pavement surfaces. The black paint will not have a defined shape or edges with a width not exceeding double of the existing lines.

(J) Pavement Marking Installer Qualifications

Ensure at least one member of every pavement marking crew is certified through the NCDOT Pavement Marking Technician Certification Process. Keep the certification current throughout the life of the project. A certified crewmember shall be present anytime this work is being performed. The certified crewmember is not required to be the same person throughout the life of the contract.

Section 1205

1 1205-4 THERMOPLASTIC (ALKYD/MALEIC)

2 (A) Application Equipment

3 (1) General

4 Use application equipment constructed to assure continuous uniformity in the
5 thickness and width of the thermoplastic pavement marking. Use application
6 equipment that provides multiple width settings ranging from 4 inches to 12 inches
7 and multiple thickness settings to achieve the pavement marking thickness ranging
8 from 0.090 inch to 0.120 inch. Special thickness equipment may be required for in
9 lane or shoulder transverse rumble strip pavement markings.

10 Do not use spray thermoplastic unless approved by NCDOT's Signing and
11 Delineation Unit.

12 (2) Premelting Kettle

13 Use equipment to install hot thermoplastic pavement marking material that includes
14 an oil-jacketed or air-jacketed premelt kettle for uniform heating and melting of the
15 thermoplastic material. Use a kettle that is equipped with an automatic thermostat
16 control device to provide positive temperature control and continuous mixing and
17 agitation of the thermoplastic material. Do not premelt thermoplastic material in
18 handliner type equipment.

19 (3) Applicator Storage Kettle

20 Equip long line pavement marking vehicles with an automatic thermostat control
21 device to maintain the thermoplastic material at the application temperature and
22 provide continuous mixing and agitation of the thermoplastic material during
23 installation. Construct the equipment so that all mixing and conveying parts, up to
24 and including the application apparatus, maintains the thermoplastic pavement
25 marking material at the specified installation temperature and which has a capacity
26 of at least 1,500 lbs. of molten thermoplastic pavement marking material. Hand
27 transfer is not allowed.

28 Handliner type application vehicles may contain the premelting and applicator
29 storage functions in the same kettle. Agitation and mixing can be done manually.
30 Drag box type and bucket type application is not allowed.

31 Use premelting and applicator storage kettles that meet the requirements of the
32 National Board of Fire Underwriters, the National Fire Protection Association and
33 State and local authorities.

34 (B) Weather Limitations and Seasonal Limitations

35 Do not apply thermoplastic pavement markings on existing or new pavements unless the
36 ambient air temperature and the temperature of the pavement is 50°F or higher.

37 Do not apply thermoplastic pavement markings between the dates specified below:

East of I-95	December 15 and the following March 16
East of I-77 to and including I-95	November 30 and the following April 1
West of and including I-77	November 15 and the following April 16

38 Exception to the above: When traffic is maintained on a portion of roadway and
39 thermoplastic pavement marking will not be placed within 30 calendar days due to
40 seasonal limitations, place pavement marking paint and beads in accordance with
41 Subarticle 1205-8(C).

1 (C) Application

2 Use only thermoplastic markings that are of the hot, machine applied type. Apply
 3 alkyd/maleic thermoplastic pavement markings by extrusion methods only. Extrusion
 4 may be accomplished using either conventional extrusion equipment or ribbon gun
 5 extrusion devices.

6 The stem portion of straight arrows shall be applied in a single pass and the stem portion
 7 of turn arrows is to be applied in no more than 2 passes of the application equipment.
 8 Arrowheads may be applied by multiple passes of the application equipment, not to
 9 exceed 3 passes.

10 Apply drop-on beads and/or highly reflective media uniformly to the surface of the
 11 molten thermoplastic material so the beads and highly reflective media are partially
 12 embedded and at a rate recommended by the manufacturer to obtain the minimum
 13 reflectance values. For highly reflective markings, a double drop system consisting of
 14 glass beads and highly reflective media is required. Produce in place markings with
 15 minimum retroreflective values shown in Table 1205-2, as obtained with a Department
 16 approved 30 m mobile or handheld retroreflectometer. Retroreflective measurements
 17 will be taken within 30 days after final placement of the pavement marking.

Item	Color	Reflectivity
Standard Glass Beads	White	375 mcd/lux/m ²
	Yellow	250 mcd/lux/m ²
Highly Reflective Media	White	800 mcd/lux/m ²
	Yellow	600 mcd/lux/m ²

18 Ensure that the marking is uniformly retroreflective upon cooling and has the ability to
 19 resist deformation caused by traffic throughout its entire length.

20 A thin layer of interim pavement marking paint at the proper width may be placed before
 21 installing the thermoplastic markings. If this option is chosen, when not specified in the
 22 plans or by the Engineer, direct payment for the paint will not be made. Cover any such
 23 thin layer of pavement marking paint with thermoplastic pavement marking within
 24 30 calendar days of placement. Apply the thin layer of pavement marking paint and
 25 beads at the rate necessary to produce a dry film thickness of 5 to 8 mils. Apply drop-on
 26 glass beads at a rate of 1 to 3 lbs/gal of paint.

27 Provide drainage openings at intervals of 250 feet in edge lines placed on the inside of
 28 curves and in edge lines on the low side of tangents. Provide openings that are no more
 29 than 12 inches and at least 6 inches in length.

30 Produce a cross-sectional thickness of the thermoplastic markings above the surface of
 31 the pavement in accordance with Table 1205-3.

Thickness	Location
240 mils	In-lane and shoulder-transverse pavement markings (rumble strips) may be placed in 2 passes.
120 mils	Center lines, skip lines, transverse bands, mini-skip lines, characters, bike lane symbols and crosswalk lines.
90 mils	Edge lines, gore lines, diagonals and arrow symbols.

Section 1205

1 (D) Observation Period

2 In addition to the requirements of Subarticle 1205-3(H), maintain responsibility for
3 minimum retroreflective values for a 30-day period beginning upon the Engineer's
4 acceptance of all markings on the project. Guarantee retroreflective values of the
5 markings during the 30-day period under the payment and performance bond in
6 accordance with Article 105-17.

7 1205-5 POLYUREA

8 (A) Weather Limitations and Seasonal Limitations

9 Do not apply polyurea pavement markings on existing or new pavements unless the
10 ambient air temperature and the temperature of the pavement is 40°F or higher.

11 Do not apply polyurea pavement marking between November 15 and the following
12 February 28 unless the surface is free from winter surface treatment applications.

13 (B) Application

14 Produce polyurea pavement marking lines that have a minimum dry thickness of 20 mils
15 when placed on concrete and asphalt pavements. Apply 30 mils on textured surfaces
16 such as OGFC.

17 Using the polyurea application equipment, apply the pavement marking materials
18 simultaneously. Apply the polyurea resin, mixed at the proper ratio according to the
19 manufacturer's recommendations, to the pavement surfaces within the proper application
20 temperatures as determined by the material manufacturer. Inject reflective glass beads
21 and highly reflective media into the molten (liquid) polyurea pavement markings. For
22 highly reflective markings, a double drop system consisting of glass beads and highly
23 reflective media is required.

24 Wait at least 15 days before applying polyurea on new asphalt. Place a thin layer of
25 pavement marking paint at the proper width before applying the polyurea markings
26 during the 15 day waiting period. Apply the thin layer of pavement marking paint and
27 beads at the rate necessary to produce a dry film thickness of 5 to 8 mils. Apply drop-on
28 beads at a rate of 1 to 3 lbs/gal of paint. Direct payment for the pavement marking paint
29 will not be made. Cover any such thin layer of paint with polyurea pavement marking
30 within 30 calendar days of placement. If paint is placed on concrete before applying
31 polyurea, remove 100% of the paint before installing polyurea. Payment for the paint and
32 removal shall be made under Article 1205-10.

33 Apply drop-on beads and/or highly reflective media uniformly to the surface of the
34 polyurea material so that the beads and reflective media are partially embedded and at a
35 rate recommended by the manufacturer to obtain the minimum reflectance values.
36 Produce in place markings with minimum retroreflective values shown in Table 1205-4,
37 as obtained with a Department approved 30 m mobile or handheld retroreflectometer.
38 Retroreflective measurements will be taken within 30 days after final placement of the
39 pavement marking.

40 Produce marking that, upon curing, is uniformly reflectorized and has the ability to resist
41 deformation caused by traffic throughout its entire length.

42 (C) Observation Period

43 In addition to the requirements of Subarticle 1205-3(H), maintain responsibility for
44 minimum retroreflective values for a 30-day period beginning upon the Engineer's
45 acceptance of all markings on the project. Guarantee retroreflective values of the
46 markings during the 30-day period under the payment and performance bond in
47 accordance with Article 105-17.

**TABLE 1205-4
MINIMUM REFLECTOMETER REQUIREMENTS
FOR POLYUREA**

Item	Color	Reflectivity
Highly Reflective Media	White	800 mcd/lux/m ²
	Yellow	600 mcd/lux/m ²

1 **1205-6 COLD APPLIED PLASTIC**

2 **(A) Application Equipment**

3 Use mechanical application equipment, defined as a mobile pavement marking machine
4 specifically designed for use in applying pressure sensitive pavement marking tape of
5 varying widths up to 12 inches. Use an applicator equipped with rollers to provide initial
6 adhesion of the preformed, pressure sensitive marking tape with the pavement surface.
7 Symbols and legends may be tamped by hand but shall be rolled with a weighted roller as
8 per the manufacturer's recommendations. Tamp the cold applied plastic pavement
9 marking material with a 200 lb. weighted roller as per the manufacturer
10 recommendations.

11 Surface preparation adhesive may be required depending on the type of cold applied
12 plastic. Refer to the manufacturers' specifications before applying cold applied plastic.

13 Most overlay tape installations should be conducted at an ambient air temperature of
14 60°F and rising and a surface temperature of 70° F with an overnight temperature at
15 least 40°F the night before application. Check the manufacturer's specifications for
16 actual requirements. Install cold applied plastic pavement markings at ambient air
17 temperature and pavement surface temperature per manufacturer's specifications. Wait
18 at least 24 hours after a rain before applying cold applied plastic pavement marking.

19 Cold applied plastic pavement markings shall be between 15 to 90 mils thick.

20 **(B) Types of Cold Applied Plastic**

21 At the time of installation, cold applied plastic pavement markings shall meet
22 Table 1205-5.

**TABLE 1205-5
REFLECTOMETER REQUIREMENTS FOR COLD APPLIED PLASTIC TAPE**

Type	Color	Reflectivity
Type 1 - Permanent Standard Tape	White	400 mcd/lux/m ²
	Yellow	300 mcd/lux/m ²
Type 2 - Permanent High Performance Tape	White	500 mcd/lux/m ²
	Yellow	300 mcd/lux/m ²
Type 3 - Permanent Wet Reflective High Performance Tape (Wet)	White	250 mcd/lux/m ²
	Yellow	200 mcd/lux/m ²
Type 3 - Permanent Wet Reflective High Performance Tape (Dry)	White	500 mcd/lux/m ²
	Yellow	300 mcd/lux/m ²
Type 4 - Removable Tape	White	700 mcd/lux/m ²
	Yellow	400 mcd/lux/m ²

23 Type 1 is typically a 2 year life cycle permanent tape used on roadways with an ADT
24 of 5,000 or less.

25 Type 2 material may come as one piece with a black border with yellow or white in the
26 center. Type 2 is typically a 5 year permanent tape used on roadways with an ADT
27 greater than 5,000.

28 Type 3 wet reflective tape shall meet Table 1205-5 retroreflective values, both wet and
29 dry. The value measured under wet conditions shall be measured in accordance with

Section 1205

1 ASTM E1710 when using a portable retroreflectometer and in accordance with
2 ASTM E2177.

3 **(C) Observation Period**

4 In addition to the requirements of Subarticle 1205-3(H), maintain responsibility for
5 minimum retroreflective values for a 30-day period beginning upon the Engineer's
6 acceptance of all markings on the project. Guarantee retroreflective values of the
7 markings during the 30-day period under the payment and performance bond in
8 accordance with Article 105-17.

9 **1205-7 HEATED-IN-PLACE THERMOPLASTIC**

10 **(A) Application Equipment**

11 Apply heated-in-place thermoplastic using a propane blow torch and other material as
12 recommended by the manufacturer.

13 **(B) Weather Limitations**

14 Apply heated-in-place thermoplastic only when ambient air temperature and pavement
15 surface temperature is 40°F and rising.

16 **(C) Applications**

17 Apply heated-in-place thermoplastic on asphalt or concrete per manufacturer's
18 specifications. The manufacturer shall certify the installer of heated-in-place
19 thermoplastic.

20 Use a one part primer sealer when installing heated-in-place thermoplastic on concrete.

21 The Contractor may choose to use heated-in-place thermoplastic symbols, characters and
22 transverse lines instead of molten thermoplastics pavement markings.

23 Produce a cross sectional thickness of installed heated-in-place thermoplastic markings
24 above the surface of the pavement after installation and upon cooling in accordance with
25 Table 1205-3.

26 For initial minimum retroreflective value requirements, see Subarticle 1205-4(C).

27 **(D) Observation Period**

28 In addition to the requirements of Subarticle 1205-3(H), maintain responsibility for
29 minimum retroreflective values for a 30-day period beginning upon the Engineer's
30 acceptance of all markings on the project. Guarantee retroreflective values of the
31 markings during the 30-day period under the payment and performance bond in
32 accordance with Article 105-17.

33 **1205-8 PAINT**

34 **(A) Application Equipment**

35 The equipment to apply paint to pavements shall be a truck mounted pneumatic or airless
36 spray machine with suitable arrangements of atomizing nozzles and controls to obtain the
37 specified markings. Paint pavement markings application equipment shall be capable of
38 placing double solid lines, single solid lines, intermittent skip lines or a combination of
39 solid and intermittent skip lines in a single pass. This equipment shall also have
40 an internal timing mechanism for measurement and controlled output of required line
41 lengths.

42 The paint applicator equipment shall have at least two paint tanks with a minimum 60 gal
43 capacity and one tank for glass beads with at least 500 lb. capacity. The spray guns used
44 for hand held paint pavement marking application shall be operable from the application
45 truck. All metal parts that hold or transfer paint pavement marking material shall be

1 stainless steel. The paint trucks shall be equipped with quick action valves. The required
 2 gauges and pressure regulators shall be conveniently located and in full view and reach of
 3 the operator. Paint strainers are required in paint supply lines.

4 The paint applicator shall be equipped with a dispenser for the glass beads as described in
 5 Subarticle 1205-3(B)(2). Provide a glass bead dispenser that operates automatically and
 6 simultaneously with the paint applicator through the same mechanism and that is capable
 7 of adjustment and designed to provide uniform flow over the full length and width of the
 8 stripe as specified in Subarticle 1205-3(G)(2).

9 Provide spray guns for hand application of detail markings, symbols and legends. A hand
 10 operated push type applicator with a glass bead dispenser may be used for radii and/or
 11 parking spaces.

12 **(B) Weather Limitations**

13 Apply paint only when the ambient air temperature and pavement surface temperatures
 14 are at least 40°F and rising and no more than 160°F.

15 **(C) Application**

16 Final pavement marking applications of paint shall be placed in 2 applications of 15 mils
 17 wet each. Apply the second application of paint upon sufficient drying time of the first.
 18 Each application of paint shall consist of drop-on beads applied at a rate to immediately
 19 obtain the minimum retroreflective values.

20 When paint is required by the Engineer or Traffic Control Plan for temporary pavement
 21 markings during temporary traffic patterns, apply one application of paint at 15 mils wet.
 22 If the temporary traffic pattern will last longer than 6 months, apply a second application
 23 of paint 6 months after the initial application. Additional applications of paint at 15 mils
 24 wet may be applied every 6 months as directed by the Engineer or Traffic Control Plan.

25 For each 15 mil application of paint, apply drop-on beads uniformly to the surface of the
 26 paint material at a rate to immediately obtain the minimum retroreflective values. At the
 27 time of installation, produce in-place markings with the minimum retroreflective values
 28 shown in Table 1205-6, as obtained with a Department approved 30 m mobile or
 29 handheld retroreflectometer. Maintain the retroreflective values shown in Table 1205-6
 30 for at least 30 days from the time of placement of the marking material.

TABLE 1205-6 REFLECTOMETER REQUIREMENTS FOR PAINT		
Item	Color	Reflectivity
Standard Glass Beads	White	225 mcd/lux/m ²
	Yellow	200 mcd/lux/m ²

31 Make sure that the marking is uniformly retroreflectorized upon drying.

32 **(D) Observation Period**

33 In addition to the requirements of Subarticle 1205-3(H), maintain responsibility for
 34 minimum retroreflective values for a 30-day period beginning upon the Engineer's
 35 acceptance of all markings on the project. Guarantee retroreflective values of the
 36 markings during the 30-day period under the payment and performance bond in
 37 accordance with Article 105-17.

38 **1205-9 MAINTENANCE**

39 Replace pavement markings that prematurely deteriorate, fail to adhere to the pavement, lack
 40 reflectorization or are otherwise unsatisfactory during the life of the project or during the
 41 12 month observation period as determined by the Engineer.

Section 1205

1 Upon notification from the Engineer, winterize the project by placing an initial or additional
2 application of paint pavement marking lines in accordance with Article 1205-8.

3 **1205-10 MEASUREMENT AND PAYMENT**

4 _____ *Pavement Marking Lines* will be measured and paid as the actual number of linear feet
5 of pavement marking lines satisfactorily placed and accepted by the Engineer. In addition,
6 *Paint Pavement Marking Lines* will be paid per linear foot for each 15 mil application placed
7 in accordance with Subarticle 1205-8(C). The quantity of solid lines will be the summation of
8 the linear feet of solid line measured end-to-end of the line. The quantity of skip or broken
9 lines will be the summation of the linear feet derived by multiplying the nominal length of
10 a line by the number of marking lines satisfactorily placed.

11 _____ *Pavement Marking Symbols* will be measured and paid as the actual number of
12 pavement marking symbols satisfactorily placed and accepted by the Engineer. In addition,
13 *Paint Pavement Marking Symbols* will be paid for each 15 mil application placed in
14 accordance with Subarticle 1205-8(C).

15 _____ *Pavement Marking Characters* will be measured and paid as the actual number of
16 characters satisfactorily placed and accepted by the Engineer. A character is considered to be
17 one letter or one number of a word message. In addition, *Paint Pavement Marking*
18 *Characters* will be paid for each 15 mil application placed in accordance with Subarticle
19 1205-8(C).

20 *Removal of Pavement Marking Lines* will be measured and paid as the actual number of linear
21 feet of pavement marking lines satisfactorily removed and accepted by the Engineer. The
22 quantity of solid lines will be the summation of the linear feet of solid line measured end-to-
23 end of the line. The quantity of skip or broken lines will be the summation of the linear feet
24 derived by multiplying the nominal length of a line by the number of marking lines
25 satisfactorily removed. No payment will be made for the removal of removable pavement
26 marking tape.

27 *Removal of Pavement Marking Symbols & Characters* will be measured and paid as the actual
28 number of pavement marking symbols and characters satisfactorily removed and accepted by
29 the Engineer.

30 *Curing Compound Removal, Lines* will be measured and paid as the actual number of linear
31 feet of pavement surface from which the curing compounds are satisfactorily removed. All
32 other surface preparation will be incidental to the work covered by this section. Measurement
33 will be made along the surface of the pavement.

34 *Curing Compound Removal, Symbols & Characters* will be measured and paid as the actual
35 number of symbols and characters for which the curing compound has been satisfactorily
36 removed. All other surface preparation will be incidental to the work covered by this section.

37 Payment at the contract unit price for the various items in the contract will be full
38 compensation for all the items covered by this section. No direct payment will be made for:
39 the work involved in applying the lines, including surface preparation; reapplication of molten
40 pavement marking crossed by a vehicle; removal of all pavement marking materials spilled on
41 the roadway surface; and repair of markings tracked by a vehicle.

42 Premarking will be incidental to other items in the contract. Unless directed by the Engineer,
43 there will be no direct payment for interim paint. No direct payment will be made for black
44 paint or tape.

45 The 5 to 8 mils of paint installed before placing the polyurea will be incidental to the work of
46 this section.

47 The Contractor may choose to use heated-in-place thermoplastic symbols, characters and
48 transverse lines instead of molten thermoplastics pavement markings and cold applied plastic
49 at no additional cost to the Department.

Section 1250

1 Replacement of pavement markings that prematurely deteriorated, failed to adhere to the
2 pavement, lacked reflectorization or were otherwise unsatisfactory during the life of the
3 project or during the 12 month observation period as determined by the Engineer will be at no
4 cost to the Department.

5 Payment for Paint Pavement Marking Lines required to winterize the project will be made in
6 accordance with Article 1205-10 except that no payment will be made on resurfacing projects
7 where paving is completed more than 30 days before the written notification by the
8 Department that winterization is required.

9 Payment will be made under:

10 **SECTION 1250**
11 **PAVEMENT MARKERS GENERAL REQUIREMENTS**

12 **1250-1 DESCRIPTION**

13 Furnish and place pavement markers in accordance with the contract.

14 **1250-2 MATERIALS**

15 **(A) General**

16 Refer to Division 10.

Item	Section
Pavement Markers	1086

17 **(B) Material Qualifications**

18 Use pavement markers that are on the NCDOT APL.

Section 1250

1 (C) Historical Performance

2 Historical performance of the pavement markers will be used in determining future use of
3 the pavement markers by the Department, even if the pavement markers have been traffic
4 qualified. Poor performance of pavement markers at any site, whether or not related to
5 a specific contract may be grounds for nonacceptance of a product on any project under
6 contract.

7 1250-3 CONSTRUCTION METHODS

8 (A) Weather Limitations

9 Do not install pavement markers or replacement reflectors if moisture tests performed on
10 the pavement indicate the presence of moisture on the pavement surface or on the
11 pavement marker. Install all pavement marker adhesives as required by the
12 manufacturer's specifications for weather and temperature limitations.

13 (B) Preparing for installation

14 Ensure that the pavement, pavement markers and replacement lens are free of dirt, dust,
15 oil, grease, moisture, curing compound, loose or unsound layers or any other material that
16 would interfere with proper bonding of the marker to the pavement or the lens to the
17 marker. Use methods approved by the Engineer for this preparation.

18 (C) Removal of Existing Pavement Markers

19 Remove the existing raised pavement markers or the snowplowable pavement markers
20 including the castings, before overlaying an existing roadway with pavement. Repair the
21 pavement by filling holes as directed by the Engineer.

22 When traffic patterns are changed in work zones due to construction or reconstruction,
23 remove all raised pavement markers or snowplowable markers including castings that
24 conflict with the new traffic pattern before switching traffic to the new traffic pattern.
25 Lens removal in lieu of total casting removal is not an acceptable practice for
26 snowplowable markers.

27 Properly dispose of the removed pavement markers. No direct payment will be made for
28 removal or disposal of existing pavement markers or repair of pavement, as such work
29 will be incidental to other items in the contract.

30 (D) Installation

31 (1) General

32 Install all pavement markers and adhesives per manufacturer's specifications.

33 (2) Color

34 Ensure that the color of the reflector corresponds to the pavement marking that the
35 marker supplements. Red reflectors may be required in combination with crystal or
36 yellow reflectors to indicate wrong way movement when viewed in the direction
37 opposing the flow of traffic.

38 (3) Appearance

39 Remove any adhesive from the reflective lens of the marker; otherwise, replace the
40 reflector lenses of a snowplowable pavement marker or the entire raised pavement
41 marker.

42 (4) Spacing

43 Space pavement markers as shown in the plans. Position pavement marker lenses
44 perpendicular to the flow of traffic as shown in the *Roadway Standard Drawings*.
45 Adjust marker longitudinal spacing up to 1 foot in either direction and/or adjust

marker lateral spacing up to 3 inches to avoid installation of the marker at a pavement construction joint or surface defect. If a marker cannot be relocated as described above, do not install the affected marker.

(E) Pavement Marker Installer Qualifications

Ensure at least one member of every pavement marker crew is certified through the NCDOT Pavement Marking Technician Certification Process. Keep the certification current throughout the life of the project. A certified crewmember shall be present anytime this work is being performed. The certified crewmember is not required to be the same person throughout the life of the contract.

**SECTION 1251
RAISED PAVEMENT MARKERS**

1251-1 DESCRIPTION

Furnish, install, maintain and remove temporary and permanent raised pavement markers in accordance with the contract.

1251-2 MATERIALS

Refer to Division 10.

Item	Section
Temporary Raised Pavement Markers	1086-1
Permanent Raised Pavement Markers	1086-2

Use pavement markers that are on the NCDOT APL.

1251-3 CONSTRUCTION METHODS

Install temporary raised pavement markers on the nonfinal pavement surfaces with epoxy, pressure sensitive adhesives or hot bitumen adhesives.

Install permanent raised pavement markers using a hot bitumen adhesive in accordance with Article 1081-3.

On final pavement surfaces, install temporary raised pavement markers using a pressure sensitive adhesive or hot bitumen adhesive. When using a pressure sensitive adhesive, install a primer/sealer when required by the manufacturer's specifications.

1251-4 MAINTENANCE

Maintain all installed temporary raised pavement markers. Replace all damaged or missing temporary raised pavement markers if any of the following occurs:

(A) Three segment failures occur in any roadway section. Three consecutive damaged or missing markers in any group of 7 represents a segment failure.

(B) Twenty percent of the markers in any roadway section are damaged or missing.

(C) Engineer determines replacement is necessary.

Maintain all installed permanent raised pavement markers until final acceptance of the project.

1251-5 MEASUREMENT AND PAYMENT

Temporary Raised Pavement Markers will be measured and paid as the actual number of temporary raised pavement markers satisfactorily placed and accepted by the Engineer.

Permanent Raised Pavement Markers will be measured and paid as the actual number of permanent raised pavement markers satisfactorily placed and accepted by the Engineer.

Payment will be made under:

1 **(C) Recycled Snowplowable Pavement Marker Castings**

2 Use properly refurbished snowplowable pavement marker castings as approved by the
3 Engineer such that approved new reflectors can be installed inside the castings.

4 **1253-4 MAINTENANCE**

5 Maintain all installed snowplowable raised pavement markers before acceptance.

6 **1253-5 MEASUREMENT AND PAYMENT**

7 *Snowplowable Pavement Markers* will be measured and paid as the actual number of
8 snowplowable pavement markers satisfactorily placed and accepted by the Engineer.

9 *Replace Snowplowable Pavement Marker Reflector* will be measured and paid for in units of
10 each that have been satisfactorily placed and accepted.

11 Payment will be made under:

Pay Item	Pay Unit
Snowplowable Pavement Marker	Each
Replace Snowplowable Pavement Marker Reflector	Each

12 **SECTION 1264**
13 **OBJECT MARKERS**

14 **1264-1 DESCRIPTION**

15 Furnish and install object markers in accordance with the contract.

16 **1264-2 MATERIALS**

17 Refer to Division 10.

Item	Section
Object markers	1088-4
U-channel posts	1094-1(B), 1094-1(C)
Joint Sealer	1028-2

18 Use object markers that are on the NCDOT APL.

19 **1264-3 CONSTRUCTION METHODS**

20 Use Type 1 object markers to mark obstructions within the roadway. Mount on sign supports
21 to supplement a sign, or mount individually on 7 foot U-channel posts, or mount on the actual
22 obstruction.

23 Use Type 2 object markers to mark obstructions that are not in the roadway. Mount
24 Type 2 object markers on the back of sign supports located in the median of divided
25 roadways, and the outside of two-lane, two-way roadways where the sign is facing the
26 opposing traffic direction. Place Type 2 object markers on the side nearest the traffic
27 approaching the back of the sign supports. If guardrail is used to protect the sign supports, or
28 where 2 signs are mounted back to back, Type 2 object markers are not required.

29 Use Type 3 object markers to mark larger obstructions within or outside the roadway, such as
30 bridge piers, abutments, rails, culvert headwalls or narrow shoulder drop-offs. Ensure the
31 stripes slope downward toward the side of the obstruction on which traffic is to pass. They
32 may be required to be mounted on the actual obstruction or individually on 7 foot U-channel
33 posts.

34 Mount end of road object markers on 7 foot U-channel posts at the end of a roadway where
35 there is no alternate vehicular path.

Section 1266

1 **1264-4 MEASUREMENT AND PAYMENT**

2 *Object Markers (Type ____)* will be measured and paid as the actual number of object
3 markers satisfactorily placed and accepted by the Engineer

4 *7' U-Channel Posts* will be measured and paid as the actual number of 7 foot U-channel posts
5 satisfactorily placed and accepted by the Engineer.

6 Payment will be made under:

Pay Item	Pay Unit
Object Markers (Type 1)	Each
Object Markers (Type 2)	Each
Object Markers (Type 3)	Each
Object Markers (End of Road)	Each
7' U-Channel Posts	Each

7 **SECTION 1266**
8 **TUBULAR MARKERS (FIXED)**

9 **1266-1 DESCRIPTION**

10 Furnish, install, relocate, maintain and remove tubular markers in accordance with the
11 contract.

12 **1266-2 MATERIALS**

13 Refer to Division 10.

Item	Section
Tubular Markers	1088-5

14 Use tubular markers that are on the NCDOT APL.

15 **1266-3 CONSTRUCTION METHODS**

16 Secure tubular markers to the pavement surfaces using epoxy or other approved types of
17 adhesives.

18 Use tubular markers affixed to pavement surfaces as a supplement to pavement markings to
19 channelize traffic. Use tubular marker such that the color of the tubular marker and
20 retroreflective sheeting would match the color of the pavement markings they supplement,
21 except as noted below:

22 (A) Use yellow tubular markers with white and crystal retroreflective sheeting on top of
23 asphalt islands as shown in the plans.

24 (B) Use orange tubular markers affixed to pavement surfaces with white and crystal
25 retroreflective sheeting to separate opposing traffic placed on one side of a 4 lane divided
26 highway.

27 (C) Gray tubular markers with white/crystal retroreflective sheeting may be used to
28 supplement white pavement markings.

29 **1266-4 MAINTENANCE**

30 Inspect and replace any worn out tubular markers at no cost to the Department.

31 Inspect and replace all damaged or missing tubular markers if any of the following occurs in
32 accordance with Article 1266-5:

33 (A) Three segment failures occur in any roadway section. Two consecutive damaged or
34 missing tubular markers in any group of 7 represents a segment failure

1 **(B)** Twenty percent of the total numbers of tubular markers in any roadway section are
 2 damaged or missing.

3 **(C)** Engineer determines replacement is necessary.

4 **1266-5 MEASUREMENT AND PAYMENT**

5 *Tubular Markers (Fixed)* will be measured and paid as the maximum number of tubular
 6 markers satisfactorily placed and accepted by the Engineer at any one time during the life of
 7 the project.

8 Payment will be made under:

Pay Item	Pay Unit
Tubular Markers (Fixed)	Each

9 **SECTION 1267**
 10 **FLEXIBLE DELINEATORS**

11 **1267-1 DESCRIPTION**

12 Furnish and install flexible delineators in accordance with the contract.

13 **1267-2 MATERIALS**

14 Refer to Division 10.

Item	Section
Flexible Delineators	1088-6

15 Use flexible delineators that are on the NCDOT APL.

16 **1267-3 CONSTRUCTION METHODS**

17 Use yellow, red or crystal retroreflective sheeting as shown in the plans. Place the
 18 retroreflective sheeting on the front and back of the delineator post as required by the plans.

19 Install the delineator post so that the entire width of the retroreflective sheeting is visible to
 20 approaching traffic.

21 Install the delineator post so the top of the reflective sheeting is 48 inches above the near edge
 22 of roadway surface.

23 Install the delineator post and base support according to the manufacturer's specifications.

24 Install the flexible delineators plumb on all sides.

25 Provide a post such that both sides of the top of the post accepts and holds securely,
 26 retroreflectorized sheeting. The color of the post shall be gray.

27 Install the post such that the post length provides for adequate ground penetration for proper
 28 performance.

29 Attach the flexible delineator post to the base support using 2 hex head bolts, flat washers,
 30 lock washers and deformed thread hex nuts. Tighten the bolts to at least 20 foot-pound
 31 torque.

32 Position delineators perpendicular to the centerline of the road. Use yellow delineators in
 33 median and on the left side of one-way ramps, loops or other one-way facilities. Use crystal
 34 delineators on the right side of divided highways, ramps, loops and all other one-way or
 35 two-way facilities. In all cases, use delineators whose colored retroreflective sheeting
 36 supplements the color of the adjacent edgeline.

37 Design the delineator post for a permanent installation to resist overturning, twisting and
 38 displacement from wind and impact forces.

Section 1267

1 **1267-4 MAINTENANCE**

2 Maintain all installed flexible delineators before acceptance.

3 **1267-5 MEASUREMENT AND PAYMENT**

4 *Flexible Delineators (color)* will be measured and paid as the actual number of flexible
5 delineators satisfactorily installed and accepted by the Engineer.

6 Payment will be made under:

DIVISION 14 LIGHTING

SECTION 1400 ROADWAY LIGHTING

1400-1 DESCRIPTION

Furnish, install, connect and place into satisfactory operating condition lighting at locations shown in the plans. Perform all work in accordance with the contract and the National Electrical Code.

This division is for methods, materials and equipment to construct and put in working order the proposed lighting; however, every fitting, minor detail, or feature may not be shown or described. The Contractor shall be an expert in the trade, capable of understanding the intent of the contract and constructing the lighting and electrical system(s) in accordance with the best practice of the trade.

The Contractor actually performing the work described in the contract shall have a license of the proper classification from the North Carolina State Board of Examiners of Electrical Contractors.

Have the licensed Contractor available on the job site as necessary when work is being performed or when requested by the Engineer. Have this Contractor possess a set of project plans and Specifications on the job site and maintain a set of accurate as built plans. This Contractor shall be qualified to responsibly instruct and direct all employees regarding the electrical work.

1400-2 MATERIALS

Refer to Division 10.

Item	Section
Conduit	1091-3
Ground Rod	1091-6
Wire	1091-2

(A) General

All materials used in the work are to be new materials unless noted elsewhere in the contract. Provide materials that are labeled or listed by an acceptable organization, which is defined as an organization that maintains periodic inspection of the production of the materials and verifies, by the labeling or listing procedure that the materials comply with appropriate standards of performance or are suitable for use in a specified manner. Provide Underwriters' Laboratories (UL) labeled and listed materials when such labeling and listing is available for such materials.

Make sure that materials are in compliance with requirements for use of domestic products, as specified in other sections of the Specifications.

(B) Conduit

Use conduit and duct that is either metallic (Rigid Metallic Conduit) or non-metallic (PVC or HDPE), as noted in the plans.

(C) Wire

Use stranded copper conductors unless specifically noted otherwise on the contract. Use wire and cable which conforms to Insulated Cable Engineers Association (ICEA)

Section 1400

1 specifications and has marks for identification (manufacturer's name, type insulation and
2 gauge of conductor) and the UL label.

3 Use wire insulation rated at 600 VAC or greater.

4 Use the following types of wiring unless noted otherwise in the plans:

Service Lateral	UL Type USE
Control System	UL Type THW or RHW or THHN
Feeder Circuits in Conduit	UL Type USE
Branch Circuits in Light Standards	UL Type SOOW Cable
Equipment Grounding Conductor	Solid MHD, Bare or Insulated
Grounding Electrode Conductor	ASTM B2

5 Use #6 AWG for the grounding electrode conductor unless noted larger in the plans.

6 **(D) Grounding and Bonding Equipment**

7 All grounding and bonding equipment shall conform to UL Standard 467. Use ground
8 rods which are 5/8 inch diameter x 10 feet copper clad steel. Permanently bond
9 grounding conductor to ground rod using an irreversible compression ground connector.
10 Unless the irreversible compression connectors are designed for use with more than one
11 conductor, only one conductor shall be placed under each irreversible compression
12 ground connector. Ensure all connections are made using a hydraulic, power or
13 ratcheting type crimper with appropriate dies. Use of handheld pliers for crimping is
14 prohibited.

15 For ease of inspection, the top of ground rods shall be no more than 6 inches below
16 finished grade and shall remain exposed until electrical inspection is complete.

17 **(E) Fuseholders**

18 Provide fused overcurrent protection in the base of each light standard and other locations
19 as noted. Use a fuseholder rated at least 600 VAC and 30 A approved for wet locations,
20 constructed so the fuse will be disconnected from the line side power every time the
21 fuseholder is opened. The fuseholder may be made of molded plastic or rubber and have
22 insulating boots. Use terminals which are specifically rated for the size and number of
23 conductors required.

24 Use fuses which have 5,000 A minimum interrupting capacity at the supply voltage, are
25 rated 10 A or as noted in the plans and are not glass type unless specified different in the
26 contract. Use the same type fuse in all fuseholders on a project unless specified
27 differently at specified locations.

28 Use fuseholders specifically designed as breakaway devices in fiberglass standards and
29 standards with breakaway bases. Use fuseholders designed to disconnect line side power
30 without damage to the terminals or conductors every time sufficient pulling force is
31 placed on the line and load side conductors.

32 **(F) Hardware**

33 Use mounting or attachment hardware including bolts, nuts, washers, straps, clamps and
34 hangers which is made of stainless steel, hot dipped galvanized or of equal corrosion
35 resistance. Use bolts, which are minimum length and are not less than one nominal size
36 smaller than the opening being used.

37 **(G) Duct and Conduit Sealer**

38 Use duct and conduit sealer or mastic which is a putty-like compound and complies with
39 the following:

40 (1) Is permanently non-hardening, non-oxidizing and non-corrosive to metals, rubber,
41 plastic, lacquer and paints;

- 1 (2) Is readily workable for thumbing into openings and forming into seals around wires
- 2 inside conduits and openings around conduits;
- 3 (3) Has a service temperature range of minus 30°F to 200°F;
- 4 (4) Is clean, non-poisonous and non-injurious to human skin; and
- 5 (5) Seals against water, dust and air and shall adhere to wood, glass, plastics, metal,
- 6 rubber and painted surfaces.

7 **(H) Pull Lines**

8 Place pull lines specifically designed for pulling a rope in all empty conduits and
9 electrical duct so that electrical circuits can be installed in the future. Use pull lines
10 which are 2 ply with a tensile strength of at least 240 lb. and resistant to tangling, rot and
11 mildew.

12 **1400-3 SUBMITTALS**

13 **(A) Catalog Cuts, Working Drawings, and As-Built Plans**

14 Electronically submit catalog cuts and/or shop drawings for materials proposed for use on
15 the project per Sections 105 and 106. Do not deliver materials which have not been
16 approved to the project. Each material catalog cut and/or drawing shall show the
17 description, brand name, stock-number, size, rating, manufacturing specification and the
18 intended use.

19 The approved submittals will be returned to the Contractor through the Resident
20 Engineer's office. Present a catalog cut or drawing for all components of each contract
21 item. Electronic submittals shall be legible with the intended item clearly marked, and
22 arranged in the same order as the contract bid items.

23 **(B) Certifications**

24 Furnish a Type 3 material certification in accordance with Article 106-3 for light
25 standards, high mounts and lowering devices and a Type 6 material certification for
26 conductors. Submit certifications when the above materials are delivered to the project.

27 Type 3 or Type 6 material certifications in accordance with Article 106-3 may be
28 requested for any or all of the other material which does not have a name plate showing
29 sufficient information to verify that the material was manufactured to the requirements of
30 this section.

31 **(C) Samples**

32 Random samples will be taken of the various items for the purpose of verifying
33 conformance with Specifications. The selection of the items to be sampled and the taking
34 of the samples will be done by the Engineer.

35 Failure to meet specification requirements by two samples of any material will be
36 sufficient reason for rejection of all materials from the same lot.

37 Upon request, there will be reimbursement for the actual verified cost of such material
38 taken as samples, including any handling charges less any discount allowed on the
39 invoice, but with no percentage added, and such material will thereafter become the
40 property of the Department.

Section 1400

1 (D) As-Built Plans

2 Submit two complete sets of as-built plans for review upon completion of the work,
3 showing the location of all buried electrical circuits, with pavement crossings
4 dimensioned from fixed objects or from survey stations.

5 Include in the as-built plans the title (No. 1), index (No. 1A), summary of
6 quantities (No. 3) and all of the layout and detail (E) sheets of the project with all changes
7 indicated. After review and approval, place one set of these as-built plans in a waterproof
8 envelope and file in each control panel.

9 Submit one set of as-built plans to the Department.

10 Show the light standard foundations that are relocated on the as-built plans in their final
11 locations.

12 Keep a daily record of the location of all items in order to ensure the accuracy of the
13 as-built plans.

14 (E) Warranties

15 Turn over warranties from each manufacturer of electrical materials and equipment
16 pertinent to the complete and satisfactory operation of the system before the acceptance
17 of the project. Indicate the expiration date on each warranty furnished. The warranty
18 shall not be less than those provided as a customary trade practice.

19 1400-4 CONSTRUCTION METHODS

20 (A) Location Surveys

21 All light standards, high mount foundations and electrical duct will be located unless
22 indicated differently elsewhere in the contract. Mark the proposed location of circuits,
23 circuit markers, control systems, service poles, junction boxes, luminaires and all other
24 components for approval before installation.

25 The plan locations of the light standards and high mounts may be adjusted to be behind
26 guardrail, to avoid obstructions or to avoid undesirable foundation conditions. Ensure
27 location changes are approved before construction. Light standards can be moved no
28 more than 10 feet longitudinally and 2 feet laterally unless approved by the Department.
29 High mast light standards can be moved no more than 25 feet radially unless approved by
30 the Department. Verify project dimensions on the site, actual measurement always taking
31 precedence over scaled plan dimensions, with every part of the work fitted to actual
32 conditions at the site.

33 (B) Damage to Facilities

34 Take all precautions necessary to avoid damage to existing underdrains and other buried
35 facilities located in certain areas. Hand trenching may be required to avoid damage to the
36 underdrains, storm sewer systems and other facilities. Construct light pole foundations
37 with a minimum horizontal clearance of 10 feet to storm sewers or other underground
38 installations which might affect the foundation stability. Make lateral and longitudinal
39 changes in pole locations in the field to provide the required clearance, as directed.

40 Trenching and construction operations may require the removal of, or result in damage
41 to, existing shoulders and paved ditches. Restore all disturbed portions of the project to
42 their original condition or as approved.

43 Installation of conductors may require trenching through existing guardrail locations.
44 Trenching may be done beneath the guardrail in a manner that will not disturb the
45 guardrail installation or the Contractor may remove short sections of guardrail to
46 facilitate mechanical trenching. Reinstall all removed guardrail by the end of the day's

1 work. Permission is required before removal of any guardrail. Repair any damage to the
2 guardrail installation or to the galvanizing of the material as directed.

3 Repair all trenched, excavated, or otherwise damaged earth surface areas by shaping,
4 smoothing, seeding and mulching the damaged areas as required by the Specifications
5 and as directed.

6 **(C) Existing Utilities**

7 Water, sewer, telephone, fire alarm, traffic signal and power lines may be located in the
8 same area that lighting standards and circuits are to be installed.

9 Locate these lines before operations are begun. Field changes approved by the Engineer
10 may be made to provide clearance required by the NESC.

11 Foundations or other construction which is installed in conflict with existing utilities will
12 not be acceptable. Remove unacceptable conflicting construction and repair damage to
13 utilities at no cost to the Department.

14 When the work involves replacing or renovating existing lighting, make all reasonable
15 efforts to prevent dark spots in the lighting system. Phase lighting construction to allow
16 existing lighting to remain in operation as long as possible.

17 **(D) Operation of Equipment**

18 Use a bucket truck to raise workers into position to install and/or adjust luminaires and
19 lamps after the initial setting of the standards. Taking down the light standard to check or
20 make adjustments at the top is not allowed.

21 Install all bore pits outside the clear zone.

22 **(E) Conduit Installation**

23 Install conduit continuous, watertight, free of kinks and make all runs with as few
24 couplings as standard lengths will permit. Do not exceed a total angle of 270° between
25 outlets unless otherwise approved. Conduit bodies with covers and neoprene gaskets
26 may be used to facilitate the installation of the wires at locations indicated in the plans.

27 Provide protection at all times against the entrance of water or other foreign matter into
28 the conduit. Plug or cap conduit when work is temporarily suspended, including nightly
29 stoppage of work.

30 Clean all conduits before installation and upon completion of the system. Snake an
31 approved cleaner with a diameter not less than 85% of the nominal diameter of the
32 conduit through each conduit before installing the wire.

33 Install the conduit in such a manner that temperature changes will not cause elongation or
34 contraction that might damage the system. Provide expansion fittings where conduit
35 crosses structure expansion joints and at other locations shown in the plans.

36 Avoid short radius bends in non-metallic conduit to prevent burn-through of the pulling
37 cable or conductors during pulling operations.

38 Install caps or plugs on stub-outs for future use. Caps and plugs shall be made of the
39 same material as the conduit. Where non-metallic conduit is joined to metallic conduit,
40 use a transition adapter. Install bushings on all conduit ends projecting into panels, boxes,
41 or other enclosures. Provide pull lines in all conduits for future installation of circuitry.
42 Coat field cut threads and other uncoated metal or damaged galvanizing with organic zinc
43 repair paint. Securely fasten conduit. For the spacing of fasteners, do not exceed 4 feet
44 for 1 1/2 inches conduit and larger or 6 feet for 1 1/4 inches conduit and smaller. Use
45 fasteners that are hot dipped galvanized or stainless steel. Provide backs with all conduit
46 straps installed on flat surfaces. Rotary-impact drills may be used for installing expansion
47 anchors in concrete. Do not use powder explosion type units.

Section 1400

1 Do not install underground conduit until the area has been brought to final earth grade.
2 Give careful attention to the vertical and horizontal alignment of the conduit to provide
3 the smoothest installation.

