DIVISION 16

EROSION CONTROL AND ROADSIDE DEVELOPMENT

SECTION 1605

TEMPORARY SILT FENCE

1605-1 DESCRIPTION

Furnish material, construct, maintain, and remove temporary silt fence in locations shown on the plans or in locations that require surface drainage to be filtered.

1605-2 MATERIALS

(A) Posts

Provide steel post meeting the following requirements:

Minimum 1.5 m long.
Minimum 34.9 mm wide measured parallel to the fence.
Minimum weight of 1.86 kg/m of length.
Equipped with an anchor plate with minimum area of 9,032 square mm.
Have a means of retaining wire and fabric in the desired position without displacement.

(B) Woven Wire Fence

Provide woven wire fence meeting the following requirements:

Minimum 812.8 mm high.
Minimum 5 horizontal wires.
Vertical wires spaced 304.8 mm apart.
Minimum 2.6 mm top and bottom wires.
Minimum 2.0 mm all other wires.

(C) Filter Fabric

Provide Type 3 engineering fabric, Class A or B meeting the requirements of Section 1056.

(D) Attachment Device

Provide No. 9 staple with a minimum length of 3801 mm or other approved attachment device.

1605-3 INSTALLATION

Install in locations as shown on the plans or as directed.
Install wire and fabric as shown in Standard Drawings.
Class B synthetic filter fabric may be used without the woven wire fence backing, subject to the following conditions:

(A) The Engineer shall approve the fabric.

(B) Post spacing is inclined toward the runoff source, at an angle of not more than 0.35 radians from vertical.

(1) Attach filter fabric to the wire fence with wire or other acceptable methods.

(2) Overlap filter fabric a minimum of 457 mm at splice joints.

(3) Install fabric that is free of defects, rips, holes, flaws, deterioration, or damage.

1605-4 MAINTENANCE AND REMOVAL

Maintain the silt fence until the project is accepted or until the fence is removed.
Section 1605

Remove and replace deteriorated or ineffective filter fabric.

Remove and dispose of silt accumulations in accordance with Section 1630 when necessary or as directed.

Leave silt fence in place until site stabilization and remove at project completion.

Removed silt fence becomes the property of the Contractor.

Dress and seed and mulch all areas where silt fence is removed in accordance with Section 1660.

**1605-5 MEASUREMENT AND PAYMENT**

*Temporary Silt Fence* will be measured and paid for in linear meter, accepted in place, along the ground line of the fence.

*Silt Excavation* will be measured and paid for in accordance with Section 1630.

*Seeding and Mulching* will be measured and paid for in accordance with Section 1660.

The requirements of Article 104-5 pertaining to revised contract prices for overrunning minor items will not apply to this item. No revision in the contract unit price will be allowed because of any overrun or underrun.

Payment will be made under:

<table>

**SECTION 1610**

**STONE FOR EROSION CONTROL**

**1610-1 DESCRIPTION**

Furnish, stockpile if directed, place, and maintain an approved stone for construction of erosion control devices at ditches, diversions, swales, pipe inlets, pipe outlets, drainage turnouts, and at other locations designated on the plans or as directed. The work includes but is not limited to furnishing, weighing, stockpiling, re-handling, placing, and maintaining stone; and disposal of any stone not incorporated into the project when necessary.

**1610-2 MATERIALS**

Refer to Division 10.

<table>
<thead>

</tr>
</thead>
<tbody>
<tr>
<td>Stone for Erosion Control</td>
<td>1042-1</td>
</tr>
<tr>
<td>Sediment Control Stone</td>
<td>1005</td>
</tr>
</tbody>
</table>

**1610-3 CONSTRUCTION METHODS**

Place stone, in locations and to the thickness, widths, and lengths as shown on the plans or as directed. Construct erosion control devices in accordance with the plans neatly and uniformly with an even surface and meeting the requirements of the plans.

**1610-4 MEASUREMENT AND PAYMENT**

*Stone For Erosion Control, Class ___* will be measured and paid for in metric tons of each class of stone that has been incorporated into the work, or has been delivered to and stockpiled on the project as directed. Stone placed in the stockpile will not be measured a second time. Measure stone by weighing in trucks on certified platform scales or other certified weighing devices.

*Sediment Control Stone* will be measured and paid for in metric tons of stone that has been incorporated into the work, or has been delivered to and stockpiled on the project as directed. Stone placed in the stockpile will not be measured a second time. Measure

SECTION 1615
TEMPORARY MULCHING

1615-1 DESCRIPTION
Furnish, place, and secure mulch material to prevent excessive soil erosion during construction operations where it is impossible or impractical to perform permanent seeding and mulching.

The actual conditions that occur during the construction of the project will determine the quantity of mulching. The quantity of mulching may be increased, decreased, or eliminated entirely as directed. Such variations in quantity will not be considered as alterations in the details of construction or a change in the character of work.

1615-2 MATERIALS
Refer to Division 10.

Item Section
Mulch for Erosion Control 1060-5

Use undiluted emulsified asphalt or other approved tacking material.

1615-3 APPLICATION
Place temporary mulch promptly at locations on temporarily seeded or non-seeded areas when so directed.

Spread mulch uniformly over the area by hand or by means of appropriate mechanical spreaders or blowers to obtain a satisfactory uniform cover. A satisfactory application of temporary mulch on non-seeded areas consists of a sufficient amount to completely and uniformly cover the ground.

When temporary mulching is performed in conjunction with temporary seeding, apply mulch in accordance with Article 1660-6. Complete mulching and tacking within 24 hours. Exercise care to prevent displacement of soil and seed or other damage to areas where temporary seeding is done.

Apply a sufficient amount of asphalt or other type binding material when using grain straw to assure that the temporary mulch is properly held in place. Take adequate precautions to prevent damage to traffic, structures, guardrails, traffic control devices, or any other appurtenances during the application of binding material. Provide adequate covering or change methods of application as required to prevent such damage. Repair any damage that occurs, including any necessary cleaning.

Take sufficient precautions to prevent mulch from entering drainage structures through displacement by wind, water, or other causes and promptly remove any blockage to drainage facilities.

1615-4 MEASUREMENT AND PAYMENT
Temporary Mulching will be measured and paid in hectares, measured along the surface of the ground over which temporary mulch has been placed as directed and accepted.
Payment will be made under:

**SECTION 1620**

**TEMPORARY SEEDING**

1620-1 DESCRIPTION

Seed and mulch selected areas in advance of the permanent seeding and mulching operations to minimize erosion of graded areas during construction operations. The work includes preparing seedbeds; furnishing, placing, and covering fertilizer and seed; furnishing and placing mulch; and other operations necessary for seeding the required areas.

Perform temporary seeding promptly at the locations and under any of the following conditions when directed:

(A) When it is impossible or impractical to bring an area to the final line, grade, and finish so that permanent seeding and mulching operations can be performed without subsequent serious disturbance by additional grading;

(B) When erosion occurs or is considered to be potentially substantial on areas of graded roadbed where construction operations are temporarily suspended or where the grading of the roadbed has been completed substantially in advance of the paving construction;

(C) During seasons of the year when permanent seeding and mulching is prohibited by the contract.

(D) When an immediate cover would be desirable to minimize erosion, siltation, or pollution on any area.

The actual conditions that occur during the construction of the project will determine the quantity of seed or fertilizer to be used. The quantity of seed or fertilizer may be increased, decreased, or eliminated entirely as directed. Such variations in quantity will not be considered as alterations in the details of construction or a change in the character of the work.

1620-2 MATERIALS

Refer to Division 10.

<table>

<tr>
<td>Seed</td>
<td>1060-4</td>
</tr>
<tr>
<td>Mulch for erosion control</td>
<td>1060-5</td>
</tr>
</tbody>
</table>

See the contract for analysis of fertilizer and the kinds of seed.

1620-3 SEEDBED PREPARATION

Scarify areas to be seeded to a depth of not less than 127 mm unless directed otherwise. The soil conditions and topography will determine the required depth of the seedbed.

Prepare the surface to be seeded with adequate furrows, ridges, terraces, trenches, or other irregularities in which seeding materials can lodge with reasonable assurance that the materials will not be easily displaced by wind, rain, or surface runoff.

1620-4 APPLYING AND COVERING FERTILIZER AND SEED

The analysis of fertilizer, the kinds of seed, and the rates of application of fertilizer and seed shall be as stated in the contract.
Apply no fertilizer or seed when the Engineer determines that conditions are unfavorable for such operations.

Distribute the fertilizer or seed uniformly over the seedbed at the required rates of applications.

Cover fertilizer and seed unless otherwise directed. If covering is required, provide it to the depth acceptable to the Engineer for the prevention of displacement by wind, rain, or surface runoff.

Mulch all areas temporarily seeded, in accordance with Section 1615, unless otherwise indicated in the contract or as directed.

The requirements of Article 1660-5 will be applicable to the approval of equipment; the use of liquid fertilizer; and the protection of traffic, structures, guardrails, traffic control devices, and other appurtenances.

1620-5 MOWING AND REPAIR OF TEMPORARY SEEDING

Maintain areas where temporary seeding is performed in a satisfactory condition, including mowing at the locations and times as directed.

Repair areas of temporary seeding, which have been damaged or have failed. Repair includes reshaping or the placing of additional earth material and repeating the seeding process.

1620-6 MEASUREMENT AND PAYMENT

Seed For Temporary Seeding will be measured and paid for in kg. The weight of seed will be determined by bag count of standard weight bags or by weighing the seed on certified platform scales or other certified weighing devices.