4 **(F) Wiring Methods**

5 Do not pull wire through a conduit system until the system is complete and has been
6 cleaned. Use approved wire pulling lubricants. Pull conductors by hand, or use
7 motorized cable-pulling equipment designed for pulling multiple cables into conduit.
8 Use sheaves or rollers, as required to prevent damage to conductor insulation. Use a
9 dynamometer (clutch device) so as not to exceed maximum allowable pulling tension if
10 conductor is pulled by mechanical means. Do not use a motorized vehicle or heavy
11 equipment to generate pulling forces. Color code all conductors per the NEC (grounded
12 neutral is white, grounding is bare or green) and use phase conductors which are black
13 and red. Approved marking tape, paint, or sleeves may be used instead of continuous
14 colored conductors for No. 8 AWG and larger. White, red or black conductor may be
15 stripped at all accessible points and used as a bare equipment grounding conductor.

16 Joints, taps and splices will only be permitted at locations indicated in the plans and by
17 the following method.

18 Install UL Listed manufactured set screw type connectors, suitable for connecting
19 multiple wires for all phase conductor splices. These precise fit connectors are insulated
20 with high-strength dielectric material and have removable access plugs over the set
21 screws. Direct buried and/or submersible versions of these connectors (UL486D),
22 equipped with factory made waterproof insulating boots, are required for splicing inside
23 junction boxes. Non-direct buried and/or non-submersible connectors (UL486A and
24 UL486B) may be used for phase conductor splicing in normally dry areas such as inside
25 poles and transformer bases. After tightening set screw, tape down the access plugs to
26 keep them securely in place. Split-bolt connectors may be used for ground wire splicing.
27 Wire nut and compression type connectors will not be allowed.

28 Cut conductor so that 3 feet of spare conductor is available for splicing from the end of
29 each respective conduit. Neatly coil extra conductor in junction box.

30 All splices inside light standards shall be easily accessible through handholes unless
31 standard is mounted on breakaway transformer base.

32 **(G) Grounding Electrodes**

33 Install grounding electrodes at each light standard, high mast light standard and control
34 system as shown in the plans. The rod shall be driven vertically until the top is 6 inches
35 below the ground surface. The grounding conductor must be connected to the grounding
36 electrode by an irreversible compression ground connector.

37 **(H) Equipment Mounting**

38 Mount equipment securely at locations shown in the plans in conformance with the
39 dimensions shown and make vertically plumb and level. Install fasteners as
40 recommended by the manufacturer and space evenly. Use all mounting holes and
41 attachment points for attaching enclosures to structures.

42 **(I) Base Protection**

43 For median mounted light standards, use a protective metal shroud installed underneath
44 the light standard base plate to protect the exposed anchor bolts and lighting circuitry
45 segments between the base plate and the top of the concrete median barrier. The metal
46 shroud shall be fabricated of either galvanized steel, minimum gauge 22, or aluminum,
47 minimum gauge 18, to match the material type of the light standard. The metal shroud
48 shall be composed of two overlapping pieces, and attached with two self-tapping stainless
49 steel or galvanized machine screws at each overlap point.

1 For high mount standard, use galvanized steel welded wire reinforcement between the top
2 of foundation and bottom of mounting base. Attach welded wire reinforcement to anchor
3 bolts with size AWG 14 copper wire or small gauge galvanized wire.

4 **(J) Galvanizing Repair**

5 Repair any damaged galvanized components in accordance with Article 1076-7.

6 **(K) Foundations**

7 Form foundations with prefabricated cardboard forms down to 12 inches minimum below
8 top of ground.

9 To avoid vehicle undercarriage snagging of any substantial remains of a breakaway
10 support (when it is broken away), the edge of the foundation or top of anchor bolt should
11 not extend more than 4 inches above a 60 inch chord aligned radially to the centerline of
12 the highway, and connecting any point within the length of the chord on the ground
13 surface on one side of the foundation to a point on the ground surface on the other side.

14 **1400-5 ELECTRICAL INSPECTIONS AND TESTING**

15 Comply with all local ordinances and regulations. Apply for and obtain all permits and/or
16 licenses required by local regulation.

17 Provide a calibrated MegOhmMeter, with certification that calibration was done within one
18 year of use. Provide a meter manufactured by Fluke, Amprobe, Biddle or Engineer approved
19 equal. Present the meter for inspection, at the Pre-Lighting-Work meeting described in
20 Section 1400-11.

21 During project construction perform an insulation resistance test on each feeder circuit
22 conductor. The insulation resistance for each conductor shall exceed 5 megaohms after
23 charging for 30 seconds at 500 VAC or 1000 VDC. The Contractor Meg Circuit Data Form is
24 available on the Department website. Submit the data form to the Engineer for review before
25 final inspection.

26 If the insulation resistance test of any conductor indicates a value of less than 5 megaohms,
27 locate the fault. If the fault is in a conductor between terminal connections, replace the
28 conductor. If the fault is at a terminal connection, repair or replace the terminal device.

29 Removing water from the conduit of a faulty circuit is not considered a repair. Water in the
30 conduit allows electric current to flow between skinned places in the conductor's insulation.
31 If a circuit fails the insulation resistance test and removing water allows the circuit to pass,
32 replace the conductors and re-test the new circuit.

33 After all control system cabinet wiring has been installed and connected in the proposed
34 permanent manner the Contractor will contact the Office of State Fire Marshall of the
35 Department of Insurance, or local authority having jurisdiction, to perform an electrical
36 inspection of the lighting system. Upon satisfactory testing, the Contractor will be issued
37 a Certificate of Inspection for the lighting system. The Contractor may then arrange with the
38 power company to provide the necessary power service. The Certificate of Inspection will be
39 turned over to the Engineer before project acceptance. Inspection by local authorities will
40 neither eliminate nor supersede the final inspection by the Engineer to ensure compliance with
41 the contract.

42 Have all work inspected and approved by the Engineer before concealment. An inspection
43 will be made during the progress and after the work has been completed. It will also include
44 an inspection made at night to determine the optical qualities of each luminaire. Adjust all
45 luminaires having unsatisfactory qualities as directed.

46 Provide the necessary personnel and equipment for aiming luminaires during nighttime
47 inspections by the Engineer.

Section 1400

1 Contact the Department to schedule a final inspection of lighting systems at least 2 weeks
2 before the requested inspection date. The Lighting and Electrical Squad will perform an
3 insulation resistance test as described above, inspect the system for adherence to contract
4 requirements and prepare a lighting inspection memo based on the Lighting System
5 Inspection Checklist. The inspection checklist is available on the Department's website.
6 Provide the personnel and equipment necessary for removing and replacing fuseholders
7 and/or operating circuit breakers to facilitate the insulation resistance test performed by the
8 Lighting and Electrical Squad.

9 1400-6 BURN-IN TEST

10 After all the issues mentioned in the lighting inspection punchlist are addressed to the
11 satisfaction of the Engineer, the lighting system will undergo a 2 week burn-in test. The burn-
12 in test consists of normal dusk to dawn operation of all lighting system control equipment and
13 apparatus, without interruption or failure attributable to poor workmanship or defective
14 material. At the end of the burn-in test, all lights and equipment will be inspected for normal
15 operation. The Contractor will make any necessary repairs or replacements at no cost to the
16 Department.

17 Conduct the burn-in test at the same time for all lights which are energized from the same
18 utility company service point.

19 Burn-in tests of individual circuits or groups of lights will not be acceptable.

20 The Contractor is responsible for all maintenance of the lighting system(s) installed or
21 renovated as part of the contract until project final acceptance.

22 1400-7 IDENTIFICATION

23 Identify each component of the lighting/electrical system as indicated in the plans. Use
24 a method of identification which includes an approved paint, adhesive label, heat shrink label
25 or embossed concrete. Label conductors on components requiring identification at each
26 terminal, circuit breaker, light standard, high mount standard, control system, junction box
27 and underpass panel.

28 Identify each circuit conductor using a one piece nylon cable tie with a label at each terminal
29 and access point. Use permanent marker to label the circuit conductor with the circuit number
30 indicated in the plans.

31 Identify light standards and high mount standards by the control system and location number
32 indicated in the plans. Put the identification on the front side of the standard facing the traffic
33 at a height of 6 feet above ground level. Identify control systems and underpass panels on the
34 exterior of the front panel.

35 1400-8 LOCKS AND KEYS

36 Supply all access doors to control cabinet enclosures with locks that meet the Engineer's
37 approval. Key all locks alike and furnish eight keys to the Engineer.

38 1400-9 ELECTRICAL SERVICE

39 Coordinate all work to ensure that electrical power of the proper voltage, phase, frequency
40 and ampacity is available to complete the project. Contact the utility company, make
41 application, pay all deposits and other costs to provide necessary electrical service. The
42 Contractor will be reimbursed for the actual verified cost of any utility company charges.

43 The Engineer will provide authorization to the Contractor for electrical service to be obtained
44 in the name of the Department and for the monthly power bills to be sent directly from the
45 utility company to the Department. The Department will be responsible for direct payment of
46 monthly power bills received from the utility company.

1 **1400-10 TERMINOLOGY**

2 The terms “High Mast” and “High Mount” are used synonymously in the contract.

3 The term “By Others” means work to be accomplished and paid under contract items other
4 than those clearly pertaining to the work specified or shown. Work by others may be included
5 in this contract for the Contractor to provide, or it may be provided under another contract or
6 by someone other than the Contractor.

7 Abandon means that the materials will not be used in the final completed form of the work.
8 Remove all abandoned materials from the project or terminate at least 18 inches below
9 subgrade so they will not be in conflict with the finished project.

10 **1400-11 CONSTRUCTION PHASING**

11 Schedule a Pre-Lighting-Work meeting before beginning work on the lighting system.
12 Include staff members from the prime contractor, electrical sub-contractor, Resident
13 Engineer’s office and the Department Lighting Designer in Raleigh.

14 Accomplish lighting work along with other roadway construction in the appropriate phases as
15 indicated in the Transportation Management Plans and these Specifications.

16 **1400-12 COORDINATION OF EXISTING LIGHTING WORK**

17 Maintain operation of the existing lighting systems until such time that they become in
18 conflict with the actual construction work, or they become a hazard to traffic as determined by
19 the Engineer.

20 Use care in working around the lights and circuitry and phase operations so that the disruption
21 of existing lighting systems will be minimized. Make repairs or replacements in conformance
22 with the contract. Should the Contractor fail to make such repairs within the time allowed,
23 the Department will cause the necessary repairs to be made by others. The costs of such
24 repairs will be deducted from any monies due the Contractor on the next subsequent monthly
25 or final payment.

26 **1400-13 MEASUREMENT AND PAYMENT**

27 There will be no direct payment, except where specifically noted in Subarticle 1400-3(C) and
28 Article 1400-9 for the work required in the preceding sections of this division. Payment of
29 the contract unit prices for the various items in the contract will be full compensation for all
30 work required.

31 **SECTION 1401**
32 **HIGH MOUNT STANDARD**

33 **1401-1 DESCRIPTION**

34 Design, furnish and install a high mount standard 60 feet or greater in height with a top-
35 latched lowering device and portable drive unit including the drive, winch, wiring, cables,
36 brackets, hardware, transformer, power cord, storage case and operating manuals.

37 **1401-2 MATERIALS**

38 **(A) High Mount Standard**

39 Provide certified computations and fabrication drawings by a professional engineer
40 licensed in the State of North Carolina.

41 Design the support including base plate and anchorage in conformance with the *AASHTO*
42 *Standard Specifications for Structural Supports for Highway Signs, Luminaires and*
43 *Traffic Signals, Fourth Edition, 2001* and the Interim Specifications valid at the time of
44 letting. Use Fatigue Category II. Design and fabricate welds in accordance with
45 Article 1072-18. Design the support for the wind velocity shown in the plans.

Section 1401

- 1 Have the drawings show all details relating to pole, access hole, base, anchorage and
2 lowering device. Show references to ASTM specifications or to other material
3 specifications for each type of material used on the drawings. Note the total weight in
4 pounds on the drawings for each component and the total assembly. Make sure that all
5 drawings are clearly identified with a drawing number and signed and dated by the
6 manufacturer's authorized representative.
- 7 Show clearly full and complete information regarding location, type, size and extent of
8 all welds on the drawings. For groove welds, indicate the particular detail and process to
9 be employed in production of the work. For prequalified joints, use of the Structural
10 Welding Code - Steel, AWS D1.1 letter classification designation of the
11 joint (B-L2b-S, etc.) will satisfy this requirement. Submit welding procedures and
12 procedure qualification records (when required by AWS D1.1) to the Materials and Tests
13 Unit for approval.
- 14 The standard may be either a multisided or round tubular member.
- 15 The criteria listed below shall apply to 60 feet, 80 feet, 100 feet and 120 feet high mount
16 light poles:
- 17 (1) Provide eight or more anchor rods for each pole.
 - 18 (2) Provide base plate thickness of at least 2.5 inches.
 - 19 (3) Provide welded wire reinforcement for base protection that meets Subarticle
20 1400-4(I).
- 21 Electronically submit complete detailed drawings and complete design computations for
22 each height of standard for approval before fabrication.
- 23 Fabricate the support in accordance with the details shown on the approved shop
24 drawings and the Specifications.
- 25 Test all base plate to upright welds using magnetic particle testing (MPT) before
26 galvanizing. All base plates must be tested at 100%. Radiographically test the
27 longitudinal seam welds within 6 inches of the base plate and within 6" of the larger end
28 of the outer tube of the slip fit joint area.
- 29 Hot dip galvanize metalwork after fabrication has been completed. Ensure the
30 galvanization conforms to ASTM A153 for fasteners and ASTM A123 for other
31 structural steel. All welds shall be abrasive blasted to an SSPC SP6 condition before
32 galvanizing.
- 33 Partial penetration longitudinal groove welds on shaft sections, having a minimum throat
34 of 60% of the thickness of material being joined, will be acceptable provided the
35 qualification requirements of the Structural Welding Code - Steel, AWS D1.1 are met.
36 However, full penetration will be required on longitudinal groove welds within 6 inches
37 of circumferential welds and in areas where a shaft section telescopes over another shaft
38 section. No field welding of any part of the assembly will be permitted.
- 39 Allow easy access to all components in the base of the standard with a hand hole with
40 a hinged and lockable door. Allow for opening of the door without the use of special
41 tools or wrenches. Make the hand hole large enough for removal of the circuit breaker
42 and the hoist gearbox and winch assembly (at least 9 inches x 18 inches.) Make the door
43 hinge and lock mechanism sturdy enough to prevent vandalism and to prevent freeze-up
44 or binding due to corrosion or too tight fit. Achieve locking with a conventional padlock.
45 Built-in locks or latching mechanism for the door will not be acceptable.

1 (B) Lowering Device

2 Electronically submit complete detailed drawings of the lowering device with manuals
3 describing the assembly, erecting and operating procedures. Include precise instructions
4 on stringing the cables and leveling the carrier ring.

5 Each high mount lighting standard shall have a device to lower the luminaires from the
6 operating position at the top of the standard to a service position approximately 3 feet
7 above the base of the standard. Include on the device a head-frame, top latching carrier
8 ring and winch assembly. Design the lowering device for the number of luminaires as
9 shown in the plans. Maximum high mast luminaire weight and effective projected area
10 are shown in the contract.

11 Mount the head frame on the standard with a slipfitter and set screws, and have sheaves
12 or rollers for the lifting and power cables. Ensure sockets automatically secure the carrier
13 ring at the top in the raised position and provide a hood on the entire assembly for
14 protection from the weather. Attain latching and unlatching by alternately raising and
15 lowering the carrier ring. Use sheaves that are non-corrosive materials with bronze
16 bushings and stainless steel shafts. Provide suitable retainers to assure that the cables
17 stay in correct position.

18 Have slipfitter tenons equally spaced for mounting the luminaires on the carrier ring. The
19 tenons shall be a suitable length to allow the installation of the LED luminaires. Have the
20 carrier ring automatically latched to the head frame when raised into position by suitable
21 pins and sockets which will prevent the luminaires from swaying, turning, vibrating, or
22 otherwise moving out of proper position. Include on the carrier ring spring loaded roller
23 arms to guide the ring during raising and lowering operations. Use springs made of
24 stainless steel and rollers made of nylon. Mount a metal NEMA 3R weatherproof
25 junction box on the ring for connection of individual luminaire circuits to the electrical
26 power supply cable. Include in the junction box a flanged inlet for connection of the
27 power supply cable. Use an inlet and cable connector which is of the locking type and
28 weatherproof.

29 Use a winch assembly that is a self-locking worm gear type designed for operation with
30 a portable power unit. Have the winch drum automatically reverse the lay of the hoist
31 cable and prevent uneven build-up or tangling.

32 Provide a terminator for joining the hoist cable and three suspension or lifting cables.
33 Provide the means to compensate for variations in the lengths of the 3 lifting cables. Use
34 hoist and lifting cables made of stranded high strength stainless steel extra flexible
35 aircraft type. Use hoist and lifting cables that meet structural requirements of Military
36 Specification MIL-W-83420E and have the center strand not protruding more than
37 0.06 inch after the cable is cut.

38 Use a power supply cable that is rated for suspension and has approved strain relief
39 fittings at each end. At the base of the standard, provide a locking type plug with
40 waterproof cover to connect to a short power supply cable stubbed from the circuit
41 breaker panel.

Section 1401

1 (C) Portable Drive

2 Supply a portable drive unit with a heavy duty reversible electric motor with torque
3 limiter type drive of adequate capacity, complete with a grounding type cord, suitable
4 couplings for attaching the unit to the winch assembly, and a sturdy storage container for
5 the unit and accessories involved. Provide one portable drive unit for the completed
6 project. Provide a drive unit with a lever switch controller with clearly marked up and
7 down positions. Connect the controller to the drive unit with a cord of sufficient length
8 to let the operator stand a minimum of 15 feet from the base of the high mount during
9 lowering or raising operations.

10 Shop assemble the portable drive unit and remove all rough edges. Use mounting or
11 adjustment bolts which allow hand tightening.

12 Provide a complete unit that includes a durable metal storage case with all equipment and
13 instructions for operation. Use a case which is the approximate size as shown in the
14 plans, has a continuous hinge on the lid, and has sturdy carrying handles on each end.
15 Furnish a hasp with padlock as shown in the plans. Construct the case with 16 gauge
16 formed and welded steel with bracing to prevent warping. Paint the inside and outside
17 with a durable quality paint. Provide an identification label as noted in the plans on the
18 storage case.

19 (D) Circuitry

20 Install an enclosed circuit breaker in the base of the high mount standard. Use a breaker
21 which is rated 480 VAC, 2 pole, 30 A, and a minimum interrupting capacity of 14,000 A
22 unless noted otherwise in the plans.

23 Provide a supply cord originating from the circuit breaker with a female twist lock
24 connector for testing the luminaires at ground level, during lowering operation using the
25 portable drive unit and when in the raised position during normal night operation.

26 Provide a junction box mounted on the lowering ring with a flanged inlet to accept the
27 female twist lock connector from the supply cord. Use plugs, flanged inlets and
28 connectors for the supply cable and drive unit which allow grounding and are
29 weatherproof.

30 Install the wiring for each high mount luminaire separately from the luminaire to the
31 junction box. Series or loop circuitry is not allowed.

32 Provide a transformer, branch circuit breaker or minimum 5A fuse and GFCI receptacle
33 as a power source for the portable drive.

34 Provide an equipment grounding conductor in the supply cable. Include an equipment
35 grounding conductor in the wiring for each luminaire.

36 Provide a High Mount Junction Box sized as shown in the plans and meeting the
37 specifications of Section 1411.

38 (E) Operation

39 Demonstrate the operation of the lowering device by raising and lowering the carrier ring
40 with luminaires a minimum of five times for each high mast. Include in this
41 demonstration latching and unlatching at the top and connection of test cables at the
42 bottom. Twisting of the cables, failure of the carrier ring to latch or unlatch, unlevelness
43 of the carrier or hang-up of guide arms will be sufficient reason not to accept the
44 lowering device.

1401-3 CONSTRUCTION METHODS

Use suitable blocking and slings to prevent warping of the high mount standard during storage and transportation. Assemble all parts and string all cables in strict accordance with the manufacturer's instructions.

Make sure that the top of the standard is not out of plumb more than 0.5% of its height.

Include assembly instructions and any special tools, blocks, washers, etc. in the portable drive storage case.

Remove all dirt, stains, marks, etc. before erecting the high mount.

Install a High Mount Junction Box with ground rod as shown in Standard Drawing 1401 of the *Roadway Standard Drawings*. See Section 1411 for junction box construction methods.

1401-4 MEASUREMENT AND PAYMENT

High Mount Standards with lowering devices to be paid will be the actual number of standards installed and accepted. High mount lighting standards with lowering device, measured as provided above, will be paid at the contract unit price each for ____ *High Mount Standard* of the appropriate height. The *High Mount Junction Box* will be paid under Section 1411. The ground rod in the High Mount Junction Box is incidental to the *High Mount Standard*.

Portable Drive Units with storage cases to be paid will be the actual number of portable drive units furnished and accepted. Portable drive units with storage case, measured as provided above, will be paid at the contract unit price each for Portable Drive Unit.

Payment will be made under:

Pay Item	Pay Unit
____ High Mount Standard	Each
Portable Drive Unit	Each

SECTION 1404 LIGHT STANDARDS

1404-1 DESCRIPTION

Furnish and install light standards less than 55 feet high complete with bracket arm(s), when required, and an AASHTO approved breakaway support (slip base, frangible base adapter, breakaway base), when required, as shown on the plans.

1404-2 MATERIALS

Provide a standard that meets the design criteria of the *AASHTO Standard Specifications for Structural Supports for Highway Signs, Luminaires and Traffic Signals* and the Interim Specifications valid at the time of letting. The support is to be designed for the wind velocity shown in the plans.

Provide a standard designed to support a luminaire, which has a center of gravity not more than 18 inches from the end of the support, with a minimum weight and projected area and, if required, a bracket arm length as indicated in the contract.

Make sure that each lighting standard has a grounding lug in the standard located within 6 inches of the handhole or in the transformer base.

Deliver standards with a smooth uniform finish, free of disfiguring scratches or dents and with suitable protection for further handling during erection.

Wrap or package each light standard as recommended by the manufacturer to prevent damage during shipping and handling. Repair or replace, at the option of the Engineer, any standards with abraded finishes or other damage.

Section 1404

1 Furnish aluminum or steel standards and bracket arms (when required); however, use the
2 elected material throughout the project.

3 Galvanize steel components after fabrication. Use galvanization which conforms to the
4 requirements of ASTM A123 for tubes, plates and bars and to ASTM A153 for hardware.

5 Use connecting bolts, washers and nuts compatible with the transformer base as
6 recommended by the light standard manufacturer and which comply with the contract.

7 Use anchor bolts, washers, nuts and shims which comply with the Specifications and details
8 shown in the plans as recommended by the light standard and transformer base
9 manufacturer(s).

10 Furnish anchor and/or connecting bolt covers and pole top caps with standards as indicated in
11 the plans.

12 Provide pole hardware such as nuts, bolts and washers for aluminum standards from
13 18-8 stainless steel or aluminum alloy 2024-T4. Provide nuts, bolts and washers for steel
14 standards from 18-8 stainless steel or steel conforming to ASTM A307. Submit drawings for
15 approval which show material specifications for each component.

16 Luminaires may be either direct pole mounted or mounted to a bracket arm. Where bracket
17 arms are required, use bracket arms for each standard which are the length shown in the plans
18 and of the same material as the standard. For direct pole mounted luminaires, minimum
19 setback distances shown in the *Roadway Standard Drawings* must be maintained.

20 For light standards installed on the shoulder or in a grassy median, provide these light
21 standards with an approved breakaway support that complies with *AASHTO Standard
22 Specifications for Structural Supports for Highway Signs, Luminaires and Traffic Signals* and
23 one of the following descriptions:

24 (A) A cast aluminum transformer base with an aluminum door,

25 (B) A frangible base insert or adapter, or

26 (C) A slip base.

27 Use the same type of breakaway support throughout the entire project. All breakaway
28 supports shall be FHWA approved. When frangible base adapters are used, include a shroud
29 between the base plate and the foundation for protection for exposed wiring and conduit at the
30 base of the standard. Secure the shroud in place in at least two locations.

31 Provide Light Standard Junction Box sized as shown in the plans and meeting the
32 specifications of Section 1411..

33 1404-3 CONSTRUCTION METHODS

34 Locate and number the light standards as shown in the plans.

35 Do not lay the standards on the ground without proper blocking and protection to prevent
36 warping and discoloration. Protect the standards from damage by other construction work,
37 including landscape mulching and fertilizing operations.

38 Securely mount the standards on the anchor bolts, and plumb with nuts torqued according to
39 the manufacturer's recommendation.

40 Mounting height is defined as vertical distance from luminaire to surface of pavement of
41 heaviest traveled lane in area illuminated by the luminaire. A tolerance of ± 1.5 feet from the
42 required mounting height will be permitted. If this tolerance is exceeded, furnish and install
43 an acceptable standard within this tolerance.

44 Install a Light Standard Junction Box as shown in Standard Drawing 1404 of the *Roadway
45 Standard Drawings*. See Section 1411 for junction box construction methods.

1 **1404-4 MEASUREMENT AND PAYMENT**

2 *Light Standards*, ____ will be measured and paid as be the actual number of light standards
 3 with bracket arm assemblies, when required, and breakaway supports, when required, of each
 4 appropriate mounting height and bracket arm type and length, when required, that have been
 5 installed and accepted. The Light Standard Junction Box will be paid under Section 1411.
 6 The ground rod in the Light Standard Junction Box is incidental to the light standard.

7 Payment will be made under:

Pay Item	Pay Unit
Light Standards, ____	Each

8

SECTION 1407

9

ELECTRIC SERVICE POLE AND LATERAL10 **1407-1 DESCRIPTION**

11 Furnish and install wood service poles, wire, conduit, bushings, fittings, connectors, meter
 12 base and weatherhead from the service point to a control system.

13 **1407-2 MATERIALS**

14 Refer to Division 10.

Item	Section
Wood Poles, Class 4	1082
Type USE Wire	1091-2, 1400-2
Conduit	1091-3

15 **1407-3 CONSTRUCTION METHODS**

16 Dig holes large enough to permit the proper use of tampers to the full depth of the hole. Place
 17 backfill in the hole in 6 inches maximum layers and thoroughly tamp. Place surplus earth
 18 around the pole in a conical shape and pack tightly to drain water away.

19 Set the pole to a depth of at least 5.5 feet unless shown otherwise in the plans. When utility
 20 power is available from outside the right of way, locate the service pole no more than 10 feet
 21 inside the right of way. The utility company will install overhead conductors from their
 22 facilities. Install an underground service lateral from the service pole to the control system.
 23 The proposed service pole will be deleted from the contract if the utility company:

24 (A) Provides a pad mount transformer,

25 (B) Allows attachment of the riser and weatherhead to their pole, or

26 (C) Provides underground service from their pole.

27 Make connections at the service head at the bottom of the drip loop to prevent siphoning of
 28 water through the cable.

29 Provide for a meter in accordance with the requirements of the utility company's condition of
 30 service. A meter base for a self-contained meter may be mounted on the service pole or back
 31 of the control enclosure as indicated in the plans. A current transformer (CT) cabinet and
 32 meter base may be mounted in either location if requested by the utility company.

33 Use stranded copper Type USE conductors installed in rigid galvanized steel conduit sized as
 34 shown in the plans for the service lateral.

35 **1407-4 MEASUREMENT AND PAYMENT**

36 *Electric Service Pole* ____ will be measured and paid as the actual number of the appropriate
 37 length and class electric service poles installed and accepted.

Section 1408

1 *Electric Service Lateral* ____ from service pole to control panel will be measured and paid as
2 the actual number of linear feet of the appropriate size and type service lateral installed and
3 accepted. Measurement will be along the longest conductor from electrical terminal to
4 electrical terminal.

5 Payment will be made under:

Pay Item	Pay Unit
Electric Service Pole ____	Each
Electric Service Lateral ____	Linear Foot

6 **SECTION 1408**
7 **LIGHT CONTROL EQUIPMENT**

8 **1408-1 DESCRIPTION**

9 Furnish and install an entire control system, including enclosure, control panel, photocell,
10 switches, contactors, breakers, terminal blocks, wiring, concrete foundation and surge
11 protection device. The control system will be standard electrical components in a stainless
12 steel enclosure mounted on a metal pole with a concrete foundation as shown in the contract.

13 **1408-2 MATERIALS**

14 Refer to Division 10.

Item	Section
Conduit	1091-3
Portland Cement Concrete, Class A	1000-4
Wire and Cable	1091-2, 1400-2

15 Provide concrete foundations and wire in accordance with the Specifications.

16 Use a piece of 4 inch rigid galvanized steel conduit with threaded conduit cap, embedded in
17 concrete as shown in the plans for mounting the control system

18 Provide a NEMA type 3R stainless steel enclosure with external stainless mounting flanges,
19 drip shield, back panel and continuous hinge door with a print pocket. Provide a door closing
20 mechanism interlocked with a flange mounted operator handle to prevent the opening of the
21 door with the service circuit breaker in the ON position, except by use of safety override
22 devices.

23 Provide an enclosure approximately 36 inches (h) x 30 inches (w) x 10 inches (d) unless noted
24 otherwise in the plans. Provide only openings necessary for the entrance of conduits as
25 shown in the plans. Do not use knockouts. Ensure the enclosure conforms to NEC Article
26 312 and mount the devices so the NEC clearances will be provided, except use 1.5 inches
27 where not specified or noted in the tables for minimum wire bending space.

28 Use galvanized slotted steel framing channel with straps and bolts, sized as shown in the plans
29 for the mounting brackets and hardware for attaching the enclosure to the pole. Use
30 galvanized finish on the brackets and hardware and coat all field cuts or scratches with
31 organic zinc repair paint.

32 Provide a neutral bar bonded to the panel with sufficient box lug type terminals to accept the
33 required number of wires.

34 Mount components to the back panel with manufacturer supplied mounting brackets or
35 permanently attached screw studs.

36 Use a service circuit breaker providing a minimum interrupting rating of 22,000 A. Provide
37 thermal magnetic, molded case, permanent trip breakers. Provide multi-tap, solderless, load
38 side box lugs or distribution terminal blocks of the appropriate size. Use insulating material

- 1 approved for NEMA 3R applications. Provide a breaker with a voltage and amperage rating
2 as indicated in the plans.
- 3 Provide a single pole, open type control circuit breaker rated at 240 VAC phase to ground
4 with a minimum current interrupting capacity of 5,000 A and a high magnetic trip setting
5 of 15 A.
- 6 Provide three 60 A, 4 pole mechanically held contactors that have coil clearing contacts and
7 coil voltage rating as indicated in the plans. Contactor latching with hooks or semi-permanent
8 magnets is unacceptable.
- 9 Use a control relay rated 240 VAC with one normally open contact and one normally closed
10 contact and has a continuous load rating and inductive make rating greater than that required
11 by the mechanically held contactor. Use a coil rated for 240 VAC, 60 Hz.
- 12 Use a selector switch which is a heavy duty 3-position maintained contact unit in a surface
13 mount (NEMA 1) enclosure with a legend consisting of On-Off-Auto and having continuous
14 current rating of 10 A at 240 VAC for the contacts.
- 15 Use feeder circuit breakers which are rated 14,000 A minimum interrupting capacity and have
16 an open type molded case with a non-adjustable thermal magnetic trip setting as noted in the
17 plans.
- 18 Use a delayed response photo-control which is the encapsulated cadmium-sulfide type,
19 suitable for use on an operating voltage range of 105 V to 285 V and nominal control voltages
20 of 120 V, 208 V, 240 V and 277 V. Ensure the control is rated for 1,000 W resistive load or
21 1,800 V-A of inductive load. Set the light-level within a range of 1.0 to 3.0 footcandles.
22 Have internal protection for surges in excess of 2,000 V peak for the control. Mount a
23 receptacle directly to the top of the enclosure with a weatherproof fitting. Use controls and
24 receptacles which conform to NEMA Standard C136.10 for roadway lighting equipment.
- 25 Use a Type 1 surge protection device (SPD) meeting UL 1449 and UL 96A, designed to
26 contain and arrest an arc of 20,000 A. Install the SPD on the load side of the service breaker.
- 27 Use terminals and lugs rated for the connection of the appropriate size copper conductors. All
28 conductors shall be made of copper and neatly wrapped in bundles or run in plastic raceways.
- 29 Perform all galvanizing in accordance with Section 1076.
- 30 Provide a drawing to scale showing the location, brand and catalog number of each
31 component of the control system for approval.
- 32 The completed light control system shall be marked "Suitable for Use as Service Equipment",
33 in a prominent location in the enclosure, in accordance with NEC Article 409.110. If the
34 control system is not made in a certified UL 60947-4-1A Panel Shop, a third party, recognized
35 by the Department of Insurance as having the authority, shall label the control systems.
- 36 Provide a Control System Junction Box sized as shown in the plans and meeting the
37 specifications of Section 1411.
- 38 **1408-3 CONSTRUCTION METHODS**
- 39 Construct the foundation for the control system as shown in the plans with the top of the
40 foundation 3 inches above finished grade.
- 41 Fasten the enclosure to the pole by means of a galvanized bracket assembly as shown in the
42 plans. Make all cuts square and remove all rough edges. Have mounting holes match
43 existing mounting holes of the enclosure.
- 44 Arrange all conduits entering the enclosure in a neat symmetrical manner and extend directly
45 downward into the foundation. Install six rigid galvanized steel (RGS) feeder circuit conduits
46 as shown in the *Roadway Standard Drawings*.

Section 1409

1 Install a Control System Junction Box as shown in Standard Drawing 1408 of the *Roadway*
2 *Standard Drawings*. Stub all feeder circuit conduits and spare conduits from Control System
3 in the Control System Junction Box. See Section 1411 for junction box construction methods.
4 See plans for conduit sizes. Place pull cord in any unused conduits and cap unused conduit in
5 junction box.

6 In accordance with NEC Article 250.64(E), to prevent the creation of electrically parallel
7 paths, install a bonded conduit choke on the underground termination point of the system
8 grounding conductor conduit. Do not terminate the system grounding conduit under the
9 concrete foundation pad.

10 Install a grounding electrode system consisting of a minimum of two ground rods spaced not
11 less than 6 feet apart at all new or relocated lighting control system panels. Connect ground
12 rods with an appropriately sized bonding jumper.

13 Apply two coats of organic zinc repair paint to all field cut metal and conduit threads as
14 specified in Article 1076-7.

15 **1408-4 MEASUREMENT AND PAYMENT**

16 *Light Control Equipment, (Type)* will be measured and paid as the actual number of the
17 appropriate type light control systems completed and accepted. The Control System Junction
18 Box will be paid under Section 1411.

19 Payment will be made under:

Pay Item	Pay Unit
Light Control Equipment, (Type) _____	Each

20 **SECTION 1409**
21 **ELECTRICAL DUCT**

22 **1409-1 DESCRIPTION**

23 Furnish and install electrical duct including materials, equipment and labor for trenching,
24 jacking, boring or directional boring and backfilling, so electrical circuits may be easily
25 installed, repaired or replaced, and be protected from traffic loading at locations shown in the
26 plans.

27 **1409-2 MATERIALS**

28 Refer to Division 10.

Item	Section
Conduit	1091-3

29 Use electrical duct that is non-metallic rigid PVC heavy wall conduit, HDPE Standard
30 Dimension Ratio (SDR) 13.5 or rigid galvanized steel conduit.

31 **1409-3 CONSTRUCTION METHODS**

32 Duct is a passageway for electrical circuits. Install ducts in accordance with NEC
33 requirements for an approved raceway. Locate the duct as shown in the plans and at a depth
34 of at least 30 inches unless indicated otherwise in the plans. Locate bore pits outside the clear
35 zone, as defined in the *AASHTO Roadside Design Guide*.

36 The lengths noted in the plans are only typical. Make actual field measurements to place the
37 ends of the duct at the required locations. Make up lengths of duct with the minimum number
38 of pieces joined together with couplings and solvent as recommended by the manufacturer.

39 Clean and plug the duct in accordance with Subarticle 1400-4(E).

40 Plug the duct with oakum or duct seal after feeder circuits in conduit are extended through
41 duct.

Section 1410

1 Place buried duct in a trench with essentially vertical walls and only wide enough for easy
2 installation of the duct. Tunneling by hand or other approved methods may be required to
3 install duct beneath existing walks or paved ditches. Perform backfilling in accordance with
4 Article 300-7.

5 Jacked duct may be installed by either of the following methods at the Contractor's option,
6 when placement of electrical duct beneath pavement by jacking is noted in the plans.

7 (A) The duct may be pushed beneath the pavement through earth without prior construction
8 of an opening.

9 (B) A bored opening not more than 1 inch larger than the outside diameter of the duct may be
10 made by augering and the duct inserted.

11 (C) A drilled opening not more than 1 inch larger than the outside diameter of the duct may
12 be made with a pneumatic vibrating machine and the duct inserted.

13 (D) HDPE conduit may be installed in accordance with Subarticle 1715-3(D).

14 Do not install non-metallic conduit by jacking method (A) as listed above.

15 If installation of a duct is begun and not completed, plug any opening as directed. Installation
16 of duct by water jetting will not be acceptable.

17 At locations where it is indicated in the plans that the duct is to be connected to boxes,
18 foundations, or other raceways, install in accordance with Subarticle 1400-4(E) to provide
19 an approved raceway as specified by the NEC.

20 Unless otherwise noted in the plans, rigid galvanized steel conduit is intended for use in above
21 ground applications only.

22 **1409-4 MEASUREMENT AND PAYMENT**

23 *Electrical Duct (Size and Type)* will be measured and paid as the actual number of linear feet
24 of duct, measured in place to the nearest whole foot, installed and accepted.

25 Payment will be made under:

Pay Item	Pay Unit
Electrical Duct, (Size & Type) _____	Linear Foot

26 **SECTION 1410**
27 **FEEDER CIRCUITS**

28 **1410-1 DESCRIPTION**

29 Furnish and install all conductors and conduit, including tools, equipment, trenching and
30 backfilling to provide electrical circuits at locations shown in the plans.

31 **1410-2 MATERIALS**

32 Refer to Division 10.

Item	Section
Conduit	1091-3
Wire and Cable	1091-2, 1400-2

33 Use UL listed, Type USE wire for feeder circuits in conduit. The equipment grounding
34 conductor may be bare or insulated. Use conductors which are copper and in accordance with
35 Subarticle 1400-2(C). Give careful attention to the required color code. Do not mark a white
36 conductor in a cable assembly any other color; however, a white conductor may be stripped at
37 all accessible points and used as a bare equipment grounding conductor.

Section 1410

1 Provide metallic (rigid galvanized steel) conduit above ground and non-metallic (PVC or
2 HDPE) conduit below ground in accordance with the Subarticle 1400-2(B) with the
3 appropriate type being used at locations as shown in the plans.

4 **1410-3 CONSTRUCTION METHODS**

5 Install feeder circuits in continuous runs, without splices, except at junction boxes or within
6 light standard bases.

7 Install conductors in accordance with the Subarticle 1400-4(F) and conduit in accordance with
8 the Subarticle 1400-4(E).

9 Excavate trenches to depths and widths as shown in the plans with essentially vertical walls
10 and as straight as possible, when underground feeder circuits are required. Locate
11 underground feeder circuits a minimum of 6 feet back of the face of curb or outside the limits
12 of the paved shoulder and stone base, as directed. Use care to prevent conflict with existing
13 or future guardrails, sign posts, delineators and similar devices.

14 Surround the underground feeder circuit in conduit with clean soil and use backfill free of
15 rocks and other objectionable materials which might damage the conduit. This will require
16 partial backfilling by hand in areas where it is likely that objectionable materials will be
17 included if mechanical methods of backfilling are used.

18 Perform all necessary search methods, including, but not limited to, use of underground metal
19 detection equipment and excavation equipment, to locate existing electrical duct. Locate the
20 duct and perform all necessary work including cleaning of the duct before installation of
21 proposed circuits.

22 When a feeder circuit in conduit passes through electrical duct, make the conduit continuous
23 through the duct unless specifically noted otherwise in the plans. After feeder circuits in
24 conduit are extended through duct, plug the duct with oakum or duct seal.

25 When only feeder circuits are required, install the load current carrying conductors and
26 grounding conductors in either existing conduit or conduit installed under other contract
27 items.

28 When more than one circuit is installed in a single raceway, a single equipment grounding
29 conductor sized as required for the largest circuit may be used without change in the contract
30 unit bid prices.

31 Multiple circuits may be placed in the same trench if they are grouped and separated
32 a minimum distance of 3 inches. When more than one circuit is installed in the same trench
33 there will not be any adjustment of the contract unit bid prices.

34 **1410-4 MEASUREMENT AND PAYMENT**

35 *Feeder Circuits* will be measured and paid as the actual number of linear feet of each
36 size and type feeder circuit completed and accepted. Measurement will be to the nearest
37 whole foot from electrical terminal to electrical terminal of the longest load current carrying
38 conductor.

39 *Feeder Circuit in* *Conduit* will be measured and paid as the actual number of linear
40 feet of each size and type feeder circuit completed and accepted. Measurement will be to the
41 nearest whole foot from electrical terminal to electrical terminal of the longest load current
42 carrying conductor.

43 Payment will be made under:

Pay Item	Pay Unit
<u> </u> Feeder Circuit	Linear Foot
<u> </u> Feeder Circuit in <u> </u> Conduit	Linear Foot

SECTION 1411
ELECTRICAL JUNCTION BOXES

1411-1 DESCRIPTION

Provide in ground junction boxes made from fiberglass reinforced polymer concrete or thermoplastic materials and provide cast-metal boxes encased in concrete of the appropriate type at locations noted in the plans, complete with all necessary covers, conduits, duct and hardware, in accordance with the contract.

1411-2 MATERIALS

Refer to Division 10.

Item	Section
Backfill	1005
Electrical Junction Boxes	1091-5

Provide an in ground junction box which is open bottom with a foot. Provide a standard "Lighting" logo on the cover unless specifically noted otherwise in the plans. Backfill beneath and around the boxes using #67 washed stone in conformance with Section 1005.

1411-3 CONSTRUCTION METHODS

Install conduits and duct before the in ground (IG) boxes are set in place. Do not rest the bottom of the box directly on conduits, ducts or cables.

Place the top of the box on the same grade as the surrounding area. Perform backfilling with sufficient care that no part of the junction box, conduit or duct is displaced or moved out of alignment. Backfill beneath and around the box to at least 12 inches using #67 washed stone aggregates in conformance with Section 1005.

Locate junction boxes for best routing of conduit and duct and to minimize drainage problems. Any junction boxes which are retaining water as identified by the Project Inspector or the Lighting and Electrical personnel during final inspection shall be corrected to the satisfaction of the Engineer prior to project acceptance.

Do not locate boxes in useable shoulders or pavements or other areas where they may be subjected to traffic loadings.

Stub the ends of conduit and duct vertical and seal. Leave approximately 10 inches from the top of the conduit to the junction box lid. Arrange wiring so that splices will not lay in the bottom of the box.

Install cast-metal barrier rail (BR) and/or sidewalk (SW) boxes and arrange conduits and ducts to best fit field conditions. During the construction of the concrete reinforcement, accurately space and securely attach Type BR and Type SW junction boxes and conduits inside the reinforcement. Bond junction box to the reinforcement in accordance with NEC Article 250.52. Place boxes with covers flush with surface of concrete. For median barrier installations, install Type BR junction boxes so that the face of each box is on the same side of the road as the serving lighting control system.

Place mastic between the cast metal box frame and the cast concrete barrier, as shown on plans to allow easy replacement of the frame.

Install a Control System Junction Box (CSJB) meeting the requirements of this section and sized as shown in the plans within 2 feet of the edge of the concrete pad in front of each Control System.

Install a High Mount Junction Box (HMJB) meeting the requirements of this section and sized as shown in the plans 10 feet from each high mount foundation. Position the junction box for best routing of underground circuitry. The junction box is used as a tee point for circuitry to the high mast standard.

Section 1412

1 For single arm or twin arm light standards installed in grassy areas, provide a light standard
2 junction box (LSJB) meeting the requirements of this section and sized as shown in the plans.
3 Install the LSJB 5 feet from the standard foundation. The LSJB shall be placed parallel to, or
4 behind the light standard foundation, as viewed from the roadway. The LSJB is used as a tee
5 point for circuitry.

6 Install a ground rod in the HMJB and the LSJB. Permanently attach grounding conductor
7 from light standard to ground rod in junction box via an irreversible compression ground
8 connector.

9 Record the precise GPS location of all junction boxes in the junction box summary on the
10 plans. Submit the list of junction box GPS locations to the Engineer and include this list in
11 the print pocket of the lighting control system.

12 **1411-4 MEASUREMENT AND PAYMENT**

13 *Electrical Junction Boxes* ____ will be measured and paid as the actual number of the
14 appropriate type (IG, BR, SW, HMJB, LSJB, CSJB) and size junction boxes installed and
15 accepted. Payment for the conduit, duct and wiring will be paid under other contract items.
16 Items used for splicing are incidental to the junction boxes.

17 Payment will be made under:

Pay Item	Pay Unit
Electrical Junction Boxes ____	Each

18 **SECTION 1412**
19 **UNDERPASS LIGHTING**

20 **1412-1 DESCRIPTION**

21 Furnish and install wall mounted (WM) and/or pendant mounted (PM) luminaires with
22 electrical circuitry, for underpass lighting at locations shown in the plans. Work includes, but
23 is not limited to, furnishing and installing underpass luminaires with LED light sources,
24 internally mounted driver and mounting hardware as well as furnishing and installing circuit
25 breakers and enclosure, pull boxes, conduit, conductors, expansion fittings, anchors, straps
26 and ground rod.

27 **1412-2 MATERIALS**

28 Refer to Division 10.

Item	Section
Conduit	1091-3
Wire and Cable	1091-2

29 Use luminaires that are listed as “Suitable for Wet Locations” according to UL Standard 1572,
30 with sealed LED light engine assemblies. Use electronic drivers that are completely pre-
31 wired integral units, for reliable operation of LED light engine(s)
32 at -40°F ambient temperature. Use the luminaire type, wattage, voltage, correlated color
33 temperature (CCT) and IES illumination distribution pattern as shown in the plans.

34 Provide Type WM luminaires that are wall mounted, with cast aluminum housing painted
35 with premium quality gray or dark bronze paint. Use the same color Type WM luminaires
36 throughout the project. Provide a prewired driver assembly which is thermally isolated from
37 the LED light engines. Provide factory installed mounting holes in the back and conduit
38 entrances in the sides and top. Provide a cast aluminum hinged door and a sealed glass lens
39 covering the LED light engines. Provide preinstalled, modular LED light engines.

40 Provide Type PM luminaires that are a pendant mounted assembly of driver, optical and
41 mounting components, including a safety chain and hanging hardware. Provide a die-cast
42 aluminum driver housing with gray paint finish, with a prewired driver assembly and an

1 electrical receptacle for attachment of hanging hardware. Provide sealed, directional LED
 2 light engines covered by a lightly diffused refractor made of UV stabilized, injection molded,
 3 prismatic, heat-resistant polycarbonate or acrylic.

4 Use a 3/4 inch rigid galvanized steel conduit with a hook and power cord entrance as the
 5 pendant. Provide a 3-conductor Type SOOW power cord and a 3/4 inch female threaded
 6 wiring compartment to attach the driver housing to the pendant as shown in the plans.

7 Use galvanized weldless forged steel eye-nuts that comply with Federal Specification WW-H-
 8 171E (Type 17), or Manufacturers Standardization Society SP-69-2003 (Type 17). Attach
 9 eye nuts to galvanized steel or stainless steel threaded rod anchored to the bridge deck with
 10 adhesive anchors. Use galvanized steel or stainless steel safety chain, S-hooks and lock nuts.

11 Use conduit and wire in accordance with Article 1400-2 and gasketed PVC junction boxes as
 12 shown in the plans.

13 Use a 2-pole, 480 VAC, 15 A circuit breaker with an interrupting capacity of at least 14,000
 14 A, installed in a NEMA 3R enclosure. The enclosure should be primed and painted with a
 15 premium grade exterior paint before installation to increase corrosion resistance. Install an
 16 equipment ground bar and provide a lock in accordance with Article 1400-8.

17 **1412-3 CONSTRUCTION METHODS**

18 Mount luminaires as shown in the plans. Use galvanized steel or stainless steel clamps and
 19 attachment hardware.

20 Install circuitry in accordance with Article 1400-4.

21 **1412-4 MEASUREMENT AND PAYMENT**

22 *Underpass Luminaires* ____ will be measured and paid as the actual number installed and
 23 accepted.

24 *Underpass Circuitry at* ____ will be paid at the contract lump sum price for underpass
 25 circuitry at the appropriate location.

26 Payment will be made under:

Pay Item	Pay Unit
Underpass Luminaires ____	Each
Underpass Circuitry at ____	Lump Sum

27 **SECTION 1413**
 28 **PORTABLE CONSTRUCTION LIGHTING**

29 **1413-1 DESCRIPTION**

30 Furnish, operate and maintain everything necessary to provide lighting for compliance with
 31 Article 105-14 Night Work requirement for artificial lighting.

32 **1413-2 MATERIALS**

33 Furnish all lighting equipment as required and retain after the work is completed. Material
 34 and/or equipment is not required to be new but shall be in good operating condition and in
 35 compliance with applicable safety and design codes.

36 Submit, for review and approval, catalog cuts giving the specific brand names, model
 37 numbers and ratings of the lighting equipment. Include in the submittals power ratings and
 38 photometric data. Do not begin night work without approval of the equipment and/or
 39 materials.

Section 1413

1 1413-3 TOWER LIGHT

2 Use tower lights which consist of mercury vapor, metal halide, high pressure sodium or low
3 pressure sodium fixtures mounted on a tower approximately 30 feet in height. Use tower light
4 fixtures which are heavy duty flood, area, or roadway style with wide beam spread, have
5 an output of 50,000 lumens minimum, have the combined outputs of all fixtures on each
6 tower light not exceed 460,000 lumens, and are weatherproof and supplied with attached
7 waterproof power cord and plug. Use a sturdy tower which is freestanding without the aid of
8 guy wires or bracing. Provide sufficient capacity in the power supply to operate the light(s)
9 and locate it for the shortest safe routing of cables to the fixtures. A tower light consisting of
10 the combined fixture(s), tower and power supply is preferred.

11 Provide tower lights of sufficient wattage and/or quantity to provide an average maintained
12 horizontal illuminance greater than 20 footcandles over the work area.

13 Aim and position the lights to illuminate the area for construction work. Make sure that there
14 is not any disabling glare to the motorist. In no case should the main beam of the light be
15 aimed higher than 60° above straight down. The lights should be set as far from traffic as
16 practical and aimed in the direction of, or normal to, the traffic flow.

17 1413-4 MACHINE LIGHTS

18 Use machine lights which have mercury vapor, metal halide, high pressure sodium or low
19 pressure sodium conventional roadway enclosed fixtures mounted on supports attached to the
20 construction machine at a height of approximately 13 feet. Use fixtures for machine lights
21 which have light output between 22,000 and 50,000 lumens. Use a power supply with
22 sufficient capacity to operate the light(s) and securely mount on the machine. Perform
23 electrical grounding of generators to frames of machines on which they are mounted in
24 conformance with the NEC.

25 Use machine light fixtures with sufficient wattage and/or quantity to provide an average
26 maintained horizontal illuminance greater than 10 footcandles on the machine and the
27 surrounding work area. Machine lights are in addition to conventional automotive type
28 headlights which are necessary for maneuverability.

29 Balloon lights are an acceptable alternate luminaire for machine lights.

30 1413-5 CONSTRUCTION METHODS

31 Use tower lights when the night work is confined to a fairly small area and is essentially
32 a stationary operation. Space tower lights no closer than 100 feet apart and no further than
33 300 feet apart. Actual spacing will be determined by approved equipment. At any spacing,
34 the required 20 footcandles of light will be the determining factor.

35 Use machine lights when the night work is not confined to a small area and is essentially
36 a continuous moving construction operation.

37 Tower lights may be provided instead of machine lights upon approval by the Engineer. Use
38 of tower lights instead of machine lights will be considered when the number of machines,
39 type of work, or need for inspection justify their use as decided by the Engineer.

40 Illuminate the work area where traffic control devices are being set up or repositioned at
41 night.

42 Where night time flagging operations are required, all flagging stations shall be illuminated to
43 a minimum of 5 footcandles.

44 The work areas to be illuminated are the areas where construction equipment and labor are in
45 operation and may be different from the work areas shown in the plans.

46 Illuminate a large enough work area so that the movements of all personnel and equipment
47 engaged in the work will be contained in the area.

Section 1413

- 1 Provide sufficient fuel, spare lamps, generators and personnel qualified to operate the lights to
2 assure that they will be maintained in operation during night work.
- 3 Existing streetlights do not eliminate the requirement for the Contractor to provide lighting.
4 Consideration may be given to the amount of illumination provided by existing lights in
5 determining the wattage and/or quantity of lights to be provided.

6 **1413-6 MEASUREMENT AND PAYMENT**

7 *Portable Lighting* provided by tower and machine lights will be paid only when a significant
8 amount of nighttime work is explicitly required and a pay item for portable lighting has been
9 included in the contract. Otherwise, portable construction lighting will be incidental to other
10 contract items and no direct payment will be made.

11 The aggregate amount to be paid on each partial payment estimate will be equal to the
12 percentage that the item of *Portable Lighting* is complete as estimated by the Engineer.

13 Payment will be made under:

Pay Item

Portable Lighting

Pay Unit

Lump Sum

DIVISION 15 UTILITY CONSTRUCTION

SECTION 1500 GENERAL UTILITY REQUIREMENTS

1500-1 DESCRIPTION

Construct various utilities as required by the contract or as directed.

Apply the applicable provisions of the rules and regulations of the NCDEQ to the construction of water lines and sanitary sewer lines. Perform all work in accordance with the applicable plumbing codes.

1500-2 COOPERATION WITH THE UTILITY OWNER

The utility owner owns the existing utility facilities and will own the new utility facilities after acceptance by the Department. The Department owns the construction contract and has administrative authority. Communications and decisions between the contractor and utility owner are not binding upon the Department or this contract unless authorized by the Engineer. Agreements between the utility owner and contractor for work that is not part of this contract or is secondary to this contract are allowed, but are not binding upon the Department.

Provide access for Department personnel and the owner's representatives to all phases of construction. Notify Department personnel and the utility owner 2 weeks before commencement of any work and one week before service interruption. Keep utility owners' representatives informed of work progress and provide opportunity for inspection of construction and testing.

Except in an emergency, do not operate any of the controls on the existing systems without prior approval of the owner.

Notify the utility owner at least 24 hours in advance of all arrangements for temporary service and for agreement with the owner as to the time that service may be interrupted.

1500-3 UTILITY LOCATIONS AND CONTRACTOR'S RESPONSIBILITY

The plans depict the best available information for the location, size and type of material for all existing utilities. Make investigations for determining the exact location, size and type of material of the existing facilities as necessary for the construction of the proposed utilities and for avoiding damage to existing facilities. Repair any contractor caused damage of existing facilities to the original or better condition at no additional cost to the Department.

1500-4 WEEKEND, NIGHT AND HOLIDAY WORK

Make connections between existing and proposed utilities at times most convenient to the public, without endangering the utility service and in accordance with the utility owner's requirements. Make connections on weekends, at night and on holidays, if necessary.

1500-5 RELATION OF WATER MAINS TO SEWERS

Lay water mains at least 10 feet laterally from existing or proposed sewers. If local conditions or barriers prevent a 10 foot separation, lay the water main with at least 18 inches vertical separation above the top of the sewer pipe either in a separate trench or in the same trench on a bench of undisturbed earth.

Section 1500

1 When a proposed water main crosses over a proposed or existing sewer, lay the water main
2 with at least 18 inches vertical separation above the top of the sewer. If local conditions or
3 barriers prevent an 18 inch vertical separation, construct both the water main and the sewer
4 for a distance of 10 feet on each side of the point crossing with ferrous pipe having water
5 main quality joints.

6 When a proposed water main crosses under a proposed or existing sewer, construct both the
7 water main and the sewer of ferrous materials with joints that are equivalent to water main
8 standards for a distance of 10 feet on each side of the point of crossing. Center the section of
9 water pipe at the point of crossing.

1500-6 PROTECTION OF PEDESTRIAN AND VEHICULAR TRAFFIC

11 During the progress of the work, keep sidewalks and crossings open for the passage of
12 pedestrians. Take necessary measures to keep roadways open for traffic unless lane or
13 roadway closures are approved.

14 Construct and maintain adequate and approved bridges over excavations as necessary for the
15 purpose of accommodating pedestrians or vehicles.

16 When open cut installation is allowed across a roadway and traffic is to be maintained,
17 construct the installation in sections so that half the width of the roadway will be available to
18 traffic. Provide all traffic control measures necessary to provide for safe traffic passage.

1500-7 SUBMITTALS AND RECORDS

20 Deliver only approved materials to the project. Provide sufficient information as required
21 under Sections 105 and 106 to demonstrate the materials meet the specifications and intended
22 use. Provide 2 copies to the utility owner and 6 copies to the Engineer or provide electronic
23 submittals if accepted by the Engineer. Identify each item's intended use. As a minimum, the
24 submitted information shall show the material description, brand name, stock number, size,
25 rating and manufacturing specification.

26 Provide working drawings of thrust restraint designs and connection details along with
27 schedules for performing the work.

28 Provide as-built plans of the installed utility. The plans shall include notations of the size and
29 type material installed, coordinates of utility controls and horizontal and vertical locations of
30 the piping. Provide 2 copies to the utility owner and 2 copies to the Engineer.

1500-8 LOCATING AND MARKING

32 Tape a continuous locator wire along the top of all piping. Mechanically fasten locator wire
33 to valve boxes, meter boxes, fire hydrants, manhole covers and other above grade
34 appurtenances. Install marking tape 18 inches to 24 inches below finished grade above all
35 pipelines.

1500-9 PLACING PIPELINES INTO SERVICE

37 Make final connections of the new work to the existing mains where indicated in the plans, as
38 required to fit the actual conditions or as directed. Provide sufficient work crews, equipment
39 and materials on site to assure quick and efficient connections.

40 Schedule and notify owners and customers in advance of any interruptions of water service
41 with ample time to make arrangements. Limit interruption of service to water customers to no
42 more than 8 hours. Provide temporary connections as needed to maintain service. Obtain
43 approval from the NCDEQ-Water Resources Section prior to placing a new water line into
44 service. Use backflow prevention assemblies for temporary connections to isolate new water
45 lines from existing water line.

1 **1500-10 MEASUREMENT AND PAYMENT**

2 The general utility construction work will be incidental and will be paid at the contract unit
3 prices of the various utility items included in the contract.

4 **SECTION 1505**
5 **EXCAVATION, TRENCHING, PIPE LAYING**
6 **AND BACKFILLING FOR UTILITIES**

7 **1505-1 DESCRIPTION**

8 Perform all excavation, undercut, foundation conditioning, pipe laying, bedding, backfill and
9 pavement, sidewalk and driveway repair necessary for installation of utilities.

10 **1505-2 MATERIALS**

11 Refer to Division 10.

Item	Section
Portland Cement Concrete, Class B	1000
Select Material	1016

12 Use Class III, IV, V or VI select material for foundation conditioning and bedding.

13 **1505-3 CONSTRUCTION METHODS**

14 Excavate, trench, lay pipe, bed and backfill utilities in conformance with the applicable
15 requirements of Division 1, Division 2 and Articles 300-1, 300-4 and 300-6. Comply with
16 AWWA and ASTM standards along with the product manufacturer requirements for installing
17 utilities.

18 **(A) Shoring**

19 Excavate trenches and pits for the installation of utilities that are safe for the workers and
20 roadway users and that protect the roadway and other property from damage. Provide
21 appropriate groundwater and surface water controls to stabilize the excavation and
22 foundation and to provide a clean working area.

23 (1) Worker Safety

24 Provide any necessary shielding or shoring to protect workers.

25 (2) Roadway Users

26 Provide shielding or shoring as required under Section 150 or as required elsewhere
27 in the contract.

28 (3) Roadbed and Foundation Protection

29 Provide shoring of excavations less than one horizontal to one vertical from existing
30 or proposed pavement to prevent failure or weakening of the roadbed. Provide plans
31 and designs demonstrating the methods and techniques proposed and their adequacy.
32 Provide engineered shoring systems as required for the actual conditions.

33 (4) Building and Structure Protection

34 Provide shoring of excavations less than one horizontal to one vertical from existing
35 structures and buildings, on or off the right of way, to prevent foundation damage.
36 Provide plans and designs demonstrating the methods and techniques proposed and
37 their adequacy. Provide engineered shoring systems as required for the actual
38 conditions.

Section 1505

1 (B) Foundation Conditioning

2 Undercut and replace weak or saturated soils below the pipe trench with select material to
3 provide a firm foundation.

4 (C) Bedding

5 Provide excavations with sufficient width for placing and compacting bedding around the
6 utility. Bed utilities in select material. Place bedding material to stable ground on both
7 sides and to at least 2 inches below and above the pipe bells. Provide at least 6 inches of
8 bedding material between rock and piping. Shape the bottom of trenches to fit the pipe.
9 Compact bedding material completely in the pipe haunches. Provide recesses in the
10 bedding to accommodate pipe joints.

11 (D) Pipe Laying

12 Lay pipe in accordance with the specifications and the manufacturer's recommendations.
13 Except where necessary in making connections with other lines or as authorized by the
14 Engineer, lay pressurized pipe with the bells facing in the direction of laying.

15 Where possible, keep joints exposed for visual inspection during testing.

16 During the progress of the work and until the completion and final acceptance, keep the
17 pipelines and their appurtenances clean throughout and remove any obstructions or
18 deposits. Provide secure watertight seals on pipe when work is not in progress.

19 Lay gravity sewer pipe upgrade with the spigot ends pointing in the direction of flow.
20 Lay each pipe to form a close concentric joint with the adjoining pipe and to prevent
21 sudden offsets of the flow line.

22 (E) Thrust Restraint

23 Provide thrust restraint for pressurized pipelines and appurtenances. When shown in the
24 plans, construct as specified with modifications to match the actual field conditions.
25 When not shown, engineer the thrust restraint system with a factor of safety of 1.25 for
26 the test pressure specified and for the actual field conditions.

27 Provide thrust restraint on the existing piping system as necessary.

28 Use joint restraint methods, such as integral restraining bells and spigots, restraining
29 retainer glands, restraining gaskets or restraining clamps and lugs with tie rods. Use
30 concrete reaction backing and thrust collars where joint restraint is impractical.

31 Where any section of a main is provided with concrete thrust restraint for fittings,
32 controls or hydrants, perform the hydrostatic pressure test after the concrete reaches
33 appropriate strength.

34 (F) Backfilling

35 Backfill in accordance with Article 300-7 and compact to the density required by
36 Subarticle 235-3(C).

37 1505-4 REPAIR OF PAVEMENTS, SIDEWALKS AND DRIVEWAYS

38 Repair sidewalks and driveways that are disturbed by excavation and trenching to an original
39 or better condition in accordance with Section 848.

40 Use asphalt plant mix to repair or replace pavement damaged by utility work. Perform all
41 work in accordance with Section 654. Immediately upon completion of the utility removal or
42 installation, make repairs to the pavement.

1 **1505-5 CONCRETE ENCASUREMENT OF UTILITY LINES**

2 Encase existing or proposed utility lines in concrete for protection in areas as shown on the
 3 utility plans or as directed. Place the concrete completely around the line with a minimum
 4 thickness of 6 inches.

5 **1505-6 MEASUREMENT AND PAYMENT**

6 *Foundation Conditioning* material will be measured and paid as provided in Article 300-9.

7 *Asphalt Plant Mix* for pavement repair will be measured and paid as provided in
 8 Article 654-4.

9 *Class B Concrete for Encasing Utility Lines* will be measured and paid in cubic yards of
 10 concrete, measured in place.

11 *__" Concrete Sidewalk* and *__" Concrete Driveways* will be measured and paid in accordance
 12 with Article 848-4.

13 Trenching, excavation, pipe laying, bedding, backfilling and disposal of unsuitable materials
 14 for utility construction are included in the contract price for the applicable utility item and no
 15 separate measurement or payment will be made.

16 The following work and items are included in the contract price for the applicable utility item
 17 and no separate measurement or payment will be made for items (A) through (F) below:

- 18 (A) Undercut or Wet Excavation,
- 19 (B) Dewatering of Excavation,
- 20 (C) Shoring and Sheet piling (except temporary shoring for maintenance of traffic covered
 21 elsewhere in the contract and protection of structures and buildings),
- 22 (D) Thrust Restraint,
- 23 (E) Bedding Material, or
- 24 (F) Select Material for Backfill.

25 Payment will be made under:

Pay Item	Pay Unit
Class B Concrete for Encasing Utility Lines	Cubic Yard

26 **SECTION 1510**
 27 **WATER LINES**

28 **1510-1 DESCRIPTION**

29 Provide water lines suitable for use in transporting potable water.

30 **1510-2 MATERIALS**

31 Refer to Division 10.

Item	Section
Water Pipe and Fittings	1036

32 The Contractor may use any of the water pipe specified under Section 1036 except where
 33 a particular type pipe is specified in the plans or required by environmental regulations or
 34 Departmental policy. The Contractor shall verify that the pipe is appropriate for the test
 35 pressure of the system and the external loading.

36 Use ductile iron fittings on water lines 4 inches or larger.

37 Use #12 AWG solid-copper wire with blue insulation for the utility locator wires.

Section 1510

1 Use 2 inch plastic marking tape colored blue with “Caution Water Line” or similar wording,
2 permanently printed at 36 inch centers.

3 Protect steel rods and other metal clamps and lugs by galvanizing or painting with approved
4 bituminous paint.

5 **1510-3 CONSTRUCTION METHODS**

6 **(A) General**

7 Meet the installation standards of AWWA or ASTM for water line construction.

8 Apply Section 1505 for excavation, trenching, pipe laying and backfill to water line
9 installation.

10 Install small diameter pipe (4 inches or less) under existing pavement by a trenchless
11 method at no additional cost to the Department.

12 Connect the ends of the water service piping using AWWA C800 type couplings or
13 fittings. Make NPT screw joints with a double wrap of a polytetrafluoroethylene (PTFE)
14 tape and torque as required by the manufacturer.

15 Store plastic pipe out of direct sunlight until burying. All plastic pipe showing
16 discoloration or deterioration will be rejected for use and replaced with suitable pipe as
17 specified under Article 106-9.

18 Install water lines with 36 inches to 42 inches of cover to finished grade unless otherwise
19 directed or approved. Install water lines with greater cover for short distances to
20 accommodate utility controls, to make tie-ins to existing facilities, to eliminate high
21 points in the pipeline or to provide clearance between existing and proposed utilities,
22 drainage, other obstacles or actual field conditions.

23 **(B) Testing and Sterilization**

24 Perform pressure and leakage tests and sterilization on newly installed water mains and
25 altered water mains prior to placing such pipelines into service. Provide all equipment,
26 piping, controls, pumps, water and safety devices necessary for performing the tests and
27 sterilization.

28 Obtain clean water for cleaning, testing and sterilization from approved sources. Provide
29 connections to potable water sources with approved backflow preventors until acceptance
30 of all test results.

31 Perform tests using clean water and provide certified results demonstrating leakage less
32 than the following amount when pressurized at 200 ± 5 psi for 2 hours.

$$W = LD\sqrt{P} \div 148,000$$

Where:

- W** = allowable leakage in gallons per hour
- L** = length of pipeline tested, in feet
- D** = nominal diameter of the pipe, in inches
- P** = average test pressure during the leakage test, in lb/sq.in.

33 Repair using approved methods or replace pipe, controls or appurtenances as necessary to
34 reduce leakage below acceptable levels. Additionally, repair any leaks that are visible
35 after 2 hours duration.

36 Clean water lines by flushing with water at least 2.5 feet per second velocity. Remove all
37 debris and dirt from water mains larger than 4 inches by passing a medium density foam
38 pig with abrasive strips through the lines.

39 Sterilize water lines in accordance with Section 1003 of the Rules Governing Public
40 Water supply and AWWA C651 Section 4.4.3, the Continuous Feed Method. Provide a

chlorine solution with between 50 parts per million and 100 parts per million in the initial feed. If the chlorine level drops below 10 parts per million during a 24 hour period, then flush, refill with fresh chlorine solution, and repeat for 24 hours. Provide certified bacteriological and contaminant test results from a state-approved or state-certified laboratory. Operate all valves and controls to assure thorough sterilization. Testing, cleaning and sterilization shall be performed consecutively.

Dispose of waste water in accordance with all environmental regulations.

For short sections (less than 100 feet) and tie-in sections of water lines perform visual tests for leakage after installation instead of separate pressure and leakage tests. Sterilize according to AWWA C651 Sections 4.6 and 4.7.

Provide copies of the test results to the Engineer and to the water line owner.

Flush with clean water until the residual chlorine is reduced to the same level as in the existing water mains.

Place new water lines into service after approval of all testing and flushing and authorization by the Engineer.

1510-4 MEASUREMENT AND PAYMENT

Water lines of the various sizes will be measured from end to end in place with no deduction for length through valves or other fixtures and paid by the horizontal linear foot.

The quantity of *Ductile Iron Water Pipe Fittings* will be measured and paid per pound based on the published weights for ductile iron fittings, exclusive of the weights of any accessories, as listed in the “DI Fittings Weight Chart” located on the Utilities Unit web site. If the Contractor elects to use compact ductile iron water pipe fittings, measurement will be based on the weight of standard size ductile iron water pipe fittings. Any fitting not listed will be measured based on the published weights for ductile iron fittings listed in ANSI/AWWA C-110/A21.10. This is limited to pressure pipe 4 inches or larger.

If the contract does not include such pay items, measurement will not be made and the work will be incidental to other contract pay items.

Payment will be made under:

Pay Item	Pay Unit
___" Water Line	Linear Foot
Ductile Iron Water Pipe Fittings	Pound

**SECTION 1515
UTILITY CONTROLS**

1515-1 DESCRIPTION

Provide appropriate control devices, valves, meters, backflow prevention assembly and hydrants on water lines and force main sewers.

1515-2 MATERIALS

Refer to Division 10.

Item	Section
Sanitary Sewer	1034
Water	1036

Deliver only approved materials to the project.

Air release valves shall meet AWWA C512. In addition, air release valves for sanitary sewer force mains shall have long bodies, shall be equipped with back flushing connections and shall have a hood over the outlet.

Section 1515

1 Double check valves (DCV) and Reduced Pressure Zone principal (RPZ) backflow prevention
2 assemblies shall be listed on the University of Southern California Foundation for Cross-
3 Connection Control and Hydraulic Research list of approved backflow devices. Line stops
4 consist of a sleeve, temporary valve and closure cap. The sleeve and cap shall meet
5 applicable AWWA standards, shall be made of cast iron or stainless steel, shall be pressure
6 rated at 200 psi and shall be sized for the type pipe to be tapped. The temporary valve shall
7 be suitable for contact with potable water with NSF certification and designed to match the
8 actual field conditions.

9 Line stop bypass pipe shall be pressure rated at 200 psi, shall be NSF certified and shall be
10 adequately restrained.

11 Use screw or slip type valve boxes with a base to fit the valve yoke and a removable plug cap
12 with the word "Water" or "Sewer" cast therein.

13 Precast manholes in accordance with Section 1525.

14 **1515-3 CONSTRUCTION METHODS**

15 Apply Section 1505 for excavation, trenching, pipe laying and backfill.

16 Place two 4 inch x 8 inch x 16 inch concrete blocks beneath valves and fire hydrants for
17 support.

18 When necessary, due to project staging, install valves, meters and fire hydrants as appropriate
19 for the current grade and make adjustments to finished grade as work progresses.

20 Provide enclosures with positive drainage for utility controls.

21 **(A) Valves**

22 Install all valves with an approved valve box set flush with the ground or pavement.
23 Place a 24 inch diameter precast concrete ring flush with the ground around all valve
24 boxes not in pavement.

25 Test and sterilize tapping valves before making the tap. Do not allow cuttings to enter
26 the tapped main.

27 **(B) Meters**

28 Install water meters adjacent to the right of way or as shown in the plans.

29 Place meter boxes with the top of the meter box flush with finished grade of the project.

30 **(C) Backflow Prevention Assembly**

31 Install backflow prevention assembly off the highway right of way or as shown in the
32 plans.

33 Licensed installers shall test and certify RPZ backflow preventer installations. Enclose
34 RPZ backflow prevention assembly above grade in a hot box.

35 Enclose DCV backflow prevention assembly below grade in a precast concrete vault with
36 positive drainage or above grade in a hot box.

37 Install the hot box on a 4 inch thick concrete slab that is 6 inches larger than the box and
38 2 inches to 4 inches above finished grade.

39 **(D) Fire Hydrants**

40 Install fire hydrants outside of the vehicle recovery area of the roadway, adjacent to the
41 right-of-way line or in protected areas.

42 Connect fire hydrants to the main with a 6 inch valve and branch line having at least as
43 much cover as the distribution main. Set hydrants plumb with the pumper nozzle facing
44 the roadway and with the breakaway safety flange between 1 inch and 4 inches above the

1 finished surrounding grade. Except where otherwise approved, place hydrants into
 2 service as soon as practicable. Place at least 7 cf of clean crushed stone around the base
 3 of the hydrant to insure drainage of the hydrant barrel.

4 Where necessary, remove the hydrant shoe and replace with the appropriate type to
 5 connect a relocated hydrant to the new pipe. Furnish and install or remove hydrant
 6 extension pieces to provide the proper bury of the pipe and hydrant.

7 **(E) Line Stops**

8 Provide line stop valves to temporarily shut down the flow in pressurized pipes. Provide
 9 line stops to temporarily dead end a pipeline when there are no available working valves
 10 on the existing piping. Provide line stops with bypass to isolate a section of the existing
 11 pipeline while maintaining the flow.

12 After line stop valves are removed, permanently cap the tapping sleeve and backfill the
 13 entire excavation with compacted select material.

14 **(F) Air Release Valves**

15 Install air release valves at the high point of pressurized pipelines. Place a precast
 16 manhole around air release valves.

17 **(G) Miscellaneous Controls**

18 Install corporation stops with tapping saddles for connecting 2 inches or smaller water
 19 lines to larger water lines. Install corporation stops at 45 ± 10 degrees from vertical on
 20 the larger line.

21 To aid in testing and flushing, install corporation stops at all elevated points along the
 22 pipeline to bleed off all entrapped air.

23 **1515-4 MEASUREMENT AND PAYMENT**

24 *Valves, Water Meters, Fire Hydrants, Line Stops* and other items listed in the pay items will
 25 be measured and paid per each for the appropriate size and type. *Fire Hydrant Leg* will be
 26 paid per linear foot.

27 The term *Relocate* in a pay item means to physically move the existing item, either vertically
 28 or horizontally, using the appropriate materials to place the item into working order.
 29 Measurement and payment will be made per each for the appropriate size and type. When
 30 relocating a fire hydrant, valves will only be paid for if there is no properly functioning
 31 existing valve.

32 No additional compensation will be made for adjustments due to project staging on new or
 33 relocated items.

34 *Reconnect Water Meter* means to transfer or replace the piping from a new water line to
 35 an existing water meter that is not relocated. Measurement and payment for meters will be
 36 made per each.

37 ___" *Water Service Line* will be paid per linear foot for pipes 2 inches or greater.

38 *Water Service Line* will be paid per linear foot for pipes less than 2 inches

39 Valve boxes, meter boxes, hot boxes, vaults and manholes for protecting and servicing utility
 40 controls are incidental to the appropriate pay item.

41 A line stop with bypass consists of installing line stops on opposite ends of the piping to be
 42 isolated, tapping the piping beyond the line stops and providing temporary bypass piping
 43 between the taps. The entire assembly of valves and piping will be measured as one unit and
 44 paid per each.

Section 1520

- 1 Corporation stops or other items to aid in testing and flushing of the piping are incidental
- 2 items.
- 3 If the contract does not include such pay items, measurement will not be done and the items
- 4 will be incidental to other contract pay items. All piping, controls, certifications,
- 5 appurtenances and other miscellaneous items necessary to place the new or relocated item in
- 6 proper working condition are incidental.
- 7 Payment will be made under:

SECTION 1520
SANITARY SEWER

1520-1 DESCRIPTION

Provide sanitary sewers suitable for transporting sewage.

1520-2 MATERIALS

Refer to Division 10.

Item	Section
Sanitary Sewer Pipe and Fittings	1034

Use any pipe specified under Section 1034 except where a particular type pipe is specified in the plans or required by environmental regulations or Departmental policy. Verify the pipe is appropriate for the test pressure of the system and the external loading.

Use ductile iron fittings on pressurized (force main) pipelines 4 inches or larger.

Use screw type plastic or brass clean-out covers.

Use #12 AWG solid-copper wire with green insulation for the utility locator wires.

Use 2 inch plastic marking tape colored green with "Caution Sewer Line," or similar wording, permanently printed at 36 inch centers.

1520-3 CONSTRUCTION METHODS

Apply Section 1505 for excavation, trenching, pipe laying and backfill to sanitary sewer installation.

Assemble pipe in accordance with the recommendations of the manufacturer.

- 1 Install PVC pipe in accordance with approved bedding methods.
- 2 Install vitrified clay sewer pipe in accordance with ASTM C12.
- 3 Install 4 inch minimum diameter sanitary sewer clean-outs flush with finished grade on 4 inch
4 and 6 inch service lines. Provide clean-outs at the right-of-way line and at changes in
5 direction. Do not locate clean-outs within the roadway pavement or shoulders. Provide
6 clean-outs no more than 50 feet apart when beyond the roadway shoulders.
- 7 Use ductile iron pipe for sewers with 10% or greater slope.
- 8 Install sewer lines entering manholes with the crown at or higher than the sewer line leaving
9 the manhole.
- 10 Install small diameter pipe (4 inches or less) under existing pavement by a trenchless method
11 at no additional compensation.

12 (A) Gravity Sanitary Sewer

13 Construct gravity sanitary sewers in conformance with *NCDEQ Gravity Sewer Minimum*
14 *Design Criteria*.

15 (1) Pipe Installation

16 Use fittings or saddles to connect service lines to the sewer main.

17 Maintain sewer flow at all times. Use temporary diversions or pumping to maintain
18 flow when connecting proposed sewers to existing sewers. Use engineered
19 temporary pumping systems capable of handling full pipe flow. Use pumping
20 systems with automatic reliable operation or constantly tended manual operation.

21 (2) Testing

22 Perform tests on newly installed sewers and altered sewers before placing into
23 service. Provide all equipment, piping, controls, pumps, water and safety devices
24 necessary for performing the tests.

25 Test all 24 inches and smaller gravity sewer lines for leakage using infiltration,
26 exfiltration, or air test. Perform visual inspection on gravity sewer lines larger than
27 24 inches. Perform line and grade testing and deflection testing on all gravity sewer
28 lines.

29 (a) Infiltration

30 For sewer lines greater than 3 feet below groundwater, measure the amount of
31 water infiltrating into the pipeline between manholes in at least 24 hours. Repair
32 leaks or replace piping when the rate of infiltration exceeds the following
33 equation:

$$W = 0.000789LD$$

Where:

- W** = maximum allowable leakage in gallons per hour
L = length of pipeline tested, in feet
D = nominal diameter of the pipe, in inches

34 (b) Exfiltration

35 For sewer lines above groundwater, perform an exfiltration test on the pipeline
36 between manholes. Repair leaks or replace piping when the rate of exfiltration
37 exceeds maximum allowable leakage calculated in Subarticle 1520-3(A)(2)(a).

38 The exfiltration test shall consist of securely plugging the pipe at the lower
39 manhole and filling the pipeline with water. Allow the water to sit for 24 hours
40 in clay or concrete pipes. Raise the water level in the upstream manhole

Section 1520

1 to 3 feet above the top of pipe. After 4 hours, measure the amount of water
2 required to bring the water level back to the level at the start of the test and
3 record the time.

4 Perform exfiltration tests through a series of manhole to manhole segments to
5 limit the length of pipe tested to between 300 feet and 1,500 feet. Shorter
6 sections may be tested with longer test times. No additional leakage allowance
7 for manholes permitted.

8 (c) Air Test

9 Instead of hydrostatic testing, sewer lines 24 inches in diameter or smaller may
10 be air tested in accordance with ASTM C828, ASTM C924 and the following.
11 Securely plug the sewer pipe at the manholes. Fill the pipe with air to 4.0 psi
12 and hold this pressure for 5 minutes. Reduce the pressure to 3.5 psi. Measure
13 the time for the pressure to drop 1.0 psi to the new pressure of 2.5 psi. Exceed
14 the minimum test time in Table 1520-1 for the appropriate nominal pipe
15 diameter.

TABLE 1520-1 AIR TEST TIME			
Pipe Size (Inches)	Test Time (Minutes/100 ft)	Pipe Size (Inches)	Test Time (Minutes/100 ft)
8	1.2	18	2.4
10	1.5	21	3.0
12	1.8	24	3.6

16 (d) Visual Inspection

17 Visually inspect sewer lines larger than 24 inches from the inside using
18 approved cameras. Correct any leakage, rolled gaskets or defects.

19 (e) Line and Grade

20 Test all sewers for straight alignment by lamping or using a laser.

21 (f) Deflection Testing

22 Perform deflection tests on all flexible pipes. Conduct the test after the final
23 backfill has been in place at least 30 days to permit stabilization of the soil-pipe
24 system. As an alternative to waiting 30 days to permit stabilization of the
25 soil-pipe system, provide certified soil testing verifying the backfill of the trench
26 has been compacted to at least 95% maximum density.

27 No pipe shall exceed a deflection of 5%. If deflection exceeds 5%, relay the
28 pipe.

29 The rigid ball or nine-point mandrel used for the deflection test shall have
30 a diameter not less than 95% of the base inside diameter or average inside
31 diameter of the pipe depending on which is specified in the ASTM, to which the
32 pipe is manufactured. The pipe shall be measured in compliance with
33 ASTM D2122. The test shall be performed without mechanical pulling devices.

34 **(B) Force Main Sanitary Sewer**

35 Construct force main sewers in conformance with *NCDEQ Minimum Design Criteria for*
36 *the Fast-Track Permitting of Pump Stations and Force Mains.*

37 (1) Installation

38 Install lines with 36 inches to 42 inches of cover to finished grade unless otherwise
39 directed or approved. Install lines with greater cover for short distances to
40 accommodate utility controls, to make tie-ins to existing facilities, to eliminate high

1 points in the pipeline or to provide clearance from existing or proposed utilities,
2 drainage, other obstacles or actual field conditions.

3 Provide automatic air release valves at all high points.

4 (2) Testing

5 Perform pressure and leakage tests on newly installed force mains and altered sewers
6 before placing such pipelines into service. Provide all equipment, piping, controls,
7 pumps, water and safety devices necessary for performing the tests and sterilization.

8 Test all new sewer force mains with clean water at 200 ± 5 psi for a 2 hour duration.
9 Vent all high points and expel all air. Provide certified results demonstrating leakage
10 less than:

$$W = 0.000106LD$$

Where:

- W = allowable leakage in gallons per hour
- L = length of pipeline tested, in feet
- D = nominal diameter of the pipe, in inches

11 Repair leaks using approved methods or replace pipe, controls or appurtenances as
12 necessary to reduce leakage. Additionally, repair any leaks that are visible after
13 2 hours duration.

14 **1520-4 MEASUREMENT AND PAYMENT**

15 ___" *Sanitary Gravity Sewer* and ___" *Force Main Sewer* will be measured from end to end in
16 place with no deduction for length through manholes, valves or fittings and paid per linear
17 foot for the appropriate size. Where two different sizes enter or go from a manhole, each size
18 will be measured to the center of the manhole. Unless otherwise shown in the plans, branch
19 connections, ells or other fixtures will be included in the length measurement. All fittings will
20 be incidental on *Sanitary Gravity Sewer*.

21 *Sanitary Sewer Clean-Out* will be measured and paid per each.

22 *Sewer Service Line* will be paid per linear foot.

23 The quantity of *Ductile Iron Sewer Pipe Fittings* will be measured and paid per pound based
24 on the published weights for ductile iron fittings, exclusive of the weights of any accessories,
25 as listed in the "DI Fittings Weight Chart" located on the Utilities Unit web site. If the
26 Contractor elects to use compact ductile iron sewer pipe fittings, measurement will be based
27 on the weight of standard size ductile iron sewer pipe fittings. Any fitting not listed will be
28 measured based on the published weights for ductile iron fittings listed in ANSI/AWWA C-
29 110/A21.10. This is limited to pressure pipe 4 inches or larger.

30 Payment will be made under:

Pay Item	Pay Unit
___" Sanitary Gravity Sewer	Linear Foot
___" Force Main Sewer	Linear Foot
Sanitary Sewer Clean-Out	Each
Sewer Service Line	Linear Foot
Ductile Iron Sewer Pipe Fittings	Pound

1525-1 DESCRIPTION

Provide utility manholes on water and sanitary sewer lines.

1525-2 MATERIALS.

Refer to Division 10.

Item	Section
Brick	1040-1
Concrete Block	1040-2
Curing Agents	1026
Gray Iron Castings	1074-7(B)
Grout, Type 2	1003
Mortar	1040-9
Portland Cement Concrete	1000
Precast Concrete Units	1077
Reinforcing Steel	1070
Select Materials	1016
Steps	1074-8
Structural Steel	1072

Use precast concrete manholes with monolithic bottoms which conform to ASTM C478, AASHTO M 199 and are as shown in the plans or in *Roadway Standard Drawings*. Use ASTM C443 gaskets or AASHTO M 198 flexible sealants for joints between precast manhole sections. Use resilient connectors for piping conforming to ASTM C923. Use ASTM A48, Class 35 cast iron or Grade 60 steel reinforcement steps with polypropylene plastic coating.

Use manhole frames and covers made of cast iron conforming to ASTM A48 Class 35, which are traffic bearing, have machined contact surfaces and are sized as shown. Use covers with two 1 inch diameter air vents for vented manholes and use solid, non-vented covers with gaskets for watertight installation. Use covers with "Sanitary Sewer" or "Water" cast in large letters as appropriate for the type of utility.

Use Type 2 grout with properties that meet Table 1003-2 in the *Grout Production and Delivery* provision except provide grout with a plastic consistency in accordance with ASTM C1107.

1525-3 CONSTRUCTION METHODS

Apply Section 1505 for excavation, trenching, pipe laying and backfill.

Make connections of pipe to manholes in cored or precast holes using a resilient connector. Use horseshoe type holes only when approved. For horseshoe type holes wrap the pipe with a butyl rubber gasket and fill the space between the pipe and manhole with a non-shrinking grout.

Provide an outside drop assembly on manholes for sewer pipes entering with 2.5 feet or more vertical drop. Inside drop assemblies may be used for connections to existing manholes when the drop exceeds 5 feet and the manhole diameter is greater than 4 feet.

In sewer manholes over 3 feet in depth, provide steps spaced 16 inches on center. Install steps in line with the effluent opening unless otherwise specified.

Construct invert channels to confine and direct the flow through sanitary sewer manholes. Use smooth finished invert channels that provide easy transition from inlet to outlet. Finish the benches or shelves to a non-slip texture and slope toward the invert channel. Precast invert channels are recommended but not required.

- 1 On deep manholes, a transition type manhole may be used provided there is at least 6 feet
 2 from the manhole bench to the transition cone.
- 3 Construct manholes with the top of the cover as shown in Table 1525-1.

TABLE 1525-1 MANHOLE CONSTRUCTION	
Location	Top height above finished grade
Roadway pavement, Driveways, Sidewalks, Parking lots	Flush ± 1/4"
Vehicle Recovery Area	Flush ± 3"
Manicured Areas, such as lawns	Flush to + 2" with concrete pad
Flood Zones less than 3 ft above finished grade	1 ft above 100 year flood elevation
Flood Zones greater than 3 ft above finished grade	2 ft above finished grade with watertight frame and cover and vent pipe to 1 ft above 100 year flood
Other areas	2 ft above finished grade

- 4 For manholes installed before finished grading or paving, construct the top flush with the
 5 current grade to provide access during all phases of construction and adjust as grading and
 6 paving work progresses in accordance with Section 858.

7 **(A) Cast-In-Place Concrete, Brick and Block Masonry**

- 8 Construct concrete manholes in accordance with Section 825 with an ordinary surface
 9 finish. Construct brick masonry in accordance with Section 830. Furnish and place
 10 reinforcing steel in accordance with Section 425. Construct block masonry in accordance
 11 with Section 834 except that reinforcing will not be required.

- 12 Where necessary to fit field conditions, vary the dimensions of the manhole and footings
 13 as directed.

14 **(B) Installation of Precast Units**

- 15 Assemble precast manhole units in accordance with the manufacturer's instructions and
 16 grout together to form a sound structural unit. Fill all lifting holes with grout. Where it is
 17 necessary to use cast-in-place, brick masonry or block masonry construction as part of the
 18 structure, apply Subarticle 1525-3(A) to such construction.

19 **(C) Fittings and Connections**

- 20 Where fittings enter the manhole, place them as the work is built up, thoroughly bonded
 21 and accurately spaced and aligned.

- 22 Make pipe connections so that the pipe does not project beyond the inside wall of the
 23 manhole and grout smooth and uniform surfaces on the inside of the manhole.

- 24 Set metal frames for covers in full mortar beds and mechanically secure by an approved
 25 method.

26 **(D) Testing**

- 27 Vacuum test all manholes before grouting and backfilling. Test according to
 28 ASTM C1244.

29 **1525-4 MEASUREMENT AND PAYMENT**

- 30 The height of the manhole will be measured and paid to the nearest tenth of a foot from the
 31 inside bottom (invert) of the manhole to the final finished top of the manhole ring.

- 32 Utility manholes will be measured and paid by appropriate diameter per each for manholes of
 33 0 to 6 feet height and per linear foot of height over 6 feet. Adjustment of existing manholes

Section 1530

1 will be measured and paid in accordance with Article 858-4. Drop assemblies will be
2 incidental to the work being performed.

3 Payment will be made under:

4 **SECTION 1530**
5 **ABANDON OR REMOVE UTILITIES**

6 **1530-1 DESCRIPTION**

7 Abandon or remove utility facilities.

8 **1530-2 MATERIALS**

9 Refer to Division 10.

Item

Flowable Fill
Portland Cement Concrete
Select Materials

Section

1000-6
1000
1016

10 **1530-3 CONSTRUCTION METHODS**

11 Apply Section 1505 for excavation, trenching, pipe laying and backfill.

12 **(A) Abandoning Pipe**

13 Abandon utility pipes shown in the plans or designated by the Engineer by emptying the
14 pipeline contents and plugging the ends with grout or flowable fill. Prepare grout to
15 a consistency that will flow and be vibrated in order for the mix to flow uniformly into
16 the pipe to be filled. Use the construction methods in Article 340-3.

17 Fill or remove the following abandoned utility pipes:

- 18 (1) Pipe larger than 24 inches.
- 19 (2) Pipe located within the roadway typical section or the project slope stake line and
20 one of the following:
 - 21 (a) Pipe 12 inches to 24 inches diameter located less than 20 feet below finished
22 grade.
 - 23 (b) Pipe 6 inches to 12 inches diameter located less than 12 feet below finished
24 grade and not made of cast iron, ductile iron, HDPE or PVC.
 - 25 (c) Located below groundwater table that could become a conduit for water
26 movement.

27 Excavate, remove and dispose of properly any abandoned pipe to be removed. Backfill
28 the resulting trench and properly compact using local excavated material or select backfill
29 as required.