Fertilizer For Temporary Seeding will be measured and paid for in metric tons. The weight of dry fertilizer will be determined by bag count of standard weight bags, or by weighing the fertilizer in trucks on certified platform scales or other certified weighing devices. The weight of liquid fertilizer will be the equivalent weight in metric tons of dry fertilizer based on available plant food.

Temporary Mulching will be measured and paid for in accordance with Section 1615.

Mowing will be measured and paid for in accordance with Section 1660.

Where earthwork and temporary seeding have been adequately constructed, completely drained, and properly maintained, and damage occurs due to natural causes, the Contractor will be paid at the contract unit price for the excavated material required for repairs to the damaged earthwork, and the contract unit prices for Seed For Temporary Seeding and Fertilizer for Temporary Seeding for correcting the damaged temporary seeding.

Repair, at no cost to the Department, any damage to earthwork or temporary seeding, which is due to carelessness or neglect on the part of the Contractor.

Payment will be made under:

SECTION 1622

TEMPORARY SLOPE DRAINS

1622-1 DESCRIPTION

Furnish, place, maintain and remove temporary slope drains at the locations shown on the plans and at locations as directed. Work includes but is not limited to furnishing all pipe, anchor stakes, and compacted earth; installation and removal of the slope drain; furnishing and installation of asphalt plant mix and stone; constructing the sump, earth
Section 1622

shoulder berm and earth berm ditch block; constructing the outlet protection; and
dressing, seeding, and mulching the disturbed area after the slope drain and berm have
been removed.

The actual conditions during the construction of the project will determine the
quantity of temporary slope drains.

The quantity of temporary slope drains may be increased, decreased, or eliminated
entirely at the direction of the Engineer. Such variations in quantity will not be
considered as alterations in the details of construction or a change in the character of the
work.

1622-2 MATERIALS

Provide temporary slope drains with pipe of sufficient size to carry the anticipated
volume of water with a minimum diameter of 305 mm. Provide plastic pipe and fittings
meeting the requirements of AASHTO M294.

Refer to Division 10.

<table>
<thead>
<tr>

<td>Asphalt Plant Mix</td>
<td>1012-1, 1020-2, 1020-8</td>
</tr>
<tr>
<td>Stone</td>
<td>1042-1</td>
</tr>
</tbody>
</table>

1622-3 CONSTRUCTION METHODS

(A) Temporary Slope Drains

Install temporary slope drains in accordance with the Standard Drawings during
all phases of grading operations and adjust as needed to properly direct water flow.

Construct an earth berm at the top of cut and fill sections to direct water flow into
temporary slope drains.

At locations of single direction waterflow, locate temporary slope drain inlets in a
sump along the earth berm. Construct an earth berm ditch block perpendicular to
the direction of the waterflow on the downstream side of the temporary slope
drain. Construct ditch blocks of sufficient height to block the flow of water but at
no higher elevation than the earth shoulder berm.

Join multiple pipe sections using an approved pipe coupling. Anchor slope drains
in accordance with the Standard Drawings.

Remove temporary slope drains as directed. Temporary slope drains become the
property the Contractor when removed. Dress the area to blend with existing
contours, and seed and mulch in accordance with Section 1660.

(B) Inlet Protection at Temporary Slope Drain:

Protect the inlet by compacting earth material or lining the inlet area with Class B
stone, asphalt plant mix, or other acceptable material in accordance with the
details in the plans. Construct either an appropriately sized Type B basin or a Pipe
Inlet Sediment Trap Type A at the inlet of the temporary slope drain to provide
adequate sediment storage.

Provide asphalt plant mix meeting the requirements of Section 610.

A prime coat or tack coat is not required.

Pavers are not required for spreading and finishing.

Compact mix to an acceptable degree.

(C) Outlet Protection at Temporary Slope Drain

Protect outlet locations subject to scour by placing Class B stone or a silt detention
device. Construct outlet protection devices as shown on the plans and at other
locations as directed.
1622-4 MEASUREMENT AND PAYMENT

Temporary Slope Drains will be measured and paid for in linear meters of pipe including inlets, measured along the invert of the temporary slope drain, that has been completed and accepted.

Inlet Protection at Temporary Slope Drain will be measured and paid for in units of each.

Stone For Erosion Control, Class ___ will be measured and paid for in accordance with Section 1610.

No payment will be made for temporary slope drains or inlet protection, that were required due to the Contractor's negligence, carelessness, or failure to install permanent controls as a part of the work scheduled.

Temporary Slope Drains and Inlet Protection at Temporary Slope Drain will be considered minor items. The requirements of Article 104-5 pertaining to revised contract unit prices for overrunning minor items will not apply to these items.

Payment will be made under:

SECTION 1630
CONSTRUCTION AND MAINTENANCE OF SILT DETENTION DEVICES

1630-1 DESCRIPTION

Excavate and satisfactorily dispose of all materials excavated in the construction, cleaning out, and maintenance of silt basins, silt ditches, and other silt detention devices. Work includes but is not limited to excavation, shaping of the basins or ditches, cleaning out and maintaining the basins or ditches, disposal of all materials, and backfilling.

1630-2 GENERAL

Excavate silt basins, silt ditches, or other silt detention devices to the dimensions and at the locations shown on the plans or as directed for the purpose of siltation control. Clean out silt detention devices, when so directed, in order to maintain their effectiveness. Backfill and shape for seeding and mulching silt detention basins and silt ditches prior to completion of the project unless otherwise directed.

1630-3 DISPOSAL OF MATERIALS

Utilize all excavated materials in the construction of roadway embankments except where otherwise directed. Dispose of materials, which are not utilized in the construction of roadway embankments in waste areas in accordance with Section 802.

1630-4 MEASUREMENT AND PAYMENT

Silt Excavation will be measured and paid for in cubic meters measured in the original position, of all materials excavated within the limits established by the plans or directed by the Engineer. If in the opinion of the Engineer it is not feasible to measure the excavated material in its original position, the volume will be determined by truck measurement in accordance with Subarticle 230-5(C), except that no deduction for shrinkage will be made.

The filling of silt basins or silt ditches will be paid for as provided in Section 225 for Unclassified Excavation or in Section 230 for Borrow Excavation, depending on the source of the material used to fill the basins or ditches.
Section 1630

Payment will be made under:

<table>

</table>

SECTION 1631
DITCH LINER AND EROSION CONTROL BLANKETS

1631-1 DESCRIPTION

Furnish, place, and maintain a ditch liner and/or erosion control blanket of synthetic roving or matting for erosion control on previously shaped and seeded drainage ditches, slopes, or other areas at locations shown in the contract or as directed. Work includes providing all materials; excavation and backfilling; placing synthetic roving; applying asphalt material; placing and securing matting; and maintaining the drainage ditch.

The conditions that occur during the construction of the project will determine the quantity of synthetic roving and matting placed. The quantity of matting may be increased, decreased, or eliminated entirely as directed. Such variations in quantity will not be considered as alterations in the details of construction or a change in the character of the work.

1631-2 MATERIALS

Refer to Division 10.

<table>
<thead>
<tr>
<th>Item</th>
<th>Section</th>
</tr>
</thead>
<tbody>
<tr>
<td>Synthetic Roving</td>
<td>1054-5</td>
</tr>
<tr>
<td>Matting for Erosion Control</td>
<td>1060-8</td>
</tr>
<tr>
<td>Staples</td>
<td>1060-8</td>
</tr>
</tbody>
</table>

Provide wooden stakes meeting the following requirements:

- Minimum 304.8 mm long.
- Minimum 25.4 mm x 50.8 mm nominal dimension.

Use undiluted emulsified asphalt for tacking material on synthetic roving.

1631-3 CONSTRUCTION METHODS

(A) Synthetic Roving

Place synthetic roving immediately following seeding. Provide a smooth soil surface free from stones, clods, or debris that will prevent the contact of the fibers with the soil. Preserve the required line, grade, and cross section of the area covered.

Apply synthetic roving uniformly over the designated area to form a random mat of continuous fibers at the rate of 0.14 to 0.19 kg per square m of fiberglass roving or 0.08 to 0.11 kg per square m of polypropylene roving. Apply tacking material over the fibers immediately after the roving is placed at a rate of 1.13 to 1.59 liters per square meter.

Bury roving to a depth of 125 mm at the upgrade end and at maximum intervals of 15.2 meters along the ditches. Install wooden stakes at the upgrade end and in an irregular pattern to securely hold the roving, no more than 3 m apart, throughout the ditch.

(B) Matting

Place matting immediately following seeding. Provide a smooth soil surface free from stones, clods, or debris that will prevent the contact of the matting with the soil. Preserve the required line, grade, and cross section of the area covered.
Unroll matting in the direction of the flow of water, and apply without stretching so that it will lie smoothly but loosely on the soil surface. Bury the up-channel or top of slope end of each piece of matting in a narrow trench at least 127 mm deep and tamp firmly. Where one roll of matting ends and a second-roll begins, overlap the end of the upper roll over the buried end of the second roll so there is a 152.4 mm overlap. Construct check trenches at least 304.8 mm deep every 15.2 m longitudinally in the matting or as directed. Fold over and bury matting to the full depth of the trench, and close and tamp firmly. Overlap matting at least 101.6 mm where 2 or more widths of matting are laid side by side.

Place staples across matting at ends, junctions, and check trenches approximately 254 mm apart.

Place staples along the outer edges and down the center of each strip of matting 0.9 m apart. Place staples along all lapped edges 50 to 76.2 mm apart.