30 Fill abandoned pipe with grout or flowable fill to at least 90% full or completely when on
31 railroad right of way.

32 Remove any abandoned utility pipe exposed by grading operations to a minimum depth
33 of 12 inches below subgrade elevation of the proposed roadbed or completed grading
34 template.

35 Plug all abandoned utility pipes. Use grout to plug all abandoned utility pipes at the
36 entrance to all manholes whether the manhole is to be abandoned or not. Use grout to

1 plug all abandoned water mains after new mains are placed in service. Abandon valves
 2 by removing valve box and backfilling with approved material.

3 **(B) Abandoning Manholes**

4 Abandon utility manholes in the construction limits by removing the top of the manhole
 5 to the manhole spring line or to an elevation of 2 feet below the roadway subgrade,
 6 whichever is greater and filling the manhole barrel with approved material.

7 Plug connecting utility pipes before filling or removing the manhole.

8 Remove the manhole taper, wall and base on all manholes to be removed.

9 Removed frames and covers become the property of the Contractor for proper disposal.

10 **(C) Remove Water Meter**

11 Remove water meters by disconnecting and plugging the water service piping at the
 12 source main and plugging the piping at the right-of-way line. Return the meter to the
 13 utility owner. Dispose of all other parts, piping and boxes.

14 **(D) Remove Fire Hydrant**

15 Remove fire hydrants by disconnecting and plugging the hydrant leg piping as close to
 16 the water main as possible. If the hydrant valve is within 4 feet of the main, close the
 17 valve, plug the outlet side of the valve and remove the valve box.

18 Removed hydrants become the property of the Contractor for proper disposal.

19 **1530-4 MEASUREMENT AND PAYMENT**

20 Utility pipe that is abandoned by filling or removal will be measured and paid by the linear
 21 foot for the size of pipe. Utility pipe that is abandoned by plugging the ends only and leaving
 22 in place will not be measured or paid. Abandoned valves will not be measured and paid.
 23 Grout used for plugging of abandoned utility pipe is incidental to the work being performed.
 24 Utility pipe that is removed by other work of the contract will be incidental to the other work.

25 *Abandon Utility Manhole* will be measured and paid per each.

26 *Remove Utility Manhole* will be measured and paid per each.

27 *Remove Water Meter and Remove Fire Hydrant* will be measured and paid per each.

28 Payment will be made under:

Pay Item	Pay Unit
Abandon ___" Utility Pipe	Linear Foot
Abandon Utility Manhole	Each
Remove Utility Manhole	Each
Remove Water Meter	Each
Remove Fire Hydrant	Each

29 **SECTION 1540**
 30 **ENCASEMENT**

31 **1540-1 DESCRIPTION**

32 Furnish and install encasement or casing pipes. For the purposes of this specification the
 33 words encasement, casing, encasement pipe and casing pipe are interchangeable.

Section 1540

1 **1540-2 MATERIAL**

2 Refer to Division 10.

Item	Section
Concrete Pipe	1034-3
Flowable Fill	1000-6
Grout	1003
PVC Pipe	1034-2
Select Materials	1016
Steel Encasement Pipe	1036-4(B)
Treated Timber	1082-3
Clay Pipe	1034-1

3 Other pipe as designed by an engineer licensed by the State of North Carolina.

4 Submit material certifications and obtain approval from the Engineer before installation.

5 **1540-3 CONSTRUCTION METHODS**

6 **(A) Open Cut**

7 Apply Section 1505 for excavation, trenching, pipe laying and backfill.

8 **(B) Welding**

9 Weld in accordance with Article 1032-5.

10 **(C) Encasements for Future Use**

11 Mark encasements for future use with a treated wooden marker post. Place wooden
12 marker post at the right of way or at the ends of encasements if encasements extend
13 beyond the right of way. Encasements 24 inches and larger require certification of
14 durability and a design life of 100 years.

15 **(D) Carrier Pipe Installation**

16 Install carrier pipe through casing using spacers or insulators to support the carrier pipe.
17 Place spacers at intervals sufficient to support the carrier pipe without sagging. Install
18 spacers sized to raise the carrier pipe bells above the encasement pipe invert.

19 Seal ends of casing with concrete, brick or other approved materials. Ensure drainage of
20 encasement by leaving a 1 inch diameter weep hole in the seal of the lower end of the
21 encasement.

22 **(E) Casing Pipe Fill**

23 Pump or place flowable fill; grout; or Class III, Class IV or Class V select materials into
24 the annular void between the carrier pipe and casing pipes 24 inches or larger.
25 Otherwise, certification of durability and a design life of 100 years is required.

26 **1540-4 MEASUREMENT AND PAYMENT**

27 ___" *Encasement Pipe* will be measured from end to end and paid at the contract unit price per
28 linear foot for each size.

29 Payment will be made under:

Pay Item	Pay Unit
___" Encasement Pipe	Linear Foot

SECTION 1550
TRENCHLESS INSTALLATION OF UTILITIES

1550-1 DESCRIPTION

Install pipe using a trenchless method. Pipe refers to the specified pipe, which may be the primary carrier pipe or an encasement pipe. Shoring means the earth support system used for installing the pipe. The terms for encasement, casing, encasement pipe and casing pipe are interchangeable.

An engineer licensed by the State of North Carolina shall design the method and certify the work will not damage the roadway above or endanger the roadway user.

1550-2 MATERIAL

Refer to Division 10.

Item	Section
Concrete	1000
Encasement Pipe	1540
Flowable Fill	1000-6
Structural Timber	1082
Structural Steel	1072
Treated Timber	1082-3

Use pipe joints that are modified to suit the installation method. Provide engineering calculations for piping and shoring. Submit material certifications and obtain approval from the Department's Engineer before installation.

Use steel or concrete liner plates. Steel tunnel liner plates shall meet Sections 16 and 25 in *AASHTO LRFD Bridge Design Specifications*. Concrete liner plates shall meet AASHTO specifications.

Drilling fluids consist of water, bentonite and polymer additives.

Other materials will be considered with adequate design and quality control.

1550-3 CONSTRUCTION METHODS

(A) General

Apply Section 1505 for excavation, trenching, pipe laying and backfill.

Install the pipe to the lines and grades shown in the plans. Use workers that are skilled in the method of construction. Construct with good workmanship by skilled workers along with proper safety precautions.

Locate ends of trenchless construction and pits beyond the vehicle recovery area of the roadway. The vehicle recovery area may be reduced using acceptable traffic control methods.

(B) Design

Contract plans will show a trenchless method including but not limited to length, profile and bore pit locations based on available information. The Contractor's design shall confirm this method is appropriate for the field conditions and for the specified pipe. Subsurface information in the vicinity of the trenchless installation may be available in accordance with Section 102-7.

Assess soil conditions expected during trenchless operations.

Design the method to minimize the vertical movement of the pipe or the completed roadway section. Use methods of construction and installation that will not disturb the soils outside of the immediate vicinity of the pipeline or pits.

Section 1550

1 Before construction, provide detailed plans for the method of installation certified by
2 an engineer licensed by the State of North Carolina. Provide certified calculations
3 demonstrating the method of installation as safe and of minimal risk. Provide certified
4 calculations of the structural adequacy of all materials. The design shall meet
5 *AASHTO LRFD Bridge Design Specifications*. An engineer licensed by the State of
6 North Carolina shall certify changes or modifications to the designed method as needed
7 for actual field conditions.

8 (C) Water Control

9 Provide groundwater control and removal as appropriate for the method of excavation
10 and installation. Remove the groundwater using an engineered dewatering system
11 provided in the design submittal. Keep surface waters out of the excavation and pits.

12 (D) Shoring

13 Provide temporary or permanent shoring, as needed. Provide temporary shoring to
14 maintain the hole or pit excavation for the duration of the work. Casing pipe 24 inches
15 and larger, tunnel liner, and shoring that is not certified for permanent use is considered
16 temporary. Fill the annular space between the specified pipe and temporary shoring.
17 Provide permanent shoring when desired or specified to maintain the open hole for an
18 indefinite time. Permanent shoring requires certification of durability and a design life of
19 100+ years.

20 Fill all voids around the excavation and shoring with structural fill material as work
21 progresses.

22 Either work continuously (24 hours/day and 7 days/week) on the operations from the
23 time the excavation begins through the filling of voids or use an engineered system for
24 shoring the excavation during work stoppage.

25 (E) Pre-Construction Meeting

26 The Contractor shall conduct a pre-construction meeting with the Department's Engineer
27 to review the proposed method for installation of the pipe. Conduct the meeting at least
28 48 hours before beginning installation. The meeting shall consist of, but is not limited to:

- 29 (1) Presentation of the construction methods for understanding by all involved,
- 30 (2) Presentation of methods for filling any potential voids around the pipe,
- 31 (3) Demonstrating that appropriate equipment and materials are on site,
- 32 (4) Providing a progress schedule, and
- 33 (5) Demonstrating ability to react to failures or roadway settlement or heave.

34 1550-4 TRENCHLESS METHODS

35 (A) Bore and Jack

36 For bore holes up to 6 inches in diameter in stable ground, the hole may be augured and
37 the pipe pushed or jacked through the cleaned out hole. For bore holes greater than 6
38 inches, provide continuous support of the hole by simultaneously jacking the pipe or
39 casing into the hole.

40 Use equipment suitably sized and designed to simultaneously bore or drill the soil or rock
41 while pushing or jacking pipe on a controlled grade. Position the cutter head within one
42 diameter of the leading edge of the pipe. In cohesive, dense and dry soils and rock,
43 position the cutter head in front of the leading edge. In non-cohesive or loose soils,
44 position the cutter head inside the pipe.

1 Dry bore only, do not use jetting or wet boring methods. Use drilling fluids only on the
2 outside of pipe for lubrication or hole stabilization.

3 Minimize over bore, match cutter diameter to the outside diameter of the encasement
4 pipe. Limit overbore to the O.D. + 2 inches.

5 Provide steering controls as necessary to maintain line and grade.

6 If conditions allow and with the approval of the Engineer, the Contractor may elect to use
7 the pipe ramming method in lieu of bore and jack. Payment for the pipe ramming
8 method will be paid as bore and jack.

9 **(B) Directional Drilling**

10 For drilled holes up to 6 inches in diameter in stable ground, the hole may be drilled and
11 reamed followed by pulling the pipe into the hole within 8 hours. For drilled holes
12 greater than 6 inches, simultaneously pull the pipe or casing into the hole as reaming
13 occurs

14 When under pavement or within a one horizontal to one vertical distance from pavement,
15 maintain the depth of cover in Table 1550-1.

Drilled Hole Diameter	Minimum Depth of Cover
2" to 6"	6 ft
> 6" to 15"	12 times the hole diameter
> 15" to 36"	15 ft

16 Begin bores at locations that allow transitioning the bore to meet the above depths.

17 Use drilling fluids as appropriate for the type soils. Pump drilling fluids only while
18 drilling or reaming. Monitor flow rates to match the amount leaving the bore hole. Do
19 not increase pressure or flow to free stuck drillheads, reamers or piping.

20 Limit drilled or reamed holes to 1.5 x O.D. for pipe 12 inches or less and O.D. + 6 inches
21 for pipes larger than 12 inches.

22 **(C) Tunneling**

23 Tunnel using hand mining, mechanical excavation, tunnel boring machine (TBM),
24 microtunneling, or other accepted tunneling method. Use tunnel shields or fore poling
25 along with benched excavation and breast boarding as appropriate for the field
26 conditions. Alternatively, the Contractor's engineer may certify that the soils are
27 self-supporting of the dead and live loads and design tunneling methods as appropriate.

28 Provide active support to the tunnel walls. Shore tunnel walls using liner plates, steel ribs
29 with lagging or other engineered method or by jacking piping into place.

30 Limit over excavation to 2 inches larger than the liner or shield. Grout the external voids
31 as work progresses and as specified by the Contractor's engineer.

32 **(D) Pipe Ramming**

33 Use pipe ramming only where soils are homogeneous and free of rock, boulders, stumps
34 and debris. Do not use in the vicinity of quick or liquefiable soils.

35 Steel bands 1/2 inch thick are allowed on the outside of the leading edge of the pipe or
36 casing to oversize the hole to reduce friction. Steel bands 1/2 inch thick may be used on
37 the inside to compact the spoil and to prevent plugging.

38 Install at the following minimum depth of cover.

Section 1550

**TABLE 1550-2
DEPTH OF COVER FOR PIPE RAMMING**

Pipe or Casing Diameter	Minimum Depth of Cover
2" to 6"	4 ft
> 6" to 14"	6 pipe diameters
>14" to 72"	8 ft

1 Contain spoil within the casing during ramming. After completion, use compressed air or
2 augers to remove the spoil. Clean the interior using a pig. Provide appropriate safety
3 devises. Limit air pressure to less than the rating of the pipe or casing.

4 Use lubricants and surfactants as needed and ensure vibration induced consolidation of
5 soils does not result in settlement greater than 0.02 feet.

6 **(E) Other Methods**

7 Other methods will be considered on a case by case basis when thoroughly engineered.

8 **(F) Lubrication and Drilling Fluids**

9 Use drilling fluids for lubrication. Do not use water alone.

10 **1550-5 QUALITY CONTROL**

11 The Contractor, at no cost to the Department, shall replace or repair damaged or defective
12 installations. The method to be used shall be designed by the Contractor's engineer and
13 approved by the Engineer.

14 **(A) Ground Movement**

15 Before excavation, establish control points for measuring vertical movement of the road
16 at 10 feet intervals along the centerline and 10 feet each side of the pipeline. A land
17 surveyor licensed in the State of North Carolina shall monitor these points daily until
18 construction is complete.

19 Cease trenchless operations when measured movement exceeds 0.02 feet. Determine
20 cause of settlement and repair as necessary. Modify trenchless methods as needed.

21 **(B) Leakage**

22 Limit leakage through tunnel walls to minor seepage. All leaks in pipes, casing or other
23 permanent shoring shall be sealed.

24 **(C) Roundness**

25 Provide permanent shoring maintaining at least 95% of nominal diameter in all
26 directions.

27 **(D) External Voids**

28 Fill all external voids greater than 2 inches high or 2 feet wide. Fill with flowable fill,
29 grout or Class II or III select material.

30 **1550-6 MEASUREMENT AND PAYMENT**

31 *Bore and Jack of ___*” will be measured and paid in linear feet. Measurement will be made
32 horizontally to the nearest tenth of a linear foot.

33 *Directional Drilling of ___*” will be measured and paid in linear feet. Measurement will be
34 made horizontally to the nearest tenth of a linear foot.

35 *Tunneling of ___*” will be measured and paid in linear feet. Measurement will be made
36 horizontally to the nearest tenth of a linear foot.

37 Measurement will be made along utility pipes with required trenchless installation. Payment
38 for trenchless installation will be made as additional compensation for utility piping with

Section 1550

1 contract pay items of the various sizes. No additional payment will be made for access pits or
2 shoring required for the installation. Shoring required for the maintenance of traffic or the
3 protection of building or other structures, on or off the right of way, shall be paid under
4 *Temporary Shoring*. No payment will be made for abandoning defective installations.

5 Payment will be made under:

DIVISION 16

EROSION CONTROL AND ROADSIDE DEVELOPMENT

SECTION 1605

TEMPORARY SILT FENCE

1605-1 DESCRIPTION

Furnish material, construct, maintain and remove temporary silt fence in locations shown in the plans or in locations that require surface drainage to be filtered.

1605-2 MATERIALS

Refer to Division 10.

Item	Section
Geotextile, Type 3	1056

(A) Posts

Provide steel posts with at least 5 feet long, 1 3/8 inch wide measured parallel to the fence and 1.25 lbs. per foot in weight per length. Equip with an anchor plate with an area of at least 14.0 square inches. Ensure a means of retaining fencing material in the desired position without displacement.

(B) Woven Wire Fence

Provide woven wire fence at least 32 inches high with 5 horizontal wires, vertical wires spaced 12 inches apart, 10 gauge top and bottom wires and 12 1/2 gauge for all other wires.

(C) Attachment Device

Provide plastic ties, wire fasteners or other approved attachment device.

1605-3 CONSTRUCTION METHODS

Install in locations as shown in the plans or as directed.

Install wire and geotextile as shown in *Roadway Standard Drawings*.

Geotextile may be used without the woven wire fence backing with a post spacing of not more than 6 feet.

Install post inclined toward runoff source, at an angle of not more than 20° from vertical.

Attach geotextile to the post with acceptable methods.

Overlap geotextile at least 18 inches at splice joints.

1605-4 MAINTENANCE AND REMOVAL

Maintain the silt fence until the project is accepted or until the fence is removed. Remove and replace deteriorated or ineffective geotextile. Remove and dispose of silt accumulations in accordance with Section 1630 when necessary or as directed.

Leave silt fence in place until site stabilization and remove at project completion. Removed silt fence becomes the property of the Contractor. Dress and seed and mulch all areas where silt fence is removed in accordance with Section 1660.

Section 1606

1 **1605-5 MEASUREMENT AND PAYMENT**

2 *Temporary Silt Fence* will be measured and paid in linear feet, accepted in place, along the
3 ground line of the fence. Temporary Silt Fence that requires removal and replacement due to
4 general deterioration or ineffective geotextile will be paid at contract unit prices. Repairs to
5 the fence due to carelessness or neglect on the part of the Contractor will be at no cost to the
6 Department.

7 *Silt Excavation* will be measured and paid in accordance with Article 1630-3.

8 *Seeding and Mulching* will be measured and paid in accordance with Article 1660-8.

9 Article 104-5, pertaining to revised contract prices, will not apply to this item. No revision in
10 the contract unit price will be allowed because of any overrun or underrun.

11 Payment will be made under:

Pay Item	Pay Unit
Temporary Silt Fence	Linear Foot

12 **SECTION 1606**
13 **SPECIAL SEDIMENT CONTROL FENCE**

14 **1606-1 DESCRIPTION**

15 Furnish materials, construct, maintain and remove special sediment control fence. Place
16 special sediment control fence as shown in the plans or as directed.

17 **1606-2 MATERIALS**

18 Refer to Division 10.

Item	Section
Sediment Control Stone, Standard Size No. 5 or 57	1005

19 **(A) Posts**

20 Provide steel posts in accordance with Subarticle 1605-2(A).

21 **(B) 1/4" Hardware Cloth**

22 Provide hardware cloth with 1/4 inch openings constructed from 24 gauge wire.

23 **(C) Attachment Device**

24 Provide plastic ties, wire fasteners or other approved attachment device.

25 **1606-3 CONSTRUCTION METHODS**

26 Install hardware cloth and sediment control stone in accordance with *Roadway Standard*
27 *Drawings*. Attach hardware cloth to post with acceptable methods.

28 Maintain the special sediment control fence until the project is accepted or until the fence is
29 removed. Remove and dispose of silt accumulations at the fence when so directed in
30 accordance with Section 1630.

31 **1606-4 MEASUREMENT AND PAYMENT**

32 *Silt Excavation* will be measured and paid in accordance with Article 1630-3.

33 *1/4" Hardware Cloth* will be measured and paid in accordance with Article 1632-5.

34 *Sediment Control Stone* will be measured and paid in accordance with Article 1610-4.

SECTION 1607
GRAVEL CONSTRUCTION ENTRANCE

1607-1 DESCRIPTION

Furnish, install, maintain and remove all material required for the construction of a gravel construction entrance.

1607-2 MATERIALS

Refer to Division 10.

Item	Section
Stone for Erosion Control, Class A	1042
Geotextile for Drainage, Type 2	1056

1607-3 CONSTRUCTION METHODS

Install a gravel construction entrance in accordance with *Roadway Standard Drawings* and at locations as directed. Install gravel construction entrances in a way to prevent vehicles from bypassing the construction entrance when leaving the project site.

1607-4 MEASUREMENT AND PAYMENT

Geotextile for Drainage will be measured and paid in accordance with Article 876-4.

Stone for Erosion Control, Class ____ will be measured and paid in accordance with Article 1610-4.

Such price and payment shall be full compensation for all work covered by this section including all materials, construction, maintenance and removal of a gravel construction entrance.

SECTION 1610
STONE FOR EROSION CONTROL

1610-1 DESCRIPTION

Furnish, stockpile if directed, place and maintain an approved stone for construction of erosion control devices at ditches, diversions, swales, pipe inlets, pipe outlets, drainage turnouts and at other locations designated in the plans or as directed. The work includes, but is not limited to, furnishing, weighing, stockpiling, re-handling, placing and maintaining stone; and disposal of any stone not incorporated into the project when necessary.

1610-2 MATERIALS

Refer to Division 10.

Item	Section
Sediment Control Stone	1005
Stone for Erosion Control	1042

Use the class or standard size of stone specified in the contract documents.

1610-3 CONSTRUCTION METHODS

Place stone, in locations and to the thickness, widths and lengths as shown in the plans or as directed. Construct erosion control devices in accordance with the plans neatly and uniformly with an even surface and meeting the plans.

1610-4 MEASUREMENT AND PAYMENT

Stone For Erosion Control, Class __ will be measured and paid in tons of each class of stone incorporated into the work, or has been delivered to and stockpiled on the project as directed. Stone placed in the stockpile will not be measured a second time. Measure stone by weighing

Section 1615

1 in trucks on certified platform scales or other certified weighing devices.
2 *Sediment Control Stone* will be measured and paid in tons of stone incorporated into the work,
3 or has been delivered to and stockpiled on the project as directed. Stone placed in the
4 stockpile will not be measured a second time. Measure stone by weighing in trucks on
5 certified platform scales or other certified weighing devices.
6 Payment will be made under:

Pay Item	Pay Unit
Stone For Erosion Control, Class __	Ton
Sediment Control Stone	Ton

7 **SECTION 1615**
8 **TEMPORARY MULCHING**

9 **1615-1 DESCRIPTION**

10 Furnish, place and secure mulch material to prevent excessive soil erosion during construction
11 operations where it is impossible or impractical to perform permanent seeding and mulching.
12 The actual conditions which occur during the construction of the project will determine the
13 quantity of mulching. The quantity of mulching may be increased, decreased or eliminated
14 entirely as directed. Such variations in quantity will not be considered as alterations in the
15 details of construction or a change in the character of work.

16 **1615-2 MATERIALS**

17 Refer to Division 10.

Item	Section
Mulch for Erosion Control	1060-5

18 Use undiluted emulsified asphalt or other approved tacking material.

19 **1615-3 CONSTRUCTION METHODS**

20 Place temporary mulch promptly at locations on temporarily seeded or non-seeded areas when
21 so directed.

22 Spread mulch uniformly over the area by hand or by means of appropriate mechanical
23 spreaders or blowers to obtain a satisfactory uniform cover. A satisfactory application of
24 temporary mulch on non-seeded areas consists of a sufficient amount to completely and
25 uniformly cover the ground. Apply tack within 24 hours after temporary mulch application.

26 When temporary mulching is performed in conjunction with temporary seeding, apply mulch
27 in accordance with Article 1660-6. Complete mulching and tacking within 24 hours of
28 temporary seeding work. Exercise care to prevent displacement of soil and seed or other
29 damage to areas where temporary seeding is done.

30 Apply a sufficient amount of asphalt or other type binding material when using grain straw to
31 assure that the temporary mulch is properly held in place. Take adequate precautions to
32 prevent damage to traffic, structures, guardrails, traffic control devices or any other
33 appurtenances during the application of binding material. Provide adequate covering or
34 change methods of application as required to prevent such damage. Repair any damage that
35 occurs, including any necessary cleaning.

36 Take sufficient precautions to prevent mulch from entering drainage structures through
37 displacement by wind, water or other causes and promptly remove any blockage to drainage
38 facilities.

1 **1615-4 MEASUREMENT AND PAYMENT**

2 *Temporary Mulching* will be measured and paid in acres, measured along the surface of the
3 ground over which temporary mulch has been placed as directed and accepted.

4 Payment will be made under:

Pay Item	Pay Unit
Temporary Mulching	Acre

5 **SECTION 1620**
6 **TEMPORARY SEEDING**

7 **1620-1 DESCRIPTION**

8 Seed and mulch selected areas in advance of the permanent seeding and mulching operations
9 to minimize erosion of graded areas during construction operations. The work includes
10 preparing seedbeds; furnishing, placing and covering fertilizer and seed; furnishing and
11 placing mulch; and other operations necessary for seeding the required areas.

12 Perform temporary seeding promptly at the locations and under any of the following
13 conditions when directed:

14 (A) When it is impossible or impractical to bring an area to the final line, grade and finish so
15 that permanent seeding and mulching operations can be performed without subsequent
16 serious disturbance by additional grading;

17 (B) When erosion occurs or is considered to be potentially substantial on areas of graded
18 roadbed where construction operations are temporarily suspended or where the grading of
19 the roadbed has been completed substantially in advance of the paving construction;

20 (C) During seasons of the year when permanent seeding and mulching is prohibited by the
21 contract;

22 (D) When an immediate cover would be desirable to minimize erosion, siltation or pollution
23 on any area.

24 The actual conditions that occur during the construction of the project will determine the
25 quantity of seed or fertilizer to be used. The quantity of seed or fertilizer may be increased,
26 decreased or eliminated entirely as directed. Such variations in quantity will not be
27 considered as alterations in the details of construction or a change in the character of the
28 work.

29 **1620-2 MATERIALS**

30 Refer to Division 10.

Item	Section
Fertilizer	1060-2
Mulch for erosion control	1060-5
Seed	1060-4

31 See the contract for analysis of fertilizer and the kinds of seed.

32 **1620-3 CONSTRUCTION METHODS**

33 **(A) Seedbed Preparation**

34 Scarify areas to be seeded to a depth of not less than 5 inches unless directed otherwise.
35 The soil conditions and topography will determine the required depth of the seedbed.

36 Prepare the surface to be seeded with adequate furrows, ridges, terraces, trenches or other
37 irregularities in which seeding materials can lodge with reasonable assurance that the
38 materials will not be easily displaced by wind, rain or surface runoff.

Section 1620

(B) Applying and Covering Fertilizer and Seed

The analysis of fertilizer, the kinds of seed and the rates of application of fertilizer and seed shall be as stated in the contract.

Apply no fertilizer or seed when the Engineer determines that conditions are unfavorable for such operations.

Distribute the fertilizer or seed uniformly over the seedbed at the required rates of applications.

Cover fertilizer and seed unless otherwise directed. If covering is required, provide it to the depth acceptable to the Engineer for the prevention of displacement by wind, rain or surface runoff.

Mulch all areas temporarily seeded, in accordance with Section 1615, unless otherwise indicated in the contract or as directed.

Article 1660-5 will be applicable to the approval of equipment and the protection of traffic, structures, guardrails, traffic control devices and other appurtenances.

(C) Mowing and Repair of Temporary Seeding

Maintain areas where temporary seeding is performed in a satisfactory condition, including mowing at the locations and times as directed.

Repair areas of temporary seeding which have been damaged or have failed. Repair includes reshaping or the placing of additional earth material and repeating the seeding process.

1620-4 MEASUREMENT AND PAYMENT

Seed for Temporary Seeding will be measured and paid in pounds. The weight of seed will be determined by bag count of standard weight bags or by weighing the seed.

Fertilizer for Temporary Seeding will be measured and paid in tons. The weight of dry fertilizer will be determined by bag count of standard weight bags or by weighing the fertilizer in trucks on certified platform scales or other certified weighing devices.

Temporary Mulching will be measured and paid in accordance with Article 1615-4.

Mowing will be measured and paid in accordance with Article 1660-8.

Where earthwork and temporary seeding have been adequately constructed, completely drained and properly maintained, and damage occurs due to natural causes, the Contractor will be paid at the contract unit price for the excavated material required for repairs to the damaged earthwork and the contract unit prices for *Seed For Temporary Seeding* and *Fertilizer for Temporary Seeding* for correcting the damaged temporary seeding.

Repair, at no cost to the Department, any damage to earthwork or temporary seeding which is due to carelessness or neglect on the part of the Contractor.

Payment will be made under:

Pay Item	Pay Unit
Seed For Temporary Seeding	Pound
Fertilizer For Temporary Seeding	Ton

SECTION 1622 TEMPORARY SLOPE DRAINS

1622-1 DESCRIPTION

Furnish, place, maintain and remove temporary slope drains at the locations shown in the plans and at locations as directed. Work includes, but is not limited to, furnishing all pipe, anchor stakes and compacted earth; installation and removal of the slope drain; constructing the sump, earth shoulder berm and earth berm ditch block; constructing the stone inlet protection; constructing the outlet protection; and dressing, seeding and mulching the disturbed area after the slope drain and berm have been removed. Standard T-sections and elbows at the inlet of the slope drain pipe may be required as directed.

The actual conditions during the construction of the project will determine the quantity of temporary slope drains.

The quantity of temporary slope drains may be increased, decreased or eliminated entirely at the direction of the Engineer. Such variations in quantity will not be considered as alterations in the details of construction or a change in the character of the work.

1622-2 MATERIALS

Provide temporary slope drains, standard T-sections and elbows with pipe of sufficient size to carry the anticipated volume of water with a minimum diameter of 12 inches. Provide plastic pipe and fittings meeting AASHTO M 294.

Refer to Division 10.

Item	Section
Corrugated Plastic Pipe and Fittings	1044-7
Sediment Control Stone, Standard Size No. 5 or 57	1005
Stone for Erosion Control, Class B	1042

1622-3 CONSTRUCTION METHODS

(A) Temporary Slope Drains

Install temporary slope drains in accordance with *Roadway Standard Drawings* during all phases of grading operations and adjust as needed to properly direct water flow.

Construct an earth berm at the top of cut and fill sections to direct water flow into temporary slope drains.

At locations of single direction water flow, locate temporary slope drain inlets in a sump along the earth berm. Construct an earth berm ditch block perpendicular to the direction of the water flow on the downstream side of the temporary slope drain. Construct ditch blocks of sufficient height to block the flow of water but at no higher elevation than the earth shoulder berm. Install an elbow at inlet of slope drain pipe as directed.

At locations of multi direction flow, install a sump on both sides of the slope drain inlet. Construct inlet protection with sediment control stone and Class B stone in accordance with *Roadway Standard Drawings*. Install a standard T-section at the slope drain inlet as directed.

Join multiple pipe sections using an approved pipe coupling. Anchor slope drains in accordance with the *Roadway Standard Drawings*. Extend slope drain to bottom of slope and erosion control measures.

Section 1630

1 **(B) Outlet Protection at Temporary Slope Drain**

2 Protect outlet locations subject to scour by placing Class B stone or a silt detention
3 device. A special stilling basin may also be used as outlet protection in accordance with
4 Section 1639 and as directed. Construct outlet protection devices as shown in the plans
5 and at other locations as directed.

6 **1622-4 MEASUREMENT AND PAYMENT**

7 *Temporary Slope Drains* will be measured and paid in linear feet of pipe, including inlets, tees
8 and elbows, measured along the invert of the temporary slope drain, completed and accepted.

9 *Sediment Control Stone* will be measured and paid in accordance with Article 1610-4.

10 *Stone for Erosion Control, Class ____* will be measured and paid in accordance with
11 Article 1610-4.

12 *Silt Excavation* will be measured and paid in accordance with Article 1630-3.

13 No payment will be made for temporary slope drains that were required due to the
14 Contractor's negligence, carelessness or failure to install permanent controls as a part of the
15 work scheduled.

16 *Temporary Slope Drains* will be considered minor items. Article 104-5, pertaining to revised
17 contract unit prices for overrunning minor items, will not apply to these items.

18 Payment will be made under:

Pay Item	Pay Unit
Temporary Slope Drains	Linear Foot

19 **SECTION 1630**
20 **CONSTRUCTION AND MAINTENANCE**
21 **OF SILT DETENTION DEVICES**

22 **1630-1 DESCRIPTION**

23 Excavate and satisfactorily dispose of all materials excavated in the construction, cleaning out
24 and maintenance of silt basins, silt ditches, diversions and other silt detention devices. Work
25 includes, but is not limited to, excavation, shaping of the basins or ditches, cleaning out and
26 maintaining the basins or ditches, disposal of all materials and backfilling.

27 **1630-2 CONSTRUCTION METHODS**

28 **(A) General**

29 Excavate silt basins, silt ditches, diversions or other silt detention devices to the
30 dimensions and at the locations shown in the plans or as directed for the purpose of
31 siltation control with non-vertical side slopes and not greater than 1.5:1 slope. Clean out
32 silt detention devices, when so directed, to maintain their effectiveness. Backfill and
33 shape for seeding and mulching silt detention basins and silt ditches before completion of
34 the project unless otherwise directed.

35 **(B) Disposal of Materials**

36 Use all excavated materials in the construction of roadway embankments except where
37 otherwise directed. Dispose of materials, which are not used in the construction of
38 roadway embankments in waste areas in accordance with Section 802.

1 **1630-3 MEASUREMENT AND PAYMENT**

2 *Silt Excavation* will be measured and paid in cubic yards measured in the original position, of
 3 all materials excavated within the limits established by the plans or directed by the Engineer.
 4 If in the opinion of the Engineer it is not feasible to measure the excavated material in its
 5 original position, the volume will be determined by truck measurement in accordance with
 6 Article 230-5, except that no deduction for shrinkage will be made.

7 The filling of silt basins, diversions or silt ditches will be paid as provided in Section 225 for
 8 *Unclassified Excavation* or in Section 230 for *Borrow Excavation*, depending on the source of
 9 the material used to fill the basins or ditches.

10 Payment will be made under:

Pay Item	Pay Unit
Silt Excavation	Cubic Yard

11 **SECTION 1631**
 12 **ROLLED EROSION CONTROL PRODUCTS**

13 **1631-1 DESCRIPTION**

14 Furnish, place and maintain a rolled erosion control product (matting) on previously shaped
 15 and seeded drainage ditches, slopes or other areas at locations shown in the contract or as
 16 directed. Work includes providing all materials, excavation and backfilling, placing and
 17 securing matting and maintaining the drainage ditch.

18 The conditions which occur during the construction of the project will determine the quantity
 19 of matting placed. The quantity of matting may be increased, decreased or eliminated entirely
 20 as directed. Such variations in quantity will not be considered as alterations in the details of
 21 construction or a change in the character of the work.

22 **1631-2 MATERIALS**

23 Refer to Division 10.

Item	Section
Matting for Erosion Control	1060-8
Staples	1060-8

24 **1631-3 CONSTRUCTION METHODS**

25 Place matting immediately following seeding. Provide a smooth soil surface free from stones,
 26 clods or debris that will prevent the contact of the matting with the soil. Preserve the required
 27 line, grade and cross section of the area covered.

28 Unroll matting in the direction of the flow of water and apply without stretching so that it will
 29 lie smoothly but loosely on the soil surface. Bury the up-channel or top of slope end of each
 30 piece of matting in a narrow trench at least 6 inches deep and tamp firmly. Where one roll of
 31 matting ends and a second-roll begins, overlap the end of the upper roll over the buried end of
 32 the second roll so there is a 4 inch overlap. Construct staple checks 4 inches on center and
 33 every 30 feet longitudinally in the matting or as directed. Fold over and bury matting to the
 34 full depth of the trench, close and tamp firmly. Overlap matting at least 4 inches where 2 or
 35 more widths of matting are laid side by side.

36 Place staples across matting at ends, junctions and check trenches approximately 10 inches
 37 apart.

38 Place staples along the outer edges and down the center of each strip of matting 3 feet apart.
 39 Place staples along all lapped edges 10 inches apart.

40 Install product with netting on the top side when excelsior or straw matting is used.

Section 1632

1 The Engineer may require adjustments in the trenching or stapling requirements to fit
2 individual cut or fill slope conditions.

3 **1631-4 MEASUREMENT AND PAYMENT**

4 *Matting* will be measured and paid in square yards as measured along the surface of the
5 ground, over which matting has been acceptably placed.

6 Payment will be made under:

Pay Item	Pay Unit
Matting For Erosion Control	Square Yard

7 **SECTION 1632**
8 **ROCK INLET SEDIMENT TRAP**

9 **1632-1 DESCRIPTION**

10 Construct, maintain and remove devices around catch basins and/or drop inlets to reduce
11 water velocity and contain sediment. Work includes furnishing all fence posts, hardware
12 cloth, hardware, stone and other materials, installing and maintaining the 1/4 inch hardware
13 cloth.

14 The actual conditions which occur during the construction of the project will determine the
15 quantity of rock inlet sediment traps constructed. The quantity of inlet sediment traps may be
16 increased, decreased or eliminated entirely as directed. Such variations in quantity will not be
17 considered as alterations in the details of construction or a change in the character of the
18 work.

19 **1632-2 MATERIALS**

20 Refer to Division 10.

Item	Section
Sediment Control Stone, Standard Size No. 5 or 57	1005
Stone for Erosion Control, Class A or Class B	1042

21 **(A) Steel Posts**

22 Provide steel posts in accordance with Subarticle 1605-2(A).

23 **(B) Attachment Devices**

24 Provide plastic ties, wire fasteners or other approved attachment device.

25 **(C) 1/4" Hardware Cloth**

26 Provide hardware cloth with 1/4 inch openings constructed from 24 gauge wire and with
27 at least 48 inches width as specified in ASTM A740.

28 **1632-3 CONSTRUCTION METHODS**

29 **(A) Type A**

30 Place structural stone, Class B, around the outside perimeter of the inlet structure with
31 approximately 2:1 side slopes and plate the upstream side with sediment control stone.

32 **(B) Type B**

33 Place structural stone, Class A, around the outside perimeter of the inlet structure with
34 approximately 2:1 side slopes and plate the upstream side with sediment control stone.

1 (C) Type C

2 Construct rock inlet sediment trap Type C devices as shown in the plans and at other
 3 locations as directed. Attach hardware cloth to posts with wire staple or other acceptable
 4 methods.

5 **1632-4 MAINTENANCE AND REMOVAL**

6 Maintain the rock inlet sediment trap, remove and dispose of silt accumulations at the inlet
 7 sediment traps when necessary or as directed in accordance with Section 1630.

8 Remove rock inlet sediment traps as the project nears completion, or as directed. Dress the
 9 area to blend with existing contours, seed and mulch the area in accordance with Section 1660.

10 **1632-5 MEASUREMENT AND PAYMENT**

11 Payment for rock inlet sediment traps will be made as follows:

12 *1/4" Hardware Cloth* will be measured and paid in linear feet of hardware cloth, measured in
 13 place from end post to end post at each separate installation completed and accepted.

14 *Stone for Erosion Control, Class ____* will be measured and paid in accordance with
 15 Article 1610-4.

16 *Sediment Control Stone* will be measured and paid in accordance with Article 1610-4.

17 *Silt Excavation* will be measured and paid in accordance with Article 1630-3.

18 Payment will be made under:

Pay Item	Pay Unit
1/4" Hardware Cloth	Linear Foot

19 **SECTION 1633**
 20 **TEMPORARY ROCK SILT CHECKS**

21 **1633-1 DESCRIPTION**

22 Construct, maintain and remove devices placed in ditches, diversions or swales to reduce
 23 water velocity and contain sediment.

24 The actual conditions which occur during the construction of the project will determine the
 25 quantity of temporary rock silt checks constructed. The quantity of silt check dams may be
 26 increased, decreased or eliminated entirely as directed. Such variations in quantity will not be
 27 considered as alterations in the details of construction or a change in the character of the
 28 work.

29 **1633-2 MATERIALS**

30 Refer to Division 10.

Item	Section
Sediment Control Stone, Standard Size No. 5 or 57	1005
Stone for Erosion Control, Class B	1042

31 **1633-3 CONSTRUCTION METHODS**

32 (A) Type A

33 Place structural stone in the channel, ditch, diversion or swale with approximately 2:1
 34 side slopes. Place sediment control stone, approximately 12 inches thick on the upstream
 35 side.

Section 1634

1 (B) Type B

2 Construct temporary rock silt check Type B devices as shown in the plans and at other
3 locations as directed.

4 **1633-4 MAINTENANCE AND REMOVAL**

5 Maintain the temporary rock silt checks, remove and dispose of silt accumulations at the silt
6 checks when so directed in accordance with Section 1630.

7 Remove temporary rock silt checks as the project nears completion. The actual time of
8 removal will be as directed. After removal of silt checks, dress the area to blend with existing
9 contours and seed and mulch the area in accordance with Section 1660.

10 **1633-5 MEASUREMENT AND PAYMENT**

11 Payment for temporary rock silt checks will be as follows:

12 *Stone for Erosion Control, Class ____* will be measured and paid in accordance with
13 Article 1610-4.

14 *Sediment Control Stone* will be measured and paid in accordance with Article 1610-4.

15 *Silt Excavation* will be measured and paid in accordance with Article 1630-3.

16 **SECTION 1634**

17 **TEMPORARY ROCK SEDIMENT DAMS**

18 **1634-1 DESCRIPTION**

19 Construct, maintain and remove devices placed in ditches, diversions, swales or drainage
20 turnouts to reduce water velocity and contain sediment.

21 The actual conditions which occur during the construction of the project will determine the
22 quantity of temporary rock sediment dams constructed. The quantity of rock sediment dams
23 may be increased, decreased or eliminated entirely as directed. Such variations in quantity
24 will not be considered as alterations in the details of construction or a change in the character
25 of the work.

26 **1634-2 MATERIALS**

27 Refer to Division 10.

Item	Section
Sediment Control Stone, Standard Size No. 5 or 57	1005
Stone for Erosion Control, Class 1 or Class B	1042
Coir Fiber Mat	1060-14

28 **1634-3 CONSTRUCTION METHODS**

29 Install coir fiber baffles on the upstream side of each type of dam in accordance with
30 Section 1640 and as directed.

31 **(A) Type A**

32 Place structural stone in the channel, ditch diversion, swale or drainage turnouts with
33 2:1 side slope on the upstream side and 3:1 side slope on the downstream side. Plate the
34 upstream side with sediment control stone approximately 12 inches thick. Use a
35 minimum spacing of 15 feet and as directed for the coir fiber baffles.

36 Provide a weir section approximately 2/3 of the channel width and with an 8 foot
37 maximum height from the bottom of the channel. In the center of the device, place the
38 weir section approximately 12 inches lower than the sides of the device or the top of the
39 channel, whichever is lower.

1 **(B) Type B**

2 Place structural stone in the channel, ditch diversion, swale or drainage turnouts with
3 2:1 side slopes and plate the upstream side with sediment control stone approximately
4 12 inches thick.

5 In the center of the device, provide a weir section with a 4 foot minimum width
6 constructed 12 inches lower than the sides of the device or the top of the channel,
7 whichever is lower. Construct the temporary rock sediment dam Type B with a 5 foot
8 minimum thickness measured along the top of the dam structure.

9 Use earthen backfill material to extend dam width and create a larger sediment storage
10 volume for the temporary rock sediment dam Type B where needed.

11 **1634-4 MAINTENANCE AND REMOVAL**

12 Maintain the temporary rock sediment dams, remove and dispose of silt accumulations at the
13 sediment dams when so directed.

14 Remove temporary rock sediment dams as the project nears completion, or at such time as the
15 Engineer deems the device to be no longer useful. The Engineer will direct the actual time of
16 removal. Prepare seed bed, seed and mulch the area in accordance with Section 1660.

17 **1634-5 MEASUREMENT AND PAYMENT**

18 Payment for temporary rock sediment dams will be made as follows:

19 *Coir Fiber Baffle* will be measured and paid in accordance with Article 1640-4.

20 *Stone for Erosion Control, Class ____* will be measured and paid in accordance with
21 Article 1610-4.

22 *Sediment Control Stone* will be measured and paid in accordance with Article 1610-4.

23 *Silt Excavation* will be measured and paid in accordance with Article 1630-3.

24 **SECTION 1635**
25 **ROCK PIPE INLET SEDIMENT TRAP**

26 **1635-1 DESCRIPTION**

27 Construct, maintain and remove devices placed around outside perimeters of pipe structures,
28 to reduce water velocity and trap sediment.

29 The conditions which occur during the construction of the project will determine the quantity
30 of temporary rock pipe inlet sediment traps to be constructed. The quantity of inlet sediment
31 traps may be increased, decreased or eliminated entirely as directed. Such variations in
32 quantity will not be considered as alterations in the details of construction or a change in the
33 character of the work.

34 **1635-2 MATERIALS**

35 Refer to Division 10.

Item	Section
Sediment Control Stone, Standard Size No. 5 or 57	1005
Stone for Erosion Control, Class A or Class B	1042

36 **1635-3 CONSTRUCTION METHODS**37 **(A) Type A**

38 Construct rock pipe inlet sediment trap Type A devices at locations shown in the plans or
39 as directed.

Section 1636

1 (B) Type B

2 Construct rock pipe inlet sediment trap Type B devices at locations shown in the plans or
3 as directed.

4 1635-4 MAINTENANCE AND REMOVAL

5 Maintain the rock pipe inlet sediment traps, remove and dispose of silt accumulations at the
6 pipe inlet sediment traps as directed in accordance with Section 1630.

7 Remove rock pipe inlet sediment traps as the project nears completion, or as directed. Prepare
8 a seed bed to blend with existing contours and seed and mulch in accordance with
9 Section 1660.

10 1635-5 MEASUREMENT AND PAYMENT

11 Payment for temporary rock pipe inlet sediment traps will be as follows:

12 *Stone for Erosion Control, Class ____* will be measured and paid in accordance with
13 Article 1610-4.

14 *Sediment Control Stone* will be measured and paid in accordance with Article 1610-4.

15 *Silt Excavation* will be measured and paid in accordance with Article 1630-3.

16 SECTION 1636

17 TEMPORARY STREAM CROSSING

18 1636-1 DESCRIPTION

19 Construct and maintain culverted temporary stream crossings. Temporary stream crossings
20 are not shown in the plan sheets and shall be determined as directed.

21 The quantity of stream crossings to be installed will be affected by the actual conditions that
22 occur during the construction of the project. The quantity of stream crossings may be
23 increased, decreased or eliminated entirely as directed. Such variations in quantity will not be
24 considered as alterations in the details of construction or a change in the character of the
25 work.

26 1636-2 MATERIALS

27 Refer to Division 10.

Item	Section
Sediment Control Stone, Standard Size No. 5 or 57	1005
Stone for Erosion Control, Class B	1042
Geotextile for Drainage, Type 2	1056

28 1636-3 CONSTRUCTION METHODS

29 Construct stream crossings according to *Roadway Standard Drawings* or as directed.

30 The Contractor shall determine the diameter of pipe(s) that will pass the peak or bankfull
31 flow, whichever is less, from a 2-year peak storm, without overtopping. Place the geotextile
32 on natural ground, on streambanks and in streambed beneath the temporary pipe(s) and stone
33 according to the detail. Install Class B stone around the pipe(s), in the stream channel and on
34 the crossing road sideslopes. Place sediment control stone on top of Class B stone according
35 to *Roadway Standard Drawings*.

36 1636-4 MEASUREMENT AND PAYMENT

37 *Sediment Control Stone* will be measured and paid in accordance with Article 1610-4.

38 *Stone for Erosion Control, Class __* will be measured and paid in accordance with
39 Article 1610-4.

- 1 *Geotextile for Drainage* will be measured and paid in accordance with Article 876-4.
- 2 *Temporary Pipe for Stream Crossing* will be measured and paid at the contract unit price per
- 3 linear foot of temporary pipe approved by the Engineer and measured in place from end to
- 4 end.
- 5 Article 104-5, pertaining to revised contract prices, will not apply to this item. No revision in
- 6 the contract unit price will be allowed because of any overrun or underrun.
- 7 Such price and payment will be full compensation for all work covered by this section,
- 8 including, but not limited to, furnishing all materials, labor, equipment and incidentals
- 9 necessary to construct the stream crossings.
- 10 Payment will be made under:

Pay Item	Pay Unit
Temporary Pipe for Stream Crossing	Linear Foot

**SECTION 1637
RISER BASIN**

1637-1 DESCRIPTION

- 14 Construct, maintain and remove riser basin devices to reduce water velocity and contain
- 15 sediment.
- 16 The actual conditions which occur during the construction of the project will determine the
- 17 quantity of riser basin devices constructed. The quantity of riser basins may be increased,
- 18 decreased or eliminated entirely as directed. Such variations in quantity will not be
- 19 considered as alterations in the details of construction or a change in the character of the
- 20 work.

1637-2 MATERIALS

- 22 Refer to Divisions 3 and 10.

Item	Section
C.S. Pipe Tee riser	1032-3
Stone for Erosion Control, Class B	1042
Coir Fiber Mat	1060-14

- 23 Provide appropriately sized and approved skimmer device.

1637-3 CONSTRUCTION METHODS

- 25 Work includes constructing earth embankments and overflow spillways, and installing outlet
- 26 pipe, tee-riser sections, trash racks, anti-flotation devices, coir fiber baffles, skimmer and
- 27 stone energy dissipater in silt basins in accordance with *Roadway Standard Drawings*. Use
- 28 either anti-flotation method shown in the plans.
- 29 Construct earth embankments with 2:1 side slopes with material meeting roadway
- 30 embankment specifications in accordance with Section 1018. The maximum height of earth
- 31 embankments is 12 feet. Compact embankment to at least 90% of AASHTO T 99 as
- 32 modified by the Department and as directed. Excavate when required to provide minimum
- 33 surface area and minimum storage volume area measured below the top of the principal
- 34 spillway (top of the riser pipe).
- 35 Install a C.S. pipe tee riser as specified in the plans. Additional C.S. pipe may be required to
- 36 obtain the required riser pipe height (crest elevation) as indicated in the plans. Construct
- 37 a trash rack and an anti-flotation device on the riser pipe. Attach skimmer to riser pipe 1 foot
- 38 above bottom elevation of basin.
- 39 Install coir fiber baffles in the basin in accordance with Section 1640 and as directed.

Section 1638

1 Construct an overflow spillway outlet, on natural ground, one foot above riser pipe. Plate
2 overflow spillway with erosion control stone Class B as specified in the plans.

3 Stabilize the embankment and surrounding areas with vegetation after installation. Construct
4 energy dissipater pad at the barrel pipe outlet with erosion control stone Class B in accordance
5 with the *Roadway Standard Drawings*.

6 **1637-4 MAINTENANCE AND REMOVAL**

7 Place a marker in the basin indicating the 50% volume level. Clean out riser basin when
8 sediment volume reaches 50% of the storage volume in accordance with Section 1630.

9 Remove riser basin devices as the project nears completion or as directed. Prepare a seed bed,
10 seed and mulch the area in accordance with Section 1660 after removal of the riser basin.

11 **1637-5 MEASUREMENT AND PAYMENT**

12 *C.S. Pipe Tee Riser, ___" Thick* will be measured and paid in units of each installed and
13 accepted. Such price shall include furnishing and installing any additional pipe required for
14 correct riser height, the trash rack and the anti-flotation device.

15 *Stone for Erosion Control, Class ___* will be measured and paid in accordance with
16 Article 1610-4.

17 *Outlet Pipe* will be measured and paid in accordance with Section 310.

18 *Silt Excavation* will be measured and paid in accordance with Article 1630-3.

19 *Coir Fiber Baffle* will be measured and paid in accordance with Article 1640-4.

20 *___" Skimmer* will be measured in units of each. *___" Skimmer* will be measured and paid for
21 as the maximum number of each size skimmer acceptably installed and in use at any one time
22 during the life of the project. Barrel and arm pipe, cleanout, relocation and reinstallation of
23 *___" Skimmer* is considered incidental to the measurement of the quantity of *___" Skimmer* and
24 no separate payment will be made. No separate payment shall be made if *___" Skimmer*,
25 barrel and/or arm pipe(s) are damaged by ice accumulation.

26 Payment will not be made for any work performed under this section that is solely for the
27 convenience of the Contractor or that is made necessary due to negligence of the Contractor.

28 Payment will be made under:

Pay Item	Pay Unit
___" x ___" x ___" C.S. Pipe Tee Riser, ___" Thick	Each
___" Skimmer	Each

29 **SECTION 1638**
30 **STILLING BASIN**

31 **1638-1 DESCRIPTION**

32 Construct, maintain and remove earth embankments used to trap sediment from dewatering
33 construction sites during construction of drilled piers, footing excavation or culvert
34 construction. Work includes providing permeable stone drain, cleaning out, maintaining,
35 removing and disposing of the stilling basins and all components and reshaping the area.

36 The actual conditions that occur during the construction of the project will determine the
37 quantity of stilling basins constructed. The quantity of stilling basins may be increased,
38 decreased or eliminated entirely as directed. Such variations in quantity will not be
39 considered as alterations in the details of construction or a change in the character of the
40 work.

1 **1638-2 MATERIALS**

2 Use suitable excavated materials, as specified in Sections 225, 230 and 240, in the
3 construction of earth embankments for stilling basins, except where otherwise specified.

4 Refer to Division 10.

Item	Section
Stone for Erosion Control, Class B	1042
Sediment Control Stone, Standard Size No. 5 or 57	1005
Coir Fiber Mat	1060-14

5 **1638-3 CONSTRUCTION METHODS**

6 Construct stilling basins at the locations shown in the plans and at other locations as directed.

7 Construct earth embankment with a permeable stone drain in a rectangular form adjacent to
8 the stream and culvert following the applicable requirements of Section 235. The maximum
9 height allowed for earth dikes is 5 feet. Excavate below the natural ground for greater depths
10 of basins.

11 Install coir fiber baffles in accordance with Section 1640 and as directed.

12 **1638-4 MAINTENANCE AND REMOVAL**

13 Maintain the stilling basins, coir fiber baffles and remove and dispose of silt accumulations at
14 the stilling basins in accordance with Section 1630.

15 Remove the stilling basins as the project nears completion, or at such time the Engineer
16 deems the device to be no longer useful. Prepare a seed bed and seed and mulch the area after
17 removal of the stilling basin in accordance with Section 1660.

18 **1638-5 MEASUREMENT AND PAYMENT**

19 *Stilling Basin* quantities will be measured and paid in cubic yards, in place and computed by
20 the average-end-method for the actual number of cubic yards of basin capacity. The
21 measurements will be the internal measurements of the basin measured up to the top of the
22 permeable stone drain. Materials used to construct the basin that originates from another
23 payment item (i.e. unclassified excavation, borrow excavation) will not be deducted from the
24 volume of that original pay item.

25 *Stone for Erosion Control, Class ____* will be measured and paid in accordance with
26 Article 1610-4.

27 *Sediment Control Stone* will be measured and paid in accordance with Article 1610-4.

28 *Coir Fiber Baffle* will be measured and paid in accordance with Article 1640-4.

29 Payment will be made under:

Pay Item	Pay Unit
Stilling Basins	Cubic Yard

30 **SECTION 1639**
31 **SPECIAL STILLING BASIN**

32 **1639-1 DESCRIPTION**

33 Furnish, place and remove special stilling basins as directed. The special stilling basin can be
34 used to filter pumped water during construction of drilled piers, footing excavation or culvert
35 construction. The special stilling basin can be used for sediment storage at the outlet of
36 temporary slope drain pipes.

Section 1639

1 1639-2 MATERIALS

2 Refer to Division 10.

Item	Section
Geotextile for Drainage, Type 2	1056
Sediment Control Stone, Standard Size No. 5 or 57	1005

3 Use geotextile and sediment control stone that is clean and without debris.

4 Use a special stilling basin that is a water permeable geotextile bag that traps sand, silt and
5 fines as sediment-laden water is pumped into it, or as runoff flows into it through the
6 temporary slope drain pipe(s).

7 Provide special stilling basin of a bag constructed to a minimum size of 10 feet x 15 feet made
8 from a nonwoven geotextile. Provide a sewn-in 8 inches (maximum) spout for receiving
9 pump discharge. Sew the bag seams with a double needle machine using a high strength
10 thread. The seams shall have a minimum wide width strength of 60 lbs. per inch in
11 accordance with ASTM D4884.

12 Construct the bag with a geotextile stabilized to provide resistance to UV degradation meeting
13 Table 1639-1.

Property	Minimum Requirement	Test Method
Weight	8.0 oz/yd	ASTM D3776
Grab tensile	200.0 lb	ASTM D4632
Puncture	520lb	ASTM D6241
Flow rate	80.0 gal/min/sf	ASTM D4491
Permittivity	1.2 1/sec	ASTM D4491
UV Resistance	70.0%	ASTM D4355

14 1639-3 CONSTRUCTION METHODS

15 Install the special stilling basin(s), geotextile and stone in accordance with *Roadway Standard*
16 *Drawings* and at locations in the plans and as directed. Place the special stilling basin(s) on
17 level ground.

18 Construct the special stilling basin(s) such that it is portable and can be used adjacent to each
19 drilled pier, footing and/or culvert, as required by the project commitments. Temporary slope
20 drain pipe(s) or pump discharge hoses will be attached to the special stilling basin(s) to divert
21 runoff or pumped effluent directly into the special stilling basin(s). The special stilling basin
22 may be cut to allow slope drain pipe to be inserted if needed and tied off tightly. The
23 remaining sleeve or spout of the bag, if present, may be used to connect more than one special
24 stilling basin in series as directed. If not used in this manner, the sleeve shall be tied off
25 tightly to allow the bag to contain the effluent and force it to filter through the sides of the
26 special stilling basin. Place the special stilling basin(s) so the incoming runoff or pumped
27 effluent flows into and through it without causing erosion to adjacent slopes or streambanks.
28 In areas of turbidity and water quality concern, place the special stilling basin(s) up grade and
29 direct its runoff into a sediment control measure before being allowed to discharge into
30 jurisdictional waters.

31 Replace and dispose of the special stilling basin(s) when it is 3/4 full of sediment or when it is
32 impractical for the bag to filter the sediment out at a reasonable flow rate. Prior approval
33 from the Engineer shall be received before removal and replacement.

34 Provide a sufficient quantity of bags to contain silt from pumped effluent during construction
35 of drilled piers, footing excavation and culvert construction. A sufficient quantity of special
36 stilling basins shall be provided to contain sediment from temporary slope drain runoff.

1 **1639-4 MEASUREMENT AND PAYMENT**

2 *Special Stilling Basin* will be measured and paid as the actual number of bags used during
3 temporary slope drain installation, drilled pier construction, footing excavation or culvert
4 construction as specified and accepted.

5 *Geotextile for Drainage* will be measured and paid in accordance with Article 876-4.

6 *Sediment Control Stone* will be measured and paid in accordance with Article 1610-4.

7 Such price and payment will be full compensation for all work covered by this section,
8 including but not limited to, furnishing all materials, placing and maintaining the special
9 stilling basin(s) and removal and disposal of silt accumulations and bag.

10 Payment will be made under:

Pay Item	Pay Unit
Special Stilling Basins	Each

11

SECTION 1640
COIR FIBER BAFFLE

12

13 **1640-1 DESCRIPTION**

14 Furnish material, install and maintain coir fiber baffles according to the details in the plans or
15 in locations as directed. Install coir fiber baffles in silt basins and sediment dams at drainage
16 outlets. Work includes providing all materials, placing, securing, excavating and backfilling
17 of coir fiber baffles.

18 **1640-2 MATERIALS**

19 **(A) Coir Fiber Mat**

20 Provide matting to meet Article 1060-14

21 **(B) Staples**

22 Provide staples made of 0.125 inch diameter new steel wire formed into a U-shape not
23 less than 12 inches in length with a throat of 1 inch in width.

24 **(C) Posts**

25 Provide steel posts at least 5 feet in length, approximately 1 3/8 inches wide measured
26 parallel to the baffle and have a minimum weight of 1.25 lbs. per foot of length. Equip
27 the post with an anchor plate having a minimum area of 14.0 square inches and of the
28 self-fastener angle steel type to have a means of retaining wire and coir fiber mat in the
29 desired position without displacement.

30 **(D) Wire**

31 Provide 9-gauge high tension wire strand of variable lengths.

32 **(E) Attachment Device**

33 Provide plastic ties, wire fasteners or other approved attachment device.

34 **1640-3 CONSTRUCTION METHODS**

35 Place the coir fiber baffles immediately upon construction of sediment dams and basins.
36 Install 3 baffles in basins with a spacing of 1/4 the basin length and according to the detail
37 sheets. Install 2 coir fiber baffles in basins less than 20 feet in length with a spacing of 1/3 the
38 basin length.

39 Place steel posts at a depth of 2 feet below the basin surface, with spacing of no more than
40 4 feet. The top height of the coir fiber baffles shall not be below the elevation of the
41 emergency spillway base of dams and basins. Attach a 9-gauge high-tension wire strand to

Section 1650

1 the steel posts at a height of 3 feet with plastic ties or wire fasteners. Install a steel post into
2 side of the basin at a variable depth and a height of 3 feet from the bottom of the basin to
3 anchor coir fiber mat. Secure anchor post to the upright steel post in basin with wire
4 fasteners.

5 Drape the coir fiber mat over the wire strand with at least 3 feet of material on each side of the
6 strand. Secure the coir fiber mat to the posts and wire strand with approved fastener. Place
7 staples across the matting at ends and junctions approximately one foot apart at the bottom
8 and side slopes of basin. Overlap matting at least 6 inches where 2 or more widths of matting
9 are installed side by side. Refer to details in the plans. The Engineer may require adjustments
10 in the stapling requirements to fit individual site conditions.

11 1640-4 MEASUREMENT AND PAYMENT

12 *Coir Fiber Baffle* will be measured and paid as the actual number of linear feet of coir fiber
13 baffles which are installed and accepted. Such price and payment will be full compensation
14 for all work covered by this section, including, but not limited to, furnishing all materials,
15 labor, equipment and incidentals necessary to install the coir fiber baffles.

16 Payment will be made under:

Pay Item	Pay Unit
Coir Fiber Baffle	Linear Foot

**SECTION 1650
WOODED AREA CLEANUP**

19 1650-1 DESCRIPTION

20 Remove and satisfactorily dispose of debris and of dead, partially dead or broken vegetation
21 from wooded areas of the right of way outside clearing limits and from other areas outside
22 construction limits on which seeding and mulching is not to be performed. Work includes
23 treating stumps with herbicide and repairing any damage to vegetation.

24 Cutover timberland, reforested areas or thickets of young native volunteer vegetation will be
25 considered to be wooded areas.

26 1650-2 MATERIALS

27 Refer to Division 10.

Item	Section
Herbicide	1060-13

28 1650-3 CONSTRUCTION METHODS

29 Remove all logs, stumps, snags, loose roots, down timber, slabs, tree laps, lumber, dead or
30 partially dead trees, broken trees or brush, dead brush, sawdust piles, discarded fences, leaf
31 piles, brick, tile masonry and other debris from the cleanup areas. Cut, all dead trees, stumps,
32 snags, broken or partially dead trees and brush, flush with the ground. Remove vegetation
33 which dies between initial cleanup and completion of the project before final acceptance.
34 Hand raking of areas or removal of a normal leaf layer is not required unless stated in the
35 contract.

36 Treat partially dead stumps or broken vegetation with a herbicide immediately after cutting.
37 Use the herbicide and the method and rate of application, specified in the contract. Follow all
38 applicable instructions, warnings and safety precautions stated on the manufacturer's label,
39 and comply with all laws and regulations governing herbicides that are in effect at the time of
40 use.

41 Dispose of all material cleaned up under this item in accordance with the applicable
42 requirements of Article 200-5 and Article 802-2.

1 **1650-4 DAMAGE TO REMAINING VEGETATION**

2 Conduct operations so as to prevent injury to trees, shrubs or other types of vegetation that are
3 to remain growing and to prevent damage to adjacent property.

4 Remove broken branches and rough edges of scarred trees or shrubs. Prune and shape these
5 areas in accordance with the International Society of Arboriculture pruning techniques. Cut
6 and dispose of any plants that are damaged beyond their value for landscape purposes and
7 seed and mulch vegetation that is damaged by the Contractor at no cost to the Department
8 when so directed.

9 **1650-5 MEASUREMENT AND PAYMENT**

10 *Wooded Area Cleanup* will be measured and paid in acres, measured horizontally, completed
11 and accepted.

12 Payment will be made under:

Pay Item	Pay Unit
Wooded Area Cleanup	Acre

13 **SECTION 1651**
14 **SELECTIVE VEGETATION**

15 **1651-1 DESCRIPTION**

16 Remove selected living trees and undesirable living undergrowth from areas of the right of
17 way outside clearing limits in accordance with these Specifications. Work includes treating
18 stumps with herbicide and repairing any damage to vegetation.

19 **1651-2 MATERIALS**

20 Refer to Division 10.

Item	Section
Herbicide	1060-13

21 **1651-3 CONSTRUCTION METHODS**

22 **(A) Trees**

23 Remove trees shown in the plans or designated. Measure all tree diameter sizes at
24 a height of 4.5 feet above the ground.

25 **(B) Undergrowth**

26 Remove all undergrowth from areas shown in the plans, described in the Specifications or
27 designated, except for those plants designated to be preserved. All plants less than
28 4 inches in diameter, measured at a height of 4.5 feet above the ground shall be classified
29 as undergrowth.

30 **(C) General**

31 Treat stumps with a herbicide immediately after cutting to prevent sprouting. Use the
32 herbicide and the method and rate of application specified in the Specifications. Follow
33 all applicable instructions, warnings and safety precautions stated on the manufacturer's
34 label, and comply with all laws and regulations governing herbicides that are in effect at
35 the time of use.

36 When work is performed properly in accordance with these Specifications, no subsequent
37 re-cutting of sprouts or seedling growth will be required.

38 Dispose of all trees and undergrowth cut in accordance with Article 200-5.

Section 1660

1 **1651-4 DAMAGE TO REMAINING VEGETATION**

2 Conduct operations so as to prevent injury to trees, shrubs or other types of vegetation that are
3 to remain growing, and also to prevent damage to adjacent property.

4 Remove broken branches and rough edges of scarred trees or shrubs. Shape and make smooth
5 these areas in accordance with generally accepted horticultural practice. Cut and dispose of
6 any plants that are damaged beyond their value for landscape purposes and seed and mulch
7 vegetation that is damaged by the Contractor at no cost to the Department.

8 **1651-5 MEASUREMENT AND PAYMENT**

9 *Selective Tree Removal* ___" will be measured and paid in units of each. Each tree removed
10 will be paid at the contract unit price for the pay item size applicable to the actual tree
11 diameter, measured at a height of 4.5 feet above the ground, as indicated in Table 1651-1.

TABLE 1651-1 SELECT TREE REMOVAL PAY ITEM SIZES	
Pay Item Size	Actual Tree Diameter
6 inch	4 inches up to 8 inches
10 inch	8 inches up to 12 inches
15 inch	12 inches up to 18 inches
18 inches	18 inches and over

12 *Selective Undergrowth Removal* will be measured and paid in acres, measured horizontally,
13 completed and accepted.

14 Payment will be made under:

Pay Item	Pay Unit
Selective Tree Removal, 6"	Each
Selective Tree Removal, 10"	Each
Selective Tree Removal, 15"	Each
Selective Tree Removal, 18"	Each
Selective Undergrowth Removal	Acre

15 **SECTION 1660**
16 **SEEDING AND MULCHING**

17 **1660-1 DESCRIPTION**

18 Prepare seedbed; furnish, place and incorporate limestone, fertilizer and seed; compact
19 seedbed; furnish, place and secure mulch; mow; and perform other operations necessary for
20 the permanent establishment of vegetation from seed on shoulders, slopes, ditches or other
21 roadside areas.

22 Perform seeding and mulching on all earth areas disturbed by construction and on portions of
23 areas seeded under previous contracts as directed where there is unsatisfactory vegetative
24 cover.

25 Adapt operations to variations in weather or soil conditions as necessary for the successful
26 establishment and growth of the grasses or legumes.

27 Preserve the required line, grade and cross section of the area treated.

28 The actual conditions which occur during the construction of the project will determine the
29 quantity of mowing. The quantity of mowing may be increased, decreased or eliminated
30 entirely as directed. Such variations in quantity will not be considered as alterations in the
31 details of construction or a change in the character of the work.

1 **1660-2 MATERIALS**

2 Refer to Division 10.

Item	Section
Fertilizer	1060-2
Limestone	1060-3
Seed	1060-4
Mulch for Erosion Control	1060-5

3 Use undiluted emulsified asphalt for tacking material.

4 The analysis of fertilizer and the kinds of seed will be as stated in the contract.

5 **1660-3 COORDINATION WITH GRADING OPERATIONS**6 Perform seeding and mulching operations on a section by section basis immediately upon
7 completion of earthwork sections in accordance with Article 225-2.8 When grading operations have been suspended, and seeding and mulching has been
9 performed on areas where work has been suspended, include in the work of seeding and
10 mulching of the adjacent sections any necessary overlapping of operations on previously
11 established vegetative cover.12 When the Contractor fails or neglects to coordinate grading with seeding and mulching
13 operations and to pursue diligently the control of erosion and siltation, the Engineer may
14 suspend the Contractor's grading operations until such time as the work is coordinated in
15 a manner acceptable to the Engineer. Such suspension will be in accordance with
16 Article 108-7.17 **1660-4 SEEDBED PREPARATION**18 Cut and satisfactorily dispose of weeds or other unacceptable growth on the areas to be
19 seeded. Shape and smooth uneven and rough areas outside of the graded section, such as crop
20 rows, farm contours, ditches and ditch spoil banks, fence line and hedgerow soil
21 accumulations and other minor irregularities which cannot be obliterated by normal seedbed
22 preparation operations, to provide for more effective seeding and for ease of subsequent
23 mowing operations.24 Scarify or otherwise loosen the soil to a depth of not less than 5 inches except as otherwise
25 provided below or otherwise directed. Break clods and work the top 2 inches to 3 inches of
26 soil into an acceptable seedbed by the use of soil pulverizers, drags or harrows; or by other
27 approved methods. Remove all rock and debris 3 inches or larger on median, shoulder and
28 ditch cut or fill slopes which are 3:1 or flatter, before the application of seed and fertilizer.
29 Remove rock 6 inches and larger displaced during seeding operations.30 Scarify, groove, trench or puncture all slope surfaces. The depth of preparation and the
31 degree of smoothness of the seedbed may be reduced on cut slopes that are 2:1 and steeper, as
32 permitted by the Engineer.33 On cut slopes that are either 2:1 or steeper, the Engineer may permit the preparation of
34 a partial or complete seedbed during the grading of the slope. If at the time of seeding and
35 mulching operations such preparation is still in a condition acceptable to the Engineer,
36 additional seedbed preparation may be reduced or eliminated.37 Limit seedbed preparation to within 2 feet of the edge of any pavement to a depth of 2 inches
38 to 3 inches.39 Do not prepare seedbed when the soil is frozen, extremely wet or when the Engineer
40 determines that it is an otherwise unfavorable working condition.

Section 1660

1 1660-5 APPLYING AND COVERING LIMESTONE, FERTILIZER AND SEED

2 (A) General

3 The contract will state the seasonal limitation for seeding operations; the kinds of grades
4 of fertilizers; the kinds of seed; and the rates of application of limestone, fertilizer and
5 seed.

6 Obtain approval from the Engineer before using equipment for the application, covering
7 or compaction of limestone, fertilizer and seed. Approval may be revoked at any time if
8 equipment is not maintained in satisfactory working condition, or if the equipment
9 operation damages the seed.

10 Apply limestone, fertilizer and seed within 24 hours after completion of seedbed
11 preparation unless otherwise permitted by the Engineer. When the Engineer determines
12 that weather and soil conditions are unfavorable, do not distribute any limestone or
13 fertilizer and do not sow any seed.

14 Take adequate precautions to prevent damage to traffic, structures, guardrails, traffic
15 control devices or any other appurtenances during the application of fertilizer. Provide
16 adequate covering or change methods of application as required to avoid such damage.
17 Repair any damage that occurs, including any cleaning that may be necessary.

18 (B) Limestone and Fertilizer

19 Limestone may be applied as a part of the seedbed preparation, provided it is
20 immediately worked into the soil. If not so applied, distribute limestone and fertilizer
21 uniformly over the prepared seedbed at the specified rate of application and then harrow,
22 rake or otherwise thoroughly work or mix into the seedbed.

23 (C) Seed

24 Distribute seed uniformly over the seedbed at the required rate of application, and
25 immediately harrow, drag, rake or otherwise work so as to cover the seed with a layer of
26 soil. Cover to a depth as directed by the Engineer. If two kinds of seed are to be used
27 which require different depths of covering, sow separately.

28 When a combination seed and fertilizer drill is used, drill fertilizer with seed after
29 applying and incorporating limestone into the soil. If using two kinds of seed requiring
30 different depth of cover, the seed requiring the lighter cover may be sown broadcast or
31 with a special attachment to the drill, or drilled lightly following the initial drilling
32 operation.

33 When using a hydraulic seeder for application of seed and fertilizer, do not allow the seed
34 to remain in water containing fertilizer for more than 30 minutes before application
35 unless otherwise permitted.

36 Compact the seedbed immediately after seed has been properly covered in the manner
37 and degree approved by the Engineer.

38 (D) Modifications

39 When adverse seeding conditions are encountered due to steepness of slope, height of
40 slope or soil conditions, the Engineer may direct or permit that modifications be made in
41 the above requirements which pertain to incorporating limestone into the seedbed;
42 covering limestone, seed and fertilizer; and compaction of the seedbed.

43 Such modifications may include but not be limited to the following:

44 (1) The incorporation of limestone into the seedbed may be omitted as follows:

45 (a) On cut slopes steeper than 2:1;

1 (b) On 2:1 cut slopes when a seedbed has been prepared during the excavation of
2 the cut and is still in an acceptable condition; or

3 (c) On areas of slopes where the surface of the area is too rocky to permit the
4 incorporation of the limestone.

5 (2) The rates of application of limestone, fertilizer and seed on slopes 2:1 or steeper or
6 on rocky surfaces may be reduced or eliminated.

7 (3) Compaction after seeding may be reduced or eliminated on slopes 2:1 or steeper, on
8 rocky surfaces or on other areas where soil conditions would make compaction
9 undesirable.

10 **1660-6 MULCHING**

11 **(A) General**

12 Mulch all seeded areas unless otherwise indicated in the contract or directed by the
13 Engineer.

14 Use grain straw as mulch at any time of the year. If permission to use material other than
15 grain straw is requested and the use of such material is approved by the Engineer, the
16 seasonal limitations, the methods and rates of application, the type of binding material or
17 other conditions governing the use of such material will be established by the Engineer at
18 the time of approval.

19 **(B) Applying Mulch**

20 Apply mulch within 24 hours after completion of seeding unless otherwise permitted.
21 Exercise care to prevent displacement of soil or seed or other damage to the seeded area
22 during the mulching operations.

23 Spread mulch uniformly by hand or by approved mechanical spreaders or blowers which
24 will provide an acceptable application. An acceptable application will be that which will
25 allow some sunlight to penetrate and air to circulate but also partially shade the ground,
26 reduce erosion and conserve soil moisture.

27 **(C) Holding Mulch**

28 Hold mulch in place by applying a sufficient amount of undiluted emulsified asphalt or
29 other approved binding material. The Engineer will approve the rate and method of
30 application of binding material. Apply the binding material directly with the mulch or
31 immediately following the mulch application.

32 Take adequate precautions to prevent damage to traffic, structures, guardrails, traffic
33 control devices or any other appurtenances during the application of asphalt binding
34 material. Provide adequate covering or change methods of application as required to
35 avoid such damage. Repair any damage that occurs, including any cleaning that may be
36 necessary.

37 Take sufficient precautions to prevent mulch from entering drainage structures through
38 displacement by wind, water or other causes and promptly remove any blockage to
39 drainage facilities which may occur.

40 **1660-7 MAINTENANCE OF SEEDING AND MULCHING**

41 Maintain areas where seeding and mulching have been performed in a satisfactory condition
42 until final acceptance of the project.

43 Mow at the location and times as directed.

44 Correct areas of damage or failure due to any cause by repairing or completely reworking as
45 directed.

Section 1661

1 Repair in accordance with Section 1661 where extensive seedbed preparation is unnecessary.
2 Rework seeding and mulching in accordance with this section where correction requires
3 extensive seedbed preparation, or where earthwork repairs or complete reshaping are
4 necessary.
5 As an exception to the above, repair areas of damage or failure resulting either from
6 negligence on the part of the Contractor in performing subsequent construction operations or
7 from not taking adequate precautions to control erosion and siltation as required throughout
8 the various sections of the Specifications, at no cost to the Department.

1660-8 MEASUREMENT AND PAYMENT

10 *Seeding and Mulching* will be measured and paid in acres, measured along the surface of the
11 ground completed and accepted. No direct payment will be made for furnishing and applying
12 the limestone and fertilizer as such work and materials will be incidental to the work covered
13 by *Seeding and Mulching*.

14 *Mowing* will be measured and paid in acres measured along the surface of the ground mowed
15 as directed. Where an area has been mowed more than once at the direction of the Engineer,
16 separate measurement will be made each time the area is mowed.

17 Corrective work will be compensated where seeding and mulching has been damaged or has
18 failed to establish a satisfactory stand of vegetation.

19 Where correction can be made without extensive seedbed preparation, the work will be paid
20 in accordance with Article 1661-5 for *Seed for Repair Seeding* and *Fertilizer for Repair*
21 *Seeding*.

22 Where earthwork and seeding and mulching has been damaged to the extent that earthwork
23 repairs or complete reshaping are necessary, the Contractor will be paid at the contract unit
24 price for the excavated material required for repairs to the damaged earthwork, and at the
25 contract unit price for *Seeding and Mulching* for correcting the damaged seeding and
26 mulching.

27 As an exception to the above, repair, at no cost to the Department, any damage to earthwork
28 or seeded and mulched areas which is due to carelessness or neglect on the part of the
29 Contractor.

30 Payment will be made under:

Pay Item	Pay Unit
Seeding and Mulching	Acre
Mowing	Acre

**SECTION 1661
REPAIR SEEDING**

1661-1 DESCRIPTION

34 Repair areas previously seeded and mulched in accordance with Section 1660 but damaged or
35 failed to successfully establish a stand of vegetation. This work does not include repair
36 seeding made necessary by negligence on the part of the Contractor as described in
37 Article 1660-7, nor does it include repairs to temporary seeding constructed in accordance
38 with Section 1620.

39 Repair damage or failure in accordance with this section where correction can be made
40 without extensive seedbed preparation.

41 Where correction will require extensive seedbed preparation, or where earthwork repairs or
42 complete reshaping are necessary, repair in accordance with Section 1660.

- 1 Repair seeding includes minor seedbed preparation; the furnishing, placing and covering of
 2 fertilizer and seed; and mulch as required, all in accordance with these Specifications.
- 3 Perform repair seeding promptly at the locations and times as directed.
- 4 The actual conditions which occur during the construction of the project will determine the
 5 quantity of seed or fertilizer used. The quantity of seed or fertilizer may be increased,
 6 decreased or eliminated entirely at the discretion of the Engineer. Such variation in quantity
 7 will not be considered as alterations in the details of construction or a change in the character
 8 of the work.

9 **1661-2 MATERIALS**

10 Refer to Division 10.

Item	Section
Fertilizer	1060-2
Seed	1060-4
Mulch for Erosion Control	1060-5

11 The analysis of fertilizer and the kinds of seed shall be as stated in the contract.

12 **1661-3 SEEDBED PREPARATION**

13 Seedbed preparation will be required unless otherwise permitted.

14 A seedbed preparation as extensive as that performed for the original seeding and mulching
 15 will not be required. The degree of preparation shall be sufficient to retain the seed against
 16 displacement by wind, rain or surface runoff, and be acceptable to the Engineer. The
 17 acceptable degree of seedbed preparation will depend on the location, soil conditions and
 18 drainage conditions at the site.

19 **1661-4 APPLICATION OF FERTILIZER, SEED AND MULCH**

20 The analysis of fertilizer, the kinds of seed and the rates of application of seed and fertilizer is
 21 the same as specified in the project special provision for seeding and mulching, unless
 22 otherwise directed, but in no case will the total rate of seed and fertilizer vary more or less
 23 than 25% of that specified for seeding and mulching.

24 Do not distribute fertilizer or sow seed when the Engineer determines that conditions are
 25 unfavorable for such operations.

26 Cover fertilizer and seed and secure mulch in place to prevent displacement by wind, rain or
 27 surface runoff.

28 Article 1660-5 will be applicable to the approval of equipment and the protection of traffic,
 29 structures, guardrails, traffic control devices and other appurtenances.

30 **1661-5 MEASUREMENT AND PAYMENT**

31 *Seed for Repair Seeding* will be measured and paid in pounds. The weight of seed will be
 32 determined by bag count of standard weight bags or by weighing the seed. No direct payment
 33 will be made for furnishing and applying mulch and all materials used to hold mulch in place,
 34 as such work and materials will be incidental to the work covered by *Seed for Repair Seeding*.

35 *Fertilizer for Repair Seeding* will be measured and paid in tons. The weight of dry fertilizer
 36 will be determined by bag count of standard weight bags, or by weighing the fertilizer in
 37 trucks on certified platform scales or other certified weighing devices.

Section 1662

1 Payment will be made under:

Pay Item	Pay Unit
Seed for Repair Seeding	Pound
Fertilizer for Repair Seeding	Ton

2 **SECTION 1662**
3 **SUPPLEMENTAL SEEDING**

4 **1662-1 DESCRIPTION**

5 Apply additional seed to areas which have been previously seeded with permanent seed but
6 on which there is an unsatisfactory cover of vegetation.

7 This work is only to provide an additional amount of seed to areas that have an insufficient
8 stand of vegetation but which are too well established to require repair seeding. Work
9 covered by this provision does not include seedbed preparation, fertilizer or mulch.

10 Perform supplemental seeding promptly at the locations and times as directed.

11 The actual conditions which occur during the construction of the project will determine the
12 quantity of seed used. The quantity of seed may be increased, decreased or eliminated
13 entirely as directed. Such variation in quantity will not be considered as alterations in the
14 details of construction or a change in the character of the work.

15 **1662-2 MATERIALS**

16 Refer to Division 10.

Item	Section
Seed	1060-4

17 Use seeds as stated in the contract.

18 **1662-3 APPLICATION**

19 Seedbed preparation will not be required.

20 The contract will state the kinds and rates of application of seed. Sow no seed when the
21 Engineer determines that conditions are unfavorable.

22 Article 1660-5 will be applicable to the approval of equipment; and the protection of traffic,
23 traffic control devices and other appurtenances.

24 **1662-4 MEASUREMENT AND PAYMENT**

25 *Seed for Supplemental Seeding* will be measured and paid in pounds. The weight of seed will
26 be determined by bag count of standard weight bags or by weighing the seed.

27 Payment will be made under:

Pay Item	Pay Unit
Seed for Supplemental Seeding	Pound

28 **SECTION 1664**
29 **SODDING**

30 **1664-1 DESCRIPTION**

31 Prepare soil, furnish and place limestone, fertilizer, sod and water; and other operations
32 necessary for the permanent establishment of vegetation from sod on shoulders, slopes,
33 ditches or other roadside areas.

34 Adapt operations to variations in weather and soil conditions so as to assure the successful
35 establishment and growth of grasses.

- 1 Preserve the required line, grade and cross section of the area treated.
- 2 The actual conditions which occur during the construction of the project will determine the
3 quantity of water used and mowing required. The quantity of water or mowing may be
4 increased, decreased or eliminated entirely at the direction of the Engineer. Such variations in
5 quantity will not be considered alterations in the details of construction or a change in the
6 character of the work.

7 **1664-2 MATERIALS**

- 8 Refer to Division 10.

Item	Section
Fertilizer	1060-2
Limestone	1060-3
Sod	1060-7
Water	1060-9

- 9 The contract will state the analysis of fertilizer and the kinds of sod.

10 **1664-3 SODDING**

11 **(A) Handling and Storing Sod**

- 12 Exercise extreme care during all operations of loading, transporting, unloading, storing,
13 placing, tamping and staking sod, to prevent breaking the sod sections and to prevent the
14 sod from drying out. Any sod that is torn, broken or too dry will be rejected. Torn or
15 broken sod, if kept moist, may be used for filling unavoidable small gaps in sod cover as
16 permitted.

- 17 Place sod on the designated areas within 48 hours after being cut unless otherwise
18 directed.

19 **(B) Soil Preparation**

- 20 Remove litter and other debris. Mow and satisfactorily dispose of weeds or other
21 unacceptable growth on the areas to be sodded.

- 22 Bring the area to be sodded to a firm uniform surface at such elevation that the surface of
23 the complete sodding conforms to the finished grade and cross section as shown in the
24 plans.

- 25 Scarify or otherwise loosen soil to a depth of not less than 5 inches. Break clods and
26 work the top 2 inches to 3 inches of soil into an acceptable soil bed by using soil
27 pulverizers, drags or harrows.

- 28 Place limestone and fertilizer before placing the sod. The contract will state the kind and
29 grade of fertilizer, and the rates of application of limestone and fertilizer. Distribute the
30 limestone and fertilizer uniformly over the area and thoroughly mix in the top 5 inches of
31 the soil by discing, harrowing or other approved methods.

- 32 Prepare the area by harrowing, dragging, raking or other approved methods to give
33 a lawn type finish. Remove all trash, debris and stones larger than 1 ½ inches in diameter
34 or other obstructions that could interfere with the placing of the sod. Moisten the finished
35 surface with water before placing the sod.

36 **(C) Placing Sod**

- 37 The contract will state the seasonal limitations for sodding and the kind of sod to use.

- 38 Sod handling and placement will be a continuous process of cutting, transporting and
39 installing without appreciable delays. Install sod within 48 hours after being cut and
40 water immediately after installation.

Section 1664

1 Place sod firmly and carefully by hand within 24 hours after soil preparation is completed
2 and accepted by the Engineer. Pack each piece of sod tightly against the edge of adjacent
3 pieces so that the fewest possible gaps will be left between the pieces. Close unavoidable
4 gaps with small pieces of sod.

5 When placing sod on a slope, begin at either the top or the toe of the slope. Place sod
6 with the long edge horizontal and with staggered vertical joints. Turn the edge of the sod
7 slightly into the ground at the top of a slope and place a layer of earth over it and compact
8 so as to divert the surface water over and onto the top of the sod.

9 Stake sod in place by driving stakes flush with the sod, on all slopes 2:1 or steeper, in
10 drainage channels, on other areas shown in the plans, and on any areas that are in such
11 condition that there is danger of sod slipping. Perform staking concurrently with sod
12 placement and before tamping with sound wooden stakes which are approximately one
13 inch square or one inch in diameter and not less than 12 inches in length. Place enough
14 stakes to prevent slipping or displacement of the sod. Drive stakes perpendicular to the
15 slope. Where backfill is necessary on cut slopes to obtain a uniform sodding area,
16 provide stakes of sufficient length to reach at least 3 inches into the solid earth
17 underneath the backfill.

18 On all other areas, use metal staples in place of wooden stakes. The metal staples should
19 be 12 inches long, made of 11 gauge new steel wire so as not to bend when pinned or
20 driven through the sod. Shorter staples may be used with the approval of the Engineer.

21 Place, stake and staple the sod where necessary, then tamp or roll carefully and firmly by
22 acceptable means. If rolled, roller shall weigh 150 lbs. per foot of roller width. Take
23 extreme care to prevent the installed sod from being torn or displaced.

24 Do not place sod when the atmospheric temperature is below 32°F. Do not use frozen
25 sod or place on frozen soil.

26 **(D) Watering Sod**

27 Water carefully and thoroughly after sod has been placed and tamped. Perform watering
28 as directed until final acceptance. Application of water may be made by the use of
29 hydraulic seeding equipment, farm type irrigation equipment or by other acceptable
30 means.

31 **1664-4 MAINTENANCE**

32 Maintain sod in a satisfactory and live condition until final acceptance of the project.
33 Maintenance includes watering and mowing at the locations and times as directed.

34 **1664-5 MEASUREMENT AND PAYMENT**

35 *Sodding* will be measured and paid in square yards, measured along the surface of the ground
36 completed and accepted. No direct payment will be made for mowing the sodding areas
37 before soil preparation as such work will be incidental to sodding. No direct payment will be
38 made for furnishing and applying limestone and fertilizer, as such will be incidental to the
39 work covered by sodding.

40 *Water* will be measured and paid in 1,000 gallon units. Measurement of water will be made
41 by means of an approved metering device at the source of supply, or by determining the
42 volumetric capacity of tank trucks used to deliver water to the project and recording the
43 number of loads delivered by each truck.

44 *Mowing* will be measured and paid in accordance with Article 1660-8.

45 The above prices and payment will be full compensation for all work covered by this section.

1 Payment will be made under:

Pay Item	Pay Unit
Sodding	Square Yard
Water	1,000 Gallons

2 **SECTION 1665**
3 **FERTILIZER TOPDRESSING**

4 **1665-1 DESCRIPTION**

5 Furnish and uniformly distribute fertilizer as a topdressing to areas on which seeding and
6 mulching, sprigging or sodding are completed and a vegetative cover is established. Top
7 dress previously seeded, sprigged or sodded areas under other contracts when so stated in the
8 contract or where so directed.

9 The actual conditions that occur during the construction of the project will determine the
10 quantity of fertilizer topdressing used. In the event that a vegetative cover has not had
11 sufficient time to develop to a size suitable for topdressing before completion of the project,
12 the work of fertilizer topdressing will be decreased or eliminated entirely. Where the use of
13 additional fertilizer topdressing would be beneficial to the establishment of grasses or
14 legumes, the work of fertilizer topdressing will be increased. The quantity of fertilizer
15 topdressing may be increased, decreased or eliminated entirely as directed. Such variations in
16 quantity will not be considered as alterations in the details of construction or a change in the
17 character of work.

18 **1665-2 MATERIALS**

19 Use fertilizer containing no urea for topdressing.

20 Refer to Division 10.

Item	Section
Fertilizer	1060-2

21 The analysis of fertilizer shall be as stated in the contract.

22 **1665-3 APPLICATION**

23 Apply fertilizer topdressing at the locations and times as directed, regardless of whether or not
24 other seeding, sprigging or sodding operations are underway at the time.

25 The contract will state the rate of application and analysis of fertilizer. Distribute fertilizer
26 uniformly without any type of soil disturbance.

27 Refer to the contract for the approval of equipment and the protection of traffic, structures,
28 guardrails, traffic control devices and other appurtenances.

29 **1665-4 MEASUREMENT AND PAYMENT**

30 *Fertilizer Topdressing* will be measured and be paid in tons. The weight of dry fertilizer will
31 be determined by bag count of standard weight bags or by weighing the fertilizer in trucks on
32 certified platform scales or other certified weighing devices.

33 In the event that an alternative analysis of fertilizer topdressing is approved and used, it will
34 be in an equivalent number of tons of fertilizer, of the specified analysis, based on nutrient
35 value.

36 Payment will be made under:

Pay Item	Pay Unit
Fertilizer Topdressing	Ton

Section 1667

**SECTION 1667
SPECIALIZED HAND MOWING**

1667-1 DESCRIPTION

This work consists of specialized hand mowing around or under fixed objects, including but not limited to guardrails, signs, barriers and slopes in a method acceptable to the Engineer.

Specialized hand mowing shall be completed with mechanically powered trimmers, string trimmers, hand operated rotary mowers or self-propelled mowers of sufficient size and quality to perform the work timely and efficiently.

The quantity of mowing to be performed will be affected by the actual conditions that occur during the construction of the project. The quantity of mowing may be increased, decreased or eliminated entirely as directed. Such variations in quantity will not be considered as alterations in the details of construction or a change in the character of the work.

1667-2 MEASUREMENT AND PAYMENT

Specialized Hand Mowing will be measured and paid as the actual number of man hours each worker spends hand mowing, as directed. When directed to mow an area more than once, separate measurement will be made each time the area is mowed.