Install product with netting on the top side when excelsior or straw matting is used.

The Engineer may require adjustments in the trenching or stapling requirements to fit individual cut or fill slope conditions.

**1631-4 MEASUREMENT AND PAYMENT**

*Synthetic Roving* will be measured and paid in square meters as measured along the surface of the ground, over which synthetic roving has been acceptably placed.

*Matting* will be measured and paid in square meters as measured along the surface of the ground, over which matting has been acceptably placed.

Payment will be made under:

**SECTION 1632**

**ROCK INLET SEDIMENT TRAP**

**1632-1 DESCRIPTION**

Construct, maintain and remove devices around catch basins and/or drop inlets to reduce water velocity and contain sediment. Work includes furnishing all fence posts, hardware cloth, hardware, stone and other materials, installing and maintaining the 6.4 mm hardware cloth.

The actual conditions that occur during the construction of the project will determine the quantity of rock inlet sediment traps constructed. The quantity of inlet sediment traps may be increased, decreased, or eliminated entirely as directed. Such variations in quantity will not be considered as alterations in the details of construction or a change in the character of the work.

**1632-2 MATERIALS**

**(A) Steel Posts**

Meet the following requirements:

- Minimum 1.5 m.
- Minimum 34.9 mm wide measured parallel to the fence.
- Minimum weight of 1.86 kg/m of length.
- Equipped with an anchor plate with minimum area of square 9,032 mm.
- Have a means of retaining wire in the desired position without displacement.
Section 1632

(B) Wire Staples

Provide No. 9 staple with a minimum length of 38.1 mm.

(C) 6.35 mm hardware cloth

Provide hardware cloth having 6.35 mm openings constructed from 24 gauge wire (0.66 mm diameter) or larger, and having a minimum width of 1.2 m as specified in ASTM A-740.

(D) Other Materials

Refer to Division 10.

</table>

1632-3 CONSTRUCTION

(A) Type A

Place structural stone (Class B stone) around the outside perimeter of the inlet structure with approximately 2:1 side slopes, and plate the upstream side with sediment control stone.

(B) Type B

Place structural stone (Class A stone) around the outside perimeter of the inlet structure with approximately 2:1 side slopes, and plate the upstream side with sediment control stone.

(C) Type C

Construct rock inlet sediment trap Type-C devices as shown on the plans and at other locations as directed.

1632-4 MAINTENANCE AND REMOVAL

Maintain the rock inlet sediment trap, and remove and dispose of silt accumulations at the inlet sediment traps when necessary or as directed in accordance with Section 1630.

Remove rock inlet sediment traps as the project nears completion, or as directed. Dress the area to blend with existing contours, and seed and mulch the area in accordance with Section 1660.

1632-5 MEASUREMENT AND PAYMENT

Payment for rock inlet sediment traps will be made as follows:

6.4 mm Hardware Cloth will be measured and paid in linear meters of hardware cloth, measured in place from end post to end post at each separate installation that has been completed and accepted.

Stone for Erosion Control, Class ____ will be measured and paid in accordance with Section 1610.

Sediment Control Stone will be measured and paid in accordance with Section 1610.

Silt Excavation will be measured and paid for in accordance with Section 1630.

Payment will be made under:

SECTION 1633
TEMPORARY ROCK SILT CHECKS

1633-1 DESCRIPTION
Construct, maintain, and remove devices placed in ditches, diversions or swales to reduce water velocity and contain sediment.

The actual conditions that occur during the construction of the project will determine the quantity of temporary rock silt checks constructed. The quantity of silt check dams may be increased, decreased, or eliminated entirely as directed. Such variations in quantity will not be considered as alterations in the details of construction or a change in the character of the work.

1633-2 MATERIALS
Refer to Division 10:

<tr>
<td>Sediment Control Stone</td>
<td>1005</td>
</tr>
</tbody>
</table>

1633-3 CONSTRUCTION

(A) Type A
Place structural stone in the channel, ditch, diversion or swale with approximately 2:1 side slopes. Place sediment control stone, approximately 304.8 mm thick on the upstream side.

(B) Type B
Construct temporary rock silt check type-B devices as shown on the plans and at other locations as directed.

1633-4 MAINTENANCE AND REMOVAL
Maintain the temporary rock silt checks, and remove and dispose of silt accumulations at the silt checks when so directed in accordance with Section 1630.

Remove temporary rock silt checks as the project nears completion. The actual time of removal will be as directed. After removal of silt checks, dress the area to blend with existing contours and seed and mulch the area in accordance with Section 1660.

1633-5 MEASUREMENT AND PAYMENT
Payment for Temporary Rock Silt Checks will be as follows:

*Stone for Erosion Control, Class* ____ will be measured and paid in accordance with Section 1610.

*Sediment Control Stone* will be measured and paid in accordance with Section 1610.

*Silt Excavation* will be measured and paid for in accordance with Section 1630.

SECTION 1634
TEMPORARY ROCK SEDIMENT DAMS

1634-1 DESCRIPTION
Construct, maintain, and remove devices placed in ditches, diversions, swales, or drainage turnouts to reduce water velocity and contain sediment.

The actual conditions that occur during the construction of the project will determine the quantity of temporary rock sediment dams constructed. The quantity of rock sediment dams may be increased, decreased, or eliminated entirely as directed. Such variations in quantity will not be considered as alterations in the details of construction or a change in the character of the work.
Section 1634

1634-2 MATERIALS

Refer to Division 10.

<table>
<thead>
<tr>
<th>Item</th>
<th>Section</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stone for Erosion Control, Class ____</td>
<td>1042-1</td>
</tr>
<tr>
<td>Sediment Control Stone</td>
<td>1005</td>
</tr>
</tbody>
</table>

1634-3 CONSTRUCTION

(A) Type-A

Place structural stone in the channel, ditch diversion, swale, or drainage turnouts with 2:1 side slope on the upstream side and 3:1 side slope on the downstream side. Plate the upstream side with sediment control stone approximately 304.8 mm thick.

Provide a weir section approximately 2/3 of the channel width and with a 2.4 m maximum height from the bottom of the channel. Place the weir section approximately 304.8 mm lower than the sides of the device or the top of the channel, whichever is lower located in the center of the device.

(B) Type-B

Place structural stone in the channel, ditch diversion, swale, or drainage turnouts with 2:1 side slopes and plate the upstream side with sediment control stone approximately 304.8 mm thick.

Provide a weir section with a 1.2 m minimum width constructed 457 mm lower than the sides of the device or the top of the channel, whichever is lower) located in the center of the device.

Construct the temporary rock sediment dam type-B with a 1.5 m minimum thickness measured along the top of the dam structure. Construct the structural stone apron approximately 2.4 m long with a 0.6 m depth.

Use earthen backfill material to extend dam width and create a larger sediment storage volume for the temporary rock sediment dam type-B where needed.

1634-4 MAINTENANCE AND REMOVAL

Maintain the temporary rock sediment dams, and remove and dispose of silt accumulations at the sediment dams when so directed.

Remove temporary rock sediment dams as the project nears completion, or at such time as the Engineer deems the device to be no longer useful. The Engineer will direct the actual time of removal. Dress seed and mulch the area in accordance with Section 1660.

1634-5 MEASUREMENT AND PAYMENT

Payment for Temporary Rock Sediment Dams will be made as follows:

Stone for Erosion Control, Class ____ will be measured and paid in accordance with Section 1610.

Sediment Control Stone will be measured and paid in accordance with Section 1610.  

Silt Excavation will be measured and paid for in accordance with Section 1630.
SECTION 1635
ROCK PIPE INLET SEDIMENT TRAP

1635-1 DESCRIPTION
Construct, maintain and remove devices placed around outside perimeters of pipe structures, to reduce water velocity and trap sediment.

The conditions that occur during the construction of the project will determine the quantity of temporary rock pipe inlet sediment traps to be constructed. The quantity of inlet sediment traps may be increased, decreased, or eliminated entirely as directed. Such variations in quantity will not be considered as alterations in the details of construction or a change in the character of the work.

1635-2 MATERIALS
Refer to Division 10.

</table>

1635-3 CONSTRUCTION

(A) Type A
Construct rock pipe inlet sediment trap type-A devices at locations shown on the plans or as directed.

(B) Type B
Construct rock pipe inlet sediment trap type-B devices at locations shown on the plans or as directed.

1635-4 MAINTENANCE AND REMOVAL
Maintain the rock pipe inlet sediment traps, and remove and dispose of silt accumulations at the pipe inlet sediment traps as directed in accordance with Section 1630.

Remove rock pipe inlet sediment traps as the project nears completion, or as directed. Dress the area to blend with existing contours and seed and mulch in accordance with Section 1660.

1635-5 MEASUREMENT AND PAYMENT
Payment for Temporary Rock Pipe Inlet Sediment Traps will be as follows:
Stone for Erosion Control, Class ___ mm will be measured and paid for in accordance with Section 1610.
Sediment Control Stone will be measured and paid for in accordance with Article 1610.
Silt Excavation will be measured and paid for in accordance with Section 1630.

SECTION 1637
RISER BASIN

1637-1 DESCRIPTION
Construct, maintain, and remove riser basin devices to reduce water velocity and contain sediment.

The actual conditions that occur during the construction of the project will determine the quantity of riser basin devices constructed. The quantity of riser basins may be increased, decreased, or eliminated entirely as directed. Such variations in quantity will not be considered as alterations in the details of construction or a change in the character of the work.
1637-2 MATERIALS

All materials shall meet the following requirements:

<table>
<thead>
<tr>
<th>Item</th>
<th>Section</th>
</tr>
</thead>
<tbody>
<tr>
<td>Perforated C.S. Pipe Tee riser</td>
<td>310</td>
</tr>
<tr>
<td>Sediment Control Stone</td>
<td>1005</td>
</tr>
</tbody>
</table>

1637-3 CONSTRUCTION

Work includes constructing earth embankments and overflow spillways, and installing outlet pipe, perforated tee-riser sections, trash racks, and anti-flotation devices in silt basins. Use either anti-flotation method shown on the plans.

Construct earth embankments with 2:1 side slopes with material meeting roadway embankment Specifications. Maximum height of earth embankments shall be 3.7 m. Compact embankment as directed. Excavate when required to provide minimum surface area and/or minimum storage volume area measured below the top of the principal spillway (top of the riser pipe).

Install a perforated C.S. pipe tee riser as specified on the plans. Place 95.3 mm holes on 76.2 mm centers on the riser pipe and face the riser pipe with sediment control stone. Additional C.S. pipe may be required to obtain the required riser pipe height (crest elevation) as indication on the plans. Construct a trash rack and an anti-flotation device on the riser pipe.

Construct an overflow spillway outlet, on natural ground, 305 mm above riser pipe. Plate overflow spillway with Erosion Control Stone Class B as specified on the plans.

Stabilize the embankment and surrounding areas with vegetation after installation.

1637-4 MAINTENANCE AND REMOVAL

Place a marker in the basin indicating the 50% volume level. Clean out riser basin when sediment volume reaches 50% of the storage volume in accordance with Section 1630.

Remove riser basin devices as the project nears completion or as directed. Dress, seed and mulch the area in accordance with Section 1660 after removal of the riser basin.

1637-5 MEASUREMENT AND PAYMENT

Stone for Erosion Control, Class B will be measured and paid in accordance with Section 1610.

Sediment Control Stone will be measured and paid in accordance with Section 1610.

Silt Excavation will be measured and paid in accordance with Section 1630.

__ mm x __ mm x __ mm Perforated C.S. Pipe Tee Riser, __ mm Thick will be measured and paid for in units of each that has been installed and accepted. Such price shall include furnishing and installing any additional pipe required for correct riser height, the trash rack, and the anti-flotation device.

Outlet Pipe will measured and paid in accordance with Section 310.

Silt Excavation will be measured and paid in accordance with Section 1630.

Payment will not be made for any work performed under this section that is solely for the convenience of the Contractor or that is made necessary due to negligence of the Contractor.

Payment will be made under:

<table>
<thead>
<tr>

</tbody>
</table>
SECTION 1638
STILLING BASIN

1638-1 DESCRIPTION

Construct, maintain, and remove earth embankments used to trap sediment from dewatering construction sites. Work includes providing permeable stone drain, cleaning out, maintaining, removing and disposing of the stilling basins and all components and reshaping the area.

The actual conditions that occur during the construction of the project will determine the quantity of stilling basins constructed. The quantity of stilling basins may be increased, decreased, or eliminated entirely as directed. Such variations in quantity will not be considered as alterations in the details of construction or a change in the character of the work.

1638-2 MATERIALS

Utilize suitable excavated materials, as specified in Sections 225, 230, and 240, in the construction of earth embankments for stilling basins, except where otherwise specified.

<table>
<thead>
<tr>
<th>Item</th>
<th>Section</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stone for Erosion Control Class</td>
<td>1042-1</td>
</tr>
<tr>
<td>Sediment Control Stone</td>
<td>1005</td>
</tr>
</tbody>
</table>

1638-3 CONSTRUCTION

Construct stilling basins at the locations shown on the plans and at other locations as directed.

Construct earth embankment with a permeable stone drain in a rectangular form adjacent to the stream and culvert following the applicable requirements of Section 235. The maximum height allowed for earth dikes is 1.5 meters. Excavate below the natural ground for greater depths of basins.

Use a minimum of three coir fiber baffles as directed by the standard drawing.

1638-4 MAINTENANCE AND REMOVAL

Maintain the stilling basins, coir fiber baffles, and remove and dispose of silt accumulations at the stilling basins in accordance with Section 1630.

Remove the stilling basins as the project nears completion, or at such time the Engineer deems the device to be no longer useful. Dress and seed and mulch the area after removal of the stilling basin in accordance with Section 1660.

1638-5 MEASUREMENT AND PAYMENT

Stilling Basin quantities will be measured and paid for in cubic meters, in place and computed by the average-end-method for the actual number of cubic meters of basin capacity. The measurements will be the internal measurements of the basin measured up to the top of the permeable stone drain. Materials used to construct the basin that originates from another payment item (i.e. unclassified excavation, borrow excavation) will not be deducted from the volume of that original pay item.

Payment will be made under:

<table>
<thead>
<tr>

SECTION 1650
WOODED AREA CLEANUP

1650-1 DESCRIPTION

Remove and satisfactorily dispose of debris and of dead, partially dead, or broken vegetation from wooded areas of the right of way outside clearing limits, and from other
areas outside construction limits on which seeding and mulching is not to be performed. Work includes treating stumps with herbicide, and repairing any damage to vegetation.

Cutover timberland, reforested areas, or thickets of young native volunteer vegetation will be considered to be wooded areas.

1650-2 MATERIALS

Refer to Division 10.

<table>
<thead>
<tr>
<th>Item</th>
<th>Section</th>
</tr>
</thead>
<tbody>
<tr>
<td>Herbicide</td>
<td>1060-13</td>
</tr>
</tbody>
</table>

1650-3 CONSTRUCTION REQUIREMENTS

Remove all logs, stumps, snags, loose roots, down timber, slabs, tree laps, lumber, dead or partially dead trees, broken trees or brush, dead brush, sawdust piles, discarded fences, leaf piles, brick, tile masonry, and other debris from the cleanup areas. Cut, all dead trees, stumps, snags, broken or partially dead trees, and brush, flush with the ground. Remove vegetation that dies between initial cleanup and completion of the project prior to final acceptance. Hand raking of areas or removal of a normal leaf layer is not required unless stated in the contract.

Treat partially dead stumps or broken vegetation with a herbicide immediately after cutting. Use the herbicide and the method and rate of application, specified in the contract. Follow all applicable instructions, warnings, and safety precautions stated on the manufacturer's label, and comply with all laws and regulations governing herbicides that are in effect at the time of use.

Dispose of all material cleaned up under this item in accordance with the applicable requirements of Article 200-5 and Article 802-2.

1650-4 DAMAGE TO REMAINING VEGETATION

Conduct operations in such a manner as to prevent injury to trees, shrubs, or other types of vegetation that are to remain growing, and also to prevent damage to adjacent property.

Remove broken branches and rough edges of scarred trees or shrubs. Prune and shape these areas in accordance with the International Society of Arboriculture pruning techniques. Cut and dispose of any plants that are damaged beyond their value for landscape purposes and seed and mulch vegetation that is damaged by the Contractor at no cost to the Department when so directed.

1650-5 MEASUREMENT AND PAYMENT

Wooded Area Cleanup will be measured and paid for in hectares, measured horizontally, completed and accepted.

Payment will be made under:

<table>
<thead>
<tr>
<th>Pay Item</th>
<th>Pay Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wooded Area Cleanup</td>
<td>Hectare</td>
</tr>
</tbody>
</table>

SECTION 1651

SELECTIVE VEGETATION REMOVAL

1651-1 DESCRIPTION

Remove selected living trees and undesirable living undergrowth from areas of the right of way outside clearing limits in accordance with these Specifications. Work includes treating stumps with herbicide, and repairing any damage to vegetation.
1651-2 MATERIALS
Refer to Division 10.

Item          Section
Herbicide     1060-13

1651-3 CONSTRUCTION REQUIREMENTS

(A) Trees
Remove trees shown on the plans or designated. Measure all tree diameter sizes at a height of 1.4 m above the ground.

(B) Undergrowth
Remove all undergrowth from areas shown on the plans, described in the Specifications, or designated, except for those plants designated to be preserved. All plants less than 101.6 mm in diameter, measured at a height of 1.4 m above the ground shall be classified as undergrowth.

(C) General
Treat stumps with a herbicide immediately after cutting to prevent sprouting. Use the herbicide and the method and rate of application specified in the Specifications. Follow all applicable instructions, warnings, and safety precautions stated on the manufacturer's label, and comply with all laws and regulations governing herbicides that are in effect at the time of use.

When work is performed properly in accordance with these Specifications, no subsequent re-cutting of sprouts or seedling growth will be required.

Dispose of all trees and undergrowth cut in accordance with the applicable requirements of Article 200-5.

1651-4 DAMAGE TO REMAINING VEGETATION

Conduct operations so as to prevent injury to trees, shrubs, or other types of vegetation that are to remain growing, and also to prevent damage to adjacent property.

Remove broken branches and rough edges of scarred trees or shrubs. Shape and make smooth these areas in accordance with generally accepted horticultural practice. Cut and dispose of any plants that are damaged beyond their value for landscape purposes and seed and mulch vegetation that is damaged by the Contractor at no cost to the Department.

1651-5 MEASUREMENT AND PAYMENT

Selective Tree Removal will be measured and paid for in units of each. Each tree removed will be paid for at the contract unit price for the pay item size applicable to the actual tree diameter, measured at a height of 1.4 m above the ground, as indicated in Table 1651-1 below.