Payment will be made under:

Pay Item	Pay Unit
Specialized Hand Mowing	Man Hour

**SECTION 1670
PLANTING**

1670-1 DESCRIPTION

Furnish, deliver and plant trees, shrubs, vines, ground covers, bedding plants and seedlings at locations shown in the plans or as directed, in accordance with these Specifications.

The work of planting includes plant bed preparation, initial planting, plant establishment and replacement planting.

Perform the operations carefully to promote the continued life and healthy growth of all plants in their final location.

The actual conditions that occur during the construction of the project will determine the quantity of plant bed fumigation or post-emergent and pre-emergent herbicidal treatment for plant beds. The quantities of post-emergent and pre-emergent herbicidal treatment for plant beds may be increased, decreased or eliminated entirely as directed. Such variations in quantity will not be considered as alterations in the details of construction or a change in the character of the work.

1670-2 MATERIALS

Refer to Division 10.

Item	Section
Fertilizer	1060-2
Water	1060-9
Nursery Grown Plant Materials	1060-10
Mulch for Planting	1060-11
Materials for Staking or Guying	1060-12
Herbicide	1060-13

Furnish nursery grown plant materials.

1 The contract will state the kind of herbicides to be used.

2 **1670-3 WEATHER AND SEASONAL LIMITATIONS**

3 Perform planting operations only between the dates shown in the contract except where
4 otherwise permitted in writing.

5 Do not plant when the temperature is below 32°F, when the plant hole is frozen or when soil
6 to excavate and fill the plant hole is frozen or too wet.

7 Apply post-emergent herbicide when the weeds are near maturity but not when the weeds are
8 under stress from drought, disease, insect damage or any other cause.

9 Do not apply post-emergent herbicide when rain is likely within the next 6 hours or as
10 restricted on the product label.

11 **1670-4 CARE AND HANDLING PLANTS**

12 **(A) General**

13 Exercise utmost care in digging, loading, transporting, unloading, planting or otherwise
14 handling plants and use adequate precautions to prevent injury to or drying out of the
15 trunk, branches or roots; and to prevent freezing of the plant roots. Heel-in plants within
16 48 hours of delivery from the nursery, if they cannot be planted within that time.

17 Properly maintain all heeled-in plants until planted. Do not have plants remain heeled-in
18 for more than 30 days. Open plants immediately when delivered in boxes or wrapped in
19 bundles or other forms of closed packages and inspect and dampen if necessary.

20 **(B) Balled and Burlapped Plants**

21 Protect the roots of balled and burlapped plants, if not immediately planted after delivery,
22 by adequately covering with a soil, mulch or sawdust that is kept moist constantly in
23 an acceptable manner appropriate to weather or seasonal conditions. Preserve the solidity
24 of the plant ball carefully.

25 **(C) Bare Rooted Plants**

26 Refrigerate or immediately heel-in all plants, if not promptly planted, in moist soil, mulch
27 or sawdust in an acceptable manner corresponding to generally accepted horticultural
28 practice.

29 Protect the plants from drying out by means of wet canvas, burlap or straw or by other
30 means acceptable while being transported or planted.

31 **(D) Geophytes**

32 Geophytes; bulbs, corms and tuberous plants; that are being shipped shall be packaged in
33 containers that meet industry standards and have been pre-approved by the engineer. All
34 individual packages shall be clearly labeled with quantity and cultivar name.

35 While bulbs, corms and tuberous plants are being transported or are being distributed in
36 planting beds, or are awaiting planting after distribution, protect them from drying out by
37 means of wet canvas, burlap, or straw, or by other means acceptable to the Engineer and
38 appropriate to weather conditions and the length of time they will be out of the ground.
39 Care shall be taken to avoid unnecessary injury to the bulbs before planting.

40 Pre-plant cool treatment is required for plants planted in a USDA Climatic Zones 9
41 and 10. Storage of bulbs, corms and tuberous plants which do not require pre-plant cool
42 treatment shall be stored in open trays and placed in a 55°F - 65°F, dry place away from
43 frost and heat and never allowed to dry out to the point of shriveling. Packing in slightly
44 moist peat is preferred. The storage area shall be well-ventilated and ethylene-free. Do
45 not store bulbs with fruit such as apples or pears which produces ethylene gas which can
46 cause problems with flowering. Do not store bulbs in paper or plastic bags unless

Section 1670

1 otherwise specified or approved. If a refrigerator is used it shall be frequently ventilated.

2 **1670-5 PLANT LOCATION**

3 Locate and mark on the ground locations for plants and outlines for areas to be planted or
4 reforested and obtain approval before digging plant holes for beds.

5 Where so directed, furnish and install standard identification wires with plastic flags to
6 designate individual plants in major planting areas.

7 Flags will not necessarily be needed for all plants required by the contract, but use these flags
8 on portions of the project until plant locations in these portions are approved.

9 Unforeseen conditions may make it necessary to make minor adjustments in plant locations
10 due to utility lines, traffic signs, rock, drainage, etc., and such adjustments will be permitted
11 subject to approval.

12 **1670-6 PRUNING**

13 Prune shrubs and trees after planting as shown in the plans or as directed by the Engineer.
14 Pruning done at any time in no way alters the Department's right to reject plant material.
15 Prune in accordance with the International Society of Arboriculture pruning techniques, and
16 according to shape, size and condition of the individual plant.

17 **1670-7 PLANT BED TREATMENT**

18 **(A) General**

19 Treat plant beds by application of herbicides where called for by the plans or directed.

20 **(B) License**

21 Make pesticide applications by or under the direct supervision of an applicator licensed
22 by the North Carolina Department of Agriculture and Consumer Services.

23 **(C) Post-Emergent Herbicidal Treatment**

24 Post-emergent herbicidal treatment includes applications of a systemic post-emergent
25 total vegetation control herbicide.

26 The contract will state the rates of application of the post-emergent herbicides.

27 Apply all herbicides in accordance with the manufacturer's instructions on the product
28 label.

29 Apply post-emergent herbicide when the weeds are near maturity but not when the weeds
30 are under stress from drought, disease, insect damage or any other cause. If cloudy
31 weather or other poor growing conditions are present, extend this 7 day period until there
32 are visible signs of herbicidal activity. Reapply if necessary to achieve a thorough
33 control.

34 **(1) Post-Emergent Application for Plant Bed Preparation**

35 Apply a systemic post-emergent total vegetation control herbicide to the bed area
36 before any tilling or mowing is performed. Perform no tilling or mowing for at least
37 7 days after the application. Thoroughly till the bed after the waiting period, or when
38 injury to the vegetation appears. Prepare the soil in good tilth with no clods over one
39 inch present and before planting.

40 **(2) Post-Emergent Application for Plant Bed Maintenance**

41 Apply a systemic post-emergent herbicidal treatment in accordance with product
42 label in a manner to ensure no damage to planted material. Perform no mowing or
43 vegetation removal by other means for at least 7 days after the application.

(D) Pre-Emergent Herbicidal Treatment

Pre-emergent herbicidal treatment includes the application of a pre-emergent herbicide.

Apply a pre-emergent herbicide to the plant bed after the existing vegetation has been completely controlled by a post-emergent herbicide application as specified in herein and after installation of planting and mulching as described in Articles 1670-9 and 1670-10. Apply pre-emergent herbicide following planting and mulching of plant bed before germination of weed seeds. An additional application of post-emergent herbicidal treatment may be necessary to control emerged weeds, as directed, if sufficient time has lapsed between tillage and installation of plant material and mulch. No direct payment will be made for additional post-emergent herbicidal work if such work is due to carelessness or neglect on the part of the Contractor.

Apply herbicide evenly over the soil surface with properly calibrated equipment at the specified rate.

If at least 0.5 inches of rainfall does not occur within 15 days of application of pre-emergent herbicidal treatment, apply at least 0.5 inches of water (2.8 gal/sy) uniformly over the planting area to activate the herbicide.

1670-8 EXCAVATION OF PLANT HOLES

Provide cylindrical shaped plant hole excavations for plants other than reforestation plants, with the plant location stake marking the center of the circle and with the sides of the hole being approximately vertical. When mechanical means are used which make digging of cylindrical holes impractical, the complete hole shall have the minimum dimensions as shown in the plans.

When plants are to be grouped together in a plant bed as contrasted to widely separated individual plants, and when so indicated in the plans, loosen and pulverize clods to a depth of not less than 5 inches for the entire area of the plant bed by means of a scarifier, disc, spade or other appropriate means before plant holes are dug.

Plant reforestation plants in holes made by a planting spade, planting bar or other means which meet the approval of the Engineer. Make the hole of sufficient size to accommodate the entire extended root system of the plant without cramping.

When geophytes; bulbs, corms and tuberous plants; are to be grouped together in a plant bed as contrasted to widely separated individual plants, and when so indicated in the plans, loosen and pulverize clods to a depth of not less than 8 inches, or as indicated in the plans, for the entire area of the plant bed by means of a scarifier, disc, spade or other appropriate means before plant holes are dug.

Place plants in holes made by a planting spade, planting bar or other means which meet the approval of the Engineer. Make the hole of sufficient size to accommodate the entire plant structure without cramping. Take care to plant all plants at a uniform depth as indicated in the plans or directed by the Engineer.

When geophytes are to be planted separately as individual plants or in small separated groups, loosen and pulverize clods with a spade, auger or other means which meet the approval of the Engineer. Individual planting holes shall be to a depth of not less than 8 inches, or sufficient size to accommodate the entire plant structure without cramping or to a depth as indicated in the plans or directed by the Engineer.

1670-9 PLANTING, BACKFILLING AND WATERING**(A) General**

The plans will state the kind and rate of application of fertilizer. Apply fertilizer during backfilling operations in a manner that will ensure proper placement of the fertilizer and avoid injury to the roots.

Section 1670

1 Scarify the walls and floor of the plant hole after the plant hole is dug. Place the plant in
2 the prepared plant hole at the proper position as regards to depth, alignment, final grade
3 of the surrounding ground level and vertical placement of the trunk. Maintain this
4 position during all subsequent backfilling and watering operations. Set plants with the
5 root collar at the same depth as grown in the nursery or raise above grade as indicated in
6 the plans.

7 Moisten the soil with water after one-half to two-thirds of the backfilling and tamping has
8 been completed, if the soil in the plant holes is not sufficiently moist. Apply water to
9 moisten all soil but not a quantity that will saturate the soil to the extent of excluding all
10 air from around the roots. Place the remainder of the backfill after complete absorption
11 of water.

12 Construct water rings around all plants, except reforestation plants, in accordance with
13 details shown in the plans. A water ring consists of a ridge of firmed soil in a ring around
14 the plant and of a minimum inside diameter equal to the diameter of the plant hole. This
15 ridge is approximately 6 inches high and is compacted firmly enough to hold water.

16 **(B) Balled and Burlapped Plants**

17 Handle balled and burlapped plants by the ball and place in the plant hole so that the soil
18 of the ball will not be loosened from the roots. After the hole has been almost completely
19 backfilled and the soil thoroughly firmed under and around the ball, cut the burlap away
20 and remove from around the stem of the plant. Complete backfilling so as to avoid
21 loosening of the soil of the root ball.

22 **(C) Container Grown Plants**

23 Planting requirements for container grown plants are the same as applicable to balled and
24 burlapped plants. Remove container immediately before planting. During the removal of
25 the container, take sufficient precautions to ensure that the soil and roots inside the
26 container are undisturbed. Scarify roots when directed.

27 **(D) Bare Rooted Plants**

28 Before the plant is placed in the plant hole, cut off smoothly any bruised or broken parts
29 of roots. Place the plant in its proper position in the hole and backfill. Carefully place
30 the backfill material, worked around and under the roots and compacted in a manner that
31 avoids bruising or breaking the roots.

32 **(E) Reforestation Plants**

33 Reforestation includes tree reforestation and shrub reforestation. Type, mixture, size,
34 furnish description and spacing will be as shown on the reforestation detail sheet in the
35 plans.

36 Before beginning reforestation, each area to be reforested will be measured by the
37 Engineer to determine the exact number of acres for tree reforestation or shrub
38 reforestation therein and the quantity of each species of seedling to be planted within the
39 area.

40 Where structures or plantings do not adequately delineate the outline of the area to be
41 reforested, stake the outline of the area as directed by the Engineer. Furnish cypress,
42 cedar, oak, locust or other wood stakes approved by the Engineer. Provide stakes with
43 a minimum industry standard of 2 inches x 2 inches (nominal) size and approximately
44 30 inches in length with a 15 inch white top. Drive stakes in the ground with
45 approximately 18 inches remaining above the ground line and place as necessary to
46 define and delineate the reforestation outline.

47 Ensure sample stock of reforestation seedlings are inspected by the Engineer, for general
48 health and moisture content, within 24 hours before planting.

1 After the plant hole has been prepared, place the plant upright in the hole at the correct
2 depth without crowding or bunching the roots. Firm the soil around the root system from
3 the bottom of the plant hole to natural ground elevation.

4 Upon completion of planting the required number of seedlings within all areas to be
5 reforested, the Contractor will be relieved of further responsibility in connection with
6 reforestation except for damage caused directly by the Contractor.

7 **(F) Geophytes**

8 When planting geophytes; bulbs, corms and tuberous plants; take care to place all plants
9 at a uniform depth as indicated in the plans or directed by the Engineer. All plants shall
10 be set upright as originally grown and at the proper spacing and depth from the natural
11 ground elevation. Soil that is backfilled into the hole to obtain the proper depth shall be
12 firmed before plant placement. Soil backfilled over the plant shall be firmed.

13 Planting shall be accomplished when the soil temperature is 40°F to 45°F or as directed
14 by the Engineer. No phase of this work shall be performed when the temperature is
15 below 32°F, when the plant holes are frozen or when soil to excavate and fill the plant
16 hole is frozen or too wet.

17 Geophytes shall be watered as stated in the contract or as directed by the Engineer.
18 Watering will be required for geophytes if the soil in the plant hole is not sufficiently
19 moist. Apply water to moisten all soil, but not in a quantity that will create standing
20 water or saturate the soil to the extent of excluding all air from around the plant.

21 **1670-10 MULCH FOR PLANTING**

22 Place mulch within 7 days of initial planting as a top layer on the backfilled plant hole and
23 water ring. Place mulch approximately 4 inches deep as shown in the plans or as directed.
24 Place additional mulch as directed during establishment.

25 No mulching will be required for reforestation plants.

26 **1670-11 WATER FOR PLANTING**

27 Water at the time of planting as specified in Article 1670-9 and at the Contractor's election
28 and the Engineer's approval. Water with gravity flow or low pressure applicators which have
29 been approved, and which will not erode soil around the plant root system or damage to
30 plants. Saturate the soil around each plant thoroughly at each watering.

31 **1670-12 STAKING OR GUYING**

32 Stake or guy plants as shown in the plans or as directed to prevent damage.

33 Ensure that the plant is attached and held rigid to the support in a manner that will prevent
34 chafing or other injury to the bark, and that will permit normal development of the trunk or
35 branch.

36 **1670-13 INITIAL PLANTING**

37 Initial planting will be complete when the plants have been placed in the plant hole,
38 backfilled, fertilized, watered, mulched, staked and guyed, and the plants are in an acceptable
39 condition.

40 **1670-14 ESTABLISHMENT**

41 Begin establishment for all initial or replacement plants immediately after they are planted.
42 Maintain trees, shrubs, vines and groundcovers, and the area of planting until final acceptance
43 of the project. Mow and maintain the area around trees and shrubs for a distance of 6 feet
44 beyond the outside limits of water rings or 6 feet beyond the limits of the guy stakes,
45 whichever is greater; within shrub beds; and for a distance of 6 feet outside the perimeter of
46 the shrub beds. Establishment includes cutting of grass and control of weeds; watering;

Section 1670

1 fertilization; replacement of mulch; repair or replacement of guy stakes, guy wires and water
2 rings; and other work as directed to ensure the survival and growth of plant material and the
3 satisfactory appearance of the project. Remove dead plant material from the project during
4 the establishment period.

5 **1670-15 REPLACEMENT PLANTING**

6 Replacement planting of trees, shrubs and ground cover consists of replacing those plants
7 which are not in a living, healthy condition or do not conform to the Specifications contained
8 in *American Standard for Nursery Stock* or damaged or stolen. Replacement of reforestation
9 plants will not be required.

10 Perform replacement planting within the planting season specified in the contract.

11 **1670-16 FINAL INSPECTION**

12 All planting shall be completed and all plants shall be in a living and healthy condition at the
13 time of final inspection.

14 **1670-17 MEASUREMENT AND PAYMENT**

15 (*Plant Species and Size Indicated in Contract*) will be measured and paid in units of each,
16 other than reforestation plants, planted and accepted.

17 *Reforestation* will be measured and paid in acres of land measured along the surface of the
18 ground.

19 *Wetland Reforestation* will be measured and paid in acres of land, measured along the surface
20 of the ground.

21 *Post-emergent Herbicidal Treatment* will be measured and paid in square yards of plant bed
22 measured along the surface of the ground.

23 *Pre-emergent Herbicidal Treatment* will be measured and paid in square yards of plant bed
24 measured along the surface of the ground.

25 *Geophytes* (plant species and size indicated in contract) will be measured and paid in units of
26 each that have been planted and accepted.

27 *Mulch for Planting* will be measured and paid in cubic yards. Where mulch is furnished in
28 bales or bags, the number of cubic yards in each bale or bag will be determined and then
29 multiplied by the number of bales or bags of the same size which have been acceptably
30 furnished and placed. Where mulch is furnished in trucks, each truck will be measured by the
31 Engineer and shall bear a legible identification mark indicating its capacity. Load each truck
32 to at least its measured capacity at the time it arrives at the site of the work.

33 *Water for Planting* will be measured and paid in units of 1,000 gallon units. Measurement of
34 water will be made by means of an approved metering device at the source of supply, or by
35 determining the volumetric capacity of tank trucks used to deliver water to the project and
36 recording the number of loads delivered by each truck.

37 No payment will be made for plant bed preparation, tillage, staking or guying and
38 fertilization, for this work will be incidental to other work in the contract.

1 Payment will be made under:

Pay Item	Pay Unit
(Plant species and size indicated in contract)	Each
Reforestation	Acre
Wetland Reforestation	Acre
Post-Emergent Herbicidal Treatment for Plant Beds	Square Yard
Pre-Emergent Herbicidal Treatment for Plant Beds	Square Yard
Geophytes	Each
Mulch for Planting	Cubic Yard
Water for Planting	1,000 Gallons

DIVISION 17

SIGNALS AND INTELLIGENT TRANSPORTATION SYSTEMS

SECTION 1700 GENERAL REQUIREMENTS

1700-1 DESCRIPTION

Furnish, install, modify and remove signals, flashing beacons, intelligent transportation systems, electrical systems and provisions for future systems.

1700-2 MATERIAL

Refer to Division 10.

Item	Section
Electrical Service Equipment	1098-1
Electrical Materials	1091

Furnish material, equipment and hardware under this section that is pre-approved on the ITS and Signals QPL.

1700-3 CONSTRUCTION METHODS

(A) General

Before beginning signal work, verify all existing signal equipment is in satisfactory working order. Report all defective signal equipment to the Engineer so as not to be held responsible for defects.

Locate existing conduit, cable runs, inductive detection loops, lead-in cable, junction boxes and detection equipment before installing or using equipment that can damage or interfere with such facilities. The locations of existing inductive detection loops shown are approximate.

Locate all underground utilities before beginning drilling, digging or trenching operations.

Ensure that an IMSA certified, or equivalent, Level II traffic qualified signal technician is standing by to provide supervision and emergency maintenance services whenever work is being performed on traffic signal controller cabinets and traffic signal controller cabinet foundations. Stand by status is defined as being able to arrive, fully equipped, at the work site within 30 minutes ready to provide services.

Immediately cease work and notify the Engineer and affected owners if damage to existing utilities, cables or equipment occurs. Make all required repairs and replacements.

(B) Regulations and Codes

Comply with NCGS § 87, Article 4, Electrical Contractors. Comply with all regulations and codes imposed by the owner of affected utility poles.

Notify the Engineer, local traffic enforcement agency, local utility company and affected railroad companies 7 business days before operational shutdowns to coordinate connection or disconnection to an existing utility or system.

Section 1700

1 Install standoffs, meter bases and service disconnects as required by the NESC, NEC,
2 local utility companies and local ordinances.

3 (C) Utility Services

4 Coordinate all work to ensure electrical power of proper voltage, phase, frequency and
5 ampacity is available to complete the work. Use electrical services cables with
6 THWN insulation.

7 When electrical, telephone and telecommunication service is not furnished by the
8 Department and is required, contact the utility company and make application to ensure
9 all work can be completed. Obtain authorization for service in the Department's name
10 and make application for service in the Department's name along with the associated
11 NCDOT Asset Inventory Number shown in the contract. Notify the Engineer
12 immediately if this number is not shown in the contract.

13 The Department will be responsible for direct payment of monthly utility company usage
14 charges. The Contractor will be responsible for all expenses associated with utility
15 installation costs, hookups, etc.

16 (D) Maintenance and Repair of Material

17 Furnish the Engineer with the name, office telephone number, cellular (mobile) telephone
18 number and pager number of the supervisory employee who will be responsible for
19 maintenance and repair of equipment during all hours.

20 Maintain and repair all signal and communications related equipment within the project
21 construction limits until completion of the observation period and receipt of written
22 notification of final acceptance of the project.

23 For all failures, malfunctions or damages to equipment, begin necessary repairs within
24 4 hours of notification. Complete repairs within 8 hours of notification. Comply with
25 Section 150 for maintenance of traffic flow. The inability to contact the supervisory
26 employee or prearranged alternate will not extend repair time requirements.

27 Remove and replace all signal and communications related equipment that fails. The
28 Department will furnish the Contractor replacement equipment for Department-furnished
29 equipment that fails.

30 Except for damages and malfunctions caused by the Contractor's work activities, the
31 Contractor will not be held responsible for pre-existing conditions reported to the
32 Engineer before starting traffic signal work at the specific intersection. The Contractor
33 will assume responsibility for all maintenance and emergency services necessary once
34 traffic signal work has begun at the specific intersection and for all damages and
35 malfunctions caused either directly or indirectly by the Contractor's work activities.

36 Perform maintenance (testing) on all Traffic Signal Conflict Monitors every 12 months
37 for the life of the project beginning with the initial test and every 12 months thereafter.
38 Provide the initial test date via the manufacturer's certification or via testing prior to
39 installation of the conflict monitor at an intersection. Use the ATSI Incorporated Model
40 PCMT-2600 Conflict Monitor Tester or an Engineer approved equivalent. Ensure that
41 the Conflict Monitor Tester is maintained and calibrated per the manufacturer's
42 recommendation. Provide to the Engineer a copy of the manufacturer's certification that
43 the Conflict Monitor Tester is in proper working order before testing the Traffic Signal
44 Conflict Monitors. Perform the test on the Traffic Signal Conflict Monitors per the
45 manufacturer's recommendation. For each Traffic Signal Conflict Monitor tested,
46 provide 2 dated copies of the test results: one copy for the Engineer and one copy for the
47 traffic signal cabinet.

1 In the event the Contractor fails to perform in accordance with the plans and *Standard*
2 *Specifications* within the time frame specified, the Department reserves the right to
3 perform maintenance and emergency service necessary to ensure continuous traffic signal
4 operation. Further, all expenses incurred by the Department in implementing this option
5 will be deducted from payment due the Contractor, plus \$2,500 liquidated damage per
6 occasion, per day, or any portion thereof, until corrected.

7 **(E) Inspections**

8 The Department may access the Contractor's equipment to perform railroad, signal and
9 preventative maintenance inspections or conflict monitor certification as necessary. The
10 Contractor shall be present for these inspections.

11 **(F) Removal of Existing Equipment and Material**

12 Remove all Department-owned signals and communications related equipment and
13 material that will not be used. Assume ownership of removed poles, messenger cable,
14 interconnect cable, communications cable and supporting hardware, unless otherwise
15 specified. Return all other equipment and material between 8:00 a.m. and 12:00 p.m.,
16 Monday through Thursday, to the Traffic Services Office within the Division responsible
17 for administration of the project.

18 **(G) Railroad Preemption**

19 Where railroad preemption is required, coordinate all work with the railroad company.
20 Do not place signals into operation until signal equipment has been interconnected with
21 required railroad-highway crossing devices and railroad preemption is working properly.
22 Ensure preemption sequences begin immediately after activation of train detection.

23 Contact and coordinate with the railroad company to schedule interconnection of the
24 signal to the railroad controller cabinet. Install lead-in cable from the signal controller
25 cabinet to a railroad company furnished and installed lockable junction box.
26 Interconnection will be made by the railroad company.

27 Provide fail-safe operation such that removal of voltage from the railroad side of the
28 isolation relay will initiate the railroad preemption sequence.

29 **(H) Vehicle Preemption Systems**

30 Where required, implement and install vehicle preemption systems. Coordinate vehicle
31 preemption work with the proper operating authority. Contact the proper operating
32 authority and schedule installation of preemption equipment.

33 **(I) Timing of Signals**

34 Implement timing values for signal controllers. Modify proposed phasing and timing of
35 existing controllers.

36 Reinstall all existing time-based coordination. As directed, make modifications to
37 existing coordination to account for changes in signal phasing.

38 The Department reserves the right to make or have the Contractor make, field timing
39 changes necessary for pattern optimization and to eliminate identifiable, potential hazards
40 to the motoring public. The Engineer will notify the Contractor of timing changes made.

41 **(J) Wire and Cable**

42 For installation in a conduit system, lubricate cable and wires before installing in conduit.
43 Use lubricant that will not physically or chemically harm cable jacket, wire insulation or
44 conduit.

Section 1700

1 Terminate all electrical wire and cable at recessed-screw or barrier type terminal blocks.
2 Unless specifically allowed, connect no more than 2 conductors to the same terminal
3 screw.

4 Splice electrical wire and cable in junction boxes or condulets. Maintain color coding of
5 wires throughout each splice.

6 Protect ends of wire and cable from water and moisture.

7 **(K) Electrical Service and Grounding**

8 Where electrical services do not include an external electrical service disconnect, modify
9 service to include electrical service disconnect and a new grounding electrode system.

10 Provide a grounding electrode system at all new electrical services. In addition to
11 NEC requirements, test grounding electrode resistance for a maximum of 20 ohms.
12 Furnish and install additional ground rods to grounding electrode system as necessary to
13 meet test requirements.

14 Modify existing electrical services, as necessary, to meet the grounding requirements of
15 the NEC, these *Standard Specifications* and the project plans. Remove any ground rods
16 in the cabinet foundation and install a new grounding electrode system. Cut off
17 abandoned ground rods in the cabinet foundation flush with the foundation surface.
18 Where a grounding electrode system is connected to the electrical service in accordance
19 with the NEC, test grounding electrode resistance for a maximum of 20 ohms.
20 Grounding electrode resistance test shall be verified or witnessed by the Engineer or the
21 Engineer's designated representative. Furnish and install additional ground rods to
22 grounding electrode system as necessary to meet the *Standard Specifications* and test
23 requirements.

24 Follow test equipment's procedures for measuring grounding electrode resistance. When
25 using clamp-type ground resistance meters, readings of less than one ohm typically
26 indicate a ground loop. Rework bonding and grounding circuits as necessary to remove
27 ground loop circuits and retest. If a ground loop cannot be identified and removed to
28 allow the proper use of a clamp-type ground resistance meter, use the three-point test
29 method.

30 Submit a completed Inductive Loop & Grounding Test Form available on the
31 Department's website.

32 Provide a length of marker tape 6 inches to 12 inches below finished grade directly over
33 grounding electrodes and conductors.

34 **(L) Electrical Bonding**

35 Using an approved termination means, connect a #14 AWG minimum, 19-strand copper
36 conductor (Type THWN) with green insulation to serve as an equipment grounding
37 conductor to metal poles, vehicular and pedestrian signal pedestals and other metallic
38 components. Use messenger cables on wood poles and metal strain poles to provide
39 effective ground fault current path to cabinet ground.

40 **(M) Traffic Signal Activation**

41 Do not place signal in steady (stop-and-go) mode until inspected and authorized by the
42 Engineer.

(N) Temporary Traffic Signal Installations

When a traffic signal is installed for control of traffic during construction of the project and scheduled for removal during or upon completion of the project, install and remove the temporary traffic signal as required. Upon removal of the temporary traffic signal, restore surface to like-new condition. Rake smooth unpaved areas, repave paved areas and seed grassed areas that were damaged by Contractor activities.

Prepare intersection for sign control before removing the temporary traffic signal. Install required regulatory signs in accordance with Sections 900, 901 and 903. Cover signs with burlap bags until traffic signal is placed into flashing operation.

Place traffic signal into flashing operation and uncover signs simultaneously. Operate the flashing operation for a period of time as directed by the Engineer.

Signal cabinets, controllers, detector units, signal heads and accessories and microwave detectors are property of the Department. Return Department owned equipment between 8:00 a.m. and 12:00 p.m., Monday through Thursday, to the Traffic Services Office within the Division responsible for administration of the project. Assume ownership of removed poles, messenger cable, interconnect cable, communications cable, supporting hardware and loop emulator detection equipment, unless otherwise specified.

1700-4 MEASUREMENT AND PAYMENT

There will be no direct payment for work covered in this section. Payment at the contract unit prices for the various items in the contract will be full compensation for all work covered by this section.

Repair, removal and replacement of damaged or unacceptable equipment or work under this section will be at no additional cost to the Department. The Department will deduct the cost of Department-owned equipment damaged by the Contractor from money due to the Contractor.

If the Department performs maintenance and emergency service necessary to ensure continuous traffic signal operation, all expenses incurred by the Department in implementing this option will be deducted from payment due the Contractor, plus \$2,500 liquidated damage per occasion, per day or any portion thereof, until corrected.

SECTION 1705 SIGNAL HEADS

1705-1 DESCRIPTION

Furnish and install vehicle and pedestrian LED signal heads, visors, interconnecting brackets, wire entrance fittings, mounting assemblies, signal cable, lashing wire, pedestrian pushbuttons (and associated lead-in cable), pedestrian signal signs, grounding systems and all necessary hardware.

1705-2 MATERIAL

Furnish material, equipment and hardware under this section that is pre-approved on the ITS and Signals QPL.

1705-3 CONSTRUCTION METHODS**(A) General**

Bag new pedestrian and vehicle signal heads with burlap bags or bags made of non-ripping material specifically designed for covering signal heads until signal heads are placed in operation. Do not use trash bags of any type.

Section 1705

- 1 When new signal heads are placed into operation, immediately bag and remove signals
- 2 heads that are not to be reused.
- 3 Adjust each signal head vertically and horizontally so that light output will be of
- 4 maximum effectiveness for traffic and pedestrians. Do not tilt signal heads forward.
- 5 Reposition signal heads as required for various construction phases.

(B) Vehicle Signal Heads

- 7 Install vehicle signal heads such that the top of the signal housing located over any
- 8 portion of a highway that can be used by motor vehicles is no more than 25.6 feet above
- 9 the pavement.
- 10 Install vehicle signal heads such that the maximum mounting height to the top of the
- 11 signal housing is as shown in Figure 1705-1 if the location is between 40 feet and 53 feet
- 12 from the stop line.

**Maximum Mounting Height of Signal Heads
Located Between 40 Feet and 53 Feet from Stop Line**

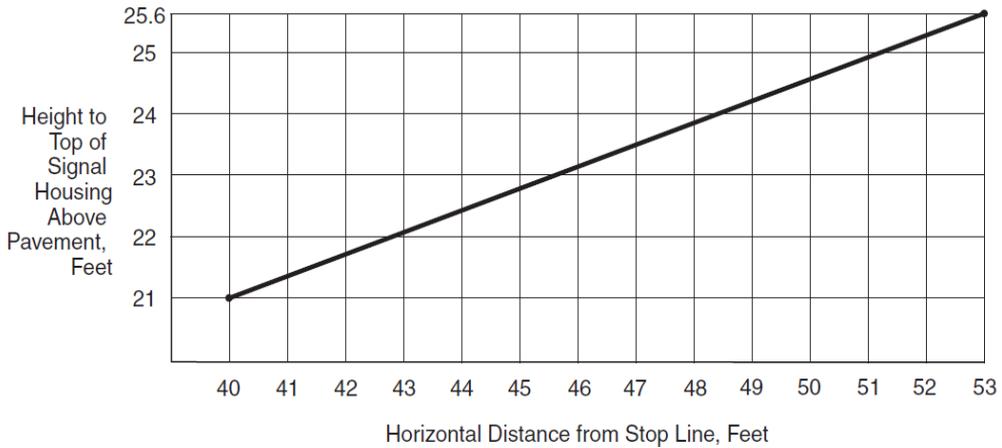

Figure 1705-1. Graph of maximum mounting height of signal heads.

- 15 Install vehicle signal heads such that the bottom of the signal housing and any related
- 16 attachments to the signal head located over any portion of a highway that can be used by
- 17 motor vehicles is at least 16.5 feet above the pavement directly below the signal head.
- 18 (1) Install vehicle signal heads such that the bottom of the signal housing (including
- 19 brackets) of a signal head that is vertically arranged and not located over a roadway
- 20 is as follows:
 - 21 (a) A minimum of 8 feet and a maximum of 19 feet above the sidewalk or, if there
 - 22 is no sidewalk, above the pavement grade at the center of the roadway.
 - 23 (b) A minimum of 8 feet and a maximum of 19 feet above the median island grade
 - 24 of a center median island if located on the near side of the intersection.
- 25 (2) Install vehicle signal heads such that the bottom of the signal housing (including
- 26 brackets) of a signal head that is horizontally arranged and not located over
- 27 a roadway is as follows:
 - 28 (a) A minimum of 8 feet and a maximum of 22 feet above the sidewalk or, if there
 - 29 is no sidewalk, above the pavement grade at the center of the roadway.

1 (b) A minimum of 8 feet and a maximum of 22 feet above the median island grade
2 of a center median island if located on the near side of the intersection.

3 Where vehicle signal heads are installed on messenger cable, install mounting hardware
4 consisting of messenger cable hanger, balance adjuster, bottom cap, wire entrance fitting
5 bracket and insulating bushings.

6 Where vehicle signal heads are installed on mast arms, install mounting hardware
7 consisting of rigid vehicle signal head mounting brackets.

8 Install signal cable in continuous lengths between signal controller cabinets and signal
9 heads. Route signal cable to minimize the length of cable installed and the number of
10 cables and conductors in each run. Pull 36 inches of additional signal cable into
11 controller cabinets.

12 Wrap signal cable to messenger cable with at least 4 turns of wrapping tape spaced at
13 intervals less than 15 inches or lash signal cable to messenger cable with one 360° spiral
14 of lashing wire per 12 inches.

15 Make electrical connections inside each signal head, signal controller cabinet and
16 termination compartment in metal poles. Do not splice cable at any other point between
17 signal heads and controller cabinet.

18 Coil sufficient signal cable beside each vehicle signal head to accommodate head shifts
19 during various construction phases. For final signal head locations, coil 36 inches on
20 each side of signal head if signal cable comes from both directions. If signal cable
21 terminates at the signal head, coil 36 inches of signal cable on the same side as the cable
22 run.

23 **(C) Pedestrian Signal Heads**

24 Install signs with mounting hardware immediately above pedestrian pushbuttons.

25 Mount the pushbutton or accessible pedestrian signal (APS) at a minimum height of
26 3.5 feet but no higher than 4.0 feet above the adjacent pedestrian travelway.

27 Connect each pushbutton with a separate run of lead-in cable between the pushbutton and
28 the termination panel in the controller cabinet. Bond pushbutton housing and all metal
29 components to cabinet ground using lead-in cable ground.

30 Mount pedestrian signal heads so the bottom of the signal housing, including brackets, is
31 not less than 7 feet or more than 10 feet above sidewalk level. Position and adjust the
32 heads to provide maximum visibility at the beginning of the controlled crosswalk.
33 Ensure pedestrian signal heads and vehicular signal heads mounted on the same support
34 are physically separated from each other.

35 **(D) Optically-Programmed Vehicle Signal Sections**

36 Install vehicle signal heads with optically-programmed vehicle signal sections so that
37 movement of the vehicle signals head is restricted. Tightly tether vehicle signal heads at
38 the top and bottom when installed on messenger cable. Attach vehicle signal heads using
39 a mounting-bracket assembly that locks the vehicle signal head into position from the
40 back and restricts movement when installed on mast arms.

41 **(E) Louvers**

42 Attach the louvers to the visors using stainless steel hardware. Position the signal head to
43 give the viewing angle as shown in the plans.

44 **(F) Modify Existing Vehicle Signal Heads**

45 Modify existing vehicle signal heads as shown in the plans.

Section 1706

1 **1705-4 MEASUREMENT AND PAYMENT**

2 *Vehicle Signal Head* (____) and *Pedestrian Signal Head* (____) will be measured and paid as
3 the actual number of signal heads of each type of material (aluminum or polycarbonate), size
4 and number of sections furnished, installed and accepted.

5 *Vehicle Signal Head with Single Optically-Programmed Sections* will be measured and paid
6 as the actual number of signal heads containing a single optically-programmed section
7 furnished, installed and accepted.

8 *Vehicle Signal Head with Multiple Optically-Programmed Sections* will be measured and paid
9 as the actual number of signal heads containing multiple optically-programmed sections
10 furnished, installed and accepted.

11 *Louver* will be measured and paid as the actual number of signal sections for which louvers
12 have been furnished, installed and accepted.

13 *Modify Existing Vehicle Signal Head* will be measured and paid as the actual number of
14 existing vehicle heads modified and accepted.

15 *Signal Cable* will be measured and paid as actual linear feet of signal cable furnished,
16 installed and accepted. Measurement will be point to point with no allowance for sag.
17 Twenty-five feet will be allowed for vertical segments up or down poles.

18 *Lead-in Cable* will be measured and paid in accordance with Section 1726.

19 No measurement will be made of visors, wire entrance fittings, interconnecting brackets,
20 mounting assemblies, pedestrian pushbuttons, pedestrian signal signs and signal head shifts as
21 these are incidental to furnishing and installing signal heads. No measurement will be made
22 for drip loops, coiled sections or lashing wire as these are incidental to furnishing and
23 installing signal cable.

24 Payment will be made under:

Pay Item	Pay Unit
Vehicle Signal Head (____)	Each
Pedestrian Signal Head (____)	Each
Vehicle Signal Head With Single Optically-Programmed Sections	Each
Vehicle Signal Head With Multiple Optically-Programmed Sections	Each
Louver	Each
Modify Existing Vehicle Signal Head	Each
Signal Cable	Linear Foot

25 **SECTION 1706 BACKPLATES**

26 **1706-1 DESCRIPTION**

27 Furnish and install backplates for vehicle signal heads with all necessary hardware.

28 **1706-2 MATERIAL**

29 Refer to Division 10.

Item	Section
Backplates	1098-2

30 Furnish material, equipment and hardware under this section that is pre-approved on the
31 ITS and Signals QPL.

1 **1706-3 CONSTRUCTION METHODS**

2 Install backplates for vehicle signal heads so as not to interfere with the function of all door
3 hinges, signal section latches and mounting hardware. Do not bend or deform backplates
4 during installation. Gooseneck fittings may be installed in reverse to accommodate
5 backplates. Use stainless steel fasteners for attaching backplates to signal sections.

6 **1706-4 MEASUREMENT AND PAYMENT**

7 *Backplates* will be measured and paid in units of each, furnished, installed and accepted. No
8 measurement will be made for different sizes, type or reflective taping of backplates.

9 Payment will be made under:

Pay Item	Pay Unit
Backplate	Each

10

**SECTION 1710
MESSENGER CABLE**

11

12 **1710-1 DESCRIPTION**

13 Furnish and install messenger cable (spanwire) with cable clamps, machine bolts, eye bolts,
14 3-bolt clamps, eye nuts, split-bolt connectors and all necessary hardware.

15 **1710-2 MATERIAL**

16 Refer to Division 10.

Item	Section
Grounding Electrodes	1091-6
Messenger Cable	1098-3
Pole Line Hardware	1098-6
Wire	1091-2

17 Furnish material, equipment and hardware under this section that is pre-approved on the
18 ITS and Signals QPL.

19 **1710-3 CONSTRUCTION METHODS**

20 Install guy assemblies before installing messenger cable.

21 Use 3/8 inch messenger cable for spans supporting vehicle signal heads and/or signs.

22 Use 1/4 inch messenger cable for spans supporting only cables unless otherwise specified.

23 For messenger cable crossing over railroad tracks, provide a minimum of 27 feet of vertical
24 clearance, unless otherwise specified.

25 For permanent installations, install messenger cable in continuous lengths with no splices
26 except where an insulator is required. With prior approval, existing messenger for temporary
27 installations may be extended instead of installing new messenger cable.

28 Tension messenger cable to eliminate appreciable sag and to match sag of surrounding
29 utilities. Otherwise, allow 3% to 4% sag of the span length between poles.

30 For mid-run spans using wood poles, attach messenger cable to the pole with a 3-bolt cable
31 clamp with J-hook consisting of 5/8 inch diameter machine bolts, J-hooks, washers and square
32 nuts to attach messenger cable to wood poles. Provide machine bolts that are 3 inches longer
33 than the pole diameter. For mid-run spans using metal or other Department-approved poles,
34 attach messenger cable to the pole with a 3-bolt clamp with J-hook secured to the metal pole
35 via a pole band clamp. Refer to *Metal Pole Standard Drawing Sheets* in effect on the date of
36 advertisement.

Section 1715

1 When terminating spans at wood poles, connect messenger cable to a deadend strandwise
2 attached to the pole via a 5/8 inch diameter shoulder eye bolt or 5/8 inch diameter shoulder
3 angle bolt with 5/8 inch eye nut as shown in *Roadway Standard Drawings*. When terminating
4 spans at metal or other Department-approved poles, connect messenger cable to a deadend
5 strandwise attached to the pole via a pole attachment clamp. Refer to *Metal Pole Standard*
6 *Drawing Sheets* as shown in the previous paragraph. Do not install more than one messenger
7 cable and strandwise assembly to a single metal or other Department-approved pole
8 attachment clamp. During installation, ensure that messenger cable is centered and directly
9 aligned at the pole clamp’s attachment point such that the cable does not exert forces on the
10 sides of the clamp’s attachment point.

11 Maintain electrical continuity at all splices.

12 **(A) Messenger Cable for Signal Heads or Lead-In Cable**

13 For messenger cable attached to joint use poles, install a new grounding system that
14 complies with Article 1720-3 for bonding messenger cable. If a pole ground exists on the
15 joint use pole, bond new pole grounding system to existing pole ground using #6 AWG
16 minimum solid bare copper grounding wire terminated with split bolt connectors or
17 parallel groove clamp at each end. If existing poles do not have a grounding system,
18 install new grounding system that complies with Article 1720-3.

19 **(B) Messenger Cable for Communications Cable**

20 For messenger cable attached to joint use poles, bond messenger cable to existing pole
21 ground at each end and at 1,300-foot intervals. Install bond using #6 AWG minimum
22 solid bare copper grounding wire terminated with split bolt connectors or parallel groove
23 clamp at each end. If existing poles do not have a grounding system, install new
24 grounding system that complies with Article 1720-3.

25 **(C) Messenger Cable for Multiple Cables**

26 On multiple messenger cable arrangements, connect all messenger cable ends with
27 #6 AWG minimum solid bare copper wire and bond with split bolt connectors or parallel
28 groove clamp and terminate to pole ground.

29 **1710-4 MEASUREMENT AND PAYMENT**

30 *Messenger Cable* (____) will be measured and paid as actual horizontal linear feet of
31 messenger cable furnished, installed and accepted. Measurement will be point to point with
32 no allowance for sag.

33 No measurement will be made of cable clamps, machine bolts, eye bolts, 3-bolt assemblies,
34 eye nuts, split bolt connectors and pole grounding systems as these will be incidental to
35 furnishing and installing messenger cable.

36 Payment will be made under:

Pay Item	Pay Unit
Messenger Cable (____)	Linear Foot

37 **SECTION 1715**
38 **UNDERGROUND CABLE INSTALLATION**

39 **1715-1 DESCRIPTION**

40 Furnish and install temporary lead-in cable or conduit for underground cable installation with
41 tracer wire, miscellaneous fittings, all necessary hardware, marker tape, backfill, graded stone,
42 paving materials and seeding and mulching.

1 **1715-2 MATERIAL**

2 Refer to Divisions 5 and 10.

Item	Section
Conduit	1091-3
Conduit Plugs, Pull Line and Tracer Wire	1091-3(G)
Duct and Conduit Sealer	1091-4
Backfill	1018-2
Graded Stone	545-2 and 545-3

3 Furnish material, equipment and hardware under this section that is pre-approved on the
4 ITS and Signals QPL.

5 **1715-3 CONSTRUCTION METHODS**6 **(A) General**

7 Ensure conduit is free of moisture and debris before pulling cables.

8 Following installation of conduit where cable is not immediately installed or conduit is
9 for future use (spare), seal the ends of the conduit with a conduit plug. Secure a pull line
10 to the conduit plug in such a manner that it will not interfere with installation of the
11 conduit plug and provides a watertight seal.

12 Extend ends of conduit 2 inches to 4 inches above concrete surfaces and 4 inches above
13 crushed stone bases. For metallic conduit, install metallic bushings and bond conduits.

14 (1) Conduit

15 (a) Conduit Entering Junction Boxes

16 Terminate conduits installed for communications cables (fiber optics, twisted
17 pair, ethernet and coaxial) in oversized junction boxes. Do not install other
18 conduits in the oversized junction box unless otherwise specified.

19 Terminate conduits installed for signal wiring, including lead-in cable, in
20 standard size junction boxes unless otherwise specified.

21 For all conduits entering junction boxes, seal spare conduits with approved
22 conduit plugs. Seal conduits containing fiber-optic communications cable,
23 signal cable and lead-in cable with duct and conduit sealer.