<table>
<thead>
<tr>

**SECTION 1660**

**SEEDING AND MULCHING**

1660-1 **DESCRIPTION**

Prepare seedbed; furnish, place, and incorporate limestone, fertilizer, and seed; compact seedbed; furnish, place, and secure mulch; mow; and perform other operations necessary for the permanent establishment of vegetation from seed on shoulders, slopes, ditches, or other roadside areas.

Perform seeding and mulching on all earth areas disturbed by construction and on portions of areas seeded under previous contracts as directed where there is unsatisfactory vegetative cover.

Adapt operations to variations in weather or soil conditions as necessary for the successful establishment and growth of the grasses or legumes.

Preserve the required line, grade, and cross section of the area treated.

The actual conditions that occur during the construction of the project will determine the quantity of mowing. The quantity of mowing may be increased, decreased, or eliminated entirely as directed. Such variations in quantity will not be considered as alterations in the details of construction or a change in the character of the work.

1660-2 **MATERIALS**

Refer to Division 10.

**Item** | **Section**
---|---
Fertilizer | 1060-2
Limestone | 1060-3
Seed | 1060-4
Mulch for Erosion Control | 1060-5

Use undiluted emulsified asphalt for tacking material.

The analysis of fertilizer and the kinds of seed will be as stated in the contract.

1660-3 **COORDINATION WITH GRADING OPERATIONS**

Perform seeding and mulching operations on a section by section basis immediately upon completion of earthwork sections in accordance with the requirements of Article 225 - 2.

When grading operations have been suspended, and seeding and mulching has been performed on areas where work has been suspended, include in the work of seeding and mulching of the adjacent sections any necessary overlapping of operations on previously established vegetative cover.

When the Contractor fails or neglects to coordinate grading with seeding and mulching operations and to diligently pursue the control of erosion and siltation, the Engineer may suspend the Contractor's grading operations until such time as the work is coordinated in a manner acceptable to the Engineer. Such suspension will be in accordance with the requirements of Article 108-7.
1660-4 SEEDBED PREPARATION

Cut and satisfactorily dispose of weeds or other unacceptable growth on the areas to be seeded. Shape and smooth uneven and rough areas outside of the graded section, such as crop rows, farm contours, ditches and ditch spoil banks, fence line and hedgerow soil accumulations, and other minor irregularities which cannot be obliterated by normal seedbed preparation operations, to provide for more effective seeding and for ease of subsequent mowing operations.

Scarify or otherwise loosen the soil to a depth of not less than 127 mm except as otherwise provided below or otherwise directed. Break clods and work the top 50.8 to 76.2 mm of soil into an acceptable seedbed by the use of soil pulverizers, drags, or harrows; or by other approved methods. Remove all rock and debris 76.2 mm or larger on median, shoulder, and ditch cut or fill slopes which are 3:1 or flatter, prior to the application of seed and fertilizer. Remove rock 152.4 mm and larger displaced during seeding operations.

Scarify, groove, trench, or puncture all slope surfaces. The depth of preparation and the degree of smoothness of the seedbed may be reduced on cut slopes that are 2:1 and steeper, as permitted by the Engineer.

On cut slopes that are either 2:1 or steeper, the Engineer may permit the preparation of a partial or complete seedbed during the grading of the slope. If at the time of seeding and mulching operations such preparation is still in a condition acceptable to the Engineer, additional seedbed preparation may be reduced or eliminated.

Limit seedbed preparation to within 609.6 mm of the edge of any pavement to a depth of 50.8 mm to 76.2 mm.

Do not prepare seedbed when the soil is frozen, extremely wet, or when the Engineer determines that it is an otherwise unfavorable working condition.

1660-5 APPLYING AND COVERING LIMESTONE, FERTILIZER, AND SEED

(A) General

The contract will state the seasonal limitation for seeding operations; the kinds of grades of fertilizers; the kinds of seed; and the rates of application of limestone, fertilizer, and seed.

Obtain approval from the Engineer before using equipment for the application, covering, or compaction of limestone, fertilizer, and seed. Approval may be revoked at any time if equipment is not maintained in satisfactory working condition, or if the equipment operation damages the seed.

Apply limestone, fertilizer, and seed within 24 hours after completion of seedbed preparation unless otherwise permitted by the Engineer. When the Engineer determines that weather and soil conditions are unfavorable, do not distribute any limestone or fertilizer and do not sow any seed.

Take adequate precautions to prevent damage to traffic, structures, guardrails, traffic control devices, or any other appurtenances during the application of fertilizer. Provide adequate covering or change methods of application as required to avoid such damage. Repair any damage that occurs, including any cleaning that may be necessary.

(B) Limestone and Fertilizer

Limestone may be applied as a part of the seedbed preparation, provided it is immediately worked into the soil. If not so applied, distribute limestone and fertilizer uniformly over the prepared seedbed at the specified rate of application and then harrow, rake, or otherwise thoroughly work or mix into the seedbed.

If liquid fertilizer is used, locate storage containers for the liquid fertilizer on the project and equip for agitation of the liquid prior to its use. Equip the storage
containers with approved measuring or metering devices which will enable the Engineer to record at any time the amount of liquid that has been removed from the container. Calibrate application equipment for liquid fertilizer, other than a hydraulic seeder, to ensure that the required rate of fertilizer is applied uniformly.

(C) Seed
Distribute seed uniformly over the seedbed at the required rate of application, and immediately harrow, drag, rake, or otherwise work so as to cover the seed with a layer of soil. Cover to a depth as directed by the Engineer. If 2 kinds of seed are to be used which require different depths of covering, sow separately.

When a combination seed and fertilizer drill is used, drill fertilizer with seed after applying and incorporating limestone into the soil. If using two kinds of seed requiring different depth of cover, the seed requiring the lighter cover may be sown broadcast or with a special attachment to the drill, or drilled lightly following the initial drilling operation.

When using a hydraulic seeder for application of seed and fertilizer, do not allow the seed to remain in water containing fertilizer for more than 30 minutes prior to application unless otherwise permitted.

Compact the seedbed immediately after seed has been properly covered in the manner and degree approved by the Engineer.

(D) Modifications
When adverse seeding conditions are encountered due to steepness of slope, height of slope, or soil conditions, the Engineer may direct or permit that modifications be made in the above requirements which pertain to incorporating limestone into the seedbed; covering limestone, seed, and fertilizer; and compaction of the seedbed.

Such modifications may include but not be limited to the following:

1. The incorporation of limestone into the seedbed may be omitted on
   a. cut slopes steeper than 2:1
   b. on 2:1 cut slopes when a seedbed has been prepared during the excavation of the cut and is still in an acceptable condition; or
   c. on areas of slopes where the surface of the area is too rocky to permit the incorporation of the limestone.

2. The rates of application of limestone, fertilizer, and seed on slopes 2:1 or steeper or on rocky surfaces may be reduced or eliminated.

3. Compaction after seeding may be reduced or eliminated on slopes 2:1 or steeper, on rocky surfaces, or on other areas where soil conditions would make compaction undesirable.

1660-6 MULCHING

(A) General
Mulch all seeded areas unless otherwise indicated in the contract or directed by the Engineer.

Use grain straw as mulch at any time of the year. If permission to use material other than grain straw is requested and the use of such material is approved by the Engineer, the seasonal limitations, the methods and rates of application, the type of binding material, or other conditions governing the use of such material will be established by the Engineer at the time of approval.
(B) Applying Mulch

Apply mulch within 24 hours after completion of seeding unless otherwise permitted. Exercise care to prevent displacement of soil or seed or other damage to the seeded area during the mulching operations.

Spread mulch uniformly by hand or by approved mechanical spreaders or blowers that will provide an acceptable application. An acceptable application will be that which will allow some sunlight to penetrate and air to circulate but also partially shade the ground, reduce erosion, and conserve soil moisture.

(C) Holding Mulch

Hold mulch in place by applying a sufficient amount of undiluted emulsified asphalt or other approved binding material. The Engineer will approve the rate and method of application of binding material. Apply the binding material directly with the mulch or immediately following the mulch application.

Take adequate precautions to prevent damage to traffic, structures, guardrails, traffic control devices, or any other appurtenances during the application of asphalt binding material. Provide adequate covering or change methods of application as required to avoid such damage. Repair any damage that occurs, including any cleaning that may be necessary.

Take sufficient precautions to prevent mulch from entering drainage structures through displacement by wind, water, or other causes and promptly remove any blockage to drainage facilities which may occur.

1660-7 MAINTENANCE OF SEEDING AND MULCHING

Maintain areas where seeding and mulching have been performed in a satisfactory condition until final acceptance of the project.

Mow at the location and times as directed.

Correct areas of damage or failure due to any cause by repairing or completely reworking as directed.

Repair in accordance with Section 1661 where extensive seedbed preparation is unnecessary.

Rework seeding and mulching in accordance with this section where correction requires extensive seedbed preparation, or where earthwork repairs or complete reshaping are necessary.

As an exception to the above, repair areas of damage or failure resulting either from negligence on the part of the Contractor in performing subsequent construction operations or from not taking adequate precautions to control erosion and siltation as required throughout the various sections of the Specifications, at no cost to the Department.

1660-8 MEASUREMENT AND PAYMENT

Seeding and Mulching will be measured and paid for in hectares, measured along the surface of the ground that has been completed and accepted. No direct payment will be made for furnishing and applying the limestone and fertilizer as such work and materials will be considered to be incidental to the work covered by Seeding and Mulching.

Mowing will be measured and paid for in hectares measured along the surface of the ground that has been mowed as directed. Where an area has been mowed more than once at the direction of the Engineer, separate measurement will be made each time the area is mowed.

Corrective work will be compensated where seeding and mulching has been damaged or has failed to establish a satisfactory stand of vegetation.
Section 1660

Where correction can be made without extensive seedbed preparation, the work will be paid for in accordance with Section 1661 for Seed for Repair Seeding and Fertilizer for Repair Seeding.

Where earthwork and seeding and mulching has been damaged to the extent that earthwork repairs or complete reshaping are necessary, the Contractor will be paid at the contract unit price for the excavated material required for repairs to the damaged earthwork, and at the contract unit price for Seeding and Mulching for correcting the damaged seeding and mulching.

As an exception to the above, repair, at no cost to the Department, any damage to earthwork or seeded and mulched areas, which is due to carelessness or neglect on the part of the Contractor.

Payment will be made under:

<table>

SECTION 1661
REPAIR SEEDING

1661-1 DESCRIPTION

Repair areas that have been previously seeded and mulched in accordance with Section 1660 but that have been damaged or have failed to successfully establish a stand of vegetation. This work does not include repair seeding made necessary by negligence on the part of the Contractor as described in Article 1660-7, nor does it include repairs to temporary seeding constructed in accordance with Section 1620.

Repair damage or failure in accordance with this section where correction can be made without extensive seedbed preparation.

Where correction will require extensive seedbed preparation, or where earthwork repairs or complete reshaping are necessary, repair in accordance with Section 1660.

Repair seeding includes minor seedbed preparation; the furnishing, placing, and covering of fertilizer and seed; and mulch as required, all in accordance with these Specifications.

Perform repair seeding promptly at the locations and times as directed.

The actual conditions that occur during the construction of the project will determine the quantity of seed or fertilizer used. The quantity of seed or fertilizer may be increased, decreased, or eliminated entirely at the discretion of the Engineer. Such variation in quantity will not be considered as alterations in the details of construction or a change in the character of the work.

1661-2 MATERIALS

Refer to Division 10.

<table>
<thead>
<tr>

</tr>
<tr>
<td>Seed</td>
<td>1060-4</td>
</tr>
<tr>
<td>Mulch for Erosion Control</td>
<td>1060-5</td>
</tr>
</tbody>
</table>

The analysis of fertilizer and the kinds of seed shall be as stated in the contract.

1661-3 SEEDBED PREPARATION

Seedbed preparation will be required unless otherwise permitted.

A seedbed preparation as extensive as that performed for the original seeding and mulching will not be required. The degree of preparation shall be sufficient to retain the
seed against displacement by wind, rain, or surface runoff, and be acceptable to the Engineer. The acceptable degree of seedbed preparation will depend on the location, soil conditions, and drainage conditions at the site.

1661-4 APPLICATION OF FERTILIZER, SEED AND MULCH

The analysis of fertilizer, the kinds of seed, and the rates of application of seed and fertilizer is the same as specified in the project special provision for seeding and mulching, unless otherwise directed, but in no case will the total rate of seed and fertilizer vary more or less than 25 percent of that specified for seeding and mulching.

Do not distribute fertilizer or sow seed when the Engineer determines that conditions are unfavorable for such operations.

Cover fertilizer and seed and secure mulch in place to prevent displacement by wind, rain, or surface runoff.

The requirements of Article 1660-5 will be applicable to the approval of equipment; the use of liquid fertilizer; and the protection of traffic, structures, guardrails, traffic control devices, and other appurtenances.

1661-5 MEASUREMENT AND PAYMENT

Seed for Repair Seeding will be measured and paid for in kilograms. The weight of seed will be determined by bag count of standard weight bags or by weighing the seed on certified platform scales or other certified weighing devices. No direct payment will be made for furnishing and applying mulch and all materials used to hold mulch in place, as such work and materials will be considered to be incidental to the work covered by Seed for Repair Seeding.

Fertilizer for repair seeding will be measured and paid for in metric tons. The weight of dry fertilizer will be determined by bag count of standard weight bags, or by weighing the fertilizer in trucks on certified platform scales or other certified weighing devices. The weight of liquid fertilizer will be the equivalent weight in metric tons of dry fertilizer.

Payment will be made under:

SECTION 1662 SUPPLEMENTAL SEEDING

1662-1 DESCRIPTION

Apply additional seed to areas that have been previously seeded with permanent seed but on which there is an unsatisfactory cover of vegetation.

This work is only to provide an additional amount of seed to areas that have an insufficient stand of vegetation but which are too well established to require repair seeding. Work covered by this provision does NOT include seedbed preparation, fertilizer, or mulch.

Perform supplemental seeding promptly at the locations and times as directed.

The actual conditions that occur during the construction of the project will determine the quantity of seed used. The quantity of seed may be increased, decreased, or eliminated entirely as directed. Such variation in quantity will not be considered as alterations in the details of construction or a change in the character of the work.

Use the kinds of seeds as stated in the contract.

1662-3 APPLICATION
   Seedbed preparation will not be required.

   The contract will state the kinds and rates of application of seed. Sow no seed when the Engineer determines that conditions are unfavorable.

   The requirements of Article 1660-5 will be applicable to the approval of equipment; and the protection of traffic, traffic control devices, and other appurtenances.

1662-4 MEASUREMENT AND PAYMENT
   *Seed for Supplemental Seeding* will be measured and paid for in kilograms. The weight of seed will be determined by bag count of standard weight bags or by weighing the seed on certified platform scales or other certified weighing devices.

   Payment will be made under:

SECTION 1664

SODDING

1664-1 DESCRIPTION
   Prepare soil, furnish and place limestone, fertilizer, sod, and water; and other operations necessary for the permanent establishment of vegetation from sod on shoulders, slopes, ditches, or other roadside areas.

   Adapt operations to variations in weather and soil conditions so as to assure the successful establishment and growth of grasses.

   Preserve the required line, grade, and cross-section of the area treated.

   The actual conditions that occur during the construction of the project will determine the quantity of water used and mowing required. The quantity of water or mowing may be increased, decreased or eliminated entirely at the direction of the Engineer. Such variations in quantity will not be considered alterations in the details of construction or a change in the character of the work.

1664-2 MATERIALS
   Refer to Division 10.

<td>1060-3</td>
</tr>
<tr>
<td>Sod</td>
<td>1060-7</td>
</tr>
<tr>
<td>Water</td>
<td>1060-9</td>
</tr>
</tbody>
</table>

   The contract will state the analysis of fertilizer and the kinds of sod.

1664-3 SODDING
   (A) Handling and Storing Sod
   Exercise extreme care during all operations of loading, transporting, unloading, storing, placing, tamping, and staking sod, to prevent breaking the sod sections and to prevent the sod from drying out. Any sod that is torn, broken, or too dry
will be rejected. Torn or broken sod, if kept moist, may be used for filling unavoidable small gaps in sod cover as permitted.

Place sod on the designated areas within 48 hours after being cut unless otherwise directed.

(B) Soil Preparation

Remove litter and other debris. Mow and satisfactorily dispose of weeds or other unacceptable growth on the areas to be sodded.

Bring the area to be sodded to a firm uniform surface at such elevation that the surface of the complete sodding conforms to the finished grade and cross section as shown on the plans.

Scarify or otherwise loosen soil to a depth of not less than 127 mm. Break clods and work the top 50.8 to 76.2 mm of soil into an acceptable soil bed by using soil pulverizers, drags, or harrows.

Place limestone and fertilizer prior to placing the sod. The contract will state the kind and grade of fertilizer, and the rates of application of limestone and fertilizer. Distribute the limestone and fertilizer uniformly over the area and thoroughly mix in the top 127 mm of the soil by discing, harrowing, or other approved methods.

Prepare the area by harrowing, dragging, raking, or other approved methods to give a lawn type finish. Remove all trash, debris and stones larger than 38 mm in diameter or other obstructions that could interfere with the placing of the sod. Moisten the finished surface with water prior to placing the sod.

(C) Placing Sod

The contract will state the seasonal limitations for sodding and the kind of sod to use.

Sod handling and placement will be a continuous process of cutting, transporting, and installing without appreciable delays. Install sod within 48 hours after being cut and water immediately after installation.

Place sod firmly and carefully by hand within 24 hours after soil preparation is completed and accepted by the Engineer. Pack each piece of sod tightly against the edge of adjacent pieces so that the fewest possible gaps will be left between the pieces. Close unavoidable gaps with small pieces of sod.

When placing sod on a slope, begin at either the top or the toe of the slope. Place sod with the long edge horizontal and with staggered vertical joints. Turn the edge of the sod slightly into the ground at the top of a slope and place a layer of earth over it and compact so as to divert the surface water over and onto the top of the sod.

Stake sod in place by driving stakes flush with the sod, on all slopes 2:1 or steeper, in drainage channels, on other areas shown on the plans, and on any areas that are in such condition that there is danger of sod slipping. Perform staking concurrently with sod placement and prior to tamping with sound wooden stakes which are approximately 645.2 square mm or 25.4 mm in diameter and not less than 304.8 mm in length. Place enough stakes to prevent slipping or displacement of the sod. Drive stakes perpendicular to the slope. Where backfill is necessary on cut slopes to obtain a uniform sodding area, provide stakes of sufficient length to reach a minimum of 76.2 mm into the solid earth underneath the backfill.