24 (b) Conduit Entering Cabinet Foundations

25 For all conduits entering the cabinet through the cabinet foundation, seal spare
26 conduits with approved conduit plugs. Seal conduits containing fiber-optic
27 communications cable, signal cable and lead-in cable with duct and conduit
28 sealer.

29 (2) Tracer Wire

30 Install tracer wire in all conduits containing fiber-optic cable. Pull tracer wire
31 simultaneously in a continuous length with the fiber-optic cable. Where multiple
32 pulls of fiber-optic cable are required and conduit is placed in the same trench, only
33 one tracer wire is required. Where multiple pulls of fiber-optic cable are required
34 and conduits may separate into individual trenches, install a tracer wire in each
35 conduit run. Provide waterproof butt splices where tracer wire is spliced. Splicing
36 will be allowed only in cabinets and junction boxes. Label all tracer wires entering
37 the equipment cabinet.

Section 1715

1 (3) Plan of Record Drawings

2 Upon completion of the conduit system for communications, furnish the Engineer
3 with a plan of record drawing detailing the locations of the conduit system.

4 (B) Trenching

5 In certain cases the Contractor may use an alternate material and method of installation
6 between trenching and plowing based on existing field conduits and preferences. Obtain
7 approval before proceeding.

8 (1) General

9 Install PVC, HDPE or rigid metallic conduit for all underground runs. Install rigid
10 metallic conduit for all underground runs located inside railroad right-of-way. Clean
11 existing underground conduit to be incorporated into a new system. Bond all
12 metallic conduit.

13 If more than one conduit is required between the same points, install conduit in one
14 common trench. Install non-detectable marker tape.

15 Install longitudinal runs of conduit a minimum of one foot from back of curb or
16 6 feet from edge of pavement in the absence of curb. If ditches are present, install
17 conduit a minimum of 4 feet from the bottom of the ditch line.

18 Maintain a minimum trench depth of 30 inches (or 12 inches in areas blocked by
19 rock or impenetrable obstructions) below finished grade or 6 inches below roadway
20 subbase, whichever is deeper. Upon completion, restore surface to like-original
21 condition within 7 calendar days of occurrence of damage. Remove all rock and
22 debris from backfill material. Remove excess material from site and compact area
23 according to Article 300-7. Backfill with excavated material and compact to 95% of
24 original density.

25 Backfill trench at locations along the trench path where non-movable objects, such as
26 rocks and boulders, cannot be avoided. The purpose of the backfill is to provide
27 a gradual change in elevation of the trench, so that excessive bending and stress will
28 not be transferred to conduits once underground conduit system is installed.

29 After installation of conduits and upon completion of tamping and backfilling,
30 perform a mandrel test on each conduit to ensure no conduit has been damaged.
31 Furnish a non-metallic mandrel having a diameter of approximately 50% of the
32 inside diameter of the conduit in which it is to be pulled through. If damage has
33 occurred, replace the entire length of conduit. Ensure pull line is re-installed.

34 (2) Unpaved Trenching

35 Install conduit in all unpaved areas for all cable including permanent traffic signal
36 installations.

37 As shown in plans or as directed by the Engineer, direct bury lead-in cable for
38 temporary traffic signal installations.

39 Rake smooth the top 1 1/2 inches and seed with same type of grass as surrounding
40 area. Finish unpaved areas flush with surrounding natural ground.

41 (3) Paved Trenching

42 On concrete surfaces, replace the entire joint of concrete unless otherwise specified.
43 On all other surfaces, neatly cut and replace the width of trench with like material.

1 Finish paved areas with materials matching damaged areas. For conduit installed
 2 under roadways, cut neatly and replace the width of paved area damaged by
 3 trenching. For conduit installed under sidewalks and walkways, remove entire
 4 section of slab from joint to joint and replace. Place graded stone material to
 5 temporarily maintain traffic where repairs cannot be performed immediately.
 6 Comply with Article 545-4.

7 **(C) Plowing (HDPE Conduit Only)**

8 Direct plow HDPE ducts simultaneously using chute plow method. Direct plow ducts at
 9 a minimum depth so the top of the highest duct is 30 inches deep unless otherwise
 10 approved.

11 Provide sufficient personnel to feed chute, operate prime mover and equipment carrying
 12 reels (if separate equipment is used), observe chute feeding, observe plowing and observe
 13 reel payout. Use chute with adequate dimensions to allow for passage of duct without
 14 damage. During plow operation, continuously check chute opening and path to be sure
 15 there are no obstructions and monitor payout reels to be sure reels are turning at a steady
 16 rate.

17 With prior approval, install a junction box at locations where splicing or coupling of the
 18 underground polyethylene conduits is necessary. Otherwise, splicing or joining of
 19 underground polyethylene conduit is prohibited.

20 **(D) Directional Drilling**

21 (1) Pre-Approvals and Minimum Depth Requirements

22 Obtain approval before beginning drilling operations.

23 At all points where HDPE conduit will traverse under roadways, driveways,
 24 sidewalks or Controlled Access Areas including entrance/exit ramps, maintain
 25 a minimum depth of 4 feet or 8 times the back reamer’s diameter, whichever is
 26 deeper. For an installation that runs parallel to a controlled access area or
 27 entrance/exit ramps maintain a minimum depth of 30 inches below finished grade.
 28 Maintain a minimum clearance of 30 inches below finished grade when crossing
 29 ditch lines. For the following structures, the minimum clearance requirements are:

TABLE 1715-1 MINIMUM CLEARANCE REQUIREMENTS FOR STRUCTURES	
Man-made Structure	Minimum Clearance Requirement
Bridge Foundation	5 ft horizontal and 4 ft vertical (clearances greater than minimum horizontal should continue to use the 4V:5H ratio, i.e., 10 ft horizontal should be no deeper than 8 ft)
Drainage Pipes 60" or Less	1 ft above or below [while maintaining a minimum depth of 30" below grade]
Drainage Pipes Greater than 60"	1 ft above or 4 ft below [while maintaining a minimum depth of 30" below grade]
Box Culverts	1 ft above or 4 ft below [while maintaining a minimum depth of 30" below grade]
Slope Protection	2 ft below
Slope Protection Foundation Footing	5 ft below

30 Guarantee the drill rig operator and digital walkover locating system operator are
 31 factory-trained to operate the make and model of equipment provided and have at
 32 least one year experience operating the make and model of drill rig. Submit
 33 documentation of the operators' training and experience for review at least 2 weeks
 34 before start of directional drilling operations.

Section 1715

1 Provide a means of collecting and containing drilling fluid/slurry that returns to the
2 surface such as a slurry pit. Provide measures to prevent drilling fluids from entering
3 drainage ditches and storm sewer systems. Prevent drilling fluid/slurry from
4 accumulating on or flowing onto pedestrian walkways, driveways and streets.
5 Immediately remove all drilling fluids/slurry that are accidentally spilled.

6 (2) Directional Drill Operations

7 Provide grounding for the drill rig in accordance with the manufacturer's
8 recommendations.

9 Place excavated material near the top of the working pit and dispose of properly.
10 Backfill pits and trenches to facilitate drilling operations immediately after drilling is
11 completed.

12 Use drill head suitable for type of material being drilled and sized no more than
13 2 inches larger than the outer diameter of the conduit. Direct drill to obtain proper
14 depth and desired destination. Pressure grout with an approved bentonite/polymer
15 slurry mixture to fill all voids. Do not jet alone or wet bore with water.

16 During drilling operation, locate drill head every 10 feet along drill path and before
17 traversing underground utilities or structures. Use digital walkover locating system
18 to track drill head during directional drilling operation. Ensure locating system is
19 capable of determining pitch, roll, heading, depth and horizontal position of the drill
20 head at any point.

21 Once drill head has reached final location, remove head and install back reamer of
22 appropriate size (no more than 2 inches larger than outer diameter of conduits) to
23 simultaneously facilitate back reaming of drill hole and installation of conduit. Back
24 reamer is sized larger than actual conduits to ensure conduits are not adversely
25 subjected to deviations caused by the original drill operation and are as straight as
26 practical in their final position.

27 The intent of these Specifications is to limit the diameter of the actual drill shaft/hole
28 so that it is no more than 2 inches larger than the conduit outer diameter. The 2
29 inches larger diameter may be accomplished during the original bore or during the
30 back reaming/conduit installation process.

31 Once installation of conduit has started, continue installation without interruption so
32 as to prevent conduit from becoming firmly set. Apply bentonite/polymer slurry
33 mixture during conduit installation.

34 Upon completion of conduit installation, perform a mandrel test on conduit system to
35 ensure conduit has not been damaged. Furnish non-metallic mandrel with a diameter
36 of approximately 50% of the inside diameter of the conduit in which it is to be pulled
37 through. If damage has occurred, replace the entire length of conduit and ensure that
38 pull line is re-installed.

39 (3) Drilling Fluids

40 Use lubrication for subsequent removal of material and immediate installation of the
41 conduit. The use of water and other fluids in connection with directional drilling
42 operations will be permitted only to the extent necessary to lubricate cuttings. Do
43 not jet alone or wet bore with water. Use drilling fluid/slurry consisting of at
44 least 10% high-grade bentonite/polymer slurry to consolidate excavated material and
45 seal drill hole walls.

46 Transport waste drilling fluid/slurry from site and dispose of in a method that
47 complies with Federal, State and local laws and regulations.

1 (4) Conduit Splicing

2 With prior approval, install a junction box at locations where splicing or coupling of
3 conduit is necessary. Otherwise, splicing or joining of HDPE conduit is prohibited.

4 **(E) Bore and Jack**

5 For bore and jack areas, comply with Articles 1540-4 except as follows:

6 For bore and jack areas, install metallic conduit at a minimum depth of 30 inches below
7 finished grade or 6 inches below roadway subbase, whichever is greater. Provide
8 a 3 feet clearance to conduit from back of curb or from edge of pavement. Terminate
9 ends of conduit into junction boxes.

10 Comply with the *NCDOT Policies and Procedures for Accommodating Utilities on Highway*
11 *Rights-of-Way* in effect on the date of advertisement.

12 **1715-4 MEASUREMENT AND PAYMENT**

13 *Tracer Wire* will be measured along the horizontal linear feet of tracer wire furnished,
14 installed and accepted. Measurement will be along the approximate centerline of the conduit
15 system. Payment will be made in linear feet. No payment will be made for excess tracer wire
16 in junction boxes and/or cabinets.

17 *Unpaved Trenching (qty)(size) & (qty)(size)* will be measured horizontal linear feet of
18 trenching for underground conduit installation of each type furnished, installed and accepted.
19 Measurement will be along the approximate centerline of the conduit system. Payment will
20 be in linear feet.

21 *Unpaved Trenching for Temporary Lead-in* will be measured in horizontal linear feet of
22 trenching for placement of temporary lead-in cable. Measurement will be along the
23 approximate centerline of the trench. Payment will be in linear feet.

24 *Paved Trenching (qty)(size) & (qty)(size)* will be measured horizontal linear feet of trenching
25 for underground conduit installation of each type furnished, installed and accepted.
26 Measurement will be along the approximate centerline of the conduit system. Payment will
27 be in linear feet.

28 *Plowing (qty)(size) & (qty)(size)* will be measured horizontal linear feet of plowing for
29 underground conduit installation furnished, installed and accepted. Measurement will be
30 along the approximate centerline of the conduit system. Payment will be in linear feet.

31 *Directional Drill (qty)(size) & (qty)(size)* will be measured horizontal linear feet of directional
32 drill for underground conduit installation furnished, installed and accepted. Measurement will
33 be along the approximate centerline of the conduit system. Payment will be in linear feet.

34 *Bore and Jack (qty)(size) & (qty)(size)* will be measured in horizontal linear feet of bore and
35 jack for underground conduit installation furnished, installed and accepted. Measurement will
36 be along the approximate centerline of the bore from junction box to junction box. Payment
37 will be in linear feet.

38 No measurement will be made of vertical segments, non-metallic conduit, metallic conduit,
39 conduit sealing material, backfill, graded stone, paving materials, miscellaneous fittings,
40 non-detectable marker tape, pull lines and seeding and mulching as these will be incidental to
41 conduit installation.

42 Conduit will be paid per linear foot based on quantity and size of conduits. As examples,
43 an installation of a single 1.25 inch HDPE conduit would be paid as:

44 Directional Drill (1)(1.25") Linear Foot, and

Section 1716

2 **SECTION 1716**
3 **JUNCTION BOXES**

4 **1716-1 DESCRIPTION**

5 Furnish and install junction boxes (pull boxes) with covers, graded stone, grounding systems
6 and all necessary hardware.

7 **1716-2 MATERIAL**

8 Refer to Division 10.

Item	Section
Junction Boxes	1098-5
#57 or #67 Washed Stone	1005

9 Furnish material, equipment and hardware under this section that is pre-approved on the
10 ITS and Signals QPL.

11 **1716-3 CONSTRUCTION METHODS**

12 Install standard size junction boxes as shown in the plans and where underground splicing of
13 electrical cables is necessary. Install standard size junction boxes within 3 feet of pole or pole
14 foundation where transitioning from below ground to a riser assembly. Install standard size
15 junction boxes within 5 feet of each end of each lateral run of conduit for electrical cables.
16 When lateral runs for electrical cables are greater than 150 feet, install additional junction
17 boxes to ensure distances between junction boxes does not exceed 150 feet.

18 Install oversized junction boxes for fiber-optic cables at locations shown in the plans.

19 Provide real world coordinates for all junction boxes and equipment cabinets installed or used
20 under this project. Provide the coordinates in feet units using the North Carolina State Plane
21 coordinate system (1983 North American Datum also known as NAD '83). Furnish
22 coordinates that do not deviate more than 1.7 feet in the horizontal plane and 3.3 feet in the
23 vertical plane. Global positioning system (GPS) equipment able to obtain the coordinate data
24 within these tolerances may be used. Submit cut sheets on the GPS unit proposed to collect
25 the data for approval by the Engineer.

26 Provide both a digital copy and hard copy of all information regarding the location (including,
27 but not limited to, manufacturer, model number, and NCDOT inventory number) in the
28 Microsoft® spreadsheet provided by the Department, shown by example in Figure 1716-1.

- 1 **Figure 1716-1. Spreadsheet.** Submit coordinate information in a spreadsheet provided by
 2 the Department and in accordance with this article.

NCDOT Inv #	Name	Location	Latitude	Longitude	Manufacturer	Model #
05-0134	Equipment Cabinet	US 70 at Raynor Rd./ Auburn-Knightdale	-78.5500	35.6873	McCain	Type-332

05-0134	Junction Box # 5 (Phase 6 Side)	US 70 at Raynor Rd./ Auburn-Knightdale	-78.5493	35.6876	Quazite	PG1118BA12(Box) PG118HA00(Cover)
05-0134	Junction Box # 6 (Phase 4 Side)	US 70 at Raynor Rd./ Auburn-Knightdale	-78.5503	35.6879	Quazite	PG1118BA12(Box) PG118HA00(Cover)

3 **1716-4 MEASUREMENT AND PAYMENT**

4 *Junction Box* (____) will be measured and paid in actual number of junction boxes of each
 5 size and type furnished, installed and accepted.

6 No measurement will be made of covers, washed stone and grounding systems as these will
 7 be incidental to furnishing and installing junction boxes.

8 Payment will be made under:

Pay Item	Pay Unit
Junction Box (____)	Each

9
10

**SECTION 1720
WOOD POLES**

11 **1720-1 DESCRIPTION**

12 Furnish and install poles, grounding systems and all necessary hardware.

13 **1720-2 MATERIAL**

14 Refer to Division 10.

Item	Section
Grounding Electrodes	1091-6
Inspection Requirements	1082
Wire	1091-2
Wood Poles	1082

Section 1721

1 Furnish material, equipment and hardware under this section that is pre-approved on the
2 ITS and Signals QPL for wood poles available on the Department’s website.

3 **1720-3 CONSTRUCTION METHODS**

4 Mark final pole locations and receive approval before installing poles. Unless otherwise
5 specified, locate poles a minimum of 6 feet behind face of curb or 10 feet from edge of
6 travelway. Ensure poles are of sufficient length to maintain the minimum required clearances
7 above the roadway, obstructions and affected railroad tracks.

8 Drill or auger a hole for placement of pole and to allow for compacting. Set pole at
9 manufacturer’s recommended depth, but at a minimum depth of 5 feet. Ensure the pole is
10 within 2 degrees of vertical when fully loaded.

11 Backfill hole with pole installed and tamp backfill in 6 inch lifts with a mechanical tamp until
12 compacted density is at least 95% of original density.

13 On new Department-owned poles, install a grounding system consisting of #6 AWG solid
14 bare copper wire that is exothermically welded to a single ground rod installed at base of pole
15 or to the electrical service grounding electrode system located within 10 feet of the pole.
16 Install ground wire so as to minimize damage from vandalism and environmental exposures.
17 Install ground wire up pole to a point adjacent to the uppermost span. Use hot-dipped
18 galvanized wire staples to secure ground wire to pole.

19 **1720-4 MEASUREMENT AND PAYMENT**

20 *Wood Pole* will be measured and paid as the actual number of wood poles furnished, installed
21 and accepted.

22 No measurement will be made for installing grounding systems as these will be incidental to
23 furnishing and installing wood poles.

24 Payment will be made under:

Pay Item	Pay Unit
Wood Pole	Each

25 **SECTION 1721**
26 **GUY ASSEMBLIES**

27 **1721-1 DESCRIPTION**

28 Furnish and install guy assemblies with all necessary hardware.

29 **1721-2 MATERIAL**

30 Refer to Division 10.

Item	Section
Guy Assemblies	1098-7
Pole Line Hardware	1098-6

31 Furnish material, equipment and hardware under this section that is pre-approved on the
32 ITS and Signals QPL.

33 **1721-3 CONSTRUCTION METHODS**

34 **(A) Guy Assemblies for Signal Heads or Lead-in Cable**

35 Install guy assemblies with guy cable, guy guards, anchors, 3-bolt clamps and associated
36 fittings. Use 2-bolt attachment method where there is adequate room on the pole to
37 comply with the NESC. Attach guy assembly and guy cable to 2 separate bolts with one
38 bolt for span and one bolt for guy cable.

Where adequate spacing is not available and a violation of the NESC would occur with the 2-bolt attachment method, use approved one-bolt attachment method for attaching messenger cable and guy assembly.

Bond guy assembly to new pole grounding system as described in Article 1720-3.

Do not attach to existing guy assemblies unless specifically approved by owner.

(B) Guy Assemblies for Communications Cable

When installing messenger cable for supporting only communications cable, use approved one-bolt attachment method for attaching messenger cable and guy assembly.

Bond guy assembly to existing pole ground using parallel groove clamp or equivalent. If existing poles do not have a grounding system, install new grounding system for bonding guy assembly that complies with Article 1720-3.

Do not attach to existing guy assemblies unless specifically approved by owner.

1721-4 MEASUREMENT AND PAYMENT

Guy Assembly will be measured and paid as the actual number of guy assemblies furnished, installed and accepted.

No measurement will be made of guy cable, guy guards, anchors, clamps, grounding systems or fittings as these will be incidental to furnishing and installing guy assemblies.

Payment will be made under:

Pay Item	Pay Unit
Guy Assembly	Each

**SECTION 1722
RISER ASSEMBLIES**

1722-1 DESCRIPTION

Furnish and install riser assemblies with clamp-on, aluminum weatherheads or heat shrink tubing, galvanized pole attachment fittings and all necessary hardware.

1722-2 MATERIAL

Refer to Division 10.

Item	Section
Grounding Electrodes	1091-6
Pole Line Hardware	1098-6
Rigid Metallic Conduit	1091-3
Riser Sealing Devices	1098-4
Wire	1091-2

Furnish material, equipment and hardware under this section that is pre-approved on the ITS and Signals QPL.

1722-3 CONSTRUCTION METHODS

Install risers with required weatherheads or heat shrink tubing on poles using pole attachment fittings. Maintain a 10 inch minimum and 18 inch maximum offset from signal messenger to the top of riser for all risers. On utility-owned poles, maintain a 40 inch offset from electrical utility's power conductors to top of riser and riser attachment fittings.

Use approved heat shrink tubing retrofit kits when installing new fiber-optic or coaxial cable into exiting risers that contain existing fiber-optic or coaxial cables.

Install heat shrink tubing retrofit kits in existing risers as specified.

Section 1722

- 1 Use separate 1/2 inch riser with weatherhead for pedestrian pushbutton.
- 2 Use separate 1 inch riser with weatherhead for electrical service.
- 3 Use separate 2 inch riser with weatherhead for signal cables (bundled). Use separate 2 inch
- 4 riser with weatherhead for lead-in cable. Install conduit on all risers for lead-in cable.
- 5 Install condulets on risers for lead-in cable, railroad preempt interconnection cables and signal
- 6 pedestals.
- 7 Use separate 2 inch riser with heat shrink tubing for fiber-optic communications cables and
- 8 coaxial cable. Install risers with heat shrink tubing so that cable can be installed without
- 9 violating its minimum bending radius. Install cable so it does not share a riser with any other
- 10 cable.
- 11 Install heat shrink tubing in accordance with manufacturer's recommendations. Provide
- 12 tubing a minimum of 5 inches in length with a minimum of 2.5 inches extended over cables
- 13 and 2.5 inches extended over risers after heat has been applied. Use nylon filler rods with
- 14 UV protection or equivalent and sealing spacer clips to separate cables where multiple cables
- 15 enter a riser. Ensure sealing spacer clips have a heat activated sealing compound with the
- 16 sealing compound fully encapsulating the space between cables. Ensure heat shrink tubing
- 17 provides a watertight fit around individual cables and outer walls of risers. Do not use cut
- 18 sections of cable or any other devices instead of filler rods. Use aluminum tape around cables
- 19 to prevent damage from sealing chemicals. Use a heat source that will provide even heat
- 20 distribution around tubing. Ensure no damage occurs to any cables.
- 21 Bond new risers, a minimum of 10 feet above grade, to the pole ground using a #6 AWG
- 22 minimum solid bare copper wire and an approved pipe clamp, a split bolt connector or
- 23 parallel groove clamp. On pole mounted cabinets where the riser are connected to the cabinet,
- 24 bond risers in the cabinet using ground bushings with a #6 AWG minimum solid bare copper
- 25 wire to the cabinet ground bus.
- 26 If a pole ground exists on the joint use pole, bond new riser to existing pole ground using
- 27 #6 AWG minimum solid bare copper wire terminated with split bolt connectors or parallel
- 28 groove clamp.
- 29 If existing poles do not have a grounding system, install new grounding system that complies
- 30 with Article 1720-3 for bonding messenger cable.
- 31 Transition from rigid galvanized steel risers to underground PVC conduits using an approved
- 32 rigid galvanized steel sweeping elbow with PVC female adaptor.

1722-4 MEASUREMENT AND PAYMENT

34 ___" Riser with ___ will be measured and paid as the actual number of risers of each type and
35 size furnished, installed and accepted. No measurement will be made of weatherheads, heat
36 shrink tubing or pole attachment fittings as these will be incidental to furnishing and installing
37 risers.

38 *Heat Shrink Tubing Retrofit Kit* will be measured and paid as the actual number of heat shrink
39 tubing retrofit kits furnished, installed and accepted.

40 Payment will be made under:

Pay Item	Pay Unit
___" Riser with ___	Each
Heat Shrink Tubing Retrofit Kit	Each

SECTION 1725
INDUCTIVE DETECTION LOOPS

1725-1 DESCRIPTION

Furnish and install inductive detection loops with loop slot sealant, loop wire, conduit with fittings and all necessary hardware.

1725-2 MATERIAL

Refer to Division 10.

Item	Section
Inductive Detection Loops	1098-8

Furnish material, equipment and hardware under this section that is pre-approved on the ITS and Signals QPL.

Provide the Engineer a Type 3 material certification and SDS for the sealant in accordance with Article 106-3.

1725-3 CONSTRUCTION METHODS

All work performed in this section shall be done in the presence of the Engineer.

Notify Engineer one week before installing inductive detection loops.

Coordinate sawcutting and loop placement with pavement markings. For new construction or for resurfacing, install inductive detection loops before placing final layer of surface course. On unmarked pavement, pre-mark locations of stop lines and lane lines before locating inductive detection loops.

Before sawcutting, pre-mark inductive detection loop locations and receive approval. Sawcut pavement at approved pre-marked locations. Do not allow vehicles to travel over unsealed loop slots.

Install conduit with bushings from edge of pavement to junction box. Ensure conduit maintains a minimum 30 inches of cover from the edge of pavement structure to the junction box. Do not sawcut through curb.

Remove all loose material and wash saw slots with a high-pressure method using an air and water mixture. Dry saw slots with compressed air. Clear saw slots of jagged edges and protrusions. Seat loop conductor at bottom of saw slot without damaging loop wire.

Before sealing loop conductors, test that impedance from the loop wire to ground is at least 100 megaohms. For each location with inductive loops, submit a completed Inductive Detection Loop & Grounding Test Results form and place copy in controller cabinet. Ensure all loops are included on form. The form is located on the Department's website.

Embed loop conductors in saw slot with loop sealant. Seal saw slot and dispose of excess sealant in an environmentally safe manner.

Between where loop conductor pairs leave saw cut in pavement and junction boxes, twist loop conductor pairs a minimum of 5 turns per foot. Permanently label each twisted pair in the junction box with nylon cable tie using indelible ink. Indicate loop number and loop polarity on the tie.

1725-4 MEASUREMENT AND PAYMENT

Inductive Loop Sawcut will be measured and paid as the actual linear feet of inductive loop sawcut furnished, installed and accepted.

No measurement will be made of loop slot sealant, loop wire, conduit and conduit fittings as these will be incidental to furnishing and installing inductive detection loops.

Section 1726

1 Payment will be made under:

Pay Item

Inductive Loop Sawcut

Pay Unit

Linear Foot

2 **SECTION 1726**
3 **LEAD-IN CABLE**

4 **1726-1 DESCRIPTION**

5 Furnish and install lead-in cable with all necessary hardware to be used in conjunction with,
6 but not limited to, inductive detection loops, pedestrian pushbutton assemblies,
7 APS assemblies or railroad circuitry.

8 **1726-2 MATERIAL**

9 Refer to Division 10.

Item

Lashing Wire and Hardware

Lead-In Cable

Wrapping Tape

Section

1098-6

1098-9

1098-6

10 Furnish material, equipment and hardware under this section that is pre-approved on the
11 ITS and Signals QPL.

12 **1726-3 CONSTRUCTION METHODS**

13 For underground runs, install lead-in cable in 2 inch non-metallic conduit. For aerial
14 installation, wrap lead-in cable to messenger cable with at least 4 turns of wrapping tape
15 spaced at intervals less than 15 inches or lash lead-in cable to messenger cable with one 360°
16 spiral of lashing wire per 12 inches.

17 Where railroad preemption is required, install lead in cable from signal controller cabinet to
18 railroad company furnished and installed lockable junction box.

19 Splicing of lead-in cable will be allowed only for runs in excess of 750 feet. Splice lead-in
20 cable in junction boxes or condulets on poles.

21 Test each complete loop system from the controller cabinet by using a megger to verify that
22 impedance from the loop system to the ground is at least 50 megaohms. After successful
23 completion of megger test, test loop system resistance using an electronic ohmmeter to verify
24 loop system resistance is less than 0.00885 ohms per foot.

25 **1726-4 MEASUREMENT AND PAYMENT**

26 *Lead-in Cable* (____) will be measured and paid as the actual linear feet of lead-in cable
27 furnished, installed and accepted. Measurement will be made by calculating the difference in
28 length markings located on outer jacket from start of run to end of run for each run.
29 Terminate all cables before determining length of cable run.

30 If markings are not visible, measurement will be point to point with no allowance for sag.
31 Twenty-five feet will be allowed for vertical segments up or down poles.

32 Payment will be made under:

Pay Item

Lead-in Cable (____)

Pay Unit

SECTION 1730
FIBER-OPTIC CABLE

1730-1 DESCRIPTION

Furnish and install single mode fiber-optic (SMFO) communications cable and drop cable assemblies, fiber-optic cable storage racks (snow shoes), communications cable identification markers, lashing wire and all necessary hardware.

1730-2 MATERIAL

Refer to Division 10.

Item	Section
Cable Identification Markers	1098-10
Fiber-Optic Cable	1098-10
Lashing Wire and Hardware	1098-6
Storage Racks	1098-10

Furnish material, equipment and hardware under this section that is pre-approved on the ITS and Signals QPL.

1730-3 CONSTRUCTION METHODS

(A) General

Provide cable manufacturer's attenuation and Optical Time Domain Reflectometer (OTDR) testing data for each reel of cable upon request.

Install SMFO communications cable, snow shoes, communications cable identification markers, lashing wire and all necessary hardware.

Comply with manufacturer's recommendations. Install communications cable on signal poles, utility poles, messenger cable and in conduits as required to bring the fiber-optic cable into and, if necessary, out of each splice enclosure.

Take all precautions necessary to ensure cable is not damaged during storage, handling and installation. Do not violate minimum bending radius of 20 times the radius of cable diameter or manufacturer's recommendation, whichever is greater. Do not step on cable nor run over cable with vehicles or equipment. Do not pull cable over or around obstructions or along the ground.

Determine lengths of cable necessary to reach from termination-point to termination-point. Install cable in continuous lengths between approved splicing facilities. Additionally, provide a sufficient amount of slack cable to allow for an additional 20 feet of cable to be present after removal of outer sheath for termination. Measure slack cable by extending cable straight out of cabinet door.

Keep cable ends sealed at all times during installation to effectively prevent the ingress of moisture. Use approved heat shrink cable end cap. Do not use tape to seal cable ends.

Before installing cable, provide 3 copies of cable manufacturer's recommended and maximum pulling tension. Do not exceed manufacturer's recommended pulling tension. Use pulling grips containing a rotating swivel. Coil cable in a figure-8 configuration whenever cable is unreeled for subsequent pulling.

Install fiber-optic cable in separate 2 inch risers with heat shrink tubing or conduits. Do not share risers or conduits containing fiber-optic cable with other type cable.

Section 1730

1 (B) Aerial Installation

2 Double lash fiber-optic cable to messenger cable with one 360° spiral per foot.

3 Use pole attachment hardware and roller guides with safety clips to install aerial run
4 cable.

5 Maintain tension during the pulling process for aerial run cable by using an approved
6 mechanical clutch (dynamometer) device. Do not allow cable to contact the ground or
7 other obstructions between poles during installation. Do not use a motorized vehicle to
8 generate cable pulling forces.

9 Use a cable suspension clamp when attaching cable tangent to a pole. Select and place
10 cable blocks and corner blocks so as not to exceed the cable's minimum bending radius.
11 Do not pull cable across J-hooks.

12 Store 100 feet of each fiber-optic cable on all cable runs that are continuous without
13 splices where specified. Obtain approval for spare cable storage locations. Store spare
14 fiber-optic cable on fiber-optic cable storage racks (snow shoes). Locate spare cable
15 storage in the middle of spans between termination points. Do not store spare fiber-optic
16 cable over the roadway or driveways.

17 Install one communications cable identification marker within 36 inches of pole
18 attachment points and at locations where more than one cable originates or terminates.

19 (C) Underground Installation

20 Install fiber-optic cable underground in conduit using cable pulling lubricants
21 recommended by the fiber-optic cable manufacturer.

22 Obtain approval of cable pulling lubricant and method of pulling before installing
23 underground fiber-optic cable.

24 Use a dynamometer (clutch device) so as not to exceed maximum allowable pulling
25 tension if cable is pulled by mechanical means. Do not use a motorized vehicle to
26 generate cable pulling forces.

27 Keep tension on cable reel and pulling line at start of each pull. Do not release tension if
28 pulling operation is halted. Restart pulling operation by gradually increasing tension
29 until cable is in motion.

30 For pulling cable through manholes, junction boxes and vaults, feed cable by manually
31 rotating the reel. Do not pull cable through intermediate junction boxes, handholds or
32 openings in conduit unless otherwise approved.

33 Install communications cable identification markers on each communications cable
34 entering a junction box.

35 (D) Installation of Drop Cable Assembly

36 Determine length of drop cable needed, including slack, to reach from termination point
37 to termination point.

38 At aerial splice enclosures, store 100 feet of slack cable on cable storage racks. At below
39 ground splice enclosures, coil 100 feet of slack cable in manhole or junction box where
40 enclosure is located.

41 At equipment cabinet end of drop cable assembly, terminate all fibers with
42 ST-PC connectors to the connector panel. Label all connectors, pigtails and the
43 connector panel. At the aerial splice enclosure location, cap off all unused fibers and
44 label to correspond with the connector panel.

1 **1730-4 MEASUREMENT AND PAYMENT**

2 *Communications Cable* (____-Fiber) will be measured and paid as the actual linear feet of
 3 fiber-optic cable of each fiber count furnished, installed and accepted. Measurement will be
 4 made by calculating the difference in length markings located on outer jacket from start of run
 5 to end of run for each run. Terminate all fibers before determining length of cable run.

6 *Drop Cable* will be measured and paid as linear feet of fiber-optic drop cable assemblies
 7 furnished, installed and accepted. Sag and vertical segments will not be paid as these
 8 distances are incidental to the installation of drop cable assemblies.

9 No measurement will be made for terminating, splicing and testing fiber-optic cable,
 10 communications cable identification markers, fiber-optic cable storage racks or lashing wire
 11 and all necessary hardware as these will be incidental to the installation of fiber-optic cable.

12 Payment will be made under:

Pay Item	Pay Unit
Communications Cable (____-Fiber)	Linear Foot
Drop Cable	Linear Foot

13

SECTION 1731

14

FIBER-OPTIC SPLICE CENTERS

15 **1731-1 DESCRIPTION**

16 Furnish and install fiber-optic interconnect centers, fiber-optic splice enclosures and all
 17 necessary hardware.

18 Modify existing fiber optic interconnect centers and/or splice enclosures as shown in the
 19 plans. Refer to manufacturer's recommendations for opening, modifying and re-sealing the
 20 existing fiber optic interconnect center and/or fiber optic splice enclosures.

21 **1731-2 MATERIALS**

22 Refer to Division 10.

Item	Section
Fiber-Optic Splice Centers	1098-11

23 Furnish material, equipment and hardware under this section that is pre-approved on the
 24 ITS and Signals QPL.

25 **1731-3 CONSTRUCTION METHODS**

26 **(A) General**

27 Include on the cover of each splice tray in a legible format the following information:

28 (1) Splice location reference number or identification information
 29 (i.e. 06-1011 tray 1 of 3, 06-1011 tray 2 of 3, etc.)

30 (2) Date the splice was made

31 (3) Company name of individual performing the splicing

32 (4) Name of individual performing the splicing

Section 1731

1 (B) Workmanship

2 Upon cutting the cable and removing the outer jacketing material down to the individual
3 buffer tubes, secure the central strength member to the enclosure so that no tensile force
4 is applied to the fibers. Secure the individual buffer tubes to the splice trays by a method
5 recommend by the manufacturer. Determine the length of each buffer tube needed to
6 ensure the buffer tube can be looped a minimum of two times around the inside the splice
7 tray. Upon determining the length of buffer tube needed remove the buffer tube to
8 expose the individual fibers for fusion splicing. Adjust individual fiber lengths as
9 necessary to ensure that once the fusion splicing process is completed that the finished
10 splices will align with the “splice block organizer” supplied within the splice tray.
11 Ensure the slice block organizer has individual fusion splice space holders for each fiber
12 splice.

13 While prepping the individual fibers for splicing install the heat shrink protecting tube
14 over the fiber and then perform the splicing operations, following the manufacturer’s
15 instructions. Verify the newly formed splice does not exceed 0.05 dB of attenuation.
16 If the attenuation is more than 0.05 dB then remake the splice until it meets the 0.05 dB
17 or less requirement. Finish the splicing operation by sliding the heat shrink tube over the
18 splice and applying heat to activate the heat shrink tubing. Secure the finished splice in
19 the splice block organizer. Ensure each splice is properly secured in a space holder in the
20 splice block organizer. Multiple splices secured to the same space holder are
21 unacceptable.

22 Ensure all buffer tubes are contained within splice trays so no bare fibers are outside tray
23 and do not damage the fiber or violate the minimum bending radius of the fiber.

24 Prior to installing the cover over the splice tray and placing it in its final resting location,
25 take a mandatory digital photograph of the splice tray that shows the final workmanship.
26 Ensure the photograph shows the “Workmanship Identification Information” as well as
27 the workmanship associated with installing and terminating the fiber. Include digital
28 copies of each photograph on a compact disk as part of the OTDR Test Results submittal.

29 (C) Termination and Splicing within Interconnect Center

30 Install interconnect centers with connector panels, splice trays, storage for slack cable or
31 fibers, mounting and strain relief hardware and all necessary hardware.

32 Terminate and splice all fibers including unused fibers.

33 Label all fiber-optic connectors, whether on jumpers, connector panels or other
34 equipment, to prevent improper connection. Obtain approval of fiber-optic connector
35 labeling method.

36 For all fibers designated for termination to connector panel within interconnect center,
37 fusion splice fibers to pigtails.

38 For all cut fibers designated to pass through interconnect center, fusion splice fibers.

39 For all buffer tubes designated to pass through interconnect center, neatly coil excess
40 tubing inside interconnect center.

41 (D) Termination and Splicing within Splice Enclosure

42 Install splice enclosures with splice trays, basket containment assemblies, racking for
43 slack cable or fibers, mounting and strain relief hardware, and all other necessary
44 hardware.

45 Fusion splice all fibers including fibers designated to be coupled with fibers from a drop
46 cable assembly and cut fibers designated to pass through splice enclosure.

47 For all buffer tubes designated to pass through splice enclosure, neatly coil excess tubing

1 inside basket provided with enclosure.

2 Label all fiber-optic splices. Obtain approval of fiber-optic connector labeling method.

3 Install heat shrink cable shields using methods recommended by the manufacturer of the
4 enclosure. Perform a pressurization flash test on enclosure in accordance with
5 manufacturer's recommended procedures at the conclusion of splicing procedure and
6 before final placement of enclosure.

7 For aerial installations, secure enclosures to messenger cable using manufacturer supplied
8 hardware. Secure SMFO cable and drop cable assemblies to snowshoes.

9 Install enclosures with enough slack cable to allow enclosure to be lowered to ground
10 level and extended into a splicing vehicle.

11 For underground, manhole, and junction box facility installations, place the enclosure
12 along with required spare cables in the facility in a neat and workmanship like manner.

13 **(E) Modify Interconnect Centers and Splice Enclosures**

14 Modify existing fiber optic interconnect centers and/or splice enclosures as shown in the
15 plans. Install additional patch panels, splice trays and pigtails where necessary and
16 fusion splice fiber connections and perform OTDR testing as required by the plans.
17 Install new fiber optic jumpers and make connections to equipment and/or patch panels
18 as necessary.

19 **(F) Testing**

20 Provide written notification a minimum of 10 days before beginning OTDR tests.

21 After splicing is completed, perform bi-directional OTDR tests on each fiber, including
22 unused fibers. Install a 1,000 foot pre-tested launch cable between the OTDR and fiber
23 optic cable to be tested and a 1,000 foot pre-tested destination cable on the end of the
24 fiber optic cable to be tested. Ensure each launch cable has been tested and is compatible
25 with the fiber being installed. Provide Engineer with test results of the launch cable
26 before use. Re-test or replace launch cable at Engineer's request.

27 Ensure fusion splice losses do not exceed 0.05 dB and connectors have a loss of 0.5 dB or
28 less. If any fiber exceeds maximum allowable attenuation or if fiber properties of the
29 cable have been impaired, take appropriate actions up to and including replacement of the
30 fiber cable.

31 Clearly label each OTDR trace identifying a starting and ending point for all fibers being
32 tested. Record the attenuation level of each fiber and clearly indicate OTDR trace results
33 in report format. Furnish 2 hard copies of each of the OTDR trace results and electronic
34 copies of all trace results along with digital photographs showing workmanship for each
35 splice on a compact disk. Furnish the manufacturer's make, model number and software
36 version of the OTDR used for testing.

37 Furnish to the Engineer 2 copies of the software needed to view the OTDR traces
38 electronically.

39 **1731-4 MEASUREMENT AND PAYMENT**

40 *Interconnect Center* will be measured and paid as the actual number of fiber-optic
41 interconnect centers furnished, installed and accepted.

42 *Splice Enclosure* will be measured and paid as the actual number of fiber-optic splice
43 enclosures furnished, installed and accepted. No measurement will be made between aerial,
44 underground, manhole or junction box installation of the fiber-optic splice enclosure.

45 *Modifying Splice Enclosure* will be measured and paid as the actual number of fiber-optic
46 splice enclosures modified and accepted. No measurement will be made between aerial,

Section 1732

1 underground, manhole or junction box installation of the fiber-optic splice enclosure.
2 No measurement will be made of splice trays, pigtails, jumpers, connector panels, testing and
3 any corrective actions, repairs and replacements needed for exceeding maximum allowable
4 attenuation or other defects, as these will be incidental to furnishing and installing fiber-optic
5 interconnect centers and splice enclosures and modifying splice enclosures.
6 Payment will be made under:

Pay Item	Pay Unit
Interconnect Center	Each
Splice Enclosure	Each
Modifying Splice Enclosure	Each

7 **SECTION 1732**
8 **FIBER-OPTIC TRANSCEIVERS**

9 **1732-1 DESCRIPTION**

10 Furnish and install fiber-optic transceivers with all necessary hardware.

11 **1732-2 MATERIALS**

12 Refer to Division 10.

Item	Section
Fiber-Optic Transceivers	1098-12

13 Furnish material, equipment and hardware under this section that is pre-approved on the
14 ITS and Signals QPL.

15 **1732-3 CONSTRUCTION METHODS**

16 Install fiber-optic transceivers in each equipment cabinet and comply with manufacturer's
17 installation instructions.

18 **1732-4 MEASUREMENT AND PAYMENT**

19 *Fiber-Optic Transceiver - Drop and Repeat* will be measured and paid as the actual number
20 fiber-optic drop and repeat transceivers furnished, installed and accepted.

21 *Fiber-Optic Transceiver - Self-Healing Ring* will be measured and paid as the actual number
22 of fiber-optic self-healing ring transceivers furnished, installed and accepted.

23 Payment will be made under:

Pay Item	Pay Unit
Fiber-Optic Transceiver - Drop and Repeat	Each
Fiber-Optic Transceiver - Self-Healing Ring	Each

24 **SECTION 1733**
25 **DELINEATOR MARKERS**

26 **1733-1 DESCRIPTION**

27 Furnish and install delineator markers with all necessary hardware.

28 **1733-2 MATERIAL**

29 Refer to Division 10.

Item	Section
Delineator Markers	1098-13

1 Furnish material, equipment and hardware under this section that is pre-approved on the
 2 ITS and Signals QPL.

3 **1733-3 CONSTRUCTION METHODS**

4 Submit sample of proposed delineator markers for approval before installation.

5 Install delineator markers using a method that firmly and securely anchors delineator marker
 6 in the ground to prohibit twisting and easy removal as directed by the plan.

7 **1733-4 MEASUREMENT AND PAYMENT**

8 *Delineator Marker* will be measured and paid as the actual number delineator markers
 9 furnished, installed and accepted.

10 Payment will be made under:

Pay Item	Pay Unit
Delineator Marker	Each

11 **SECTION 1734**
 12 **REMOVE EXISTING COMMUNICATIONS CABLE**

13 **1734-1 DESCRIPTION**

14 Remove existing communications cable.

15 **1734-2 CONSTRUCTION METHODS**

16 Removal of existing aerial communications cable also includes proper disposal of
 17 communications cable, messenger cable and mounting hardware, including abandoned risers.

18 Removal of existing underground communications cable includes proper disposal of
 19 communications cable and junction boxes, if required. Where junction boxes have been
 20 removed, backfill hole to 95% of surrounding density.

21 Do not reuse any removed communications cable, messenger cable, junction boxes, pole
 22 attachment hardware or abandoned risers on the project, unless otherwise specified. In the
 23 event that any of the removed communications cable, junction boxes or pole attachment
 24 hardware is to be returned to the Engineer, it will be so noted in the plans.

25 **1734-3 MEASUREMENT AND PAYMENT**

26 *Remove Existing Communications Cable* will be measured in horizontal linear feet of existing
 27 communications cable removed and accepted. Payment will be in linear feet. Sag, vertical
 28 segments or spare segments of communications cable will not be paid as these distances will
 29 be incidental to the removal of existing communications cable.

30 No additional measurement will be made for multiple cables being removed from the same
 31 conduit or same pole. Where multiple adjacent conduits exist (each containing multiple
 32 cables), each conduit will be measured and paid separately. No payment will be made for
 33 cable that cannot be removed and is abandoned in place.

34 No measurement will be made of the removal of messenger cable, pole attachment hardware
 35 and junction boxes, as these will be incidental to removing existing communications
 36 hardware.

37 Payment will be made under:

Pay Item	Pay Unit
Remove Existing Communications Cable	Linear Foot

1735-1 DESCRIPTION

Remove and reinstall existing communications cable for pole relocations.

1735-2 MATERIAL

Refer to Division 10

Item	Section
Pole Line Hardware	1098-6

1735-3 CONSTRUCTION METHODS

During project, transfers of existing communications cable to new poles may be required. Perform transfers as directed by the Engineer. Remove existing cables from pole to be removed and reinstall these cables and any existing attachment hardware on new pole. Remove all communications hardware from existing pole. Furnish and install any new attachment hardware as required.

1735-4 MEASUREMENT AND PAYMENT

Cable Transfer will be measured and paid as the actual number of cable transfers with attachment hardware to new poles furnished, installed and accepted.

Payment will be made under:

Pay Item	Pay Unit
Cable Transfer	Each

**SECTION 1736
SPREAD SPECTRUM RADIO**

1736-1 DESCRIPTION

Furnish and install a spread spectrum radio system (900 MHz Serial or 900 MHz Serial /Ethernet) with all necessary hardware and signage in accordance with the plans and specifications to provide a data link between field devices (i.e. traffic signal controllers, dynamic message signs, etc.). Provide a radio system with a bi-directional, full duplex communications channel between 2 "line-of-sight" antennas using license free, spread spectrum technology operating in the 902-928 MHz frequency band.

Furnish material and workmanship conforming to the NEC, the NESC, UL or a third-party listing agency accredited by the North Carolina Department of Insurance and all local safety laws. Comply with all regulations and codes imposed by the owner of affected utility poles.

1736-2 MATERIAL

Refer to Division 10.

Item	Section
Pole Line Hardware	1098-6
Retroreflective Sheeting	1092-2
Signs and Hardware	1092-1
Spread Spectrum Radio	1098-18
Wire	1091-2

1736-3 CONSTRUCTION METHODS**(A) General**

Perform a radio path Site Survey test before installing any equipment. Ensure the test evaluates the signal strength (dBm), fade margin (dB), signal-to-noise ratio, data integrity (poll test) and a complete frequency spectrum scan. Ensure the radio path site survey test is performed using the supplied brand of radio equipment to be deployed. During the initial radio path signal strength test it may be determined that a repeater station may be necessary to complete the intended link. Provide the test results to the Engineer for review and approval. Submit copies of the test results and colored copies of the frequency spectrum scan along with an electronic copy of this information. The Engineer will approve final locations of antennas and any necessary repeater stations.

For 900 MHz serial radios install a data interface cable (Type 1, Type 2, Type 3), radio frequency signal jumper, lightning arrestor, coaxial cable, coaxial cable shield grounding and weatherproofing kit, antenna and antenna mounting hardware. If the installation requires a dual antenna configuration to accommodate communications in multiple directions install a power divider/splitter, antenna splitter cables and additional antenna and mounting hardware

For 900 MHz Serial/Ethernet radios install an Ethernet cable, radio frequency signal jumper, lightning arrestor, coaxial cable, coaxial cable shield grounding and weatherproofing kit, antenna and antenna mounting hardware. If the installation requires a dual antenna configuration to accommodate communications in multiple directions install a power divider/splitter, antenna splitter cables and additional antenna and mounting hardware

Install the antenna in such a manner that avoids conflicts with other utilities (separation distances in accordance with the guidelines of the NESC) and as specified in the antenna manufacturer's recommendations. Secure the antenna mounting hardware to the pole and route the coaxial cable such that no strain is placed on the N-Type male coaxial connectors. On wood pole installations, bond the antenna mounting hardware to the pole ground using #6 AWG bare copper wire using split bolt or compression type fitting.

Install the coaxial cable shield grounding system by carefully removing the outer jacket of the coaxial cable without damaging the cable shield. Install the shield grounding system following the cable manufacturer's recommendations. Install and weatherproof the connection using the appropriate weatherproofing materials and following the manufacturer's recommendations. On wood poles, secure the #6 AWG grounding lead cable to the pole ground using split bolt or compression type fitting or a method approved by the Engineer. On metal poles, secure the #6 AWG grounding lead cable to the pole using a method approved by the Engineer.

Do not exceed the one inch bend radius of the coaxial cable as it traverses from the cabinet to the antenna assembly. Connect the lightning arrestor to the coaxial cable in the equipment cabinet. Properly ground and secure the arrestor in the cabinet. Permanently label all cables entering the cabinet. Ensure the power supply for the radio system is not connected to the GFCI receptacle circuit located in the cabinet. Place a copy of all manufacturer equipment specifications and instruction and maintenance manuals in the equipment cabinet.

At certain locations it may be necessary to integrate the radio system with a fiber optic system. Follow the details shown in the fiber optic splice plans.

Section 1736

1 **(B) Disconnect Switch**

2 At all locations, where the antenna is mounted on a joint use pole, install a double pole,
3 snap switch to remove power from the spread spectrum radio system. Do not mount
4 weatherproof box on the traffic signal cabinet door. Drill a hole in the side of the traffic
5 signal cabinet. Mount the outlet box over the hole using a half inch chase nipple and
6 bushings. Ensure sealing gaskets are in place and no water can enter the cabinet.
7 Securely mount the weatherproof outlet box with additional mounting screws. Bond the
8 outlet box to the equipment ground bus. See plans for approximate mounting height.
9 Run the power supply cord of the spread spectrum radio unit into the outlet box and
10 connect to switch. Securely attach power supply cord to equipment rack. Install
11 disconnect switch with lockout tag cover. If the antenna is mounted on a joint use pole,
12 the “disconnect switch” is required.

13 Do not install power supply for the radio in a GFCI protected outlet.

14 **(C) Warning Sign(s) and Decal(s)**

15 At all locations, where the antenna is mounted on a joint use pole, secure a warning sign
16 to pole. Mount warning sign(s) at locations called for in the plans. Ensure there are no
17 conflicts between the warning sign and surrounding utilities. Mount warning sign to be
18 easily viewed. Do not mount warning sign under pole grounds or conduit. If the antenna
19 is mounted on a joint use pole, the RF warning sign is required.

20 Clean and remove any dirt or oil on traffic cabinet before placing decal. Place decal
21 adjacent to the disconnect switch located on the outside of traffic cabinet. If the antenna
22 is mounted on a joint use pole, the decal is required.

23 **1736-4 MEASUREMENT AND PAYMENT**

24 *900MHz Serial Spread Spectrum Radio* will be measured and paid as the actual number of
25 900 MHz serial spread spectrum radios furnished, installed and accepted. This item includes
26 the appropriate sized antenna(s), radio, power supplies, disconnect/snap switch, signs, decals,
27 data interface cable, coaxial cable, lightning arrestor, radio frequency signal jumper, coaxial
28 cable power divider (splitter), coaxial cable connectors, coaxial cable shield grounding system
29 with weatherproofing, labeling and any integration between the radio system and a fiber optic
30 network if necessary, installation materials and configuration software necessary to complete
31 this work, including the radio path Site Survey test and warranties.

32 *900 MHz Serial/Ethernet Spread Spectrum Radio* will be measured and paid as the actual
33 number of 900 MHz serial/Ethernet spread spectrum radios furnished, installed and accepted.
34 This item includes the appropriate sized antenna(s), radio, power supplies, disconnect/snap
35 switch, signs, decals, Ethernet cable, coaxial cable, lightning arrestor, radio frequency signal
36 jumper, coaxial cable power divider (splitter), coaxial cable connectors, coaxial cable shield
37 grounding system with weatherproofing, labeling and any integration between the radio
38 system and a Ethernet switch if necessary, installation materials and configuration software
39 necessary to complete this work, including the radio path Site Survey test and warranties.

40 Payment will be made under:

Pay Item	Pay Unit
900MHz Serial Spread Spectrum Radio	Each
900MHz Serial/Ethernet Spread Spectrum Radio	Each

SECTION 1743 PEDESTALS

1743-1 DESCRIPTION

Furnish and install the size and type of support assembly for vehicular or pedestrian signal heads, pedestrian pushbuttons, Intelligent Transportation System technologies or other traffic control devices as shown in the plans. Furnish assembly with foundation, grounding system and all necessary hardware as shown in the *Roadway Standard Drawings*. Provide a pedestal assembly that meets *AASHTO Standard Specifications for Structural Supports for Highway Signs, Luminaires and Traffic Signals* in effect on the date of project advertisement. Unless otherwise required by the plans, install signal pedestals and pedestrian pushbutton posts on FHWA-approved breakaway support or anchor systems.

Furnish and install screw-in helical foundation as an alternative to the standard reinforced concrete foundation for supporting Type I and Type II Pedestals. Do not use for Type III Pedestals.

1743-2 MATERIAL

Refer to Division 10.

Item	Section
Grounding Electrodes	1091-6
Signal Pedestals	1098-14
Wire	1091-2

Furnish material, equipment and hardware under this section that is pre-approved on the ITS and Signals QPL.

Pedestals are defined as follows:

(A) Type I - Pedestrian Pushbutton Post

(B) Type II - Normal-Duty Pedestal

(C) Type III - Heavy-Duty Pedestal

1743-3 CONSTRUCTION METHODS

(A) Type I Pedestrian Pushbutton Post

Install pushbutton post for mounting pedestrian pushbutton or an accessible pedestrian signal (APS) assembly (refer to Section 1705).

Install underground conduit for pushbutton lead-in cable in the pushbutton post's foundation.

Attach or anchor pushbutton post to the top of foundation via a breakaway support in a vertical plumb orientation. Ensure post is of sufficient length to accommodate the pushbutton, accessible pedestrian signals and any associated pedestrian informational signing at the mounting heights shown in the plans or *Roadway Standard Drawings*.

(B) Type II and III Pedestals

Locate foundations, determine elevation and submit findings for normal-duty and heavy-duty pedestals. Obtain the Engineer's approval of foundation locations and elevations before constructing foundations.

Excavate in accordance with Section 410. If encountered, remove rock or boulders to a sufficient depth to obtain stability necessary to support the structure for design loads. Ensure ground is level before installing foundations.

Construct foundations in accordance with Section 825. Cast concrete for pole

Section 1743

1 foundations against undisturbed soil unless otherwise permitted. Provide forms with
2 chamfer strips that measure one inch along diagonal face at all corners above ground
3 level. Do not install foundations over uncompacted fill or muck.

4 Install conduit in foundations.

5 Securely place, position and align anchor bolts symmetrically about the center of
6 foundation.

7 Give exposed vertical concrete surfaces a broom finish. Give exposed horizontal
8 surfaces a float finish.

9 Level tops of concrete foundations. Do not allow tops to exceed 4 inches above adjacent
10 ground surface. Pour and finish foundation to a level that is flush with the surrounding
11 sidewalk when possible.

12 Do not erect pedestals until concrete has attained a minimum compressive strength of
13 2,500 psi as determined by cylinder breaks.

14 Refer to *Roadway Standard Drawings*.

15 **(C) Screw-In Helical Foundation Anchor Assembly:**

16 Advance or mechanically screw foundation into soil until top of attachment plate is level
17 with finished grade. Slide the anchor bolt heads through the keyhole openings and under
18 the attachment plate with threads pointing up. Bolt the pedestal base to the foundation
19 attachment plate.

20 For further construction methods, see manufacturer’s installation drawings.

21 **1743-4 MEASUREMENT AND PAYMENT**

22 *Type I Post with Foundation* will be measured and paid as the actual number of pedestrian
23 pushbutton posts furnished, installed and accepted.

24 *Type II Pedestal with Foundation* will be measured and paid as the actual number of normal-
25 duty pedestals with foundations furnished, installed and accepted.

26 *Type III Pedestal with Foundation* will be measured and paid as the actual number of heavy-
27 duty pedestals with foundations furnished, installed and accepted.

28 No measurement will be made for pedestal foundations, pedestal screw-in helical foundations,
29 grounding systems and any peripheral pedestal mounting hardware as these are incidental to
30 furnishing and installing pedestals.

31 Payment will be made under:

Pay Item	Pay Unit
Type I Post with Foundation	Each
Type II Pedestal with Foundation	Each
Type III Pedestal with Foundation	Each

SECTION 1745
SIGNS INSTALLED FOR SIGNALS

1745-1 DESCRIPTION

Furnish and install signs for signals with cable hangers, rigid sign mounting brackets, U-channel posts and all necessary hardware.

1745-2 MATERIAL

Refer to Division 10.

Item	Section
Signs and Hardware	1092-1
Retroreflective Sheeting	1092-2

Use Grade C retroreflective sheeting, except for black sheeting. Use non-reflective for black sheeting.

Conform to the message layout, size and color as required in the MUTCD.

For messenger cable mounting, furnish either messenger cable hangers with free-swinging, 360° adjustable sign brackets or 3-bolt clamps as directed. Furnish aluminum, galvanized steel or stainless steel sign supporting hardware.

For ground mounting, furnish steel, 3-lb, U-channel posts with hardware for ground mounting. Comply with Section 903.

For mast-arm mounting, furnish rigid aluminum, galvanized steel or stainless steel sign mounting brackets.

1745-3 CONSTRUCTION METHODS

Install signs with applicable mounting hardware. Comply with sign offsets and mounting heights as shown in the MUTCD and the *Roadway Standard Drawings*.

For messenger cable mounting, install signs 6 inches minimum from signal heads.

For ground mounting, comply with Article 903-3.

For mast arm mounting, install attachment brackets to allow adjustment so signs:

(A) Are aimed in required direction,

(B) Are plumb as viewed from respective approaches,

(C) May be tilted forward or backward as required, and

(D) May be raised or lowered on mast arm throughout full length of sign.

1745-4 MEASUREMENT AND PAYMENT

Sign for Signals will be measured and paid as the actual number of signs for signals, regardless of mounting method, furnished, installed and accepted.

Payment will be made under:

Pay Item	Pay Unit
Sign for Signals	Each

Section 1747

**SECTION 1746
RELOCATE EXISTING SIGN**

1746-1 DESCRIPTION

Relocate existing signs.

1746-2 CONSTRUCTION METHODS

As directed by the plans, relocate existing signs. Comply with Article 1745-3.

1746-3 MEASUREMENT AND PAYMENT

Relocate Existing Sign will be measured and paid as the actual number of existing signs, regardless of mounting method, relocated and accepted.

Payment will be made under:

Pay Item	Pay Unit
Relocate Existing Sign	Each

**SECTION 1747
LED BLANKOUT SIGN**

1747-1 DESCRIPTION

Furnish and install Light Emitting Diode (LED) blankout signs with all necessary hardware as set forth in the plans and specifications. Design the signs with the options to display “NO (LEFT or RIGHT) TURN TRAIN”. Fabricate the sign to be between 27 inches and 29 inches wide, between 37 inches and 39 inches high and approximately 8 inches deep.

1747-2 MATERIAL

Furnish material, equipment and hardware under this section that is pre-approved on the ITS and Signals QPL.

1747-3 CONSTRUCTION METHODS

Install LED blankout signs with wire entrance fittings, span wire cable mounting assemblies, pedestal mounting assemblies, rigid mounting assemblies, signal cable, lashing wire and all necessary hardware.

Relocate existing blankout signs with all necessary hardware.

1747-4 MEASUREMENT AND PAYMENT

LED Blankout Signs will be measured and paid as the actual number of LED blankout signs with mounting hardware furnished, installed and accepted.

Relocate Existing Blankout Sign will be measured and paid as the actual number of blankout signs relocated and accepted.

Payment will be made under:

Pay Item	Pay Unit
LED Blankout Signs	Each
Relocate Existing Blankout Sign	Each

SECTION 1750
SIGNAL CABINET FOUNDATIONS

1750-1 DESCRIPTION

Furnish and install signal cabinet foundations and all necessary hardware.

Furnish either poured concrete foundations or preformed cabinet pad foundations and all necessary hardware. Obtain approval of foundation type.

1750-2 MATERIAL

Refer to Division 10.

Item	Section
Signal Cabinet Foundation	1098-15
Portland Cement Concrete	1000-4

Furnish preformed cabinet pad foundation material, equipment and hardware under this section that is pre-approved on the ITS and Signals QPL.

1750-3 CONSTRUCTION METHODS

Comply with Section 825.

When using poured concrete foundations and preformed cabinet pads, use procedures, equipment and hardware as follows:

(A) Locate new cabinets so as not to obstruct sight distance of vehicles turning on red.

(B) Obtain approval for final cabinet foundation locations before pouring concrete base.

(C) Do not install foundations over uncompacted fill or muck.

(D) Hand tamp soil before placing concrete and ensure ground is level.

(E) Maintain 12 inches minimum from service pole to closest point on foundation unless otherwise approved.

(F) Use a minimum of four 1/2 inch diameter expanding type anchor bolts to secure cabinet to foundation.

(G) Install minimum 4 inches above and 4 inches below finished grade.

(H) Locate external stubbed out conduit at cabinet foundation so conduit is in middle of cabinet. Provide service conduit as the rightmost conduit coming into cabinet. Provide 2 spare conduits stubbed out; one pointed toward service pole and the other toward direction of lead in cable. Inscribe identification arrow in foundation indicating direction of spare conduits.

(I) Give cabinet foundation a broom finish and chamfered edges.

(J) Seal space between cabinet base and foundation with permanent, flexible, waterproof sealing material.

1750-4 MEASUREMENT AND PAYMENT

Signal Cabinet Foundation will be measured and paid as the actual number furnished, installed and accepted.

Payment will be made under:

Pay Item	Pay Unit
Signal Cabinet Foundation	Each

Section 1751

**SECTION 1751
CONTROLLERS WITH CABINETS**

1751-1 DESCRIPTION

Furnish and install controllers with cabinets and all necessary hardware. Furnish all pole or foundation mounting hardware, detector sensor cards, external electrical service disconnects, one Corbin Number 2 cabinet key, one police panel key, conflict monitors or malfunction management units, surge protection, grounding systems, AC/DC isolator cards and all necessary hardware.

1751-2 MATERIAL

Furnish material, equipment and hardware under this section that is pre-approved on the ITS and Signals QPL.

1751-3 CONSTRUCTION METHODS

(A) General

Remove existing controllers and cabinets where required. Remove maintenance diary from cabinet and place in new cabinet or deliver to the Engineer. Take existing equipment out of service only at the time directed.

Locate new cabinets so as not to obstruct sight distance of vehicles turning on red.

Install controllers, cabinets, detector sensor units and hardware that provide required phasing, color sequence, flash sequence, interconnection, railroad clearance and preemption and emergency vehicle clearance and preemption.

Stencil signal inventory number on cabinet side facing roadway. Use 3 inch black characters.

Provide external electrical service disconnect at all new and existing cabinet locations unless otherwise specified.

Do not program controller for late night flashing operation at railroad preemption installations. For all other installations, do not program controller for late night flashing operation unless otherwise directed. Ensure all signal heads for same approach flash concurrently during flashing operation.

Provide serial number and cabinet model number for each new controller and controller cabinet installed.

Install pole mounted cabinets so height to cabinet middle is 4 feet.

Activate controllers with proposed phasing and timing.

(B) System Interconnection

When interconnection of signals is required (via fiber optics, ethernet, wireless, etc.), install communications interface equipment and hardware for signals. Demonstrate proper operation of interconnection using manual commands and upload/download capability to each local controller from the respective master controller after interconnection is complete.

Program telemetry command sequences and enable devices necessary for testing of communication between local controllers and field master controllers and between field master controllers and Department-furnished central computer. Where master controllers are not used, demonstrate proper operation of interconnection between local intersections controllers and a central system server.

1 **(C) Workshop**

2 Provide enclosed workshop to set up and test new controllers and cabinets before
 3 installation. Locate workshop within Division responsible for project administration.
 4 Ensure workshop provides protection from weather and sufficient space to house 2 test
 5 observers, all necessary test equipment and material, controllers and cabinets.

6 Configure and test each controller and cabinet to match the proposed signal design.
 7 Ensure all equipment furnished and installed or modified by the Contractor at each
 8 location operates in full compliance with the plans and project special provisions. Test
 9 each controller and cabinet for proper color sequence, flashing operation, phase timings,
 10 preemption, coordination and conflict monitor programming or malfunction management
 11 unit programming. Ensure that simultaneous conflicting phase outputs will cause the
 12 cabinet to revert to flashing operation. For intersections with any type of preemption,
 13 submit a completed Preemption Test Procedure Checklist. The checklist is located on the
 14 Department's website.

15 Test the cabinet and controller for eight hours minimum. Following this test and before
 16 installation, the Engineer will inspect the equipment in operation. The Engineer may
 17 require other tests to ensure proper operation. These tests shall be at no additional cost to
 18 the Department.

19 **1751-4 MEASUREMENT AND PAYMENT**

20 *Controllers with Cabinet* (____) will be measured and paid as the actual number of each type
 21 of controllers with cabinets furnished, installed and accepted.

22 *Detector Card* (____) will be measured and paid as the actual number furnished, installed and
 23 accepted.

24 No measurement will be made of conflict monitors, malfunction management units, external
 25 electrical service disconnect, grounding systems, modems, meter bases and workshop as these
 26 will be incidental to furnishing and installing controllers with cabinets.

27 Payment will be made under:

Pay Item	Pay Unit
Controllers with Cabinet (____)	Each

28

SECTION 1752

29

MODIFY CABINET FOUNDATIONS30 **1752-1 DESCRIPTION**

31 Where approved by the Engineer, install conduit entrances into existing foundations in
 32 accordance with the plans and specifications. Modify existing foundations in accordance with
 33 the plans and specifications.

34 **1752-2 MATERIAL**

35 Refer to Article 1750-2.

36 **1752-3 CONSTRUCTION METHODS**37 **(A) Install Conduit Entrance into Existing Foundation**

38 Install Conduit Entrances into existing cabinet foundations by core drilling foundations to
 39 install additional conduit.

40 Maintain a minimum of 3 inches of cover between new conduit and edge of foundation.
 41 Maintain minimum clearances of 1 inch from the flange of the base adapter and 2 inches
 42 from existing conduits. Avoid damaging existing conduit, conductors and anchor bolts.
 43 Repair all such damages. Where approved by the Engineer, the foundation may be

Section 1752

- 1 chipped instead of drilled for conduit entrance. When possible, maintain traffic signal
- 2 operations while drilling is performed.
- 3 Bond new metallic conduit to the equipment ground bus.
- 4 After installation of conduit, place grout to seal around conduit and return the foundation
- 5 to normal appearance.

(B) Modify Foundation

- 7 Enlarge existing cabinet foundations to accommodate the new cabinet and/or to provide
- 8 a maintenance technician pad.
- 9 Excavate the ground around the existing foundation to a depth sufficient to expose
- 10 a minimum of 4 inches of the foundation below existing grade.
- 11 Rough the sides of the existing foundation from the top to a point 4 inches below grade
- 12 by means of a chisel or other method approved by the Engineer.
- 13 Wash the sides of the foundation with water pressurized at 50 psi and thoroughly dry
- 14 with compressed air.
- 15 Drill holes approximately 12 inches deep on 12 inches centers into the existing
- 16 foundation. Install #4 dowels and epoxy into place. Provide dowels of the lengths in
- 17 Table 1752-1.

TABLE 1752-1 LENGTH OF DOWEL	
Foundation Extension	Length of Dowel
> 16"	24"
> 6" and < 16"	17"
= 6"	14"

- 18 Use concrete to install the maintenance technician pad.
- 19 Form the sides of the modified foundation to a minimum depth of 4 inches below grade.
- 20 Position forms so that all existing exposed foundation surfaces at or above grade level
- 21 will be matched.
- 22 Apply a coating of approved epoxy bonding agent to all exposed roughened concrete
- 23 surfaces as recommended by the manufacturer.
- 24 Enlarge the foundation to the distance specified for new cabinet foundations. Provide
- 25 a one inch chamfer on all new outside edges.
- 26 Maintenance technician pads should be added to the foundation to provide a minimum
- 27 work area of 24 inches [length] x 30 inches [width] from both the front and rear doors of
- 28 the cabinet.

1752-4 MEASUREMENT AND PAYMENT

- 30 *Conduit Entrance into Existing Foundation* will be measured and paid as the actual number of
- 31 conduit entrances drilled into existing cabinet foundations furnished, installed and accepted.
- 32 *Modify Foundation for Controller Cabinet* will be measured and paid as the actual number of
- 33 existing cabinet foundations modified and accepted.

34 Payment will be made under:

Pay Item	Pay Unit
Conduit Entrance into Existing Foundation	Each
Modify Foundation for Controller Cabinet	Each

**SECTION 1753
CABINET BASE ADAPTER/EXTENDER**

1753-1 DESCRIPTION

Furnish and install cabinet base adapters and extenders with all necessary hardware for Type 170 cabinets.

1753-2 MATERIAL

Refer to Division 10.

Item	Section
Cabinet Base Adapter or Extender	1098-16

Furnish material, equipment and hardware under this section that is pre-approved on the ITS and Signals QPL.

1753-3 CONSTRUCTION METHODS

Install cabinet base adapter at locations requiring new Model 332 cabinet on existing/modified foundation.

Install cabinet base extender at locations requiring new Model 332 cabinet on new foundation or existing Model 332 cabinet that does not have cabinet base extender.

Where new Model 336 cabinet is used as base mount cabinet, install adapter or extender, as required.

Use permanent, flexible waterproof sealing material to:

- (A) Seal between cabinet base and cabinet base adapter/extender,
- (B) Seal 2-piece cabinet base adapter/extender seams, and
- (C) Seal space between cabinet base adapter/extender and foundation.

1753-4 MEASUREMENT AND PAYMENT

Cabinet Base Adapters will be measured and paid as the actual number furnished, installed and accepted.

Cabinet Base Extenders will be measured and paid as the actual number furnished, installed and accepted.

Payment will be made under:

Pay Item	Pay Unit
Cabinet Base Adapter	Each
Cabinet Base Extender	Each

**SECTION 1755
BEACON CONTROLLER ASSEMBLIES**

1755-1 DESCRIPTION

Furnish and install beacon controller assemblies with cabinets. Furnish all pole mounting hardware, solid state flashers, one Corbin Number 2 cabinet key, surge protection, grounding systems and all necessary hardware.

Section 1757

1 **1755-2 MATERIAL**

2 Refer to Division 10.

Item	Section
Beacon Controller Assemblies	1098-17
Grounding Electrodes	1091-6
Wire	1091-2

3 Furnish material, equipment and hardware under this section that is pre-approved on the
4 ITS and Signals QPL.

5 **1755-3 CONSTRUCTION METHODS**

6 Remove existing beacon controller assemblies where required. Remove maintenance diary
7 from cabinet and place in new cabinet or deliver to the Engineer. Take existing equipment
8 out of service only at the time directed.

9 Locate new beacon controller assemblies so as not to obstruct sight distance of turning
10 vehicles.

11 Install new beacon controller assemblies. Provide external electrical service disconnect at
12 new and existing cabinet locations unless otherwise specified.

13 Stencil signal inventory number on cabinet side facing roadway. Use 3 inch black characters.
14 Provide serial number and cabinet model number for each new beacon controller assembly.

15 Install pole mounted cabinets so height to cabinet middle is 4 feet.

16 **1755-4 MEASUREMENT AND PAYMENT**

17 *Beacon Controller Assembly and Cabinet* (____) will be measured and paid as the actual
18 number furnished, installed and accepted.

19 No measurement will be made of surge protectors, external electrical service disconnect,
20 grounding systems and removing existing beacon controller assemblies as these are incidental
21 to furnishing and installing beacon controller assemblies.

22 Payment will be made under:

Pay Item	Pay Unit
Beacon Controller Assembly and Cabinet (____)	Each

23 **SECTION 1757**

24 **REMOVAL OF EXISTING TRAFFIC SIGNALS**

25 **1757-1 DESCRIPTION**

26 Remove existing traffic signal materials and associated signal hardware.

27 **1757-2 CONSTRUCTION METHODS**

28 **(A) General**

29 Remove existing traffic signals at the locations indicated in the contract. Maintain and
30 repair traffic signal equipment within the limits of the project until the traffic signal
31 equipment is disconnected and stockpiled.

1 **(B) Removal**

2 Dismantle and remove existing traffic signal equipment and material, excluding joint use
 3 poles. Disconnect and remove all Department equipment from joint use poles in
 4 a manner that will not damage the poles or existing utilities. Cut electrical conduit and
 5 remove to at least 18 inches below finished ground elevation unless otherwise directed by
 6 the Engineer.

7 Install the required regulatory signs in accordance with Sections 900, 901 and 903 of the
 8 Standard Specifications before deactivating the traffic signal. Cover the signs with
 9 burlap bags until the traffic signal is removed or put into flashing operation.

10 If necessary to flash the traffic signal before removal of the signal equipment,
 11 immediately uncover the signs before placing the traffic signal into flashing operation.
 12 Operate the flashing operation for a period of time as directed by the Engineer.

13 Deactivate, dismantle and remove the traffic signal after the period of flashing operation
 14 or as directed by the Engineer.

15 Use methods to remove the traffic signal that will not result in damage to other portions
 16 of the project or facility. Repair damage that results from the Contractor's actions at no
 17 additional cost to the Department.

18 Final acceptance of the project is contingent upon the removal of the existing traffic
 19 signal. Removal of the existing traffic signal is part of the work required by the final
 20 completion date.

21 **(C) Disposal**

22 Remove all Department traffic signal equipment, span poles, messenger cable,
 23 interconnect cable and supporting hardware that will not be reused. Assume ownership
 24 and promptly transport the removed poles, messenger cable, interconnect cable and
 25 supporting hardware. Return all other traffic signal equipment and material to the Traffic
 26 Services Office within the Division responsible for the administration of the project.

27 Return the removed equipment and material between the hours of 8:00 a.m. and
 28 12:00 p.m. Monday through Thursday or at a time mutually agreed upon by the
 29 Contractor and the Engineer. Replace or repair all material lost or damaged during its
 30 removal and transit. Label all returned equipment and material to indicate its original
 31 location.

32 **1757-3 MEASUREMENT AND PAYMENT**

33 *Traffic Signal Removal* will be measured and paid as the actual number of intersections that
 34 were completely cleared of all traffic signal equipment. The traffic signal equipment shall
 35 have existed along the roadway before the start of construction on the project, shall have had
 36 no changes made to the phasing or timing by the Contractor, shall have had no additional
 37 equipment installed by the Contractor during the life of the project (excluding equipment for
 38 maintenance) and shall have been removed as a part of the project.

39 Payment will be made under:

Pay Item	Pay Unit
Traffic Signal Removal	Each

INDEX

This index is not intended to be a complete concordance, but is intended to provide general reference where a word or term may be found. It is not intended to express emphasis on that particular referenced location. The entire book is available online and may be searched extensively and specifically for particular words and phrases.

 Items, major, 1-6, 1-33
 Lump sum price, 1-4, 1-80, 1-87
 Subletting of, 1-70
 Termination of, 1-78
 Time (days), 1-5
 Contractor, 1-5
 Contractor
 Furnished certification, 1-53
 Furnished sources, 2-19
 Supervision by, 1-46
 Contractor's
 License, 1-19
 Responsibility for process control, 7-10

Control

- Limits, 6-11
- Of material, 1-52
- Of work, 1-44
- Plan, transportation management, 11-1
- Strips, 1-56
- Unit for asphalt binder, 6-24

Controllers with cabinets, 17-38

Converting catch basins/drop inlets, 8-38

Cooperation

- Between contractors, 1-46
- By contractor, 1-46
- With utility owner, 1-47

Coordination

- Plans, specifications/provisions, 1-45
- With Railway, 1-58
- With seeding operations, 2-18

Copper arsenate, chromated, 10-174

Copyright, 1-58, 1-63

Correction of bid errors, 1-21

Corrective action, 1-73, 2-29, 4-37, 6-9, 6-11, 6-17, 6-31, 6-35, 7-8, 7-15, 7-16, 17-28

Cored slabs, prestressed concrete, 4-52

Corrugated

- Aluminum alloy,
 - Culvert pipe, 3-6
 - Pipe elbows, 3-5, 3-7
 - Pipe tees, 3-6, 10-56
 - Structural plate pipe and arch, 10-55
- Metal culvert pipe, 10-55
- Plastic pipe and fittings, 3-6, 3-7, 8-12, 10-67
- Steel, 3-5
 - Pipe, 3-1

Course, base, 1-3, 1-7, 1-8, 5-10

Covering of signs, 9-1

Crash cushions, temporary, 10-198, 11-12

Creosote, 10-174

Criteria for withdrawal of bid, 1-22

Cross sections, 1-44, 1-88, 2-12, 2-15, 2-19, 2-22, 2-25, 5-26, 7-2, 8-4, 8-7

Crushed stone or gravel, 10-28, 10-39, 17-11

Culvert, 1-5

Culvert

- Excavation, box, 4-21
- Foundation, conditioning, 4-21
- Pipe, 10-55
- Pipe, vitrified clay, 10-61, 15-11, 15-18

Curb ramps, 8-30

Curing

- Agents for concrete, 10-53
- Compound, 4-32, 4-40, 7-5, 8-19, 8-34, 10-53, 10-127, 10-141, 12-3, 12-12, 12-13
- Compound removal, 12-3, 12-12, 12-13
- Concrete, 4-39, 10-127, 10-140

Current controlling operation(s), 1-5

Damage

- Claims, responsibility, 1-59, 1-62
- Liquidated, 1-51, 1-72, 1-74, 1-77

Dampproofing, 4-82

Dampproofing

- Materials, 10-47
- Method "B", 4-84

Data sheet, safety, 4-60, 4-64, 10-166

Date of availability, 1-5

Date, intermediate completion, 1-6

Day, calendar, 1-4

Debris, 1-43, 1-61, 2-1, 2-3, 2-6, 2-14

Deck drains, 4-25, 4-40, 4-81, 4-72

Default, 1-20

Default of contract, 1-73

Defective material, 1-56

Definition of terms, 1-1

Deformed steel bar for structures, 10-86

Deleterious substances, 10-37, 10-39

Delineation, 2-21, 8-2, 8-40, 11-3, 12-1

Delineator markers, 10-220, 17-28

Delineators, 10-185

Delineators

- Barrier, 4-84, 8-35, 10-186, 11-15
- Drum, 10-192
- Flexible, 10-188, 12-19
- Guardrail and barrier, 8-34, 8-40, 10-186

Delivery

- And handling of materials, 1-52, 10-43
- Of bids, 1-18

Demolition of buildings/appurtenances, 2-5

Demountable sheeting, 9-6

Density, 1-56, 2-24

Density determination

- Conventional method, 5-12
- Nuclear Method, 5-12

Department

- Furnished material, 1-56
- Furnished signs, 9-2
- Legal rights, waiver of, 1-65

Deposit, bid, 1-4, 1-14, 1-16, 1-17

Details of construction plans, 1-30

Detectable warnings, 8-30

Detours, 11-3, 12-2

Diesel hammers, 4-67

Digital Terrain Modeling (DTM), 2-16

Dimensions-precaster concrete units, 10-121

Dimensional tolerances, 10-102, 10-146

Directional drilling, 15-21

Direct tension indicators, 4-56, 10-93

Disadvantaged Bus. Enterprise, 1-20, 1-71

Disposal, 2-1, 2-5, 2-6, 2-8, 2-27

Disposal of materials, 2-13, 2-26, 16-8

Disposal of waste / debris, 8-7

Disposition of surplus property, 1-39

Disqualification of contractors, 1-20

Ditch excavation, 2-26

Ditches, berm, 2-14, 2-26

Ditches, silt, 1-61, 2-26, 16-8

Division of Highways, 1-5

Documentation (Records), 6-15

Documents required for final estimate, 1-88

Domestic steel, 1-53

Dowels/tie bars for pavement, 10-87

Drains in walls and culverts, 4-33

Drains, shoulder, 8-13

Drawings

- Shop, 1-45, 9-1, 9-17
- Working, 1-9, 1-44

Drilled piers, 4-8
 Driving equipment, (pile), 4-71
 Drop-on beads, pavement marking, 10-181
 Drums, 10-192, 11-9
 Skinny, 10-194, 11-18
 Drums-type delineators, 10-192
 Dryer, 6-25
 Duct and conduit sealer, 10-203, 14-2
 Ductile iron pipe, 15-10, 10-61
 Dust control, 1-61

Easement, 1-4, 1-5, 1-8, 8-4
 Eccentric reducers, corrugated steel, 3-7, 10-57
 Edge planing, 10-107
 Elapsed time for placing concrete, 10-6,
 10-133
 Elastomeric bearings, 10-154
 Electrical
 Duct, 14-18
 Inspections and testing, 14-7
 Junction boxes, lighting, 14-20
 Service pole and lateral, 14-14
 Embankments, 2-23
 Embankment monitoring, 2-25
 Emulsified asphalt, anionic, 10-45
 Emulsified asphalt, cationic, 10-45
 Encasement, 10-63, 15-5, 15-17
 Encroachment on right of way, 1-58
 End sections, pipe, 3-7
 Endwalls, 8-23
 Engineer, 1-5
 Engineering fabrics, *see Geotextiles*.
 Epoxy
 And adhesives, 10-163
 Coated steel, 10-87
 Paint, coal tar, 10-156
 Equipment, 1-5
 Equipment
 Driving, pile, 4-71
 Mounting, 14-6
 Rental rates, 1-82
 Erecting prestressed concrete members, 4-50
 Erosion
 Control, 2-1, 2-20, 8-9
 Control, rolled products, 16-9
 Control requirements, 2-13
 Control, stone, 16-3
 Control work, failure to maintain, 1-51
 Estimates, progress, 1-85
 Evaluation for wetlands and species, 2-21
 Examination of plans, specs, contract 1-13
 Excavation
 Borrow, 2-18
 Box culvert, 4-21
 Channel, 4-23
 Ditch, 2-26
 Foundation, 4-3
 Roadway, 2-12
 Unclassified structure, 4-21
 Undercut, 2-15
 Execution of contract, 1-16, 1-21
 Expansion joints, 4-33, 7-7, 8-19
 Explosives, use of, 2-8, 2-11, 4-6, 11-2
 Expressway gutter, 8-28

Extension of contract time, 1-31, 1-35, 1-77
 Extra work, 1-5, 1-35

Fabric, *see Geotextile*.
 Fabricated metal stay-in-place forms, 4-26
 Fabricated steel grates, 10-119
 Fabricating and placing reinforcement, 4-47
 Fabrication of steel-reinforcing, 10-87
 Fabrication of structural steel, 10-102
 Facing or bearing surfaces, 10-108
 Failure
 To furnish contract bonds, 1-30
 To maintain satisfactory progress, 1-72
 To perform erosion control work, 1-51
 Falsework and forms, 4-24
 Federal participation, 1-58
 Feeder circuits, 14-19
 Fence
 Barbed wire, 8-48, 10-73
 Chain link, 8-47, 10-70
 Gates for, 8-48
 Posts, 8-47, 10-173
 Reset, 8-49
 Special Sediment Control, 16-2
 Temporary silt, 16-1
 Woven wire, 8-47, 10-72, 10-75, 16-1
 Fertilizer, 10-80
 Topdressing, 16-31
 Fiber
 Optic cable, 10-213, 17-25
 Optic splice centers, 10-218, 17-25
 Optic transceivers, 10-219, 17-28
 Field
 Erection of steel structures, 4-51
 Laboratory for concrete pavement, 7-27
 Field
 Laboratory requirements, 6-9
 Painting, 4-62
 Welding, 4-54
 Filled joints, 4-33
 Final
 Acceptance date, 1-5
 Cleaning up, 1-40
 Estimate, 1-6, 1-34, 1-65
 Estimate assembly, 1-6, 1-88
 Finish, 4-42, 7-5, 7-13, 7-20, 10-128,
 10-145
 Payment, 1-6, 1-85, 1-89
 Surface testing, 6-29, 6-37, 7-13
 Fine aggregate, 10-27, 10-30, 10-37
 Finishing concrete, 4-37, 7-2, 7-12, 7-20
 Fire hydrant, 1-47, 10-63, 15-2, 15-7, 15-8,
 15-17
 Fittings and accessories-fence, 8-46, 10-74
 Fittings and manhole installation, 15-13
 Flagger, 8-7, 10-200, 11-3, 11-11
 Flashing arrow boards, 11-7
 Flexible delineators, 10-188, 10-189, 12-19
 Float finish – concrete, 4-42, 7-3, 7-12, 8-18
 Flowable fill, 3-8, 3-9, 10-8, 15-17 to 15-22
 Fly ash – concrete, 10-7, 10-52, 10-131
 Force main sewer, 10-61, 15-7, 15-12
 Force account, 1-6, 1-80
 Force account notice, 1-6, 1-33

- Forms for concrete bridge decks, 4-26
- Forms-in-place method, 4-41
- Forms, stay in place, metal, 4-26, 10-120
- Formula, job mix, 5-14, 6-7, 6-20, 6-40, 6-62

 - Barrier, grout for concrete, 10-21
 - Control, 10-189, 11-1
 - Control
 - Devices, 11-4
 - Gen. requirements, work zone, 11-1
 - Plan (TMP), 11-1
 - Supervision, 11-3
 - Work zone, 11-1
 - Control, failure to maintain, 11-5
 - Islands and medians, 8-33
 - Stoppage, 11-3
 - Maintenance of, 1-89
 - Opening sections of project to, 1-64
 - Soil-cement base, 5-19
 - Through, 1-8
- Transfer of load, 10-142
- Transformers, 10-221
- Transverse joints, 7-6, 7-20
- Trash racks, 16-15
- Travelway, excavation within, 11-2
- Travelway, pedestrian, 11-4, 17-7
- Treated
 - Base course, cement, 5-19
 - Soil, lime, 5-3
- Tree removal, select, 2-3, 16-21
- Trenching
 - Excavation/backfilling for utilities, 15-3
 - Paved, 17-12
 - Unpaved, 17-12
- Trenchless methods, 3-7, 15-18
- Truck measurement, 2-22, 5-27
- Truck mounted attenuators, 10-199, 11-13
- Trust account, 1-86
- Tubular markers (fixed), 10-187, 12-18
- Tubular triple steel beam guardrail, 8-41
- Tunneling, trenchless method, 15-21
- Type
 - A, B devices - Temporary rock silt, 16-11
 - III barricades, 11-11
- U-channel posts, sign supports, 10-190, 12-17
- Ultra-thin Bonded Wearing Course, 6-54
- Unauthorized work, 1-49
- Unclassified excavation, 2-13
- Unclassified structure excavation, 4-20
- Uncoated steel sheet and light plates, 1-79
- Undercut excavation, 2-15
- Underdrains, 8-11, 14-4
- Underground conduit, 14-5, 17-12, 17-15
- Underground storage tank, 2-6
- Undergrowth removal, 16-21
- Underpass lighting, 14-24
- Underruns of contract quantities, 1-32, 1-34
- Unit bid price, 1-5, 1-15, 1-21
- Unloading and handling, 3-1
- Unpaved trenching, 17-12
- Untreated
 - Timber and lumber, 10-172
- Utilities/Excavation/trenching, etc., 15-3

- Utility
 - Controls, 15-7
 - Lines, Concrete encasement of, 15-4
 - Manholes, 15-13
 - Owner, Cooperation with the, 1-47
 - Requirements, General, 15-1
- Utilization of excavated materials, 4-5, 4-20
- Value engineering proposal, 1-40
- Valve boxes, 8-37, 15-8
- Valve, water, 10-63
- Vegetation removal, selective, 16-21
- Vegetation control, herbicide, 10-85
- Vehicular
 - Access, 11-4
 - Crossing, construction, 11-2
 - Traffic, Protection of pedestrian, 15-2
- Very high early strength concrete, 7-23
- Vibrating concrete, 4-30, 7-3
- Video imaging loop emulator, 10-212
- Void, claims - assignment of, 1-57
- Wages, 1-65, 1-80, 1-83
- Wages and conditions of employment, 1-65
- Waiver of legal rights by Department, 1-65
- Walls and culverts, drains in, 4-33
- Warnings, detectable, 8-30
- Washers for high strength bolts, 10-92
- Washers for use with fasteners, 10-119
- Waste, 1-43, 2-2
- Waste and debris, disposal of, 4-3, 8-7
- Waste material, 2-14, 8-8
- Waste suitable material, 2-18
- Water
 - Curing concrete, 4-40, 10-53, 10-127, 10-141
 - Distribution equipment, 5-4, 5-20
 - For planting, 16-38
 - Lines, 15-5
 - Mains, 15-1, 15-6
 - Mains to sanitary sewer, Relation, 15-1

 - Pollution, 1-60
 - Pumping, 4-4, 4-21
 - Reducing admixture for concrete, 10-51
 - Service line, 15-9
 - Sterilization and testing, 15-6, 15-13
 - Stops, 4-83
 - System installation, 15-6
 - System - pressure test, leakage test and Valves, 10-63
- Waterborne paints, 10-156
- Watering sod, 16-30
- Watering, planting and backfilling, 16-36
- Waterline installation, 15-5
- Waterproofing,
 - Method A, 4-84
- Waterproofing/dampproofing, 4-82, 10-47
- Watertightness, 4-25

- Weather, limitations, 6-1, 6-3, 12-2, 12-6, 12-8, 12-10, 12-11, 12-14
- Weekend, night and holiday work, 15-1
- Weep holes, 4-22, 4-33, 15-18
- Weighing, 1-55
- Weighing aggregate, 10-12
- Weighmaster, 1-55
- Weight of slag, 10-36
- Weir section, 16-12
- Welded steel pipe, 3-7, 10-58
- Welded stud shear connectors, 10-98
- Welding - overhead sign assemblies, 10-209
- Welding
 - Code, 10-98, 10-111
 - Signs, 10-209
 - Structural steel, 10-112
- Welding, field, 4-54
- Welds and welders, qualifications of, 10-112
- Wells, 2-4
- Widening existing structures, 4-32
- Wire
 - Reinforcement, 10-85
 - Fasteners for temporary silt fence, 16-1
 - Barbed for fences, 8-46, 10-73
 - Woven, fence, 16-1
- Withdrawal of bids-mistakes, 1-22
- Withdrawal or revision of bids, 1-18
- Wood forms, 4-25, 8-17
- Wooded area cleanup, 16-20
- Work
 - In/over/adjacent - navigable waters, 1-59
 - Zone
 - Signs, 10-189, 11-5
 - Traffic control, 11-1 to 11-19
 - Additional, 1-3, 1-20, 1-46, 1-76
 - Contractor's responsibility for, 1-64
 - Control of, 1-44
- Work
 - Erosion control, failure to perform, 1-51, 2-13
 - Extra, 1-5, 1-35
 - Force account, 1-6, 1-80
 - Inspection of, 1-48
 - Night, weekend and holiday, 15-1
 - Scope of, 1-30
 - Suspension of, 1-32, 1-64
 - Suspension ordered by Engineer, 1-31
 - Unauthorized, 1-49
- Working drawings, 1-9, 1-44, 10-100, 10-129
- Woven wire fence, 8-47, 10-72, 16-1

- Zinc paint, inorganic, self-curing, 10-155
- Zones, blasting, 11-2