On all other areas, use metal staples in place of wooden stakes. The metal staples should be 305 mm long, made of 2.3 mm in diameter new steel wire so as not to bend when pinned or driven through the sod. Shorter staples may be used with the approval of the Engineer.

Place, stake, and staple the sod where necessary, then tamp or roll carefully and firmly by acceptable means. If rolled, roller shall weigh 223.2 kg/m of roller
width. Take extreme care to prevent the installed sod from being torn or displaced.

Do not place sod when the atmospheric temperature is below 0°C. Do not use frozen sod or place on frozen soil.

(D) Watering Sod

Water carefully and thoroughly after sod has been placed and tamped. Perform watering as directed until final acceptance. Application of water may be made by the use of hydraulic seeding equipment, farm type irrigation equipment, or by other acceptable means.

1664-4 MAINTENANCE

Maintain sod in a satisfactory and live condition until final acceptance of the project. Maintenance includes watering and mowing at the locations and times as directed.

1664-5 MEASUREMENT AND PAYMENT

Sodding will be measured and paid for in square meters, measured along the surface of the ground that has been completed and accepted. No direct payment will be made for mowing the sodding areas prior to soil preparation as such work will be considered to be incidental to sodding. No direct payment will be made for furnishing and applying limestone and fertilizer, as such will be incidental to the work covered by sodding.

Water will be measured and paid for in 1 kiloliter units. Measurement of water will be made by means of an approved metering device at the source of supply, or by determining the volumetric capacity of tank trucks used to deliver water to the project and recording the number of loads delivered by each truck.

Mowing will be measured and paid for in accordance with Section 1660.

The above prices and payment will be full compensation for all work covered by this section.

Payment will be made under:

SECTION 1665
FERTILIZER TOPDRESSING

1665-1 DESCRIPTION

Furnish and uniformly distribute fertilizer as a topdressing to areas on which seeding and mulching, sprigging, or sodding are completed and a vegetative cover is established. Top dress previously seeded, sprigged, or sodded areas under other contracts when so stated in the contract or where so directed.

The actual conditions that occur during the construction of the project will determine the quantity of fertilizer topdressing used. In the event that a vegetative cover has not had sufficient time to develop to a size suitable for topdressing before completion of the project, the work of fertilizer topdressing will be decreased or eliminated entirely. Where the use of additional fertilizer topdressing would be beneficial to the establishment of grasses or legumes, the work of fertilizer topdressing will be increased. The quantity of fertilizer topdressing may be increased, decreased, or eliminated entirely as directed. Such variations in quantity will not be considered as alterations in the details of construction or a change in the character of work.

1665-2 MATERIALS

Use fertilizer containing no urea for topdressing.
Refer to Division 10.

**Item**

Fertilizer

The analysis of fertilizer shall be as stated in the contract.

### 1665-3 APPLICATION OF FERTILIZER TOPDRESSING

Apply fertilizer topdressing at the locations and times as directed, regardless of whether or not other seeding, sprigging, or sodding operations are underway at the time.

The contract will state the rate of application and analysis of fertilizer. Distribute fertilizer uniformly without any type of soil disturbance.

Refer to the requirements of the contract for the approval of equipment; the use of liquid fertilizer; and the protection of traffic, structures, guardrails, traffic control devices, and other appurtenances.

### 1665-4 MEASUREMENT AND PAYMENT

_Fertilizer Topdressing_ will be measured and be paid in metric tons. The weight of dry fertilizer will be determined by bag count of standard weight bags, or by weighing the fertilizer in trucks on certified platform scales or other certified weighing devices. The weight of liquid fertilizer will be the equivalent weight in metric tons of dry fertilizer.

In the event that an alternative analysis of fertilizer topdressing is approved and used, it will be in an equivalent number of metric tons of fertilizer, of the specified analysis, based on nutrient value.

Payment will be made under:

### SECTION 1670

#### PLANTING

### 1670-1 DESCRIPTION

Furnish, deliver, and plant trees, shrubs, vines, ground covers, bedding plants, and seedlings at locations shown on the plans or as directed, in accordance with these Specifications.

The work of planting includes plant bed preparation, initial planting, plant establishment, and replacement planting.

Perform the operations in a careful, workmanlike manner that will promote the continued life and healthy growth of all plants in their final location.

The actual conditions that occur during the construction of the project will determine the quantity of plant bed fumigation or post-emergence and pre-emergence herbicidal treatment for plant beds. The quantities of plant bed fumigation and post-emergence and pre-emergence herbicidal treatment for plant beds may be increased, decreased, or eliminated entirely as directed. Such variations in quantity will not be considered as alterations in the details of construction or a change in the character of the work.
1670-2 MATERIALS

Refer to Division 10.

</tbody>
</table>

Furnish nursery grown plant materials.

Use methyl bromide as fumigant consisting of a mixture of 80% methyl bromide and 20% chloropicrin. A different ratio of fumigant containing methyl bromide and chloropicrin may be used provided that the amount of active ingredient specified in Article 1670-7 is provided.

Use a 2 mil polyethylene agricultural plastic sheeting free of holes, punctures, and tears to cover the fumigated plant beds. Use an appropriate width of plastic for the width of the plant bed, and obtain approval prior to fumigation.

The contract will state the kind of herbicides to be used.

1670-3 WEATHER AND SEASONAL LIMITATIONS

Perform planting operations only between the dates shown in the contract except where otherwise permitted in writing.

Do not plant when the temperature is below 0°C, when the plant hole is frozen or when soil to excavate and fill the plant hole is frozen, or too wet.

Perform fumigation during or within 2 weeks prior to the time allowed for planting as shown in the contract. Fumigate when the soil temperature is at least 13°C at a depth of 127 mm and moderately moist (50-85% of field capacity).

Apply post-emergence herbicide when the weeds are near maturity but not when the weeds are under stress from drought, disease, insect damage, or any other cause.

Do not apply post-emergence herbicide when rain is likely within the next 6 hours or as restricted on the product label.

1670-4 CARE AND HANDLING PLANTS

(A) General

Exercise utmost care in digging, loading, transporting, unloading, planting, or otherwise handling plants, and use adequate precautions to prevent injury to or drying out of the trunk, branches, or roots; and to prevent freezing of the plant roots. Heel-in plants within 48 hours of delivery from the nursery, if they can not be planted within that time.

Properly maintain all heeled-in plants until planted. Do not have plants remain heeled-in for more than 30 days. Open plants immediately when delivered in boxes or wrapped in bundles or other forms of closed packages and inspect and dampen if necessary.

(B) Balled and Burlapped Plants

Protect the roots of balled and burlapped plants, if not immediately planted after delivery, by adequately covering with a soil, mulch, or sawdust that is kept moist constantly in an acceptable manner appropriate to weather or seasonal conditions. Preserve the solidity of the plant ball carefully.
(C) Bare Rooted Plants
   Refrigerate or immediately heel-in all plants, if not promptly planted, in moist soil, mulch, or sawdust in an acceptable manner corresponding to generally accepted horticultural practice.

   Protect the plants from drying out by means of wet canvas, burlap, or straw, or by other means acceptable while being transported or planted.

1670-5 PLANT LOCATION

   Locate and mark on the ground locations for plants and outlines for areas to be planted or reforested and obtain approval prior to digging plant holes for beds.

   Where so directed, furnish and install standard identification wires with plastic flags to designate individual plants in major planting areas.

   Flags will not necessarily be needed for all plants required by the contract, but use these flags on portions of the project until plant locations in these portions are approved.

   Unforeseen conditions may make it necessary to make minor adjustments in plant locations due to utility lines, traffic signs, rock, drainage, etc., and such adjustments will be permitted subject to approval.

1670-6 PRUNING

   Prune shrubs and trees after planting as shown on the plans or as directed by the Engineer. Pruning done at any time in no way alters the Department's right to reject plant material. Prune in accordance with the International Society of Arboriculture pruning techniques, and according to shape, size, and condition of the individual plant.

1670-7 PLANT BED TREATMENT

(A) General:
   Treat plant beds by fumigation or by application of herbicides where called for by the plans or directed.

(B) License
   Make pesticide applications by or under the direct supervision of an applicator licensed by the North Carolina Department of Agriculture and Consumer Services.

(C) Fumigation
   Fumigate the plant beds with an approved fumigant in preparation for planting.

   Prior to fumigation, level the plant bed to a proper planting grade. Till the bed to a depth of 127 to 203.2 mm. Prepare soil in good tilth with no dry clods over 25 mm in diameter present. Cover with plastic tarp within 24 hours of soil preparation completion or other approved process.

   Apply the approved fumigant gas according to product labeling. If plastic is required then use envelope folds at the edges of the bed with the edge of the plastic buried 101.6 to 152.4 mm deep.

   Keep the plastic over the bed for a period of 48 to 72 hours. Reform the bed to the required shape, after removal of the plastic, with little or no soil inversion. Pursue continuous planting within 24 hours of plastic cover removal.

(D) Post-Emergence Herbicidal Treatment
   Post-emergence herbicidal treatment includes applications of a systemic post-emergence total vegetation control herbicide.

   The contract will state the rates of application of the post-emergence herbicides.

   Apply all herbicides in accordance with the manufacturer's instructions on the product label.

   Apply post-emergence herbicide when the weeds are near maturity but not when the weeds are under stress from drought, disease, insect damage, or any other
cause. If cloudy weather or other poor growing conditions are present, extend this 7 day period until there are visible signs of herbicidal activity. Reapply if necessary to achieve a thorough control.

Post-Emergence Application for Plant Bed Preparation:
Apply a systemic post-emergence total vegetation control herbicide to the bed area before any tilling or mowing is performed. Perform no tilling or mowing for at least 7 days after the application. Thoroughly till the bed after the waiting period, or when injury to the vegetation appears. Prepare the soil in good tilth with no clods over 25.4 mm present and prior to planting.

Post-Emergence Application for Plant Bed Maintenance:
Apply a systemic post-emergence herbicidal treatment in accordance with product label in a manner to ensure no damage to planted material. Perform no mowing or vegetation removal by other means for at least 7 days after the application.

(E) Pre-Emergence Herbicidal Treatment
Pre-emergence herbicidal treatment includes the application of a pre-emergence herbicide.
Apply a pre-emergence herbicide to the plant bed after the existing vegetation has been completely controlled by a post-emergence herbicide application as specified in Subarticle 1670-7 (D) and after installation of planting and mulching as described in Article 1670-9 and Article 1670-10. Apply pre-emergence herbicide following planting and mulching of plant bed prior to germination of weed seeds. An additional application of post-emergence herbicidal treatment may be necessary to control emerged weeds, as directed, if sufficient time has lapsed between tillage and installation of plant material and mulch. No direct payment will be made for additional post-emergence herbicidal work if such work is due to carelessness or neglect on the part of the Contractor.

Apply herbicide evenly over the soil surface with properly calibrated equipment at the specified rate.

If a minimum of 12.7 mm of rainfall does not occur within 15 days of application of pre-emergence herbicidal treatment, apply a minimum of 12.7 mm of water (12.7 liters per square meter uniformly over the planting area to activate the herbicide.

1670-8 EXCAVATION OF PLANT HOLES
Provide cylindrical shaped plant hole excavations for plants other than reforestation plants, with the plant location stake marking the center of the circle and with the sides of the hole being approximately vertical. When mechanical means are used which make digging of cylindrical holes impractical, the complete hole shall have the minimum dimensions as shown on the plans.

When plants are to be grouped together in a plant bed as contrasted to widely separated individual plants, and when so indicated on the plans, loosen and pulverize clods to a depth of not less than 127 mm for the entire area of the plant bed by means of a scarifier, disc, spade, or other appropriate means before plant holes are dug.

Plant reforestation plants in holes made by a planting spade, planting bar, or other means that meet the approval of the Engineer. Make the hole of sufficient size to accommodate the entire extended root system of the plant without cramping.

1670-9 PLANTING, BACKFILLING, AND WATERING
(A) General
The plans will state the kind and rate of application of fertilizer. Apply fertilizer during backfilling operations in a manner that will ensure proper placement of the fertilizer and avoid injury to the roots.

Scarify the walls and floor of the plant hole after the plant hole is dug. Place the
plant in the prepared plant hole at the proper position as regards to depth, alignment, final grade of the surrounding ground level, and vertical placement of the trunk. Maintain this position during all subsequent backfilling and watering operations. Set plants with the root collar at the same depth as grown in the nursery or raise above grade as indicated on the plans.

Moisten the soil with water after one-half to two-thirds of the backfilling and tamping has been completed, if the soil in the plant holes is not sufficiently moist. Apply water to moisten all soil but not a quantity that will saturate the soil to the extent of excluding all air from around the roots. Place the remainder of the backfill after complete absorption of water.

Construct water rings around all plants, except reforestation plants, in accordance with details shown on the plans. A water ring consists of a ridge of firmed soil in a ring around the plant and of a minimum inside diameter equal to the diameter of the plant hole. This ridge is approximately 152.4 mm and is compacted firmly enough to hold water.

(B) **Balled and Burlapped Plants**

Handle balled and burlapped plants by the ball and place in the plant hole so that the soil of the ball will not be loosened from the roots. After the hole has been almost completely backfilled and the soil thoroughly firmed under and around the ball, cut the burlap away and remove from around the stem of the plant. Complete backfilling so as to avoid loosening of the soil of the root ball.

(C) **Container Grown Plants**

Planting requirements for container grown plants are the same as applicable to balled and burlapped plants. Remove container immediately before planting. During the removal of the container sufficient precautions shall be taken so as to ensure that the soil and roots inside the container are undisturbed. Scarify roots when directed.

(D) **Bare Rooted Plants**

Before the plant is placed in the plant hole, cut off smoothly any bruised or broken parts of roots. Place the plant in its proper position in the hole and backfill. Carefully place the backfill material, worked around and under the roots, and compacted in a manner that avoids bruising or breaking the roots.

(E) **Reforestation Plants**

Reforestation includes tree reforestation and shrub reforestation. Type, mixture, size, furnish description, and spacing will be as shown on the reforestation detail sheet in the plans.

Prior to beginning reforestation, each area to be reforested will be measured by the Engineer to determine the exact number of hectares for tree reforestation or square meters or shrub reforestation therein, and the quantity of each species of seedling to be planted within the area.

Where structures or plantings do not adequately delineate the outline of the area to be reforested, stake the outline of the area as directed by the Engineer. Furnish cypress, cedar, oak, locust, or other wood stakes approved by the Engineer. Provide stakes with a minimum industry standard of 50.8 mm x 50.8 mm (nominal) size and approximately 762 mm in length with a 381 mm white top. Drive stakes in the ground with approximately 457 mm remaining above the ground line, and place as necessary to define and delineate the reforestation outline.

Have sample stock of reforestation seedlings inspected by the Engineer, for general health and moisture content, within 24 hours prior to planting.
After the plant hole has been prepared, place the plant upright in the hole at the correct depth without crowding or bunching the roots. Firm the soil around the root system from the bottom of the plant hole to natural ground elevation.

Upon completion of planting the required number of seedlings within all areas to be reforested, the Contractor will be relieved of further responsibility in connection with reforestation except for damage caused directly by the Contractor.

**1670-10 MULCH FOR PLANTING**

Place mulch within 7 days of initial planting as a top layer on the backfilled plant hole and water ring. Place mulch approximately 101.6 mm deep as shown on the plans or as directed. Place additional mulch as directed during establishment.

No mulching will be required for reforestation plants.

**1670-11 WATER FOR PLANTING**

Water at the time of planting as specified in Article 1670-9 and at the Contractor’s election and the Engineer’s approval. Water with gravity flow or low pressure applicators which have been approved, and which will not erode soil around the plant root system or damage to plants. Saturate the soil around each plant thoroughly at each watering.

**1670-12 STAKING OR GUYING**

Stake or guy plants as shown on the plans or as directed to prevent damage.

Ensure that the plant is attached and held rigid to the support in a manner that will prevent chafing or other injury to the bark, and that will permit normal development of the trunk or branch.

**1670-13 INITIAL PLANTING**

Initial planting will be considered complete when the plants have been placed in the plant hole, backfilled, fertilized, watered, mulched, staked, and guyed, and the plants are in an acceptable condition.

**1670-14 ESTABLISHMENT**

Begin establishment for all initial or replacement plants immediately after they are planted. Maintain trees, shrubs, vines, and groundcovers, and the area of planting until final acceptance of the project. Mow and maintain the area around trees and shrubs for a distance of 1.83 m beyond the outside limits of water rings or 1.83 m beyond the limits of the guy stakes, whichever is greater; within shrub beds; and for a distance of 1.83 m outside the perimeter of the shrub beds. Establishment includes cutting of grass and control of weeds; watering; fertilization; replacement of mulch; repair or replacement of guy stakes, guy wires, and water rings; and other work as directed to ensure the survival and growth of plant material and the satisfactory appearance of the project. Remove dead plant material from the project during the establishment period.

**1670-15 REPLACEMENT PLANTING**

Replacement planting of trees, shrubs, and ground cover consists of replacing those plants which are not in a living, healthy condition or do not conform to the Specifications contained in the edition of *American Standard for Nursery Stock* or that have been damaged or stolen. Replacement of reforestation plants will not be required.

Perform replacement planting within the planting season specified in the contract.

**1670-16 FINAL INSPECTION**

All planting shall be completed and all plants shall be in a living and healthy condition at the time of final inspection.
Section 1670

1670-17 MEASUREMENT AND PAYMENT

(Plant Species and Size Indicated in Contract) will be measured and paid for in units of each, other than reforestation plants, that have been planted and accepted.

Reforestation will be measured and paid for in hectares of land measured along the surface of the ground.

Wetland Reforestation will be measured and paid for in hectares of land, measured along the surface of the ground.

Plant Bed Fumigation will be measured and paid for in square meters of plant bed measured along the surface of the ground.

Post-emergence Herbicidal Treatment will be measured and paid for in square meters of plant bed measured along the surface of the ground.

Pre-emergence Herbicidal Treatment will be measured and paid for in square meters of plant bed measured along the surface of the ground.

Mulch for Planting will be measured and paid for in cubic meters. Where mulch is furnished in bales or bags, the number of cubic meters in each bale or bag will be determined and then multiplied by the number of bales or bags of the same size, which have been acceptably furnished and placed. Where mulch is furnished in trucks, each truck will be measured by the Engineer and shall bear a legible identification mark indicating its capacity. Load each truck to at least its measured capacity at the time it arrives at the site of the work.

Water for Planting will be measured and paid for in units of 1 kiloliter. Measurement of water will be made by means of an approved metering device at the source of supply, or by determining the volumetric capacity of tank trucks used to deliver water to the project and recording the number of loads delivered by each truck.

No payment will be made for plant bed preparation, tillage, staking or guyng, and fertilization, for this work will be considered incidental to other work in the contract.

Payment will be made under:
